A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Paint: 5 percent, but not less than 1 gal. of each material and color applied.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store materials not in use in tightly covered containers in well-ventilated areas with ambient temperatures continuously maintained at not less than 45 deg F.

1. Maintain containers in clean condition, free of foreign materials and residue.

2. Remove rags and waste from storage areas daily.

1.6 FIELD CONDITIONS

A. Apply paints only when temperature of surfaces to be painted and ambient air temperatures are between 50 and 95 deg F.

B. Do not apply paints when relative humidity exceeds 85 percent; at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Benjamin Moore & Co.
2. Dunn-Edwards Corporation.
3. Kelly-Moore Paint Company Inc.
4. Sherwin-Williams Company (The).
5. Vista Paint Company Corporation

2.2 PAINT, GENERAL

A. MPI Standards: Products shall comply with MPI standards indicated and shall be listed in its "MPI Approved Products Lists."

1. Provide products from manufacturer's premium or professional product line.

B. Material Compatibility:

1. Materials for use within each paint system shall be compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
2. For each coat in a paint system, products shall be recommended in writing by topcoat manufacturers for use in paint system and on substrate indicated.

C. VOC Content: For field applications that are inside the weatherproofing system, paints and coatings shall comply with South Coast Air Quality Management District (SCAQMD), Rule 1113, effective 07/01/2008:~~Bay Area Air Quality Management District (BAAQMD), Reg. 8, Rule 3, effective 01/01/2004~~:

1. Flat Paints, Coatings, and Primers: 50 g/L.
2. Nonflat Paints, Coatings, and Primers: 50 g/L.
3. Nonflat (High Gloss) Paints, Coatings, and Primers: 50 g/L.
4. Primers, Sealers, and Undercoaters: 100 g/L.
5. Anticorrosive and Anti-Rust Paints Applied to Ferrous Metals: 100 g/L.
6. Clear Wood Finishes, Lacquers: 275 g/L.
7. Clear Wood Finishes, Varnishes: 275 g/L.
8. Dry-Fog Coatings: 150 g/L.
9. Floor Coatings: 50 g/L.
10. High Temperature Industrial Maintenance Coatings: 420 g/L.

11. Industrial Maintenance Coatings: 100 g/L.
12. Pretreatment Wash Primers: 420 g/L.
13. Shellacs, Clear: 730 g/L.
14. Shellacs, Pigmented: 550 g/L.
15. Zinc-Rich Industrial Maintenance Primers: 100 g/L.
16. ~~Flat Paints, Coatings, and Primers: 100 g/L.~~
17. ~~Nonflat Paints, Coatings, and Primers: 150 g/L.~~
18. ~~Nonflat (High Gloss) Paints, Coatings, and Primers: 250 g/L.~~
19. ~~Primers, Sealers, and Undercoaters: 200 g/L.~~
20. ~~Anticorrosive and Anti-Rust Paints Applied to Ferrous Metals: 400 g/L.~~
21. ~~Clear Wood Finishes, Lacquers: 550 g/L.~~
22. ~~Clear Wood Finishes, Varnishes: 350 g/L.~~
23. ~~Dry-Fog Coatings: 400 g/L.~~
24. ~~Floor Coatings: 250 g/L.~~
25. ~~High Temperature Industrial Maintenance Coatings: 420 g/L.~~
26. ~~Industrial Maintenance Coatings: 250 g/L.~~
27. ~~Pretreatment Wash Primers: 420 g/L.~~
28. ~~Shellacs, Clear: 730 g/L.~~
29. ~~Shellacs, Pigmented: 550 g/L.~~
30. ~~Zinc-Rich Industrial Maintenance Primers: 250 g/L.~~

D. Low-Emitting Materials: For field applications that are inside the weatherproofing system, 90 percent of paints and coatings shall comply with the requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

E. Colors: As indicated in a color schedule.

1. Ten percent of surface area will be painted with deep tones.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Applicator present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.

B. Maximum Moisture Content of Substrates: When measured with an electronic moisture meter as follows:

1. Concrete: 12 percent.
2. Wood: 15 percent.
3. Gypsum Board: 12 percent.
4. Plaster: 12 percent.

C. Gypsum Board Substrates: Verify that finishing compound is sanded smooth.

D. Plaster Substrates: Verify that plaster is fully cured.

E. Verify suitability of substrates, including surface conditions and compatibility, with existing finishes and primers.

F. Proceed with coating application only after unsatisfactory conditions have been corrected.

1. Application of coating indicates acceptance of surfaces and conditions.

3.2 PREPARATION

A. Comply with manufacturer's written instructions and recommendations in "MPI Architectural Painting Specification Manual" applicable to substrates and paint systems indicated.

B. Remove hardware, covers, plates, and similar items already in place that are removable and are not to be painted. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and painting.

1. After completing painting operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.

C. Clean substrates of substances that could impair bond of paints, including dust, dirt, oil, grease, and incompatible paints and encapsulants.

1. Remove incompatible primers and reprime substrate with compatible primers or apply tie coat as required to produce paint systems indicated.

D. Concrete Substrates: Remove release agents, curing compounds, efflorescence, and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces to be painted exceeds that permitted in manufacturer's written instructions.

E. Steel Substrates: Remove rust, loose mill scale, and shop primer, if any. Clean using methods recommended in writing by paint manufacturer.

F. Shop-Primed Steel Substrates: Clean field welds, bolted connections, and areas where shop paint is abraded. Paint exposed areas with the same material as used for shop priming to comply with SSPC-PA 1 for touching up shop-primed surfaces.

G. Galvanized-Metal Substrates: Remove grease and oil residue from galvanized sheet metal by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied paints.

H. Wood Substrates:

1. Scrape and clean knots, and apply coat of knot sealer before applying primer.
2. Sand surfaces that will be exposed to view, and dust off.
3. Prime edges, ends, faces, undersides, and backsides of wood.
4. After priming, fill holes and imperfections in the finish surfaces with putty or plastic wood filler. Sand smooth when dried.

3.3 APPLICATION

A. Apply paints according to manufacturer's written instructions and to recommendations in "MPI Manual."

1. Use applicators and techniques suited for paint and substrate indicated.
2. Paint surfaces behind movable equipment and furniture same as similar exposed surfaces. Before final installation, paint surfaces behind permanently fixed equipment or furniture with prime coat only.
3. Paint front and backsides of access panels, removable or hinged covers, and similar hinged items to match exposed surfaces.
4. Do not paint over labels of independent testing agencies or equipment name, identification, performance rating, or nomenclature plates.
5. Primers specified in painting schedules may be omitted on items that are factory primed or factory finished if acceptable to topcoat manufacturers.

B. Tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of same material are to be applied. Tint undercoats to match color of topcoat, but provide sufficient difference in shade of undercoats to distinguish each separate coat.

C. If undercoats or other conditions show through topcoat, apply additional coats until cured film has a uniform paint finish, color, and appearance.

D. Apply paints to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and color breaks.

E. Painting Fire Suppression, Plumbing, HVAC, Electrical, Communication, and Electronic Safety and Security Work:

1. Paint the following work where exposed in equipment rooms or where exposed to elements, moisture, or corrosion:
    a. Equipment, including panelboards and switch gear.
    b. Uninsulated metal piping.
    c. Uninsulated plastic piping.
    d. Pipe hangers and supports.
    e. Metal conduit.
    f. Tanks that do not have factory-applied final finishes.

g. Duct, equipment, and pipe insulation having cotton or canvas insulation covering or other paintable jacket material.

2. Paint the following work where exposed in occupied spaces:
   a. Equipment, including panelboards.
   b. Uninsulated metal piping.
   c. Uninsulated plastic piping.
   d. Pipe hangers and supports.
   e. Metal conduit.
   f. Duct, equipment, and pipe insulation having cotton or canvas insulation covering or other paintable jacket material.
   g. Other items as directed by Architect.
3. Paint portions of internal surfaces of metal ducts, without liner, behind air inlets and outlets that are visible from occupied spaces.

3.4 FIRE-RATED AND SMOKE CONTAINMENT ASSEMBLIES

A. Fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions or any other wall required to have protected openings or penetrations shall be effectively and permanently identified with signs or stenciling. Such identification shall:
   1. Be located in accessible concealed floor, floor-ceiling or attic spaces; and
   2. Be repeated at intervals not exceeding 30 feet measured horizontally along both sides of the wall or partition; and
   3. Include lettering not less than 0.5 inch in height, incorporating the suggested wording: " X HOUR FIRE AND/OR SMOKE BARRIER-PROTECT ALL OPENINGS" or other wording approved or required by AHJ (Authority Having Jurisdiction). Replace “X” with the appropriate designated hourly rating.
   4. Apply a minimum one-inch wide bright red horizontal line, both sides of wall, interrupted for approved text, at the required interval.

B. Refer to the Life Safety Plan and Construction Subsystems Drawings for locations of walls and applicable ratings.

3.5 FIELD QUALITY CONTROL

A. Dry Film Thickness Testing: Owner may engage the services of a qualified testing and inspecting agency to inspect and test paint for dry film thickness.
   1. Contractor shall touch up and restore painted surfaces damaged by testing.
   2. If test results show that dry film thickness of applied paint does not comply with paint manufacturer's written recommendations, Contractor shall pay for testing and apply additional coats as needed to provide dry film thickness that complies with paint manufacturer's written recommendations.

3.6 CLEANING AND PROTECTION

A. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.

B. After completing paint application, clean spattered surfaces. Remove spattered paints by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.

C. Protect work of other trades against damage from paint application. Correct damage to work of other trades by cleaning, repairing, replacing, and refinishing, as approved by Architect, and leave in an undamaged condition.

D. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

3.7 INTERIOR PAINTING SCHEDULE

A. Concrete Substrates, Nontraffic Surfaces:

1. Latex System MPI INT 3.1A:
    a. Prime Coat: Latex, interior, matching topcoat.
    b. Topcoat: Latex, interior (MPI Gloss Level 3), MPI #52.
    c. Topcoat: Latex, interior, semi-gloss (MPI Gloss Level 5), MPI #54.

B. Steel Substrates:

1. Latex System, Alkyd Primer MPI INT 5.1Q:
    a. Prime Coat: Shop primer specified in Section where substrate is specified.
    b. Intermediate Coat: Latex, interior, matching topcoat.
    c. Topcoat: Latex, interior, semi-gloss (MPI Gloss Level 5), MPI #54.

C. Galvanized-Metal Substrates:

1. Latex System MPI INT 5.3A:
    a. Prime Coat: Primer, galvanized, water based, MPI #134.
    b. Intermediate Coat: Latex, interior, matching topcoat.
    c. Topcoat: Latex, interior, semi-gloss (MPI Gloss Level 5), MPI #54.

D. Wood Substrates: Wood trim Doors.

1. High-Performance Architectural Latex System MPI INT 6.3A:
    a. Prime Coat: Primer, latex, for interior wood, MPI #39.
    b. Intermediate Coat: Latex, interior, high performance architectural, matching topcoat.
    c. Topcoat: Latex, interior, high performance architectural, semi-gloss (MPI Gloss Level 5), MPI #141.

E. Gypsum Board and Plaster Substrates:

1. High-Performance Architectural Latex System MPI INT 9.2B:
   a. Prime Coat: Primer sealer, latex, interior, MPI #50.
   b. Intermediate Coat: Latex, interior, high performance architectural, matching topcoat.
   c. Topcoat: Latex, interior, high performance architectural (MPI Gloss Level 3), MPI #139.
   d. Topcoat: Latex, interior, high performance architectural, semi-gloss (MPI Gloss Level 5), MPI #141.

END OF SECTION

SECTION 09 9313 - CONCRETE FLOOR SEALING

PART 1 - GENERAL

1.1 SUMMARY

A. Applied sealer for horizontal cast-in-place concrete surfaces.

B. Related Sections:

1. Section 03 3000 - Cast-In-Place Concrete.

1.2 SUBMITTALS

A. Product Data: Submit manufacturer's product data and installation instructions.

1.3 QUALITY ASSURANCE

A. Installer: Licensed installers, experienced and trained in the use of these products.

B. Suitability of Substrate: Do not apply to concrete surfaces which may have insufficient chemical reaction, including older or weather concrete, concrete subject to runoff or weathered concrete, or heavily sandblasted concrete.

C. Regulatory Requirements: Comply with requirements of authorities having jurisdiction and applicable codes at the location of the project.

1.4 DELIVERY, STORAGE AND HANDLING

A. Deliver materials and products in unopened factory labeled packages. Protect from damage.

B. Store in a safe place, out of direct sunlight. Keep containers tightly sealed. Do not allow product to freeze. Use within manufacturer’s recommended shelf life, approximately 12 months.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Concrete Sealer: Sealer by Monochem, Aquaseal W20.

1. VOC: 0.

2. Coverage: As recommended by manufacturer.

PART 3 - EXECUTION

3.1 PREPARATION

A. Prior to start of application, inspect existing conditions to ensure surfaces are suitable for installation including the following:

1. Concrete has cured for a minimum of 28 days ~~prior to application of stain~~.
2. Surface is completely free of sealers, oils, dirt, paint, alkali, penetrating sealers and foreign materials ~~that would prevent the stain from penetrating the concrete surface~~.
3. Concrete has been swept clean.
4. Test area has been approved.

3.2 APPLICATION

A. Concrete Sealer:

1. Strictly comply with manufacturer's installation recommendations.
2. Apply at rated recommended by manufacturer.
3. Clean surface as recommended by manufacturer.

3.3 CLEANING AND PROTECTION

A. Protection: Do not cover, but protect floor area from paint and other contaminates that could inhibit the stain.

END OF SECTION

SECTION 09 9600 - HIGH-PERFORMANCE COATINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes surface preparation and the application of high-performance coating systems.

B. Related Requirements:

1. Section 01 4339 "Exterior Walls Mockups".
2. Section 05 5213 "Pipe and Tube Railings" for shop priming pipe and tube railings with coatings specified in this Section.
3. Section 09 9113 "Exterior Painting" for general field painting.

1.3 DEFINITIONS

A. MPI Gloss Level 5 (Semi-Gloss Finish): 35 to 70 units at 60 degrees, according to ASTM D 523.

B. MPI Gloss Level 6 (Gloss Finish): 70 to 85 units at 60 degrees, according to ASTM D 523.

C. MPI Gloss Level 7 (High-Gloss Finish): More than 85 units at 60 degrees, according to ASTM D 523.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product. Include preparation requirements and application instructions.

1. Include ~~printout of current "MPI Approved Products List"~~ product list for each product category specified, with the proposed product highlighted.
2. Indicate VOC content.

B. Sustainable Design Submittals:

1. Product Data: For paints and coatings, indicating VOC content.
2. Laboratory Test Reports: For paints and coatings, indicating compliance with requirements for low-emitting materials.

C. Samples for Verification: For each type of coating system and each color and gloss of topcoat indicated.

1. Submit Samples on rigid backing, 8 inches square.
2. Apply coats on Samples in steps to show each coat required for system.
3. Label each coat of each Sample.
4. Label each Sample for location and application area.

D. Product List: Cross-reference to coating system and locations of application areas. Use same designations indicated on Drawings and in schedules. Include color designations.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Coatings: 5 percent, but not less than 1 gal. of each material and color applied.

1.6 QUALITY ASSURANCE

A. Mockups: Apply mockups of each coating system indicated to verify preliminary selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Architect will select one surface to represent surfaces and conditions for application of each coating system.
   a. Wall and Ceiling Surfaces: Provide samples of at least 100 sq. ft..
   b. Other Items: Architect will designate items or areas required.
2. Final approval of color selections will be based on mockups.
   a. If preliminary color selections are not approved, apply additional mockups of additional colors selected by Architect at no added cost to Owner.
3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
5. Comply with requirements of Section 01 4339 "Exterior Walls Mockups".

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store materials not in use in tightly covered containers in well-ventilated areas with ambient temperatures continuously maintained at not less than 45 deg F.

1. Maintain containers in clean condition, free of foreign materials and residue.
2. Remove rags and waste from storage areas daily.

1.8 FIELD CONDITIONS

A. Apply coatings only when temperature of surfaces to be coated and ambient air temperatures

are between 50 and 95 deg F.

B. Do not apply coatings when relative humidity exceeds 85 percent; at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.

C. Do not apply exterior coatings in snow, rain, fog, or mist.

PART 2 - PRODUCTS

~~?.~~ ~~Behr Process Corporation~~

2.2 HIGH-PERFORMANCE COATINGS, GENERAL

~~A.~~ ~~MPI Standards: Products shall comply with MPI standards indicated and shall be listed in its "MPI Approved Products Lists."~~

~~1.~~ Provide products from manufacturer's premium or professional product line.

B. Material Compatibility:

1. Materials for use within each paint system shall be compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.

2. For each coat in a paint system, products shall be recommended in writing by topcoat manufacturers for use in paint system and on substrate indicated.

3. Products shall be of same manufacturer for each coat in a coating system.

C. VOC Content: For field applications that are inside the weatherproofing system, paints and coatings shall comply with VOC content limits of the South Coast Air Quality Management District (SCAQMD), Rule 1113, effective 07/01/2008 and the following VOC content limits:

1. Flat Paints, Coatings, and Primers: VOC content of not more than 50 g/L.

2. Nonflat Paints, Coatings, and Primers: VOC content of not more than 50 g/L.

3. Nonflat (High Gloss) Paints, Coatings, and Primers: VOC content of not more than 50 g/L.

4. Anticorrosive and Anti-Rust Paints Applied to Ferrous Metals: VOC content of not more than 100 g/L.

5. Clear Wood Finishes, Varnishes: VOC not more than 275 g/L.

6. Clear Wood Finishes, Lacquers: VOC not more than 275 g/L.

7. Floor Coatings: VOC not more than 50 g/L.

8. Shellacs, Clear: VOC not more than 730 g/L.

9. Shellacs, Pigmented: VOC not more than 550 g/L.

10. Primers, Sealers, and Undercoaters: VOC content of not more than 100 g/L.

D. Low-Emitting Materials: For field applications that are inside the weatherproofing system, 90 percent of paints and coatings shall comply with the requirements of the California Department

of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

E. Colors: As indicated in color schedule.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Applicator present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.

B. Maximum Moisture Content of Substrates: When measured with an electronic moisture meter as follows:

1. Concrete: 12 percent.
2. Gypsum Board: 12 percent.

C. Gypsum Board Substrates: Verify that finishing compound is sanded smooth.

D. Verify suitability of substrates, including surface conditions and compatibility, with existing finishes and primers.

E. Proceed with coating application only after unsatisfactory conditions have been corrected.

1. Application of coating indicates acceptance of surfaces and conditions.

3.2 PREPARATION

A. Comply with manufacturer's written instructions and recommendations in "MPI Architectural Painting Specification Manual" applicable to substrates and coating systems indicated.

B. Remove hardware, covers, plates, and similar items already in place that are removable and are not to be painted. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and painting.

1. After completing painting operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.

C. Clean substrates of substances that could impair bond of coatings, including dust, dirt, oil, grease, and incompatible paints and encapsulants.

1. Remove incompatible primers and reprime substrate with compatible primers or apply tie coat as required to produce coating systems indicated.

D. Concrete Substrates: Remove release agents, curing compounds, efflorescence, and chalk. Do not coat surfaces if moisture content or alkalinity of surfaces to be coated exceeds that permitted in manufacturer's written instructions.

1. Clean surfaces with pressurized water. Use pressure range of 1500 to 4000 psi at 6 to 12 inches .

2. Abrasive blast clean surfaces to comply with SSPC-SP 7/NACE No. 4.

E. Steel Substrates: Remove rust, loose mill scale, and shop primer if any. Clean using methods recommended in writing by paint manufacturer.

F. Shop-Primed Steel Substrates: Clean field welds, bolted connections, and areas where shop paint is abraded. Paint exposed areas with the same material as used for shop priming to comply with SSPC-PA 1 for touching up shop-primed surfaces.

G. Galvanized-Metal Substrates: Remove grease and oil residue from galvanized sheet metal by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied coatings.

3.3 APPLICATION

A. Apply high-performance coatings according to manufacturer's written instructions and recommendations in "MPI Architectural Painting Specification Manual."

1. Use applicators and techniques suited for coating and substrate indicated.

2. Coat surfaces behind movable equipment and furniture same as similar exposed surfaces. Before final installation, coat surfaces behind permanently fixed equipment or furniture with prime coat only.

3. Coat backsides of access panels, removable or hinged covers, and similar hinged items to match exposed surfaces.

4. Do not apply coatings over labels of independent testing agencies or equipment name, identification, performance rating, or nomenclature plates.

B. Tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of the same material are to be applied. Tint undercoats to match color of finish coat, but provide sufficient difference in shade of undercoats to distinguish each separate coat.

C. If undercoats or other conditions show through final coat, apply additional coats until cured film has a uniform coating finish, color, and appearance.

D. Apply coatings to produce surface films without cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections. Produce sharp glass lines and color breaks.

3.4 FIELD QUALITY CONTROL

A. Dry Film Thickness Testing: Owner may engage the services of a qualified testing and inspecting agency to inspect and test coatings for dry film thickness.

1. Contractor shall touch up and restore coated surfaces damaged by testing.

2. If test results show that dry film thickness of applied coating does not comply with coating manufacturer's written recommendations, Contractor shall pay for testing and apply additional coats as needed to provide dry film thickness that complies with coating manufacturer's written recommendations.

3.5 CLEANING AND PROTECTION

A. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.

B. After completing coating application, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.

C. Protect work of other trades against damage from coating operation. Correct damage to work of other trades by cleaning, repairing, replacing, and recoating, as approved by Architect, and leave in an undamaged condition.

D. At completion of construction activities of other trades, touch up and restore damaged or defaced coated surfaces.

3.6 EXTERIOR HIGH-PERFORMANCE COATING SCHEDULE

A. Concrete Substrates, Vertical Surfaces:

1. Epoxy-Modified Latex System ~~MPI EXT 3.1E~~:
   a. Prime Coat: Epoxy-modified latex, matching topcoat.
   b. Intermediate Coat: Epoxy-modified latex, matching topcoat.
   c. Topcoat: Epoxy-modified latex, semi-gloss (MPI Gloss Level 5)~~, MPI #215~~.

B. Steel Substrates:

1. Epoxy System ~~MPI EXT 5.1F~~:
   a. Prime Coat: Primer, epoxy, anti-corrosive, for metal, ~~MPI #101~~.
   b. Intermediate Coat: Epoxy, high build, low gloss, ~~MPI #108~~.
   c. Topcoat: Epoxy, gloss, ~~MPI #77~~.

C. Galvanized-Metal Substrates:

1. Epoxy System ~~MPI EXT 5.3C~~:
   a. Prime Coat: Primer, epoxy, anti-corrosive, for metal, ~~MPI #101~~.
   b. Intermediate Coat: Epoxy, matching topcoat.
   c. Topcoat: Epoxy, gloss, ~~MPI #77~~.

3.7 INTERIOR HIGH-PERFORMANCE COATING SCHEDULE

A. Concrete Substrates, Vertical Surfaces:

1. Epoxy-Modified Latex System ~~MPI INT 3.1G~~:
   a. Prime Coat: Epoxy-modified latex, matching topcoat.
   b. Intermediate Coat: Epoxy-modified latex, matching topcoat.
   c. Topcoat: Epoxy-modified latex, semi-gloss (MPI Gloss Level 5), ~~MPI #215~~.

B. Steel Substrates:

1. Epoxy System MPI INT 5.1L:
    a. Prime Coat: Primer, epoxy, anti-corrosive, for metal, ~~MPI #101~~.
    b. Intermediate Coat: Epoxy, matching topcoat.
    c. Topcoat: Epoxy, gloss, ~~MPI #77~~.

C. Galvanized-Metal Substrates:

1. Epoxy over Epoxy Primer System MPI INT 5.3D:
    a. Prime Coat: Primer, epoxy, anti-corrosive, for metal, ~~MPI #101~~.
    b. Intermediate Coat: Epoxy, matching topcoat.
    c. Topcoat: Epoxy, gloss, ~~MPI #77~~.

D. Gypsum Board Substrates:

1. Epoxy-Modified Latex System MPI INT 9.2F:
    a. Prime Coat: Primer sealer, latex, interior, ~~MPI #50~~.
    b. Intermediate Coat: Epoxy-modified latex, matching topcoat.
    c. Topcoat: Epoxy-modified latex, semi-gloss (MPI Gloss Level 5), ~~MPI #215~~.

END OF SECTION

SECTION 09 9653 - ELASTOMERIC COATINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes surface preparation and application of elastomeric coatings to the following exterior substrates:

1. Concrete unit masonry.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Indicate VOC content.

B. Samples for Verification: For each type of elastomeric coating indicated and in each color and gloss.

1. Submit Samples on same type of substrate as that to receive application, 8 inches square.
2. Apply coats on Samples in steps to show each separate coat, including primers and block fillers as applicable.
3. Label each coat of each Sample.
4. Label each Sample for location and application area.

C. Product List: Cross-reference to paint system and locations of application areas. Use same designations indicated on Drawings and in schedules. Include color designations.

1.4 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Quantity: Furnish an additional 5 percent but not less than 1 gal. of each material, color, and texture applied.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store materials not in use in tightly covered containers in well-ventilated areas with ambient temperatures continuously maintained at not less than 45 deg F.

1. Maintain containers in clean condition, free of foreign materials and residue.
2. Remove rags and waste from storage areas daily.

1.6 FIELD CONDITIONS

A. Apply coatings only when temperature of surfaces to be coated and ambient air temperatures are between 50 and 90 deg F unless otherwise permitted by manufacturer's written instructions.

B. Do not apply coatings in snow, rain, fog, or mist; when relative humidity exceeds 85 percent; at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.

C. Allow wet surfaces to dry thoroughly and attain temperature and conditions specified before starting or continuing coating operation.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace elastomeric coatings that fail within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Water penetration through the coating.
   b. Deterioration of coating beyond normal weathering.
2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by the following:

1. Dow Corning, Basis of Design: AllGuard Silicone Elastomeric Coating.

2.2 MATERIALS

A. Moisture-Vapor Transmission: Minimum 43.2, based on testing according to ASTM D 1653.

B. Material Compatibility:

1. Materials for use within each paint system shall be compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
2. For each coat in a paint system, products shall be recommended in writing by manufacturers of topcoat for use in paint system and on substrate indicated.

C. Colors: As selected by Architect from manufacturer's full range.

D. Crack Fillers: Elastomeric coating manufacturer's recommended, factory-formulated crack fillers or sealants, including crack filler primers, compatible with substrate and other materials indicated.

E. Primer: Elastomeric coating manufacturer's recommended, factory-formulated, alkali-resistant primer compatible with substrate and other materials indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Applicator present, for compliance with manufacturer's requirements for maximum moisture content, alkalinity, and other conditions affecting performance of work.

B. Begin coating only when moisture content of substrate is 12 percent or less when measured with an electronic moisture meter.

C. Begin coating no sooner than 28 days after substrate is constructed and is visually dry on both sides.

D. Verify that substrate is within the range of alkalinity recommended by manufacturer.

E. Verify suitability of substrates, including surface conditions and compatibility with existing finishes and primers.

F. Begin coating application only after unsatisfactory conditions have been corrected and surfaces are dry.

3.2 PREPARATION

A. Comply with manufacturer's written instructions applicable to substrates and coating systems indicated.

B. Remove hardware and hardware accessories, plates, machined surfaces, light fixtures, and similar items already installed that are not to be coated. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and coating.

1. After completing coating operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.

C. Clean substrates of substances that could impair bond of coatings, including dirt, oil, grease, and incompatible paints and encapsulants. Do not coat surfaces if moisture content or alkalinity of surfaces to be coated exceeds that permitted in manufacturer's written instructions.

1. Remove incompatible primers and reprime substrate with compatible primers as required to produce coating systems indicated.

2. Perform cleaning and coating application so dust and other contaminants from cleaning process will not fall on wet, newly coated surfaces.

D. Crack Repair: Fill cracks according to manufacturer's written instructions before coating surfaces.

3.3 APPLICATION

A. Apply elastomeric coatings according to manufacturer's written instructions.

1. Use equipment and techniques best suited for substrate and type of material being applied.
2. Coat surfaces behind movable items the same as similar exposed surfaces.
3. Apply each coat separately according to manufacturer's written instructions.

B. Primers: Apply at a rate to ensure complete coverage.

C. Elastomeric Finish Coat(s): Manufacturer's recommended number of coats and total dry film thickness for condition of substrate.

D. Tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of same material are to be applied. Tint undercoats similar to color of topcoat, but provide sufficient difference in shade of undercoats to distinguish each separate coat.

E. If undercoats or other conditions show through topcoat, apply additional coats until cured film has a uniform finish, color, and appearance.

F. Apply coatings to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and color breaks.

G. Apply coatings to prepared surfaces as soon as practicable after preparation and before subsequent surface soiling or deterioration.

H. Spray Application: Use spray equipment for application only when permitted by authorities having jurisdiction. Wherever spray application is used, do not double back with spray equipment to build up film thickness of two coats in one pass.

3.4 FIELD QUALITY CONTROL

A. Field Testing and Inspection: Owner reserves the right to engage the services of a qualified testing agency to verify installed thickness of elastomeric coatings.

3.5 CLEANING AND PROTECTION

A. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.

B. After completing coating application, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.

C. Protect work of other trades against damage from coating application. Correct damage to work of other trades by cleaning, repairing, replacing, and refinishing, as approved by Architect, and leave in an undamaged condition.

D. At completion of construction activities, touch up and restore damaged or defaced coated surfaces.

END OF SECTION

SECTION 09 9654 - POLYVINYLIDENE DIFLUORIDE (PVDF) COATING SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Summary: Section includes shop-applied polyvinylidene difluoride (PVDF) exposed coil coated finish and extrusion coatings also known as high-performance organic finish, baked-on fluorocarbon finish, or special fluoropolymer finish as specified in other sections of this Specifications to include the coatings for work of the following:

1. Section 01 4339 "Exterior Walls Mockups".
2. Section 07 4113.13 - Formed Metal Roof Panels.
3. Section 07 4213.13 - Formed Metal Wall Panels.
4. Section 07 4213.23 - Metal Composite Material Wall Panels.
5. Section 07 6200 - Sheet Metal Flashing and Trim.
6. Section 08 4113 - Aluminum-Framed Entrances and Storefronts.
7. Section 08 4229.23 - Sliding Automatic Entrances.
8. Section 08 4413 - Glazed Aluminum Curtain Walls.
9. Section 08 9119 - Fixed Louvers.

PART 2 - PRODUCTS

2.1 POLYVINYLIDENE DIFLUORIDE (PVDF) RESIN

A. Manufacturers: Provide products by one of the following:

1. Arkema, Inc.; Kynar 500.
2. Solvay Solexis S.p.A; Hylar 5000.

B. PVDF Resin: Highly non-reactive and pure thermoplastic fluoropolymer; fine powder grade used as principal ingredient for high-performance coating system.

2.2 COATING MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following.

1. Akzo Nobel.
2. BASF/Morton Industrial Coatings.
3. PPG Industries, Inc.
4. Valspar Corporation.

B. Applicators: Applicators approved and licensed by coating manufacturer.

2.3 COIL-COATED FINISH

A. Exposed-Coil-Coated Finish: High performance organic coatings complying with AAMA 620 for architectural aluminum and AAMA 621 for hot dipped galvanized (HDG) and zinc-aluminum coated steel substrates.

1. Two-Coat Fluoropolymer: Fluoropolymer finish containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
   a. Coating Products:
      1) PPG Duranar.
      2) Valspar Fluropon.
      3) BASF/Morton Fluoroceram.
      4) Azxo Nobel Trinar.
2. Three-Coat Fluoropolymer: Fluoropolymer finish containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
   a. Coating Products:
      1) PPG Duranar XL Plus.
      2) Valspar Fluropon.
      3) BASF/Morton Fluoroceram.
      4) Azxo Nobel Trinar.
3. Color: As selected by Architect from manufacturer's full range.

B. Concealed Finish: Pretreat with manufacturer's standard white or light-colored acrylic or polyester-backer finish, consisting of prime coat and wash coat with minimum total dry film thickness of 0.5 mil.

2.4 FLUOROPOLYMER PANEL AND EXTRUSION COATINGS

A. High-Performance Organic Finish: Two-coat fluoropolymer finish complying with AAMA 2604 AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

1. Coating Products:

a. PPG Duranar.
b. Valspar Fluropon.
c. BASF/Morton Fluoroceram.
d. Azxo Nobel Trinar.

B. High-Performance Organic Finish: Three -coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

1. Coating Products:
   a. PPG Duranar XL.
   b. Fluropon Classic.

2.5 MISCELLANEOUS MATERIALS

A. Touch-up and Repair of PVDF Coatings: Two-component, fluoropolymer coating using 100 percent fluoroethylene alkyl vinyl ether (FEVE) resins and aliphatic isocyanate.

1. Coating Products:
   a. PPG Industries, Inc.; Duranar ADS System.
   b. Valspar Corporation; Fluropon ADS.

2.6 FLUOROPOLYMER COATINGS SHOP APPLICATION

A. Pretreatment: Chrome phosphate based pretreatment.

B. Methods: A system consisting of the primer and finish, each spray-applied by an approved applicator at the factory, force-cured in accordance with the coating manufacturers current printed instructions.

C. Fluorocarbon top finish color coating shall have a minimum baking cycle of 450 deg F for 20 minutes and shall have a minimum dry film thickness of 1.0 mil.

PART 3 - EXECUTION (Not Used)

END OF SECTION

SECTION 09 9737 - DRY ERASE COATING

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. This Section specifies field-applied dry erase coatings including surface preparation and primer.

1.2 RELATED REQUIREMENTS

A. Section 09 2116 - Gypsum Board Assemblies; gypsum board substrate.

B. Section 10 1100 - Visual Display Surfaces; whiteboard and chalkboard substrates.

1.3 SUBMITTALS

A. Comply with Division 01 Section: Submittals.

B. Product Data: Manufacturer's data sheets on each product to be used, including:

C. Preparation instructions and recommendations.

D. Storage and handling requirements and recommendations.

E. Installation methods.

F. Maintenance Instructions: Provide precautions against cleaning materials and methods that may be detrimental to finish and performance.

G. Samples: Submit verification sample of specified color on manufacturer’s standard sample card.

1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications: Minimum 3 years manufacturing dry erase coatings.

B. Mock-ups: Prepare mock-ups for Architect's review and to establish requirements for substrate finish and final coating application, texture and color.

1. Install dry erase coatings mock-up in area designated by Architect.
2. Correct areas, modify method of application/installation, or adjust finish texture as directed by Architect to comply with specified requirements.
3. Maintain mock-ups accessible to serve as a standard of quality for this Section.
4. Accepted mock-ups may remain in place.

C. Sustainable Design:

1. Indoor Air Quality: UL GREENGUARD Gold Certified product.
2. USGBC LEED IEQ Credit 4.2 for Low-Emitting Materials - Paints and Coatings

3. Compliance achieved using 150 g/l VOC content threshold.
4. Provide coating meeting SCAQMD Rule 1113 Section (c)(1) requirements, default limit of 250g/l VOC.
5. Compliance achieved using CA 01350 indoor air emissions.
6. Compliance achieved using USGBC VOC Budget Methodology for low- emitting materials.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in original factory wrappings and containers, clearly labeled with manufacturer, product name, and fire hazard classification.

B. Store materials in original undamaged packages and containers inside a well - ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity. Store at temperatures above 40 degrees F. Do not allow product to freeze.

1.6 PROJECT CONDITIONS

A. Maintain ambient temperature not less than 50 deg F minimum and 85 deg F maximum 72 hours prior to beginning of installation.

B. Do not install dry erase coatings unless substrate temperature is above 60 degrees F.

C. Do not install dry erase coatings until the space is enclosed and weatherproof.

D. Do not install dry erase coatings until temperature is stabilized and permanent lighting is in place.

1.7 WARRANTY

A. Warranty: Manufacturer’s 10 year limited material warranty.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Manufacturer: IdeaPaint, 40 Broad Street, 1st Floor, Boston, MA 02109, telephone 617-714-1050, fax 617-714-1080, website www.ideapaint.com.

2.2 PRODUCTS

A. Dry Erase Coating: CREATE by IdeaPaint, providing a surface suitable for use of dry erase markers.

B. Color: Specialty and Custom color as selected.

C. Fire Rating (ASTM E84): Class A, flame spread index 10, smoke developed index 20.

D. VOC (EPA Method 24): 18 g/L Part A and B mixed, 1.4 g/L Part A only, 97 g/L Part B only.

E. Solids: 98 percent Part A, 40 percent Part B.

F. Density: 12.18 lbs/gal Part A, 8.14 lbs/gal Part B.

G. Opacity/Hiding Power (ASTM D2805): 98.3 percent.

H. Sag Resistance (ASTM D4400 Method 6.5.6): 4.8.

I. Flow and Leveling (ASTM D2801): 6.

J. Crack Resistance (ASTM D522): 29 percent.

K. Finish/Gloss (ASTM D523) on Dry Wall Board:

1. 20 degrees: 22.4.
2. 60 degrees: 66.0.
3. 85 degrees: 66.8.

L. Scrub Resistance (ASTM D2486): Greater than 11,100 cycles.

M. Stain Removal/Washability (ASTM D3450): 94.9 percent.

N. Flashpoint (ASTM D92 Open Cup): Greater than 200 degrees F Part A, greater than 200 degrees F Part B.

O. QUV (following 500 hours of exposure, samples prepared on Kilz primed drywall) Control panel: L = 96.74, a = -1.02, b = 2.14. Test panel: L = 96.27, a = -1.44, b = 4.04. Delta E = 2.00.

P. Chemistry Type: A non isocyanate based coating.

Q. Primer: IdeaPaint PRIMER, Sherwin-Williams Multi-Purpose, PPG Seal Grip, Glidden Gripper or Kilz Premium. Visit http://learn.ideapaint.com/preferred-products for a complete list of primers.

1. Priming is required over stained surfaces for optimal hiding power, such as stained whiteboards or stained chalkboards.
2. Priming is required for surface color changes for optimal hiding power of original surface color.
3. Priming is required over new drywall, plastic, aluminum, steel (galvanized and ungalvanized), and vinyl.

R. Roller Covers: Provided by manufacturer. No substitutions.

PART 3 - **EXECUTION**

3.1 EXAMINATION

A. Examine areas and conditions in which dry erase coatings will be installed.

B. Complete finishing operations, including painting, before beginning installation of dry erase coatings.

C. Wall surfaces to receive dry erase coatings shall be dry and free from dirt, grease, loose paint, and scale.

D. Do not proceed with installations until unsatisfactory conditions have been corrected.

3.2 SURFACE PREPARATION

A. Remove hardware, accessories, plates and similar items to allow dry erase coatings to be installed.

B. Repair damaged areas by filling voids with spackle. Sand smooth repaired or textured surfaces. Scuff glossy and non-porous surfaces using medium grit sandpaper. Paint product is a high gloss coating; imperfections and visible seams will telegraph.

C. Gypsum Board Surface: Provide Level 4 finish per ASTM C840 and GA-214. Recess nails and screws. Repair irregular tape joints, sand and remove dust.

D. Prime: Prime substrate using materials recommended by manufacturer if changing color of the surface, if covering a stained surface, or if applying on new drywall. Follow manufacturer's application, dry time, and recoat instructions prior to proceeding.

1. Changing color of the surface: Prime surface until the color of the existing surface does not show through.
2. Covering stained surface: Prime surface until undesired marks and stains do not show through.

E. Clean: Wipe surface with a clean, damp cloth to remove dust and environmental debris. Allow surface to completely dry.

F. Ventilate area thoroughly to aid in curing process and to dissipate mild odor. Allow a high percentage of outside air into current ventilation.

3.3 APPLICATION

A. Comply with manufacturers printed installation instructions. Mix components in strict accordance with manufacturer's instructions. Pot life is 1 hour maximum.

B. Apply dry erase coating with specified roller only. Comply with the following:

1. Apply heavy single coat only, using 2 layer method as described. Do not recoat or touch up applied coating once 10 minute return time has passed.
2. Divide your entire planned surface into areas up to 50 square feet.
3. Use a 4 inch foam roller to cut in all edges and light switches within the current area.
4. Using the included 9 inch roller, from one end of the current area to the other, apply in sections up to 4 feet wide by the full height of the surface.
5. Be sure to overlap the edges of each section and use a backrolling technique as you go to even out the application.
6. Watch for roller marks, drip marks, debris and missed spots, re-roll as needed.
7. Every 50 square feet or 3-5 minutes, return to the first section of the area you have just finished and apply the second layer using the same method detailed above. This helps to build up a thick and effective IdeaPaint surface.
8. Do not wait more than 10 minutes to perform the second layer over the first.
9. Remove masking tape within 1 hour of painting.

C. Dry erase coating may be applied directly onto clean, dry, smooth surfaces which are:
   1. A finished drywall surface
   2. A latex-based topcoat

D. Coating shall cure for a minimum of 4 days after application before use.

E. Application Rate: 5 mils wet film thickness as measured with a wet film gauge; maximum 50 square feet per quart or 200 square feet per gallon.

3.4 CLEANING AND MAINTENANCE

A. Regular erasing and cleaning should be done with a standard dry erase eraser or a dry microfiber towel. For more thorough cleaning, a damp microfiber towel may be used or IdeaPaint Cleaner.

B. If damaged, the original surface shall be deglossed by sanding surface and priming before recoating.

3.5 PROTECTION

A. Protect installed product and finished surfaces from damage during construction.

END OF SECTION

SECTION 10 1100 - VISUAL DISPLAY UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Visual display board assemblies.
2. Glass markerboards.
3. Magnetic glass markerboards.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, finishes, and accessories for visual display units.

B. LEED Submittals:

1. Product Data for Credit IEQ 4.1: For adhesives, documentation including printed statement of VOC content.
2. Laboratory Test Reports for Credit IEQ 4.1: For adhesives, documentation indicating that products comply with the testing and product requirements of the California Department of Public Health's (formerly, the California Department of Health Services') "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."
3. Product Data for Credit EA 4: For recycled content, documentation indicating recycled content.

C. Shop Drawings: For visual display units.

1. Include plans, elevations, sections, details, and attachment to other work.
2. Show locations of panel joints. Show locations of field-assembled joints for factory-fabricated units too large to ship in one piece.
3. Include sections of typical trim members.

D. Samples for Verification: For each type of visual display unit indicated.

1. Accessories: Full-size Sample of each type of accessory.

E. Product Schedule: For visual display units. Use same designations indicated on Drawings.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For visual display units to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

B. Provide the following upon request:

1. Qualification Data: For qualified Installer.

2. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for surface-burning characteristics of tackboards.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver factory-fabricated visual display units completely assembled in one piece. If dimensions exceed maximum manufactured unit size, or if unit size is impracticable to ship in one piece, provide two or more pieces with joints in locations indicated on approved Shop Drawings.

1.8 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install visual display units until spaces are enclosed and weathertight, wet-work in spaces is complete and dry, work above ceilings is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

B. Field Measurements: Verify actual dimensions of construction contiguous with visual display units by field measurements before fabrication.

1. Allow for trimming and fitting where taking field measurements before fabrication might delay the Work.

1.9 WARRANTY

A. Special Warranty for Porcelain-Enamel Face Sheets: Manufacturer agrees to repair or replace porcelain-enamel face sheets that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Surfaces lose original writing and erasing qualities.

b. Surfaces exhibit crazing, cracking, or flaking.

2. Warranty Period: Life of the building.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.
2. Smoke-Developed Index: 50 or less.

2.2 VISUAL DISPLAY BOARD ASSEMBLY

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Claridge Products and Equipment, Inc.
2. Egan Visual Inc.
3. Marsh Industries, Inc.; Visual Products Group.
4. Peter Pepper Products, Inc. Basis of Design Tactics Plus Writing Surface

B. Visual Display Board Assembly: factory fabricated.

1. Assembly: markerboard.
2. Corners: Square.
3. Width: As indicated on Drawings.
4. Height: As indicated on Drawings.
5. Mounting Method: Panel hanger system .

C. Markerboard Panel: Porcelain-enamel-faced markerboard panel on core indicated.

1. Color: As selected by Architect from full range of industry colors.

D. Tackboard Panel: Vinyl-fabric-faced tackboard panel on core indicated.

1. Fabric Wrapped Edge: Wrap edge of tackboard panel with fabric facing.
2. Color and Pattern: As selected by Architect from full range of industry colors.

E. Aluminum Frames: Fabricated from not less than 0.062-inch- thick, extruded aluminum; slim size and standard shape.

1. Aluminum Finish: Manufacturer's standard baked-enamel or powder-coat finish.

F. Chalktray: Manufacturer's standard; continuous.

1. Solid Type: Extruded aluminum with ribbed section and smoothly curved exposed ends. Magnetic type.

2.3 GLASS MARKERBOARDS

A. Magnetic Glass Markerboards: 5/16" tempered magnetic glass markerboard, with smooth polished edge and eased corners; color coated on back surface.

1. GlasPro-GL Magnetic glass.

B. Glass Markerboards: 5/16" tempered glass makerboard with smooth polished edge and eased corners; color coated on back surface.

1. Deko Markerboards.

C. Mounting: Round, stainless-steel standoffs, holding glass approximately 1 inch from wall surface; mounted in notches in standoffs at top and bottom edges of markerboard.

1. Color and Surface: See Interior Finish Material Legend on drawings.

2.4 MARKERBOARD PANELS

A. Porcelain-Enamel Markerboard Panels: Balanced, high-pressure, factory-laminated markerboard assembly of three-ply construction, consisting of moisture-barrier backing, core material, and porcelain-enamel face sheet with low-gloss finish. Laminate panels under heat and pressure with manufacturer's standard, flexible waterproof adhesive.

1. Face Sheet Thickness: 0.021 inch uncoated base metal thickness.
2. Manufacturer's Standard Core: Minimum 1/4 inch thick, with manufacturer's standard moisture-barrier backing.
3. Laminating Adhesive: Manufacturer's standard moisture-resistant thermoplastic type.

2.5 MATERIALS

A. Porcelain-Enamel Face Sheet: PEI-1002, with face sheet manufacturer's standard two- or three-coat process.

B. Clear Tempered Glass: ASTM C 1048, Kind FT, Condition A, Type I, Class 1, Quality Q3, with exposed edges seamed before tempering.

C. Extruded Aluminum: ASTM B 221, Alloy 6063.

D. Clips: Manufacturer's standard Z-clip mounting system.

2.6 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations

in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.7 ALUMINUM FINISHES

A. Baked-Enamel or Powder-Coat Finish: AAMA 2603, except with a minimum dry film thickness of 1.5 mils. Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances, surface conditions of wall, and other conditions affecting performance of the Work.

B. Examine walls and partitions for proper preparation and backing for visual display units.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Comply with manufacturer's written instructions for surface preparation.

B. Clean substrates of substances, such as dirt, mold, and mildew, that could impair the performance of and affect the smooth, finished surfaces of visual display boards.

C. Prepare surfaces to achieve a smooth, dry, clean surface free of flaking, unsound coatings, cracks, defects, projections, depressions, and substances that will impair bond between visual display units and wall surfaces.

3.3 INSTALLATION

A. General: Install visual display surfaces in locations and at mounting heights indicated on Drawings, or if not indicated, at heights indicated below. Keep perimeter lines straight, level, and plumb. Provide grounds, clips, backing materials, adhesives, brackets, anchors, trim, and accessories necessary for complete installation.

B. Factory-Fabricated Visual Display Board Assemblies: Attach concealed clips, hangers, and grounds to wall surfaces and to visual display board assemblies with fasteners at not more than 16 inches o.c. Secure tops and bottoms of boards to walls.

C. Rail Support System: Install horizontal support rail at mounting heights indicated on Drawings, or if not indicated, at height indicated below. Attach to wall with fasteners at 12 inches o.c.

1. Mounting Height: 72 inches above finished floor to top of rail.

2. Hang visual display units on rail support system.

3.4 CLEANING AND PROTECTION

A. Clean visual display units according to manufacturer's written instructions. Attach one removable cleaning instructions label to visual display unit in each room.

B. Touch up factory-applied finishes to restore damaged or soiled areas.

C. Cover and protect visual display units after installation and cleaning.

END OF SECTION

SECTION 10 1200 - DISPLAY CASES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Bulletin boards.

B. Related Requirements:

1. Section 10 1100 "Visual Display Units" for tackboards.

1.3 DEFINITIONS

A. Bulletin Board: Glazed cabinet with tackboard panel, without shelves, typically of shallow depth for display of paper documents.

B. Tackboard Panel: A material for holding push-pins or tacks typically consisting of a facing; such as fabric, vinyl, or cork; adhered to a substrate; such as fiberboard, hardboard, particleboard.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for bulletin boards. Include furnished specialties and accessories.

B. LEED Submittals:

1. Laboratory Test Reports for Credit IEQ 4.1: For adhesives, documentation indicating that products comply with the testing and product requirements of the California Department of Public Health's (formerly, the California Department of Health Services') "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

2. Product Data for Credit IEQ 4.4: For composite wood products, documentation indicating that the product contains no urea formaldehyde.

3. Laboratory Test Reports for Credit IEQ 4.4: For composite wood products used in bulletin boards, documentation indicating that products comply with the testing and product requirements of the California Department of Public Health's (formerly, the California Department of Health Services') "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

C. Shop Drawings: For bulletin boards.

1. Include plans, elevations, sections, and attachment details.
2. Show location of seams and joints in tackboard panels.
3. Include sections of typical trim members.

D. Samples for Verification: For each type of exposed finish for the following.

1. Tackboard Panel: Not less than 8-1/2 by 11 inches, with facing and substrate indicated for final Work. Include one panel for each type, color, and texture required.
2. Trim: 6-inch- long sections of each trim profile including corner section.

1.6 CLOSEOUT SUBMITTALS

A. Maintenance Data: For bulletin boards to include in maintenance manuals.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install bulletin boards for indoor installations until spaces are enclosed and weathertight, wet-work in spaces is complete and dry, work above ceilings is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

B. Field Measurements: Verify actual dimensions of openings for and bulletin boards by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.
2. Smoke-Developed Index: 50 or less.

2.2 BULLETIN BOARD

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Claridge Products and Equipment, Inc.
2. Laurence, C.R. Co., Inc.
3. Peter Pepper Products, Inc.
4. Vomar Products, Inc.

B. General: Factory-fabricated unit consisting of manufacturer's standard wall-mounted cabinet with tackboard panel on back inside surface and operable glazed doors at front.

1. Frame and Cabinet Profile: Square frame section with square cabinet corners.
2. Mounting: Surface mounted.
3. Size: As indicated on Drawings.

C. Aluminum-Framed Cabinet: Extruded aluminum; with manufacturer's standard baked-enamel or powder-coat finish.

D. Exterior Bulletin Boards: Aluminum-framed units of weather-resistant construction; with vents to dissipate trapped moisture, weather-resistant tackboard panel, and weather-stripped hinged doors.

E. Glazed Hinged Doors: Tempered glass; set in frame matching cabinet material and finish. Equip each door with full-height continuous hinge and cylinder lock with two keys.

1. Thickness: Not less than 5 mm thick.
2. Number of Doors: As indicated on Drawings.

2.3 TACKBOARD PANELS

A. Vinyl-Fabric-Faced Tackboard Panel <Insert designation>: Vinyl fabric factory laminated to 3/8-inch- thick fiberboard backing.

2.4 MATERIALS

A. Particleboard: ANSI A208.1, Grade M-1, made with binder containing no urea formaldehyde., that complies with the testing and product requirements of the California Department of Public Health's (formerly, the California Department of Health Services') "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

B. Vinyl Fabric: FS CCC-W-408D, Type II, burlap weave; weighing not less than 13 oz./sq. yd.; with flame-spread index of 25 or less when tested according to ASTM E 84.

C. Extruded-Aluminum Bars and Shapes: ASTM B 221, Alloy 6063.

D. Clear Tempered Glass: ASTM C 1048, Kind FT, Condition A, Type I, Class 1, Quality Q3, with exposed edges seamed before tempering.

E. Fasteners: Provide screws, bolts, and other fastening devices made from same material as items being fastened, except provide hot-dip galvanized, stainless-steel, or aluminum fasteners for exterior applications. Provide types, sizes, and lengths to suit installation conditions. Use security fasteners where exposed to view.

F. Adhesives: Manufacturer's standard product that complies with the testing and product requirements of the California Department of Public Health's (formerly, the California Department of Health Services') "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

2.5 FABRICATION

A. Fabricate bulletin boards to requirements indicated for dimensions, design, and thickness and finish of materials.

B. Use metals and shapes of thickness and reinforcing required to produce flat surfaces, and to impart strength for size, design, and application indicated.

C. Fabricate cabinets and door frames with reinforced corners, mitered to a hairline fit, with no exposed fasteners.

2.6 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.7 ALUMINUM FINISHES

A. Baked-Enamel or Powder-Coat Finish: AAMA 2603, except with a minimum dry film thickness of 1.5 mils. Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, with Installer present, for compliance with requirements for installation tolerances, surface conditions of wall, and other conditions affecting performance of the Work.

B. Examine walls and partitions for proper backing for .

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install units in locations and at mounting heights indicated on Drawings, or if not indicated, at heights indicated below. Keep perimeter lines straight, level, and plumb. Provide grounds, clips, backing materials, adhesives, brackets, anchors, trim, and accessories necessary for complete installation.

1. Mounting Height: 72 inches above finished floor to top of cabinet.

B. Bulletin Boards: Attach units to wall surfaces with concealed clips, hangers, or grounds.

3.3 ADJUSTING AND CLEANING

A. Adjust doors to operate smoothly without warp or bind and so contact points meet accurately. Lubricate operating hardware as recommended by manufacturer.

B. Touch up factory-applied finishes to restore damaged areas.

END OF SECTION

SECTION 10 1419 - DIMENSIONAL LETTER SIGNAGE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Fabricated channel dimensional characters.

1.3 COORDINATION

A. Furnish templates for placement of electrical service embedded in permanent construction by other installers.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. LEED Submittals:

1. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regionally manufactured materials. Include statement indicating cost for each regionally manufactured material.
    a. Include statement indicating location of manufacturer and distance to Project for each regionally manufactured material.
2. Product Data for Credit IEQ 4.1: For adhesives, documentation including printed statement of VOC content.
3. Laboratory Test Reports for Credit IEQ 4.1: For adhesives, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

C. Shop Drawings: For dimensional letter signs.

1. Include fabrication and installation details and attachments to other work.
2. Show sign mounting heights, locations of supplementary supports to be provided by others, and accessories.
3. Show message list, typestyles, graphic elements, and layout for each sign at least half size.
4. Show locations of electrical service connections.

D. Samples for Verification: For each type of sign assembly showing all components and with the required finish(es), in manufacturer's standard size unless otherwise indicated and as follows:

1. Dimensional Characters: Full-size Sample of each type of dimensional character.

2. Exposed Accessories: Full-size Sample of each accessory type.

E. Sign Schedule: Use same designations specified or indicated on Drawings or in a sign schedule.

F. Delegated-Design Submittal: For signs indicated in "Performance Requirements" Article.

1. Include structural analysis calculations for signs indicated to comply with design loads; signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For signs to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Comply with the University's Campus Sign Program requirements.

B. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

C. Provide the following upon request:

1. Qualification Data: For Installer.

1.7 FIELD CONDITIONS

A. Field Measurements: Verify locations of electrical service embedded in permanent construction by other installers by field measurements before fabrication, and indicate measurements on Shop Drawings.

1.8 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of signs that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Deterioration of finishes beyond normal weathering.
   b. Separation or delamination of sheet materials and components.

2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 4000 "Quality Requirements," to design sign structure and anchorage of dimensional character sign type(s) to withstand design loads as indicated on Drawings.

B. Thermal Movements: For exterior fabricated channel dimensional characters, allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

2.2 DIMENSIONAL CHARACTERS

A. Fabricated Channel Characters : Metal face and side returns, formed free from warp and distortion; with uniform faces, sharp corners, and precisely formed lines and profiles; internally braced for stability and for securing fasteners; and as follows.

1. Character Material: Sheet or plate stainless steel.
2. Material Thickness: Manufacturer's standard for size and design of character.
3. Character Height: As indicated.
4. Character Depth: As indicated.
5. Finishes:
    a. Integral Stainless-Steel Finish: No. 4.
6. Mounting: Manufacturer's standard for size and design of character .
    a. Hold characters at manufacturer's recommended distance from wall surface.

2.3 DIMENSIONAL CHARACTER MATERIALS

A. Stainless-Steel Sheet: ASTM A 240/A 240M or ASTM A 666, Type 304, stretcher-leveled standard of flatness.

B. Paints and Coatings for Sheet Materials: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposure indicated.

2.4 ACCESSORIES

A. Fasteners and Anchors: Manufacturer's standard as required for secure anchorage of signage, noncorrosive and compatible with each material joined, and complying with the following:

1. For exterior exposure, furnish stainless-steel devices unless otherwise indicated.
2. Exposed Metal-Fastener Components, General:
    a. Fabricated from same basic metal and finish of fastened metal unless otherwise indicated.

b. Fastener Heads: For nonstructural connections, use oval countersunk screws and bolts with tamper-resistant Allen-head slots unless otherwise indicated.

3. Sign Mounting Fasteners:

a. Concealed Studs: Concealed (blind), threaded studs welded or brazed to back of sign material, screwed into back of sign assembly, or screwed into tapped lugs cast integrally into back of cast sign material, unless otherwise indicated.

B. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.5 FABRICATION

A. General: Provide manufacturer's standard sign assemblies according to requirements indicated.

1. Preassemble signs and assemblies in the shop to greatest extent possible. Disassemble signs and assemblies only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation; apply markings in locations concealed from view after final assembly.

2. Mill joints to a tight, hairline fit. Form assemblies and joints exposed to weather to resist water penetration and retention.

3. Comply with AWS for recommended practices in welding and brazing. Provide welds and brazes behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed connections of flux, and dress exposed and contact surfaces.

4. Conceal connections if possible; otherwise, locate connections where they are inconspicuous.

5. Internally brace signs for stability and for securing fasteners.

6. Provide rebates, lugs, and brackets necessary to assemble components and to attach to existing work. Drill and tap for required fasteners. Use concealed fasteners where possible; use exposed fasteners that match sign finish.

7. Castings: Fabricate castings free of warp, cracks, blowholes, pits, scale, sand holes, and other defects that impair appearance or strength. Grind, wire brush, sandblast, and buff castings to remove seams, gate marks, casting flash, and other casting marks before finishing.

B. Brackets: Fabricate brackets, fittings, and hardware for bracket-mounted signs to suit sign construction and mounting conditions indicated. Modify manufacturer's standard brackets as required.

1. Stainless-Steel Brackets: Factory finish brackets with No. 4 finish unless otherwise indicated.

2.6 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.7 STAINLESS-STEEL FINISHES

A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.

B. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross scratches.

1. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

2. Directional Satin Finish: No. 4.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of signage work.

B. Verify that sign-support surfaces are within tolerances to accommodate signs without gaps or irregularities between backs of signs and support surfaces unless otherwise indicated.

C. Verify that electrical service is correctly sized and located to accommodate signs.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install signs using mounting methods indicated and according to manufacturer's written instructions.

1. Install signs level, plumb, true to line, and at locations and heights indicated, with sign surfaces free of distortion and other defects in appearance.

2. Before installation, verify that sign surfaces are clean and free of materials or debris that would impair installation.

3. Corrosion Protection: Coat concealed surfaces of exterior aluminum in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

B. Mounting Methods:

1. Concealed Studs: Using a template, drill holes in substrate aligning with studs on back of sign. Remove loose debris from hole and substrate surface.

3.3 ADJUSTING AND CLEANING

A. Remove and replace damaged or deformed characters and signs that do not comply with specified requirements. Replace characters with damaged or deteriorated finishes or components that cannot be successfully repaired by finish touchup or similar minor repair procedures.

B. Remove temporary protective coverings and strippable films as signs are installed.

C. On completion of installation, clean exposed surfaces of signs according to manufacturer's written instructions, and touch up minor nicks and abrasions in finish. Maintain signs in a clean condition during construction and protect from damage until acceptance by Owner.

END OF SECTION

SECTION 10 1423 - PANEL SIGNAGE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Panel signs.
2. Room-identification signs.

1.3 DEFINITIONS

A. Accessible: In accordance with the accessibility standard.

1.4 COORDINATION

A. Furnish templates for placement of sign-anchorage devices embedded in permanent construction by other installers.

B. Furnish templates for placement of electrical service embedded in permanent construction by other installers.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. LEED Submittals:

1. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regionally manufactured materials. Include statement indicating cost for each regionally manufactured material.
    a. Include statement indicating location of manufacturer and distance to Project for each regionally manufactured material.
2. Product Data for Credit IEQ 4.1: For adhesives, documentation including printed statement of VOC content.
3. Laboratory Test Reports for Credit IEQ 4.1: For adhesives, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

C. Shop Drawings: For panel signs.

1. Include fabrication and installation details and attachments to other work.
2. Show sign mounting heights, locations of supplementary supports to be provided by others, and accessories.
3. Show message list, typestyles, graphic elements, including raised characters and Braille, and layout for each sign at least half size.

D. Samples for Verification: For each type of sign assembly showing all components and with the required finish(es), in manufacturer's standard size unless otherwise indicated and as follows:

1. Panel Signs: Full-size Sample .
2. Room-Identification Signs: Full-size Sample.

E. Sign Schedule: Use same designations specified or indicated on Drawings or in a sign schedule.

1.6 CLOSEOUT SUBMITTALS

A. Maintenance Data: For signs to include in maintenance manuals.

1.7 QUALITY ASSURANCE

A. Comply with University's Campus Sign Program requirements.

B. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

C. Provide the following upon request:

1. Qualification Data: For Installer.

1.8 FIELD CONDITIONS

A. Field Measurements: Verify locations of anchorage devices embedded in permanent construction by other installers by field measurements before fabrication, and indicate measurements on Shop Drawings.

1.9 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of signs that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Deterioration of finishes beyond normal weathering.
   b. Deterioration of embedded graphic image.
   c. Separation or delamination of sheet materials and components.
2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Accessibility Standard: Comply with applicable provisions in the 2010 ADA Standards and 2016 CBC 10 and 11B for signs.

2.2 SIGNS

A. Panel Sign : Sign with smooth, uniform surfaces; with message and characters having uniform faces, sharp corners, and precisely formed lines and profiles; and as follows:

1. Solid-Sheet Sign and Returns: Acrylic sheet with finish specified in "Surface Finish and Applied Graphics" Subparagraph below and as follows:
   a. Thickness: 0.125 inch.
   b. Etched and Filled Graphics: Sign face etched or routed to receive enamel-paint infill.
2. Engraved Plastic-Laminate Sign: Plastic-laminate face laminated to contrasting phenolic core to produce composite sheet.
3. Mounting: Surface mounted to wall with two-face tape .
4. Surface Finish and Applied Graphics:
   a. Integral Acrylic Sheet Color: As selected by Architect from full range of industry colors.
5. Text and Typeface: Accessible raised characters and Braille. Finish raised characters to contrast with background color, and finish Braille to match background color.
6. Flatness Tolerance: Sign panel shall remain flat or uniformly curved under installed conditions as indicated and within a tolerance of plus or minus 1/16 inch measured diagonally from corner to corner.

B. Room-Identification Sign : Sign with smooth, uniform surfaces; with message and characters having uniform faces, sharp corners, and precisely formed lines and profiles; and as follows:

1. Laminated-Sheet Sign: Sandblasted polymer face sheet with raised graphics laminated over subsurface graphics to acrylic backing sheet to produce composite sheet.
   a. Composite-Sheet Thickness: 0.25 inch.
   b. Color(s): As selected by Architect from manufacturer's full range.
2. Sign-Panel Perimeter: Finish edges smooth.
   a. Edge Condition: .
   b. Corner Condition in Elevation: Square.
3. Mounting: Surface mounted to wall with two-face tape.
4. Text and Typeface: Accessible raised characters and Braille typeface as selected by Architect from manufacturer's full range . Finish raised characters to contrast with background color, and finish Braille to match background color.

2.3 PANEL-SIGN MATERIALS

A. Acrylic Sheet: ASTM D 4802, category as standard with manufacturer for each sign, Type UVF (UV filtering).

B. Paints and Coatings for Sheet Materials: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposure indicated.

2.4 ACCESSORIES

A. Two-Face Tape: Manufacturer's standard high-bond, foam-core tape, 0.045 inch thick, with adhesive on both sides.

B. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.5 FABRICATION

A. Comply with requirements of CBC 2016 11B.703.2 for signage fabrication.

B. General: Provide manufacturer's standard sign assemblies according to requirements indicated.

1. Preassemble signs and assemblies in the shop to greatest extent possible. Disassemble signs and assemblies only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation; apply markings in locations concealed from view after final assembly.
2. Conceal connections if possible; otherwise, locate connections where they are inconspicuous.
3. Internally brace signs for stability and for securing fasteners.

C. Surface-Engraved Graphics: Machine engrave characters and other graphic devices into panel surface indicated to produce precisely formed copy, incised to uniform depth.

1. Engraved Opaque Acrylic Sheet: Fill engraved graphics with manufacturer's standard enamel.

2.6 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of signage work.

B. Verify that sign-support surfaces are within tolerances to accommodate signs without gaps or irregularities between backs of signs and support surfaces unless otherwise indicated.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with CBC 11B.703.4 requirements for mounting signage.

B. General: Install signs using mounting methods indicated and according to manufacturer's written instructions.

1. Install signs level, plumb, true to line, and at locations and heights indicated, with sign surfaces free of distortion and other defects in appearance.
2. Install signs so they do not protrude or obstruct according to the accessibility standard.
3. Before installation, verify that sign surfaces are clean and free of materials or debris that would impair installation.
4. Corrosion Protection: Coat concealed surfaces of exterior aluminum in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

C. Room-Identification Signs and Other Accessible Signage: Install in locations on walls as indicated and according to accessibility standard.

D. Mounting Methods:

1. Two-Face Tape: Clean bond-breaking materials from substrate surface and remove loose debris. Apply tape strips symmetrically to back of sign and of suitable quantity to support weight of sign without slippage. Keep strips away from edges to prevent visibility at sign edges. Place sign in position, and push to engage tape adhesive.

E. Signs Mounted on Glass: Provide opaque sheet matching sign material and finish onto opposite side of glass to conceal back of sign.

3.3 ADJUSTING AND CLEANING

A. Remove and replace damaged or deformed signs and signs that do not comply with specified requirements. Replace signs with damaged or deteriorated finishes or components that cannot be successfully repaired by finish touchup or similar minor repair procedures.

B. Remove temporary protective coverings and strippable films as signs are installed.

C. On completion of installation, clean exposed surfaces of signs according to manufacturer's written instructions, and touch up minor nicks and abrasions in finish. Maintain signs in a clean condition during construction and protect from damage until acceptance by Owner.

END OF SECTION

SECTION 10 2113.17 - PHENOLIC-CORE TOILET COMPARTMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Phenolic-core toilet compartments configured as toilet enclosures and urinal screens.

B. Related Requirements:

1. Section 05 5000 "Metal Fabrications" for supports that attach ceiling-hung compartments to overhead structural system.
2. Section 06 1053 "Miscellaneous Rough Carpentry" for blocking.
3. Section 10 2800 "Toilet, Bath, and Laundry Accessories" for toilet tissue dispensers, grab bars, purse shelves, and similar accessories mounted on toilet compartments.

1.3 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for toilet compartments.

C. LEED Submittals:

1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

D. Shop Drawings: For toilet compartments.

1. Include plans, elevations, sections, details, and attachment details.
2. Show locations of cutouts for compartment-mounted toilet accessories.
3. Show locations of centerlines of toilet fixtures.
4. Show locations of floor drains.
5. Show ceiling grid, ceiling-mounted items, and overhead support or bracing locations.

E. Samples for Verification: For the following products, in manufacturer's standard sizes unless otherwise indicated:

1. Each type of material, color, and finish required for toilet compartments, prepared on 6-inch- square Samples of same thickness and material indicated for Work.

2. Each type of hardware and accessory.

F. Product Schedule: For toilet compartments, prepared by or under the supervision of supplier, detailing location and selected colors for toilet compartment material.

1.4 INFORMATIONAL SUBMITTALS

A. Product Certificates: For each type of toilet compartment.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For toilet compartments to include in maintenance manuals.

1.6 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of toilet fixtures, walls, columns, ceilings, and other construction contiguous with toilet compartments by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.

2. Smoke-Developed Index: 450 or less.

B. Regulatory Requirements: Comply with applicable provisions in the 2010 ADA Standards and 2016 CBC 11B.604 for toilet compartments designated as accessible.

2.2 PHENOLIC-CORE TOILET COMPARMENTS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Accurate Partitions Corporation.

2. Bobrick Washroom Equipment, Inc.

3. Bradley Corporation; Mills Partitions.

4. Partition Systems Incorporated of South Carolina; Columbia Partitions.

B. Toilet-Enclosure Style: Ceiling hung.

C. Urinal-Screen Style: Wall hung.

D. Door, Panel, and Pilaster Construction: Solid phenolic-core panel material with melamine facing on both sides fused to substrate during panel manufacture (not separately laminated), and with eased and polished edges and no-sightline system. Provide minimum 3/4-inch- thick doors and pilasters and minimum 1/2-inch- thick panels.

E. Pilaster Sleeves (Caps): Formed from stainless-steel sheet, not less than 0.031-inch nominal thickness and 3 inches high, finished to match hardware.

F. Brackets (Fittings):

1. Full-Height (Continuous) Type: Manufacturer's standard design; stainless steel.

G. Phenolic-Panel Finish:

1. Facing Sheet Finish: One color and pattern in each room.
2. Color and Pattern: As selected by Architect from manufacturer's full range, with manufacturer's standard dark color core.
3. Edge Color: Manufacturer's standard.

2.3 HARDWARE AND ACCESSORIES

A. Hardware and Accessories: Manufacturer's heavy-duty operating hardware and accessories.

1. Hinges: Manufacturer's minimum 0.062-inch- thick stainless-steel paired, self-closing type that can be adjusted to hold doors open at any angle up to 90 degrees, allowing emergency access by lifting door. Mount with through-bolts.
2. Latch and Keeper: Manufacturer's heavy-duty surface-mounted cast-stainless-steel latch unit designed to resist damage due to slamming, with combination rubber-faced door strike and keeper, and with provision for emergency access. Provide units that comply with regulatory requirements for accessibility at compartments designated as accessible. Mount with through-bolts.
3. Coat Hook: Manufacturer's heavy-duty combination cast-stainless-steel hook and rubber-tipped bumper, sized to prevent in-swinging door from hitting compartment-mounted accessories. Mount with through-bolts.
4. Door Bumper: Manufacturer's heavy-duty rubber-tipped cast-stainless-steel bumper at out-swinging doors. Mount with through-bolts.
5. Door Pull: Manufacturer's heavy-duty cast-stainless-steel pull at out-swinging doors that complies with regulatory requirements for accessibility. Provide units on both sides of doors at compartments designated as accessible. Mount with through-bolts.
6. Comply with 2013 CBC 11B.309.4.

B. Anchorages and Fasteners: Manufacturer's standard exposed fasteners of stainless steel, finished to match the items they are securing, with theft-resistant-type heads. Provide sex-type bolts for

through-bolt applications. For concealed anchors, use stainless-steel, hot-dip galvanized-steel, or other rust-resistant, protective-coated steel compatible with related materials.

2.4 MATERIALS

A. Stainless-Steel Sheet: ASTM A 666, Type 304, stretcher-leveled standard of flatness.

B. Stainless-Steel Castings: ASTM A 743/A 743M.

2.5 FABRICATION

A. Fabrication, General: Fabricate toilet compartment components to sizes indicated. Coordinate requirements and provide cutouts for through-partition toilet accessories where required for attachment of toilet accessories.

B. Ceiling-Hung Units: Provide manufacturer's standard corrosion-resistant anchoring assemblies with leveling adjustment nuts at pilasters for connection to structural support above finished ceiling. Provide assemblies that support pilasters from structure without transmitting load to finished ceiling. Provide sleeves (caps) at tops of pilasters to conceal anchorage.

C. Door Size and Swings: Unless otherwise indicated, provide 24-inch- wide in-swinging doors for standard toilet compartments and 36-inch- wide out-swinging doors with a minimum 32-inch-wide clear opening for compartments designated as accessible.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for fastening, support, alignment, operating clearances, and other conditions affecting performance of the Work.

1. Confirm location and adequacy of blocking and supports required for installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Comply with manufacturer's written installation instructions. Install units rigid, straight, level, and plumb. Secure units in position with manufacturer's recommended anchoring devices.

1. Maximum Clearances:
   a. Pilasters and Panels: 1/2 inch.
   b. Panels and Walls: 1 inch.
2. Full-Height (Continuous) Brackets: Secure panels to walls and to pilasters with full-height brackets.
   a. Locate bracket fasteners so holes for wall anchors occur in masonry or tile joints.
   b. Align brackets at pilasters with brackets at walls.

B. Ceiling-Hung Units: Secure pilasters to supporting structure and level, plumb, and tighten. Hang doors and adjust so bottoms of doors are level with bottoms of pilasters when doors are in closed position.

C. Urinal Screens: Attach with anchoring devices to suit supporting structure. Set units level and plumb, rigid, and secured to resist lateral impact.

3.3 ADJUSTING

A. Hardware Adjustment: Adjust and lubricate hardware according to hardware manufacturer's written instructions for proper operation. Set hinges on in-swinging doors to hold doors open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors to return doors to fully closed position.

END OF SECTION

SECTION 10 2123 - CUBICLE CURTAINS AND TRACK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Curtain tracks and carriers.
2. Cubicle curtains.

B. Related Requirements:

1. Section 06 1053 "Miscellaneous Rough Carpentry" for supplementary wood framing and blocking for mounting items requiring anchorage.
2. Section 09 2216 "Non-Structural Metal Framing" for supplementary metal framing and blocking for mounting items requiring anchorage.

1.3 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of product.

1. Include durability, laundry temperature limits, fade resistance, applied curtain treatment, and fire-test-response characteristics for each type of curtain fabric indicated.
2. Include data for each type of track.

C. Shop Drawings:

1. Show layout and types of cubicles, sizes of curtains, number of carriers, anchorage details, and conditions requiring accessories. Indicate dimensions taken from field measurements.
2. Include details on blocking above ceiling and in walls.

D. Samples for Verification: For each type of product required, prepared on Samples of size indicated below:

1. Curtain Fabric: 10-inch- square swatch or larger as required to show complete pattern repeat, from dye lot used for the Work, with specified treatments applied. Mark top and face of material.

2. Curtain Track: Not less than 10 inches long.

3. Curtain Carrier: Full-size unit.

E. Curtain and Track Schedule: Use same designations indicated on Drawings.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For curtains, track, and hardware to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Curtains: Provide curtain fabrics with the following characteristics:

1. Launderable to a temperature of not less than 160 deg F .

2. Flame resistant and identical to those that have passed NFPA 701 when tested by a testing and inspecting agency acceptable to authorities having jurisdiction.

a. Identify fabrics with appropriate markings of a qualified testing agency.

2.2 CURTAIN SUPPORT SYSTEMS

A. Extruded-Aluminum Curtain Track: Not less than 1-1/4 inches wide by 3/4 inch high ; with 0.062-inch minimum wall thickness.

1. Curved Track: Factory-fabricated, 12-inch- radius bends.

2. Finish: Satin anodized.

B. Curtain Track Accessories: Fabricate splices, end caps, connectors, end stops, coupling and joining sleeves, wall flanges, brackets, ceiling clips, and other accessories from same material and with same finish as track.

1. Suspended-Track Support: Not less than 7/8-inch- OD tube.

2. End Stop: Removable with carrier hook.

3. Switch Unit: Shuttle and coupling device for rerouting and securing cubicle curtain, with pull chain for switching track.

C. Curtain Carriers: Two nylon rollers and nylon axle with chrome-plated steel hook.

D. Exposed Fasteners: Stainless steel.

E. Concealed Fasteners: Stainless steel.

2.3 CURTAINS

A. Cubicle Curtain Fabric: Curtain manufacturer's standard, 100 percent polyester; inherently and permanently flame resistant, stain resistant, and antimicrobial.

B. Curtain Grommets: Two-piece, rolled-edge, rustproof, nickel-plated brass; spaced not more than 6 inches o.c.; machined into top hem.

C. Curtain Tieback: Nickel-plated brass chain; one at each curtain termination.

2.4 CURTAIN FABRICATION

A. Continuous Curtain Panels:

1. Width: Equal to track length from which curtain is hung plus 10 percent added fullness, but not less than 12 inches added fullness.

2. Length: Equal to floor-to-ceiling height, minus depth of track and carrier at top, and minus clearance above the finished floor as follows:

a. Cubicle Curtains: 12 inches .

b. Blackout Curtains:

3. Top Hem: Not less than 1 inch and not more than 1-1/2 inches wide, triple thickness, reinforced with integral web, and double lockstitched.

4. Bottom Hem: Not less than 1 inch and not more than 1-1/2 inches wide, triple thickness, reinforced, and double lockstitched.

5. Side Hems: Not less than 1/2 inch and not more than 1-1/4 inches wide, with triple turned edges, and single lockstitched.

6. Vertical Seams: Not less than 1/2 inch wide, double turned and double stitched.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install tracks level and plumb, according to manufacturer's written instructions.

B. Up to 20 feet in length, provide track fabricated from single, continuous length.

1. Curtain Track Mounting: As indicated on Drawings.

C. Surface-Track Mounting: Fasten tracks to ceilings at intervals recommended by manufacturer. Fasten tracks to structure at each splice and tangent point of each corner. Center fasteners in track to ensure unencumbered carrier operation. Attach track to ceiling as follows:

1. Mechanically fasten directly to bottom of concrete deck with post-installed anchors.

2. Mechanically fasten directly to finished ceiling with toggle bolts.

3. Mechanically fasten to furring through suspended ceiling with screw and tube spacer.
4. Mechanically fasten to suspended ceiling grid with screws.
5. Attach track to suspended ceiling grid with manufacturer's proprietary clip.

D. Suspended-Track Mounting: Install track with manufacturer's standard tubular aluminum suspended supports at intervals and with fasteners recommended by manufacturer. Fasten supports to structure. Provide supports at each splice and tangent point of each corner. Secure ends of track to wall with flanged fittings or brackets.

E. Track Accessories: Install splices, end caps, connectors, end stops, coupling and joining sleeves, and other accessories as required for a secure and operational installation.

F. Curtain Carriers: Provide curtain carriers adequate for 6-inch spacing along full length of curtain plus an additional carrier.

G. Cubicle Curtains: Hang curtains on each curtain track. Secure with curtain tieback.

END OF SECTION

SECTION 10 2213 - WIRE MESH PARTITIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Wire mesh equipment barriers.

1.3 DEFINITIONS

A. Intermediate Crimp: Wires pass over one and under the next adjacent wire in both directions, with wires crimped before weaving and with extra crimps between the intersections.

B. Lock Crimp: Deep crimps at points of the intersection that lock wires securely in place.

1.4 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of product.

C. LEED Submittals:

1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

2. Laboratory Test Reports for Credit IEQ 4.2: For paints and coatings, documentation indicating that products comply with the testing and product requirements of the California Department of Public Health's (formerly, the California Department of Health Services') "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

D. Shop Drawings:

1. Include plans, elevations, sections, details, and attachments to other work.

2. Indicate clearances required for operation of doors and gates.

E. Delegated-Design Submittal: For wire mesh partitions indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For wire mesh partition hardware to include in maintenance manuals.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: [Fabricator of products] [An employer of workers trained and approved by manufacturer].

B. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.3, "Structural Welding Code - Sheet Steel."

C. Provide the following upon request:

1. Qualification Data: For Installer.
2. Welding certificates.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver wire mesh items with cardboard protectors on perimeters of panels and doors and with posts wrapped to provide protection during transit and Project-site storage. Use vented plastic.

1.8 FIELD CONDITIONS

A. Field Measurements: Verify actual dimensions of construction contiguous with wire mesh units by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Acorn Wire & Iron Works, LLC.
2. California Wire Products Corporation.
3. Kenco Wire and Iron Products Inc.
4. SpaceGuard Products.

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 4000 "Quality Requirements," to design wire mesh units.

B. Structural Performance: Wire mesh units shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated.

1. Concentrated load of 50 lbf applied horizontally on an area of 1 sq. ft. at any location on a panel.
2. Total load of 200 lbf applied uniformly over each panel.
3. Concentrated load and total load need not be assumed to act concurrently.

C. Seismic Performance: Wire mesh units shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

2.3 MATERIALS

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Steel Wire: ASTM A 510.

C. Steel Plates, Channels, Angles, and Bars: ASTM A 36/A 36M.

D. Steel Sheet: Cold-rolled steel sheet, ASTM A 1008/A 1008M, Commercial Steel (CS), Type B.

E. Steel Tubing: ASTM A 500/A 500M, cold-formed structural-steel tubing or ASTM A 513, Type 5, mandrel-drawn mechanical tubing.

F. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with G60 zinc (galvanized) or A60 zinc-iron-alloy (galvannealed) coating designation.

G. Panel-to-Panel Fasteners: Manufacturer's standard steel bolts, nuts, and washers.

H. Post-Installed Anchors: Capable of sustaining, without failure, a load equal to 6 times the load imposed when installed in unit masonry and 4 times the load imposed when installed in concrete, as determined by testing according to ASTM E 488/E 488M, conducted by a qualified independent testing agency.

1. Material for Interior Locations: Carbon-steel components are zinc plated to comply with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5, unless otherwise indicated.
2. Material for Exterior Locations and Where Stainless Steel Is Indicated: Alloy Group 1 stainless-steel bolts, ASTM F 593, and nuts, ASTM F 594.

I. Power-Driven Fasteners: ICC-ES AC70.

J. Seismic Bracing: Angles with legs not less than 1-1/4 inch wide, formed from 0.040-inch-thick, metallic-coated steel sheet; with bolted connections and 1/4-inch- diameter bolts.

K. Low-Emitting Coatings: Paints and coatings shall comply with the testing and product requirements of the California Department of Public Health's (formerly, the California Department of Health Services') "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

2.4 WIRE MESH EQUIPMENT BARRIERS

A. Mesh: 0.135-inch- diameter, intermediate-crimp steel wire woven into 1-1/2-inch diamond mesh.

B. Panels: 1-1/4-by-1-1/4-by-1/8-inch steel angle framing on four sides, with wire mesh welded to framing.

1. Horizontal Panel Stiffeners: 1-1/4-by-1-1/4-by-1/8-inchsteel angles or 3/4-by-1/4-inch hot-rolled steel flat bars.

2. Height: 60 inches.

C. Line and Corner Posts: 2-by-2-by-0.068-inch steel tubing with steel base plates welded to bottoms, drilled for attachment to floor, and with steel caps welded to tops.

1. Height: Panel height plus 12-inch- high, sweep space.

D. Finish for Uncoated Ferrous Steel: Hot-dip galvanized Powder-coated finish unless otherwise indicated.

1. Color: As indicated by manufacturer's designations.

2.5 FABRICATION

A. General: Fabricate wire mesh items from components of sizes not less than those indicated. Use larger-sized components as recommended by wire mesh item manufacturer. Furnish bolts, hardware, and accessories required for complete installation with manufacturer's standard finishes.

1. Fabricate wire mesh items to be readily disassembled.

2. Welding: Weld corner joints of framing and grind smooth, leaving no evidence of joint.

B. Heavy-Duty Wire Mesh Partitions: Fabricate wire mesh partitions with cutouts for pipes, ducts, beams, and other items indicated. Finish edges of cutouts to provide a neat, protective edge.

1. Mesh: Weld mesh to framing.

2. Framing: Fabricate framing with mortise and tenon corner construction.

a. Provide horizontal stiffeners as indicated or, if not indicated, as required by panel height and as recommended by wire mesh partition manufacturer. Weld horizontal stiffeners to vertical framing.

b. Fabricate partition and door framing with slotted holes for connecting adjacent panels.

3. Fabricate wire mesh partitions with 3 to 4 inches of clear space between finished floor and bottom horizontal framing.

2.6 STEEL AND IRON FINISHES

A. Galvanizing: Hot-dip galvanize items as indicated to comply with ASTM A 153/A 153M for steel and iron hardware and with ASTM A 123/A 123M for other steel and iron products.

1. Do not quench or apply post-galvanizing treatments that might interfere with paint adhesion.

B. Powder-Coat Finish: Immediately after cleaning and pretreating, apply manufacturer's standard baked-on powder-coat finish, suitable for use indicated, with a minimum dry film thickness of 2 mils.

1. Color and Gloss: As selected by Architect from manufacturer's full range.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine floors for suitable conditions where wire mesh items will be installed.

C. Examine walls to which wire mesh items will be attached for properly located blocking, grounds, and other solid backing for attachment of support fasteners.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 WIRE MESH PARTITIONS ERECTION

A. Anchor wire mesh partitions to floor with 3/8-inch- diameter postinstalled expansion anchors at 12 inches o.c. through anchor clips located at each post and corner. Shim anchor clips as required to achieve level and plumb installation.

1. Anchors may be set with power-actuated fasteners instead of postinstalled expansion anchors if indicated on Shop Drawings.

B. Anchor wire mesh partitions to walls at 12 inches o.c. through back corner panel framing and as follows:

1. For concrete and solid masonry anchorage, use expansion anchors.

2. For steel-framed gypsum board assemblies, use lag bolts set into wood backing between studs. Coordinate with stud installation to locate backing members.

3. For steel-framed gypsum board assemblies, fasten brackets directly to steel framing or concealed reinforcements using self-tapping screws of size and type required to support structural loads.

C. Secure top capping bars to top framing channels with 1/4-inch- diameter "U" bolts spaced not more than 28 inches o.c.

D. Provide seismic supports and bracing as indicated or, if not indicated, as recommended by manufacturer and as required for stability, extending and fastening members to supporting structure.

E. Where standard-width wire mesh partition panels do not fill entire length of run, provide adjustable filler panels to fill openings.

F. Install doors complete with door hardware.

3.3 WIRE MESH EQUIPMENT BARRIER ERECTION

A. Anchor wire mesh equipment barriers to floor with 3/8-inch- diameter expansion anchors through post bases. Shim post bases as required to achieve level and plumb installation.

B. Floor anchors may be set with power-actuated fasteners instead of postinstalled expansion anchors if indicated on Shop Drawings.

3.4 ADJUSTING AND CLEANING

A. Remove and replace defective work, including doors and framing that are warped, bowed, or otherwise unacceptable.

END OF SECTION

SECTION 10 2239.13 - FOLDING GLASS-PANEL PARTITIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes manually operated, glass-panel partitions.

B. Related Requirements:

1. Section 05 5000 "Metal Fabrications" for supports that attach supporting tracks to overhead structural system.

1.3 DEFINITIONS

A. STC: Sound Transmission Class.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.5 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. LEED Submittals:

1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

2. Certificates for Credit MR 7: Chain-of-custody certificates certifying that operable glass-panel partitions comply with forest certification and chain-of-custody requirements. Include statement indicating cost for each certified wood product.

C. Shop Drawings: For operable glass-panel partitions.

1. Include plans, elevations, sections, details, numbered panel installation sequence, and attachments to other work.

2. Indicate stacking and operating clearances. Indicate location and installation requirements for hardware and track, blocking, and direction of travel.

D. Samples for Verification: For each type of exposed material, finish, covering, or facing, prepared on Samples of size indicated below:

1. Panel Edge Material: Not less than 3 inches long.
2. Glass: Units 12 inches square.
3. Hardware: One of each exposed door-operating device.

E. Delegated-Design Submittal: For operable glass-panel partitions.

1. Include design calculations for seismic restraints.

1.6 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Partition track, track supports and bracing, switches, turning space, and storage layout.
2. Suspended ceiling components.
3. Structural members to which suspension systems are attached.
4. Size and location of initial access modules for acoustical tile.
5. Items penetrating finished ceiling, including the following:
   a. Lighting fixtures.
   b. HVAC ductwork, outlets, and inlets.
   c. Speakers.
   d. Sprinklers.
   e. Smoke detectors.
   f. Access panels.
6. Plenum acoustical barriers.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For operable glass-panel partitions to include in maintenance manuals.

1. In addition to items specified in Section 01 7823 "Operation and Maintenance Data," include the following:
   a. Panel finish and finishes for exposed trim and accessories. Include precautions for cleaning materials and methods that could be detrimental to finishes and performance.
   b. Seals, hardware, track, track switches, carriers, and other operating components.

1.8 QUALITY ASSURANCE

A. Manufacturer Qualifications: A qualified manufacturer that is certified for chain of custody by an FSC-accredited certification body.

B. Vendor Qualifications: A vendor that is certified for chain of custody by an FSC-accredited certification body.

C. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

D. Provide the following upon request:

1. Setting Drawings: For embedded items and cutouts required in other work[, including support-beam, mounting-hole template].

2. Qualification Data: For qualified Installer.

3. Seismic Qualification Certificates: For operable glass-panel partitions, tracks, accessories, and components, from manufacturer. Include seismic capacity of partition assemblies to remain in vertical position during a seismic event and the following:

a. Basis for Certification: Indicate whether certification is based on analysis, testing, or experience data, according to ASCE/SEI 7.

b. Detailed description of partition anchorage devices on which the certification is based and their installation requirements.

4. Product Certificates: For each type of operable glass-panel partition.

5. Product Test Reports: For each operable glass-panel partition, for tests performed by a qualified testing agency.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Protectively package and sequence panels in order for installation. Clearly mark packages and panels with numbering system used on Shop Drawings. Do not use permanent markings on panels.

1.10 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of operable glass-panel partitions that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Faulty operation of operable glass-panel partitions.

b. Deterioration of metals, metal finishes, and other materials beyond normal use.

2. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 01 4000 "Quality Requirements," to design seismic bracing of tracks to structure above.

B. Seismic Performance: Operable glass-panel partitions shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the partition panels will remain in place without separation of any parts from the system when subjected to the seismic forces specified."

2.2 OPERABLE GLASS PANELS

A. Operable Glass Panels: Frameless aluminum glass-panel partition system, including panels, suspension system, operators, and accessories.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Avanti.
   b. Hufcor, Inc.
   c. KWIK-WALL Company.
   d. Moderco Inc.
   e. Modernfold, Inc.; a DORMA Group company.
   f. NanaWall Systems, Inc.

B. Panel Operation: Manually operated, individual panels.

C. Panel Construction: As required to support panel from suspension components and with reinforcement for hardware attachment. Fabricate panels with tight hairline joints and concealed fasteners. Fabricate panels so finished in-place partition is rigid; level; plumb; aligned, with tight joints and uniform appearance; and free of bow, warp, twist, deformation, and surface and finish irregularities.

1. Factory-Glazed Fabrication: Glaze operable glass panels in the factory where practical and possible for applications indicated. Comply with manufacturer's written instructions and with requirements in Section 08 8000 "Glazing."

D. Glass and Glazing: As follows:

1. Safety Glass Standard for Partition Panels: Provide glass products complying with testing requirements in 16 CFR 1201, Category II, or ANSI Z97.1, Class A.

2. Glass: Manufacturer's standard safety glass and glass assemblies as indicated and complying with the following:
   a. Tempered Glass: ASTM C 1048, Kind FT (fully tempered), Type I (transparent flat glass), Class 1 (clear), Quality-Q3.
   b. Glass Thickness: As indicated.
   c. Glass Vertical Edge: Polished.

3. Glazing System: Manufacturer's standard factory-glazing system that produces acoustical seal.

E. Dimensions: Fabricate operable glass-panel partitions to form an assembled system of dimensions indicated and verified by field measurements.

1. Panel Width: As indicated.

F. STC: Not less than 36.

G. Panel Closure: Manufacturer's standard unless otherwise indicated.

H. Hardware: Manufacturer's standard as required to operate operable glass-panel partition and accessories; with decorative, protective finish.

1. Floor Lock: Thumb-turn actuated.

I. Panel Frame Finishes:

1. Exposed Metal: As selected by Architect from manufacturer's full range as follows:

a. Metal-Clad Aluminum: Satin stainless steel.

2.3 SEALS

A. General: Provide seals that produce operable glass-panel partitions complying with performance requirements and the following:

1. Manufacturer's standard seals unless otherwise indicated.

2. Seals made from materials and in profiles that minimize sound leakage.

3. Seals fitting tight at contact surfaces and sealing continuously between adjacent panels and between operable glass-panel partition perimeter and adjacent surfaces, when operable glass-panel partition is extended and closed.

2.4 SUSPENSION SYSTEMS

A. Tracks: Steel or aluminum with adjustable steel hanger rods for overhead support, designed for operation, size, and weight of operable glass-panel partition indicated. Size track to support partition operation and storage without damage to suspension system, operable glass-panel partitions, or adjacent construction. Limit track deflection to no more than 0.10 inch between bracket supports. Provide a continuous system of track sections and accessories to accommodate configuration and layout indicated for partition operation and storage.

1. Panel Guide: Aluminum guide on both sides of the track to facilitate straightening of the panels; finished with factory-applied, decorative, protective finish.

2. Head Closure Trim: As required for acoustical performance; primed for field finish.

B. Carriers: Trolley system as required for configuration type, size, and weight of partition and for easy operation; with ball-bearing wheels.

1. Multidirectional Carriers: Capable of negotiating intersections without track switches.

C. Track Intersections, Switches, and Accessories: As required for operation, storage, track configuration, and layout indicated for operable glass-panel partitions, and compatible with partition assembly specified. Fabricate track intersections and switches from steel or aluminum.

1. Curve-and-Diverter Switches: Allow radius turns to divert panels to an auxiliary track.

2. L Intersections: Allow panels to change 90 degrees in direction of travel.

3. T Intersections: Allow panels to pass through or change 90 degrees to another direction of travel.

4. X Intersections: Allow panels to pass through or change travel direction full circle in 90-degree increments, and allow one partition to cross track of another.

5. Multidirectional Switches: Adjustable switch configuring track into L, T, or X intersections and allowing panels to be moved in all pass-through, 90-degree change, and cross-over travel direction combinations.

6. Center carrier stop.

D. Aluminum Finish: Mill finish or manufacturer's standard, factory-applied, decorative finish unless otherwise indicated.

E. Steel Finish: Manufacturer's standard, factory-applied, corrosion-resistant, protective coating unless otherwise indicated.

2.5 ACCESSORIES

A. Storage Pocket Door: Full height at end of partition runs to conceal stacked partition; of same frame material, finish, thickness, and acoustical qualities as panels; complete with operating hardware. Hinges in finish to match other exposed hardware.

1. Manufacturer's standard method to secure storage pocket door in closed position.

2. Rim Lock: Key-operated lock cylinder, keyed to master key system, to secure storage pocket door in closed position. Include two keys per lock.

B. Vertical Edge Trim: Manufacturer's standard transparent trim to protect vertical edges of glass in frameless panels.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine flooring, structural support, and opening, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of operable glass-panel partitions.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Comply with ASTM E 557 except as otherwise required by operable glass-panel partition manufacturer's written installation instructions.

B. Install operable glass-panel partitions and accessories after other finishing operations, including painting, have been completed in area of partition installation.

C. Install panels from marked packages in numbered sequence indicated on Shop Drawings.

D. Broken, cracked, chipped, deformed, or unmatched panels are not acceptable.

E. Broken, cracked, deformed, or unmatched gasketing or gasketing with gaps at butted ends is not acceptable.

3.3 ADJUSTING

A. Adjust operable glass-panel partitions, hardware, and other moving parts to function smoothly, and lubricate as recommended by manufacturer.

B. Adjust storage pocket doors to operate smoothly and easily, without binding or warping.

C. Verify that safety devices are properly functioning.

3.4 MAINTENANCE SERVICE

A. Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months' full maintenance by manufacturer's authorized service representative. Include quarterly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper operable-partition operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain operable glass-panel partitions.

END OF SECTION

SECTION 10 2600 - WALL AND DOOR PROTECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Stainless Steel Wall guards.
2. Corner guards.
3. Impact-resistant wall coverings.

1.3 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: Include construction details, material descriptions, impact strength , fire-test-response characteristics, dimensions of individual components and profiles, and finishes for each impact-resistant wall protection unit.

C. LEED Submittals:

1. Product Data for Credit IEQ 4.1: For adhesives, documentation including printed statement of VOC content.
2. Product Data for Credit IEQ 4.4: For particleboard, documentation indicating that products contain no urea formaldehyde.
3. Laboratory Test Reports for Credit IEQ 4: For adhesives, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

D. Shop Drawings: For each impact-resistant wall protection unit showing locations and extent. Include sections, details, and attachments to other work.

1. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

E. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below.

1. Wall and Corner Guards: 12 inches long. Include examples of joinery, corners, end caps, top caps, and field splices.
2. Impact-Resistant Wall Covering: 6 by 6 inches square.

1.4 CLOSEOUT SUBMITTALS

A. Maintenance Data: For each impact-resistant wall protection unit to include in maintenance manuals.

1. Include recommended methods and frequency of maintenance for maintaining optimum condition of plastic covers under anticipated traffic and use conditions. Include precautions against using cleaning materials and methods that may be detrimental to plastic finishes and performance.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An employer of workers trained and approved by manufacturer.

B. Source Limitations: Obtain impact-resistant wall protection units from single source from single manufacturer.

C. Product Options: Drawings indicate size, profiles, and dimensional requirements of impact-resistant wall protection units and are based on the specific system indicated. Refer to Section 01 4000 "Quality Requirements."

1. Do not modify intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If modifications are proposed, submit comprehensive explanatory data to Architect for review.

D. Surface-Burning Characteristics: Provide impact-resistant, plastic wall protection units with surface-burning characteristics as determined by testing identical products per ASTM E 84, NFPA 255, or UL 723 by UL or another qualified testing agency.

E. Preinstallation Conference: Conduct conference at Project site.

F. Provide the following upon request:

1. Qualification Data: For qualified Installer.
2. Material Certificates: For each impact-resistant plastic material, from manufacturer.
3. Material Test Reports: For each impact-resistant plastic material.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Store impact-resistant wall protection units in original undamaged packages and containers inside well-ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.

1. Maintain room temperature within storage area at not less than 70 deg F during the period plastic materials are stored.

2. Keep plastic sheet material out of direct sunlight.
3. Store plastic wall protection components for a minimum of 72 hours, or until plastic material attains a minimum room temperature of 70 deg F.
    a. Store corner-guard covers in a vertical position.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install impact-resistant wall protection units until building is enclosed and weatherproof, wet work is complete and dry, and HVAC system is operating and maintaining temperature at 70 deg F for not less than 72 hours before beginning installation and for the remainder of the construction period.

1.8 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of impact-resistant wall protection units that fail in materials or workmanship within specified warranty period.
    1. Failures include, but are not limited to, the following:
        a. Structural failures.
        b. Deterioration of plastic and other materials beyond normal use.
    2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MATERIALS

A. PVC Plastic: ASTM D 1784, Class 1, textured, chemical- and stain-resistant, high-impact-resistant PVC or acrylic-modified vinyl plastic with integral color throughout; extruded and sheet material, thickness as indicated.
    1. Impact Resistance: Minimum 25.4 ft-lbf/in. of notch when tested according to ASTM D 256, Test Method A.
    2. Chemical and Stain Resistance: Tested according to ASTM D 543 .
    3. Self-extinguishing when tested according to ASTM D 635.
    4. Flame-Spread Index: 25 or less.
    5. Smoke-Developed Index: 450 or less.

B. Aluminum Extrusions: Alloy and temper recommended by manufacturer for type of use and finish indicated, but with not less than strength and durability properties specified in ASTM B 221 for Alloy 6063-T5.

C. Stainless-Steel Sheet: ASTM A 240/A 240M.

D. Fasteners: Aluminum, nonmagnetic stainless-steel, or other noncorrosive metal screws, bolts, and other fasteners compatible with items being fastened. Use security-type fasteners where exposed to view.

2.2 WALL GUARDS

A. Bumper Rail : Assembly consisting of continuous stainless steel rail with extruded aluminum retainer; designed to withstand impacts.

1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
   a. Life Science Products, Inc. Sani-Rail.
2. Continuous Rail: Minimum 0.125-inch- thick, one-piece, Type 304, stainless steel rail, with No. 4 finish.
3. Retainer Clips: Manufacturer's standard aluminum impact-absorbing clips.
4. Mounting: Surface mounted directly to wall .

2.3 CORNER GUARDS

A. Surface-Mounted, Metal Corner Guards : Fabricated from one-piece, formed or extruded metal with formed edges; with 90- or 135-degree turn to match wall condition.

1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
   a. Arden Architectural Specialties, Inc.
   b. Construction Specialties, Inc.
   c. Life Science Products, Inc.
   d. IPC Door and Wall Protection Systems; Division of InPro Corporation.
2. Material: Stainless steel, Type 304.
   a. Thickness: Minimum 0.0625 inch.
   b. Finish: Directional satin, No. 4.
3. Wing Size: Nominal 3-1/2 by 3-1/2 inches.
4. Corner Radius: 1/8 inch.
5. Mounting: **Adhesive.**

2.4 IMPACT-RESISTANT WALL COVERINGS

A. Impact-Resistant Sheet Wall Covering : Fabricated from plastic sheet wall-covering material.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Arden Architectural Specialties, Inc.

b. Construction Specialties, Inc.

c. IPC Door and Wall Protection Systems; Division of InPro Corporation.

d. Korogard Wall Protection Systems; a division of RJF International Corporation.

2. Size: 48 by 96 inches for sheet.

3. Sheet Thickness: 0.040 inch.

4. Color and Texture: As selected by Architect from manufacturer's full range.

5. Height: Wainscot.

6. Trim and Joint Moldings: Extruded rigid plastic that matches sheet wall covering color.

7. Mounting: Adhesive.

2.5 FABRICATION

A. Fabricate impact-resistant wall protection units to comply with requirements indicated for design, dimensions, and member sizes, including thicknesses of components.

B. Assemble components in factory to greatest extent possible to minimize field assembly. Disassemble only as necessary for shipping and handling.

C. Fabricate components with tight seams and joints with exposed edges rolled. Provide surfaces free of wrinkles, chips, dents, uneven coloration, and other imperfections. Fabricate members and fittings to produce flush, smooth, and rigid hairline joints.

2.6 METAL FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

1. Remove tool and die marks and stretch lines, or blend into finish.

2. Grind and polish surfaces to produce uniform finish, free of cross scratches.

3. Run grain of directional finishes with long dimension of each piece.

4. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

B. Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and wall areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.

B. Examine walls to which impact-resistant wall protection will be attached for blocking, grounds, and other solid backing that have been installed in the locations required for secure attachment of support fasteners.

1. For impact-resistant wall protection units attached with adhesive or foam tape, verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Complete finishing operations, including painting, before installing impact-resistant wall protection system components.

B. Before installation, clean substrate to remove dust, debris, and loose particles.

3.3 INSTALLATION

A. General: Install impact-resistant wall protection units level, plumb, and true to line without distortions. Do not use materials with chips, cracks, voids, stains, or other defects that might be visible in the finished Work.

B. Impact-Resistant Wall Covering: Install top and edge moldings, corners, and divider bars as required for a complete installation.

3.4 CLEANING

A. Immediately after completion of installation, clean plastic covers and accessories using a standard, ammonia-based, household cleaning agent.

B. Remove excess adhesive using methods and materials recommended in writing by manufacturer.

END OF SECTION

SECTION 10 2800 - TOILET, BATH, AND LAUNDRY ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Public-use washroom accessories.
2. Public-use shower room accessories.
3. Childcare accessories.
4. Underlavatory guards.
5. Custodial accessories.

B. Related Requirements:

1. Section 09 3013 "Ceramic Tiling" for ceramic toilet and bath accessories.

1.3 COORDINATION

A. Coordinate accessory locations with other work to prevent interference with clearances required for access by people with disabilities, and for proper installation, adjustment, operation, cleaning, and servicing of accessories.

B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

1.4 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Include anchoring and mounting requirements, including requirements for cutouts in other work and substrate preparation.
3. Include electrical characteristics.

C. Product Schedule: Indicating types, quantities, sizes, and installation locations by room of each accessory required.

1. Identify locations using room designations indicated.
2. Identify accessories using designations indicated.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For accessories to include in maintenance manuals.

1.6 WARRANTY

A. Manufacturer's Special Warranty for Mirrors: Manufacturer agrees to repair or replace mirrors that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, visible silver spoilage defects.
2. Warranty Period: 15 years from date of Substantial Completion.

PART 2 - PRODUCTS

A. See Drawings for Toilet Accessory Schedule.

2.2 PUBLIC-USE SHOWER ROOM ACCESSORIES

A. Shower Curtain Rod :

1. Description: 1-1/4-inch OD; fabricated from nominal 0.05-inch- thick stainless steel.
2. Mounting Flanges: Stainless-steel flanges designed for exposed fasteners.
3. Finish: Stainless steel, No. 4 finish (satin).

B. Shower Curtain :

1. Size: Minimum 12 inches wider than opening by 72 inches high.
2. Material: Nylon-reinforced vinyl, minimum 10 oz. or 0.008-inch- thick vinyl, with integral antibacterial agent.
3. Color: White.
4. Grommets: Corrosion resistant at minimum 6 inches o.c. through top hem.
5. Shower Curtain Hooks: Chrome-plated or stainless-steel, spring wire curtain hooks with snap fasteners, sized to accommodate specified curtain rod. Provide one hook per curtain grommet.

C. Folding Shower Seat :

1. Configuration: Rectangular seat.
2. Seat: Phenolic or polymeric composite of slat-type or one-piece construction in color as selected by Architect.

3. Mounting Mechanism: Stainless steel, No. 4 finish (satin).

D. Robe Hook :

1. Description: Double -prong unit.
2. Material and Finish: Stainless steel, No. 4 finish (satin).

2.3 CHILDCARE ACCESSORIES

A. Diaper-Changing Station :

1. Description: Horizontal unit that opens by folding down from stored position and with child-protection strap.
   a. Engineered to support minimum of 250-lb static load when opened.
2. Mounting: Surface mounted, with unit projecting not more than 4 inches from wall when closed.
3. Operation: By pneumatic shock-absorbing mechanism.
4. Material and Finish: HDPE in manufacturer's standard color.
5. Liner Dispenser: Built in.

2.4 UNDERLAVATORY GUARDS

A. Underlavatory Guard :

1. Description: Insulating pipe covering for supply and drain piping assemblies that prevents direct contact with and burns from piping; allow service access without removing coverings.
2. Material and Finish: Antimicrobial, molded plastic, white.

2.5 CUSTODIAL ACCESSORIES

A. Mop and Broom Holder :

1. Description: Unit with shelf, hooks, holders, and rod suspended beneath shelf.
2. Length: 36 inches.
3. Hooks: Four.
4. Mop/Broom Holders: Three, spring-loaded, rubber hat, cam type.
5. Material and Finish: Stainless steel, No. 4 finish (satin).
   a. Rod: Approximately 1/4-inch- diameter stainless steel.

2.6 MATERIALS

A. Stainless Steel: ASTM A 666, Type 304, 0.031-inch minimum nominal thickness unless otherwise indicated.

B. Steel Sheet: ASTM A 1008/A 1008M, Designation CS (cold rolled, commercial steel), 0.036-inch minimum nominal thickness.

C. Galvanized-Steel Sheet: ASTM A 653/A 653M, with G60 hot-dip zinc coating.

D. Galvanized-Steel Mounting Devices: ASTM A 153/A 153M, hot-dip galvanized after fabrication.

E. Fasteners: Screws, bolts, and other devices of same material as accessory unit and tamper-and-theft resistant where exposed, and of galvanized steel where concealed.

F. Chrome Plating: ASTM B 456, Service Condition Number SC 2 (moderate service).

G. Mirrors: ASTM C 1503, Mirror Glazing Quality, clear-glass mirrors, nominal 6.0 mm thick.

2.7 FABRICATION

A. General: Fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with full-length, continuous hinges. Equip units for concealed anchorage and with corrosion-resistant backing plates.

B. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to Owner's representative.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install accessories according to manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights indicated.

B. Grab Bars: Install to withstand a downward load of at least 250 lbf, when tested according to ASTM F 446.

3.2 ADJUSTING AND CLEANING

A. Adjust accessories for unencumbered, smooth operation. Replace damaged or defective items.

B. Remove temporary labels and protective coatings.

C. Clean and polish exposed surfaces according to manufacturer's written instructions.

END OF SECTION

SECTION 10 4413 - FIRE PROTECTION CABINETS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Fire-protection cabinets for the following:
    a. Portable fire extinguishers.

B. Related Requirements:

1. Section 10 4416 "Fire Extinguishers."

1.3 PREINSTALLATION CONFERENCE

A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of product. Show door hardware, cabinet type, trim style, and panel style. Include roughing-in dimensions and details showing recessed-, semirecessed-, or surface-mounting method and relationships of box and trim to surrounding construction.

1. Show location of knockouts for hose valves.

C. Shop Drawings: For fire-protection cabinets. Include plans, elevations, sections, details, and attachments to other work.

D. Samples for Verification: For each type of exposed finish required, prepared on Samples 6 by 6 inches square.

E. Product Schedule: For fire-protection cabinets. Indicate whether recessed, semirecessed, or surface mounted. Coordinate final fire-protection cabinet schedule with fire-extinguisher schedule to ensure proper fit and function. Use same designations indicated on Drawings.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For fire-protection cabinets to include in maintenance manuals.

1.6 COORDINATION

A. Coordinate size of fire-protection cabinets to ensure that type and capacity of fire extinguishers indicated are accommodated.

B. Coordinate sizes and locations of fire-protection cabinets with wall depths.

1.7 SEQUENCING

A. Apply vinyl lettering on field-painted fire-protection cabinets after painting is complete.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Rated Fire-Protection Cabinets: Listed and labeled to comply with requirements in ASTM E 814 for fire-resistance rating of walls where they are installed.

2.2 FIRE-PROTECTION CABINET

A. Cabinet Type: Suitable for fire extinguisher.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
    a. Guardian Fire Equipment, Inc.
    b. JL Industries, Inc.; a division of the Activar Construction Products Group.
    c. Larsens Manufacturing Company.
    d. Nystrom, Inc.
    e. Potter Roemer LLC.

B. Cabinet Construction: Nonrated

C. Cabinet Material: Cold-rolled steel sheet.

D. Semirecessed Cabinet: One-piece combination trim and perimeter door frame overlapping surrounding wall surface with exposed trim face and wall return at outer edge (backbend).

1. Square-Edge Trim: 1-1/4- to 1-1/2-inch backbend depth.

E. Cabinet Trim Material: Steel sheet .

F. Door Material: Steel sheet.

G. Door Style: Flush opaque panel, frameless, with no exposed hinges.

H. Door Hardware: Manufacturer's standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.

1. Provide projecting door pull and friction latch.

2. Provide continuous hinge, of same material and finish as trim, permitting door to open 180 degrees.

I. Accessories:

1. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as directed by Architect.
   a. Identify fire extinguisher in fire-protection cabinet with the words "FIRE EXTINGUISHER."
      1) Location: Applied to cabinet glazing.
      2) Application Process: Decals.
      3) Lettering Color: Red.
      4) Orientation: Vertical.

J. Materials:

1. Cold-Rolled Steel: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B.
   a. Finish: Factory primed for field painting.

2.3 FABRICATION

A. Fire-Protection Cabinets: Provide manufacturer's standard box (tub) with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated.

1. Weld joints and grind smooth.
2. Provide factory-drilled mounting holes.
3. Prepare doors and frames to receive locks.
4. Install door locks at factory.

B. Cabinet Doors: Fabricate doors according to manufacturer's standards, from materials indicated and coordinated with cabinet types and trim styles.

1. Fabricate door frames with tubular stiles and rails and hollow-metal design, minimum 1/2 inch thick.
2. Fabricate door frames of one-piece construction with edges flanged.
3. Miter and weld perimeter door frames.

C. Cabinet Trim: Fabricate cabinet trim in one piece with corners mitered, welded, and ground smooth.

2.4 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's AMP 500, "Metal Finishes Manual for Architectural and Metal Products," for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces of fire-protection cabinets from damage by applying a strippable, temporary protective covering before shipping.

C. Finish fire-protection cabinets after assembly.

D. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls and partitions for suitable framing depth and blocking where semirecessed cabinets will be installed.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare recesses for recessed and semirecessed fire-protection cabinets as required by type and size of cabinet and trim style.

3.3 INSTALLATION

A. General: Install fire-protection cabinets in locations and at mounting heights indicated or, if not indicated, at heights indicated below: or, if not indicated, at heights acceptable to authorities having jurisdiction.

1. Fire-Protection Cabinets: 54 inches above finished floor to top of cabinet.
2. Ensure that cabinet handle and top of fire extinguishers are mounted no higher than 48 inches above finished floor.

B. Fire-Protection Cabinets: Fasten cabinets to structure, square and plumb.

1. Unless otherwise indicated, provide recessed fire-protection cabinets. If wall thickness is inadequate for recessed cabinets, provide semirecessed fire-protection cabinets.
2. Provide inside latch and lock for break-glass panels.

C. Identification: Apply decals at locations indicated.

3.4 ADJUSTING AND CLEANING

A. Remove temporary protective coverings and strippable films, if any, as fire-protection cabinets are installed unless otherwise indicated in manufacturer's written installation instructions.

B. Adjust fire-protection cabinet doors to operate easily without binding. Verify that integral locking devices operate properly.

C. On completion of fire-protection cabinet installation, clean interior and exterior surfaces as recommended by manufacturer.

D. Touch up marred finishes, or replace fire-protection cabinets that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by fire-protection cabinet and mounting bracket manufacturers.

E. Replace fire-protection cabinets that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION

SECTION 10 4416 - FIRE EXTINGUISHERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes portable, hand-carried fire extinguishers and mounting brackets for fire extinguishers.

B. Related Requirements:

1. Section 10 4413 "Fire Protection Cabinets."

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product. Include rating and classification, material descriptions, dimensions of individual components and profiles, and finishes for fire extinguisher and mounting brackets.

B. Product Schedule: For fire extinguishers. Coordinate final fire-extinguisher schedule with fire-protection cabinet schedule to ensure proper fit and function. Use same designations indicated on Drawings.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For fire extinguishers to include in maintenance manuals.

1.6 COORDINATION

A. Coordinate type and capacity of fire extinguishers with fire-protection cabinets to ensure fit and function.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace fire extinguishers that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
    a. Failure of hydrostatic test according to NFPA 10.

b. Faulty operation of valves or release levers.

2. Warranty Period: Six years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Portable Fire Extinguishers."

B. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.

1. Provide fire extinguishers approved, listed, and labeled by FM Global.

2.2 PORTABLE, HAND-CARRIED FIRE EXTINGUISHERS

A. Fire Extinguishers: Type, size, and capacity for each fire-protection cabinet and mounting bracket indicated.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Amerex Corporation. B500 (Campus Standard)

2. Valves: Nickel-plated, polished-brass body.

3. Handles and Levers: Stainless steel.

4. Instruction Labels: Include pictorial marking system complying with NFPA 10, Appendix B, and bar coding for documenting fire-extinguisher location, inspections, maintenance, and recharging.

B. Multipurpose Dry-Chemical Type in Steel Container: UL-rated 4-A:60-B:C, 10-lb nominal capacity, with monoammonium phosphate-based dry chemical in enameled-steel container.

2.3 MOUNTING BRACKETS

A. Mounting Brackets: Manufacturer's standard steel, designed to secure fire extinguisher to wall or structure, of sizes required for types and capacities of fire extinguishers indicated, with plated or red baked-enamel finish.

B. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated by Architect.

1. Identify bracket-mounted fire extinguishers with the words "FIRE EXTINGUISHER" in red letter decals applied to mounting surface.

a. Orientation: Vertical.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine fire extinguishers for proper charging and tagging.

1. Remove and replace damaged, defective, or undercharged fire extinguishers.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install fire extinguishers and mounting brackets in locations indicated and in compliance with requirements of authorities having jurisdiction.

1. Mounting Brackets: 48 inches above finished floor to top of fire extinguisher.

2. Do not install brackets in fire protection cabinets.

B. Mounting Brackets: Fasten mounting brackets to surfaces, square and plumb, at locations indicated.

END OF SECTION

SECTION 10 5119 - PHENOLIC CORE LOCKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes phenolic core lockers and benches.

1.3 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of phenolic core locker.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of locker and bench.

C. LEED Submittals:

1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.
2. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regionally manufactured materials. Include statement indicating cost for each regionally manufactured material.
    a. Include statement indicating location of manufacturer and distance to Project for each regionally manufactured material.
    b. Include statement indicating location of manufacturer and point of extraction, harvest, or recovery for each raw material used in regionally extracted and manufactured materials. Indicate distance to Project and fraction by weight of each regionally manufactured material that is regionally extracted.
3. Laboratory Test Reports for Credit IEQ 4.1: For adhesives, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
4. Product Data for Credit IEQ 4.4: For adhesives and composite products, documentation indicating that products contain no urea formaldehyde.

5. Laboratory Test Reports for Credit IEQ 4.4: For composite products, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

D. Shop Drawings: For phenolic core lockers.

1. Include plans, elevations, sections, details, and attachments to other work.
2. Show details full size.
3. Show locations and sizes of furring, blocking, and hanging strips, including concealed blocking and reinforcement specified in other Sections.
4. Show locations and sizes of cutouts and holes for items installed in lockers.
5. Show locker fillers, trim, base, sloping tops, and accessories.
6. Show locker numbering sequence.

E. Samples for Verification: For the following products:

1. Phenolic core panels, not less than 8 by 10 inches, for each type, color, pattern, and surface finish.
2. Corner pieces of locker front frame joints between stiles and rail, as well as exposed end pieces, not less than 18 inches wide by 18 inches high by 6 inches deep.
3. Exposed cabinet hardware and accessories, one unit for each type and finish.

1.4 CLOSEOUT SUBMITTALS

A. Maintenance Data: For adjusting, repairing, and replacing locker doors and latching mechanisms to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. Provide the following upon request:

1. Qualification Data: For qualified Installer.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Do not deliver lockers until painting and similar operations that could damage lockers have been completed in installation areas. If lockers must be stored in other-than-installation areas, store only in areas where environmental conditions are the same as those in final installation location, and comply with requirements specified in "Field Conditions" Article.

1.7 FIELD CONDITIONS

A. Environmental Limitations: Do not deliver or install lockers until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature between 60 and 90 deg F and relative humidity between 43 and 70 percent during the remainder of the construction period.

B. Field Measurements: Where lockers are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication, and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

1. Locate concealed framing, blocking, and reinforcements that support lockers by field measurements before being enclosed, and indicate measurements on Shop Drawings.

C. Established Dimensions: Where lockers are indicated to fit to other construction, establish dimensions for areas where lockers are to fit. Provide allowance for trimming at site, and coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.8 COORDINATION

A. Coordinate sizes and locations of concealed support bases.

1. Requirements are specified in Section 06 1053 "Miscellaneous Rough Carpentry."

B. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of work specified in other Sections to ensure that lockers can be supported and installed as indicated.

1.9 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of lockers that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Structural failures.
   b. Faulty operation of locks or hardware.
   c. Deterioration of and other materials beyond normal use.
2. Warranty Period: Three years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Accessibility Requirements: For lockers indicated to be accessible, comply with applicable provisions in the 2010 ADA Standards and CBC 11B.

2.2 PLASTIC-LAMINATE-CLAD WOOD LOCKERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. ASI Storage Solutions
2. Clubline Lockers
3. General Partitions Manufacturing Corp.

4. List Industries.
5. PSISC.

B. Construction Style: Flush overlay.

C. Locker Body: Fabricated from solid phenolic-core panel material with melamine facing on both sides fused to substrate during panel manufacture (not separately laminated), and with eased and polished edges.

1. Side Panels: 3/4 3/8 inch thick.
2. Back Panel: 3/4 5/16 inch thick.
3. Top Panel: 3/4 3/8 inch thick.
4. Bottom Panel: 3/4 3/8 inch thick.

D. Phenolic Core-Clad Doors: Solid phenolic-core panel material with melamine facing on both sides fused to substrate during panel manufacture (not separately laminated), and with eased and polished edges..

1. Thickness: 3/4 1/2 inch thick.

E. End Panels: Match style, material, construction, and finish of phenolic core doors.

F. Corners and Filler Panels: 3/4-inch- thick panels. Match style, material, construction, and finish of phenolic core doors.

G. Continuous Finish Base: Phenolic core, 3/4-inch- thick panel that matches door faces; fabricated in lengths as long as practical to enclose base and base ends of lockers.

H. Continuously Sloping Tops: Phenolic core, 3/4 1/2-inch- thick panel that matches door faces for installation over lockers with separate flat tops. Fabricate tops in lengths as long as practical, without visible fasteners at splice locations. Provide fasteners, supports, and closures, as follows:

1. Closures: Hipped-end type.
2. Sloping-top corner fillers, mitered.

I. Phenolic-Panel Finish:

1. Color and Pattern: As selected by Architect from manufacturer's full range, with manufacturer's standard dark color core.
2. Edge Color: Manufacturer's standard.

2.3 MATERIALS

A. Furring, Blocking, Shims, and Hanging Strips: Soft or hard lumber, kiln dried to less than 15 percent moisture content.

B. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage. Provide metal expansion sleeves or expansion bolts for post-installed anchors. Use nonferrous-metal or hot-dip galvanized anchors and inserts at inside face of exterior walls and at floors.

C. Wood Support Base: 2-by-4-inch nominal-size lumber treated with manufacturer's standard preservative-treatment, pressure process.

2.4 HARDWARE

A. General: Provide manufacturer's standard locker hardware complying with the requirements in this Section.

B. Cam Padlock Hasp: Surface mounted, steel; finished to match other locker hardware.

C. Frameless Hinges (European Type): Fully concealed, self-closing, nickel-plated steel, with not less than 125 degrees of opening.

~~D.~~ Wire Pulls: Back mounted; Manufacturers standard . 5 inches ~~long,~~ 2-1/2 inches ~~deep, and~~ 5/16 inch ~~in diameter.~~

E. Accessible Handle: Metal, fixed, graspable lever handle and rose trim; surface mounted.

F. Hooks: Manufacturer's standard, stainless j-hooks ~~ball-pointed aluminum or steel; epoxy coated~~. Attach hooks with at least two fasteners.

G. Exposed Hardware Finishes: Unless otherwise indicated, provide finish that complies with BHMA A156.18 for BHMA finish number indicated.

1. Satin Chromium Plated: BHMA 626 for brass or bronze base; BHMA 652 for steel base.

2.5 ACCESSORIES

A. Number Plates: 1-1/2-inch- diameter, etched, embossed, or stamped, stainless-steel plates with black numbers and letters at least 1/2 inch high. Identify lockers in sequence indicated on Drawings. Finish plates to match other locker hardware.

2.6 BENCHES

A. Pedestal-Leg Locker Benches: Bench supported by pedestal legs, minimum of two pedestals for each bench, with overall height of 18 inches measured from top of bench to floor, as follows:

1. Metal Pedestal Legs: 1-1/2-inch- square, painted steel tube.
2. Bench Tops: 1-1/4 inches deep; fabricated as follows:
   a. Butcher Block Top: Solid laminated hard.
   b. Width: 17 inches.
   c. Length: As Indicated .

2.7 FABRICATION

A. Fabricate each locker, an individual door and frame, an individual top, a bottom, and a back, and with common intermediate uprights separating compartments.

1. Fabricate lockers to dimensions, profiles, and details indicated.
2. Ease edges of corners of solid- members to 1/16-inch radius.

B. Fabricate components square, rigid, without warp, and with finished faces flat and free of scratches and chips. Accurately factory machine components for attachments. Make joints tight and true.

1. Fabricate lockers using manufacturer's standard construction, with joints made with dowels, dados, or rabbets. Dado side panels to receive shelving except where indicated to be adjustable.
2. Fabricate lockers with joints that are mortise and tenon ~~dadoed or rabbeted~~, glued full length, and stapled. Dado side panels to receive shelving except where indicated to be adjustable.
3. Join drawer subfronts, backs, and sides with manufacturer's standard glued joints.
4. Join drawer subfronts, backs, and sides with mortise and tenon ~~glued rabbeted joints supplemented by mechanical fasteners~~ or glued dovetail joints.

C. Accessible Lockers: Fabricate as follows:

1. Locate bottom shelf no lower than 15 inches above the floor.
2. Where hooks, coat rods, or additional shelves are provided, locate no higher than 48 inches above the floor.

D. Venting: Fabricate lockers with space between doors and locker assembly of not less than 1/4 inch .

E. Number Plates: Inlay number plates flush in each locker door, near top, centered.

F. Complete fabrication, including assembly, finishing, and hardware application, to maximum extent possible, before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.

1. Trial fit assemblies at fabrication shop that cannot be shipped completely assembled. Install dowels, screws, bolted connectors, and other fastening devices that can be removed after trial fitting. Verify that various parts fit as intended, and check measurements of assemblies against field measurements indicated on Shop Drawings before disassembling for shipment.

G. Shop cut openings, to maximum extent possible, to receive hardware, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine walls, floors, and support bases, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Verify that furring is attached to concrete and masonry walls that are to receive lockers.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Before installing lockers, examine factory-fabricated work for completeness and complete work as required, including removal of packing.

3.3 INSTALLATION

A. Install support base with 1/2-inch- thick ply top.

B. Assemble knocked-down lockers with manufacturer's standard fasteners, with no exposed fasteners on face frames.

C. Install lockers level, plumb, and true; use concealed shims.

D. Connect groups of lockers together with manufacturer's standard brass-finished fasteners, through predrilled holes, with no exposed fasteners on face frames. Fit lockers accurately together to form flush, tight, hairline joints.

E. Install lockers without distortion so doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings, providing unencumbered operation. Complete installation of hardware and accessory items as indicated.

1. Installation Tolerance: No more than 1/8 inch in 96-inchsag, bow, or other variation from a straight line. Shim as required with concealed shims.

F. Locker Anchorage: Fasten lockers through locker base, at ends, and not more than 36 inches o.c. with No. 8 brass-finished, flush-head screws sized for 1-inch penetration into base.

G. Locker Anchorage: Fasten lockers through back, near top and bottom, at ends with No. 8 pan-head sheet metal screws through metal backing or metal framing behind wall finish and spaced not more than 16 inches o.c.

H. Scribe and cut corner and filler panels to fit adjoining work using fasteners concealed where practical. Repair damaged finish at cuts.

I. Attach sloping-top units to lockers, with end panels covering exposed ends.

J. Install number plates after lockers are in place.

1. Attach number plate on each locker door, near top, centered, with at least two screws with finish matching number plate.

K. Anchor locker benches to floors.

1. Uniformly space pedestals not more than 72 inches apart; securely fasten pedestals to bench top and anchor to floor.

3.4 ADJUSTING, CLEANING, AND PROTECTION

A. Clean, lubricate, and adjust hardware. Adjust doors to operate easily without binding. Verify that integral locking devices operate properly.

B. Protect lockers from damage, abuse, dust, dirt, stain, or paint. Do not permit use during construction.

C. Touch up marred finishes, or replace lockers that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by locker manufacturer.

END OF SECTION

SECTION 11 1233 - PARKING GATES

PART 1 GENERAL

1.1 SECTION INCLUDES

A. High performance barrier gate operator and accessories.

1.2 RELATED SECTIONS

A. Section 03 30 00 - Cast-in-Place Concrete: Concrete mounting pads.

B. Division 16 - Requirements for electrical connections.

1.3 REFERENCES

A. Underwriters' Laboratory (UL): Categories FDDR and FDDR7 - Door, Drapery, Gate, Louver, and Window Operators and Systems.

1.4 SUBMITTALS

A. Submit under provisions of Section 01 30 00.

B. Product Data: Equipment list, system description, electrical wiring diagrams for installation, and manufacturer's data sheets on each product to be used, including:
   1. Preparation instructions and recommendations.
   2. Storage and handling requirements and recommendations.
   3. Installation methods.

C. Shop Drawings: Submit shop drawings showing layout, profiles, and product components, including anchorage, edge conditions, and accessories.
   1. Operation, installation, and maintenance manuals including wiring diagrams.
   2. Risers, layouts, and special wiring diagrams showing any changes to standard drawings

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store products in manufacturer's unopened packaging with labels intact until ready for installation.

B. Schedule delivery of parking control equipment so that spaces are sufficiently complete that operators can be installed upon delivery.

1.6 QUALITY ASSURANCE

A. Perform installation by factory authorized contractor specifically trained in gate operation systems of the type found within this section.

B. Provide documentation of maintenance and repair service availability for emergency

conditions.

C. Provide quarterly maintenance for one year following Substantial Completion of the Project.

1.7 WARRANTY

A. Manufacturer's standard warranty for two years or 2 million cycles.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer:

B. Requests for substitutions will be considered in accordance with provisions of Section 01 60 00.

2.2 HIGH PERFORMANCE BARRIER GATE OPERATOR

A. Magnetic Automation Corp MIB 10 Super High Speed Barrier Gate Operator: Barrier open/close time 0.6 seconds, 100% duty cycle, boom length up to 10 feet.

B. Magnetic Automation Corp MIB 20 High Speed Barrier Gate Operator: Barrier open/close time 0.9 seconds, 100% duty cycle, boom length up to 10 feet.

C. Magnetic Automation Corp MIB 30 High Speed Barrier Gate Operator: Barrier open/close time 1.4-1.9 seconds, 100% duty cycle, boom length up to 12 feet.

D. Magnetic Automation Corp MIB 40 High Speed Barrier Gate Operator: Barrier open/close time 4.0 seconds, 100% duty cycle, boom length up to 20 feet.

E. UL Classification:
   1. Conforms to UL Category FDDR - Door, Drapery, Gate, Louver and Window Operators and Systems Certified
   2. Conforms to UL Category FDDR7 - Door, Drapery, Gate, Louver and Window Operators and Systems Certified for Canada

F. Housing: Manufactured from 14 gauge steel onto steel base, then phosphate and powder coated for maximum protection against corrosion and superior durability.

G. Drive Unit:
   1. MIB 10: 1056.5035 100% duty cycle spring-balanced brushless DC servo motor providing 0.6-3.0sec open/close in excess of 2 million cycles; maximum arm length 10 feet; left- or right-hand operation.
   2. MIB 20: BDU20*-C900 100% duty cycle spring-balanced AC torque motor providing 0.9sec open/close time in excess of 2 million cycles; maximum arm length 10 feet; left- or right-hand operation.
   3. MIB 30: BDU30*-C900 100% duty cycle spring-balanced AC torque motor providing 1.4-1.9sec open/close time in excess of 2 million cycles; maximum arm length 12 feet; left- or right-hand operation.

4. MIB 40: BDU40*-C900 100% duty cycle spring-balanced AC torque motor providing 4.0sec open/close time in excess of 2 million cycles; maximum arm length 20 feet; left- or right-hand operation.

H. Controller:
1. MIB 10: MLC90-C100 Magnetic Lane Controller, two potential free inputs to open and close barrier and one safety device (i.e. photoelectric beams, safety loop, etc) input, two relay outputs for gate position feedback (open/close), one relay output for error indication.
2. MIB 20: MLC11-U100 Magnetic Lane Controller with built-in dual channel vehicle loop detectors, (5) potential free inputs and (2) 24V DC outputs, easy to program lane configurations and operation parameters via selector switch, push buttons and LCD display.
3. MIB 30/40: MLC10-U100 Magnetic Lane Controller with built-in dual channel vehicle loop detectors, (5) potential free inputs and (2) 24V DC outputs, easy to program lane configurations and operation parameters via selector switch, push buttons and LCD display.

I. Additional Required Controls:
1. Low power consumption and high MCBF (> 2,000,000 cycles).
2. Direct drive operation resulting in condensation/corrosion resistance, extremely low maintenance, ability to be stalled in any position without risk of damage, problem-free operation in cold climatic conditions and overall extended service life – no belts, pulleys or chains.
3. Modular construction with drive unit mounted to a heavy duty casting allowing easy access door to be mounted on any side of barrier.
4. Built-in position sensors (no limit switches) providing precise arm position status and a self-learning control unit to guarantee optimum braking and no boom arm bouncing, sagging or rotating out of position.
5. Easy to program controller for common lane configurations.
6. Knox key switch, submastered to campus.
7. Interface to building fire arm, open on alarm.

J. Gate Arm:

1. Arm: 15 foot octagonal aluminum arm (requires pendulum support or support pillar).
2. Arm: 20 foot octagonal aluminum arm.

K. Optional Equipment:
1. RS232/422/485 or TCP/IP communication for MIB20, MIB30 or MIB40.
2. Single channel vehicle loop detector.
3. Dual channel vehicle loop detector.
4. Additional foam protection inserted on the bottom of octagonal aluminum boom for extra safety.
5. Swing away flange
6. Wood arm flange adaptor (wood boom supplied by customer).
7. Pendulum support for boom arm lengths over 14 feet.

8. Contact for release of barrier arm
9. Additional I/O extension module.
10. Custom RAL color.
11. Boom arm lights with controller.
12. Support pillar in RAL 2000 Orange.
13. Support pillar in RAL 2000 Orange with electro-mechanical arm lock and control unit.
14. Additional heater for extremely cold environments.

PART 3 EXECUTION

3.1 EXAMINATION

A. Do not begin installation until substrates have been properly prepared.

B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.2 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

A. Install in accordance with manufacturer's instructions including the following:
1. Mount directly to concrete pad, firmly secured, plumb and level.
2. Mount to mounting pedestal; provide base plate.
3. Wire in accordance with National Electric Code.
4. Enclose all splices in easily accessible junction boxes or on terminal boards.
5. Tag and identify all cable runs in all junction boxes.

B. Test system and adjust to assure components and accessories are properly connected and in working order.

3.4 PROTECTION

A. Protect installed products until completion of project.

B. Touch-up, repair or replace damaged products before Substantial Completion.

3.5 MAINTENANCE

A. Maintain at three-month intervals during specified maintenance period, primarily checking rubber end stops on direct drive unit.

END OF SECTION

SECTION 11 1313 - LOADING DOCK BUMPERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes loading dock bumpers.

1.3 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of loading dock bumper.

C. Shop Drawings: For dock bumpers. Include plans, elevations, sections, details, and attachments to other work.

PART 2 - PRODUCTS

2.1 DOCK BUMPERS

A. General: Surface-mounted bumpers; of type, size, and construction indicated; designed to absorb kinetic energy and minimize damage to loading dock structure.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    a. Kelley; 4Front Engineered Solutions, Inc.
    b. Rite-Hite Holding Corporation.
    c. Serco; 4Front Engineered Solutions, Inc.

B. Laminated-Tread Dock Bumper : Fabricated from multiple, uniformly thick plies cut from fabric-reinforced rubber tires. Laminate plies under pressure on not less than two 3/4-inch-diameter, steel supporting rods that are welded at one end to 1/4-inch- thick, structural-steel end angle and secured with a nut and angle at the other end. Fabricate angles with predrilled anchor holes and sized to provide not less than 1 inch of tread plies extending beyond the face of closure angles.

1. Thickness: 6 inches.
2. Horizontal Style: 10 inches high by length indicated on Drawings.

C. Anchorage Devices: Galvanized-steel anchor bolts, nuts, washers, bolts, sleeves, cast-in-place plates, and other anchorage devices as required to fasten bumpers securely in place and to suit installation type indicated. Hot-dip galvanized according to ASTM A 153/A 153M or ASTM F 2329.

D. Materials: ASTM 36/A 36M for steel plates, shapes, and bars. Hot-dip galvanize according to ASTM A 123/A 123M.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Dock Bumpers: Attach dock bumpers to face of loading dock in a manner that complies with requirements indicated for spacing, arrangement, and position relative to top of platform and anchorage.

1. Bolted Attachment: Attach dock bumpers to preset anchor bolts embedded in concrete or to cast-in-place inserts or threaded studs welded to embedded-steel plates or angles. If preset anchor bolts, cast-in-place inserts, or threaded studs welded to embedded-steel plates or angles are not provided, attach dock bumpers by drilling and anchoring with expansion anchors and bolts.

3.3 ADJUSTING

A. After completing installation of exposed, factory-finished dock bumpers, inspect exposed finishes and repair damaged finishes.

END OF SECTION

SECTION 11 1319 - STATIONARY LOADING DOCK EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Recessed dock levelers.
2. Edge-of-dock levelers.

B. Related Requirements:

1. Section 05 5000 "Metal Fabrications" for curb angles at edges of recessed pits andloading dock platform edge channels.
4. Section 11 1313 "Loading Dock Bumpers" for loading dock bumpers.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Inspect and discuss electrical roughing-in, equipment bases, and other preparatory work specified elsewhere.
2. Review sequence of operation for each type of loading dock equipment.
3. Review coordination of interlocked equipment specified in this Section and elsewhere.
4. Review required testing, inspecting, and certifying procedures.

1.4 DEFINITIONS

A. Operating Range: Maximum amount of travel above and below the loading dock level.

B. Working Range: Recommended amount of travel above and below the loading dock level for which loading and unloading operations can take place.

1.5 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for stationary loading dock equipment.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

C. Shop Drawings: For stationary loading dock equipment.

1. Include plans, elevations, sections, details, and attachments to other work.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of anchors and field connection.
3. Include diagrams for power, signal, and control wiring.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For stationary loading dock equipment to include in operation and maintenance manuals.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

1. Maintenance Proximity: Not more than two hours' normal travel time from Installer's place of business to Project site.

B. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.3, "Structural Welding Code - Sheet Steel."

C. Provide the following upon request:

1. Qualification Data: For Installer.
2. Welding certificates.
3. Product Test Reports: For each dock leveler, for tests performed by manufacturer and witnessed by a qualified testing agency.
    a. Indicate compliance of dock levelers with requirements in MH 30.1 for determining rated capacity, which is based on comprehensive testing within last two years of current products.
    b. Submittal Form: According to MH 30.1.

1.8 FIELD CONDITIONS

A. Field Measurements: Verify actual dimensions of construction contiguous with stationary loading dock equipment, including recessed pit dimensions and heights of loading docks, by field measurements before fabrication.

1.9 WARRANTY

A. Manufacturer's Special Warranty: Manufacturer agrees to repair or replace dock levelers that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including cracked or broken structural support members, load-bearing welds, and front and rear hinges.

b. Faulty operation of operators, control system, or hardware.

c. Deck plate failures including cracked plate or permanent deformation in excess of 1/4 inch between deck supports.

d. Hydraulic system failures including failure of hydraulic seals and cylinders.

2. Warranty Period for Structural Assembly: 10 years from date of Substantial Completion.

3. Warranty Period for Hydraulic System: Five years from date of Substantial Completion.

4. Warranty shall be for unlimited usage of leveler for the specified rated capacity over the term of the warranty.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 RECESSED DOCK LEVELERS

A. General: Recessed, hinged-lip-type dock levelers designed for permanent installation in concrete pits preformed in the edge of loading platform; of type, function, operation, capacity, size, and construction indicated; and complete with controls, safety devices, and accessories required.

1. Manufacturers: Subject to compliance with requirements, provide products by the following:

n. Serco Hydraulic Model HFC8740:18-SBL ; 4Front Engineered Solutions, Inc.

o. Or approved equal.

B. Standard: Comply with MH 30.1, except for structural testing to establish rated capacity.

C. Rated Capacity: Capable of supporting total gross load of <Insert load> without permanent deflection or distortion.

D. Platform: Not less than 1/4-inch- thick, nonskid steel plate.

1. Platform Size: As indicated on Drawings.

2. Frame: Manufacturer's standard.

3. Toe Guards: Equip open sides of dock leveler over range indicated with metal toe guards.

a. Toe-Guard Range: Entire upper working range.

E. Hinged Lip: Not less than 5/8-inch- thick, nonskid steel plate.

1. Hinge: Full-width, piano-type hinge with heavy-wall hinge tube and grease fittings, with gussets on lip and ramp for support.

2. Safety Barrier Lip: Designed to protect material-handling equipment from an accidental fall from loading platform edge of the dock leveler when the leveler is not in use.

F. Function: Dock levelers shall compensate for differences in height between truck bed and loading platform.

1. Vertical Travel: Operating range above platform level of sufficient height to enable lip to extend and clear truck bed before contact with the following minimum working range:

a. Above Adjoining Platform: 12 inches .

b. Below Adjoining Platform: 12 inches .

2. Automatic Vertical Compensation: Floating travel of ramp with lip extended and resting on truck bed shall compensate automatically for upward or downward movement of truck bed during loading and unloading.

3. Automatic Lateral Compensation: Tilting of ramp with lip extended and resting on truck bed shall compensate automatically for canted truck beds of up to 4 inches over width of ramp.

4. Lip Operation: Manufacturer's standard mechanism, which automatically extends and supports hinged lip on ramp edge with lip resting on truck bed over dock leveler's working range, allows lip to yield under impact of incoming truck and automatically retracts lip when truck departs.

a. Length of Lip Extension: 16 18 inches.

5. Automatic Ramp Return: Automatic return of unloaded ramp, from raised or lowered positions to stored position, level with platform, as truck departs.

H. Hydraulic Operating System: Electric control from a remote-control station; fully hydraulic operation. Electric-powered hydraulic raising and hydraulic lowering of ramp. Equip leveler with a packaged unit including a unitized, totally enclosed, nonventilated electric motor, pump, manifold reservoir, and valve assembly of proper size, type, and operation for capacity of leveler indicated. Include means for lowering ramp below platform level with lip retracted behind dock bumpers. Provide a hydraulic velocity fuse connected to main hydraulic cylinder to limit loaded ramp's free fall to not more than 3 inches.

1. Remote-Control Station: Weatherproof single -button station of the constant-pressure type, enclosed in NEMA ICS 6, Type 4 box. Ramp raises by depressing and holding button; ramp lowers at a controlled rate by releasing button.

2. Remote-Control Station with Emergency Stop: Weatherproof multibutton control station with an UP button of the constant-pressure type and an emergency STOP button of the momentary-contact type, enclosed in NEMA ICS 6, Type 4 box. Ramp raises by depressing and holding UP button; ramp lowers at a controlled rate by releasing UP button. All ramp movement stops, regardless of position of ramp or lip, by depressing STOP button. Normal operation resumes by engaging a manual reset button or by pulling out STOP button.

3. Independent Lip Operation: Electric-powered hydraulic raising and hydraulic lowering of lip, controlled independent of raising and lowering of ramp.

K. Construction: Fabricate dock-leveler frame, platform supports, and lip supports from structural- or formed-steel shapes. Weld platform and hinged lip to supports. Fabricate entire assembly to withstand deformation during both operating and stored phases of service. Chamfer lip edge to minimize obstructing wheels of material-handling vehicles.

1. Cross-Traffic Support: Manufacturer's standard method of supporting ramp at platform level in stored position with lip retracted. Provide a means to release supports to allow ramp to descend below platform level.

2. Maintenance Strut: Integral strut to positively support ramp in up position during maintenance of dock leveler.

N. Materials:

1. Steel Plates, Shapes, and Bars: ASTM 36/A 36M.

2. Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from steel plate complying with ASTM A 572/A 572M, Grade 55.

3. Steel Tubing: ASTM A 500/A 500M, cold formed.

4. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

O. Dock-Leveler Finish: Manufacturer's standard finish.

1. Toe Guards: Paint toe guards to comply with ANSI Z535.1.

P. Accessories:

1. Curb Angles: 3-by-3-by-1/4-inch galvanized-steel curb angles for edge of recessed leveler pit, with 1/2-inch- diameter by 6-inch- long concrete anchors welded to angle at 6 inches o.c.

3. Night Locks: Manufacturer's standard means to prevent extending lip and lowering ramp when overhead doors are locked.

6. Abrasive skid-resistant surface.

2.3 EDGE-OF-DOCK LEVELERS

A. General: Surface-mounted, hinged-lip-type, edge-of-dock levelers designed for permanent installation on face of loading dock platform; of type, function, operation, capacity, size, and construction indicated; and complete with controls, safety devices, and accessories required.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

n. Serco; 4Front Engineered Solutions, Inc. SM6630

B. Standard: Comply with MH 30.1, except for structural testing to establish rated capacity.

C. Platform Ramp Width: 66 inches.

D. Hinged Lip: Not less than 3/8-inch- thick, nonskid steel tread plate.

1. Hinge: Full-width, piano-type hinge with heavy-wall hinge tube and grease fittings, with gussets on lip and ramp for support.

E. Function: Dock levelers shall compensate for differences in height between truck bed and loading platform.

1. Vertical Travel: Operating range above platform level of sufficient height to enable lip to extend and clear truck bed before contact with the following minimum working range:

a. Above Adjoining Platform: 5 inches .

b. Below Adjoining Platform: 5 inches.

2. Lip Operation: Manufacturer's standard mechanism, which automatically extends and supports hinged lip on ramp edge with lip resting on truck bed over dock leveler's working range, allows lip to yield under impact of incoming truck and automatically retracts lip when truck departs.

a. Length of Lip Extension: 15 inches .

F. Mechanical Operating System: Manual control; counterbalance and spring operation. Spring-operated raising and walk-down lowering of unloaded ramp. Equip leveler with a torsion-spring counterbalancing mechanism controlled by a hold-down device.

1. Lever Handle: Self-storing lever handle for raising unloaded ramp with minimal lifting force by pulling lever back to extend lip and pushing lever forward to lower ramp and lip.

2. Removable Lifting Handle: For raising unloaded ramp by lifting action.

G. Integral Laminated-Tread Dock Bumper: Fabricated from 6-inch- thick, multiple, uniformly thick plies cut from fabric-reinforced rubber tires. Laminate plies under pressure on not less than two 3/4-inch- diameter, steel supporting rods that are welded at one end to 1/4-inch- thick, structural-steel end angle and secured with a nut and angle at the other end. Fabricate angles with predrilled anchor holes and sized to provide not less than 1 inch of tread plies extending beyond the face of closure angles.

H. Materials:

1. Steel Plates, Shapes, and Bars: ASTM 36/A 36M.

2. Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from steel plate complying with ASTM A 572/A 572M, Grade 55.

3. Steel Tubing: ASTM A 500/A 500M, cold formed.

4. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

I. Dock-Leveler Finish: Manufacturer's standard finish.

2.4 FINISH REQUIREMENTS

A. Finish loading dock equipment after assembly and testing.

B. Galvanizing Hot-dip galvanize components to comply with the following:

1. ASTM A 123/A 123M for iron and steel loading dock equipment.

2. ASTM A 153/A 153M or ASTM F 2329 for iron and steel hardware for loading dock equipment.

C. Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat in manufacturer's standard color.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for electrical systems for loading dock equipment to verify actual locations of connections before equipment installation.

C. Examine walls and floors of pits for suitable conditions where recessed loading dock equipment is to be installed. Pits shall be plumb and square and properly sloped for drainage from back to front of loading dock.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Coordinate size and location of loading dock equipment indicated to be attached to or recessed into concrete or masonry, and furnish anchoring devices with templates, diagrams, and instructions for their installation.

B. Set curb angles in concrete edges of dock-leveler recessed pits with tops flush with loading platform. Fit exposed connections together to form hairline joints.

C. Clean recessed pits of debris.

3.3 INSTALLATION

A. General: Install loading dock equipment as required for a complete installation.

1. Rough-in electrical connections.

B. Recessed Dock Levelers: Attach dock levelers securely to loading dock platform, flush with adjacent loading dock surfaces and square to recessed pit.

C. Edge -of-Dock Levelers: Attach dock levelers to loading dock platform in a manner that complies with requirements indicated for arrangement and position relative to top of platform.

1. Weld anchor holes in contact with continuous embedded loading dock edge channel. Weld or bolt bumper blocks to face of loading dock.

3.4 ADJUSTING

A. Adjust loading dock equipment to function smoothly and safely, and lubricate as recommended by manufacturer.

B. Test dock levelers for vertical travel within operating range indicated.

C. After completing installation of exposed, factory-finished loading dock equipment, inspect exposed finishes and repair damaged finishes.

3.5 MAINTENANCE SERVICE

A. Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months' full maintenance by skilled employees of loading dock equipment Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper loading dock equipment operation at rated speed and capacity. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain loading dock equipment.

END OF SECTION

SECTION 11 3100 - RESIDENTIAL APPLIANCES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Cooking appliances.
2. Refrigeration appliances.
3. Cleaning appliances.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of product.

1. Include installation details, material descriptions, dimensions of individual components, and finishes for each appliance.
2. Include rated capacities, operating characteristics, electrical characteristics, and furnished accessories.

C. LEED Submittals:

1. Product Data for Credit EA 1.4: For appliances indicated, documentation that products are ENERGY STAR rated.
2. Product Data for Credit EA 9.2: For water-efficient clothes washer, documentation indicating modified energy factor and water factor.

D. Samples: For each exposed product and for each color and texture specified, in manufacturer's standard size.

E. Product Schedule: For appliances. Use same designations indicated on Drawings.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For each residential appliance to include in operation and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Provide the following upon request:

1. Qualification Data: For manufacturer.
2. Product Certificates: For each type of appliance.
3. Field quality-control reports.

1.7 WARRANTY

A. Special Warranties: Manufacturer agrees to repair or replace residential appliances or components that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

B. Microwave Oven: Full warranty, including parts and labor, for on-site service on the magnetron tube.

1. Warranty Period: Five years from date of Substantial Completion.

C. Refrigerator/Freezer, Sealed System: Full warranty, including parts and labor, for on-site service on the product.

1. Warranty Period for Sealed Refrigeration System: Five years from date of Substantial Completion.
2. Warranty Period for Other Components: Two years from date of Substantial Completion.

D. Dishwasher: Full warranty, including parts and labor, for on-site service on the product.

1. Warranty Period for Deterioration of Tub and Metal Door Liner: 10 years from date of Substantial Completion.
2. Warranty Period for Other Components: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Electrical Appliances: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Accessibility: Where residential appliances are indicated to comply with accessibility requirements, comply with applicable provisions in the DOJ's 2010 ADA Standards for Accessible Design and 2013 CBC 11B.

2.2 MICROWAVE OVENS

A. Microwave Oven :

1. Type: Conventional.
2. Capacity: 2.0 cu. ft..
3. Oven Door: Door with observation window and pull handle.
4. Microwave Power Rating: 1000 W.
5. Electric Power Supply: 120 V, 60 Hz, 1 phase, 15 A .
6. Controls: Digital panel controls and timer display.
7. Other Features: Turntable.
8. Material: Stainless steel.

2.3 REFRIGERATOR/FREEZERS

A. Refrigerator/Freezer : Two-door, side-by-side refrigerator/freezer and complying with AHAM HRF-1. Comply with 2013 CBC 11B.804.6.6.

1. Type: Freestanding.
2. Freezer Features: One freezer compartment(s) with door(s).
   a. Automatic defrost.
   b. Interior light in freezer compartment.
   c. Automatic icemaker and storage bin.
3. Energy Performance, ENERGY STAR: Provide appliances that qualify for the EPA/DOE ENERGY STAR product-labeling program.

2.4 DISHWASHERS

A. Dishwasher : Complying with AHAM DW-1.

1. Type: Built-in undercounter.
2. Capacity:
   a. International Place Settings of China: 12.
   b. Water Consumption for Full Load: 3.2 gal. per cycle.
3. Sound Level: Maximum 48 dB.
4. Tub and Door Liner: Stainless steel with sealed detergent and automatic rinsing-aid dispensers.
5. Rack System: Nylon -coated sliding dish racks, with removable cutlery basket.
6. Controls: Touch-pad controls with four wash cycles and hot-air and heat-off drying cycle options.
7. Features:
   a. Waste food disposer.

b. Self-cleaning food-filter system.

c. Hot-water booster heater for 160 deg F wash water with incoming water at 100 deg F.

d. Lock-out feature.

e. Half-load option.

f. Digital display panel.

8. Energy Performance, ENERGY STAR: Provide appliances that qualify for the EPA/DOE ENERGY STAR product-labeling program.

2.5 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, power connections, and other conditions affecting installation and performance of residential appliances.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before appliance installation.

C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install appliances according to manufacturer's written instructions.

B. Freestanding Equipment: Place units in final locations after finishes have been completed in each area. Verify that clearances are adequate to properly operate equipment.

3.3 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Perform visual, mechanical, and electrical inspection and testing for each appliance according to manufacturers' written recommendations. Certify compliance with each manufacturer's appliance-performance parameters.
2. Operational Test: After installation, start units to confirm proper operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and components.

B. An appliance will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain residential appliances.

END OF SECTION

SECTION 11 5213 - PROJECTION SCREENS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Electrically operated, front-projection screens and controls.

B. Related Requirements:

1. Section 05 5000 "Metal Fabrications" for metal support framing for front-projection screens.
2. Section 06 1053 "Miscellaneous Rough Carpentry" for wood backing for screen installation.

1.3 DEFINITIONS

A. Gain: Ratio of light reflected from screen material to that reflected perpendicularly from a magnesium carbonate surface as determined per SMPTE RP 94.

B. Half-Gain Angle: The angle, measured from the axis of the screen surface to the most central position on a perpendicular plane through the horizontal centerline of the screen where the gain is half of the peak gain.

1.4 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of product.

C. Shop Drawings: Show layouts and types of front-projection screens. Include the following:

1. Drop lengths.
2. Location of seams in viewing surfaces.
3. Location of screen centerline relative to ends of screen case.
4. Anchorage details, including connection to supporting structure for suspended units.
5. Details of juncture of exposed surfaces with adjacent finishes.
6. Location of wiring connections for electrically operated units.

7. Wiring diagrams for electrically operated units.
8. Accessories.

D. Samples for Initial Selection: For finishes of surface-mounted screen cases.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For front-projection screens to include in maintenance manuals.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Environmental Limitations: Do not deliver or install front-projection screens until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.7 COORDINATION

A. Coordinate layout and installation of front-projection screens with adjacent construction, including ceiling suspension systems, light fixtures, HVAC equipment, fire-suppression system, and partitions.

PART 2 - PRODUCTS

2.1 ELECTRICALLY OPERATED, FRONT-PROJECTION SCREENS

A. General: Manufacturer's standard units consisting of case, screen, motor, controls, mounting accessories, and other components necessary for a complete installation. Provide units that are listed and labeled as an assembly by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Controls: Remote, key-operated, three-position control switch installed in recessed device box with flush cover plate matching other electrical device cover plates in room where switch is installed.
    a. Provide number of control switches indicated for each screen.
    b. Provide power supply for low-voltage systems if required.
3. Motor in Roller: Instant-reversing motor of size and capacity recommended by screen manufacturer; with permanently lubricated ball bearings, automatic thermal-overload protection, preset limit switches to automatically stop screen in up and down positions, and positive-stop action to prevent coasting. Mount motor inside roller with vibration isolators to reduce noise transmission.

4. End-Mounted Motor: Instant-reversing, gear-drive motor of size and capacity recommended by screen manufacturer; with permanently lubricated ball bearings, automatic thermal-overload protection, preset limit switches to automatically stop screen in up and down positions, and positive-stop action to prevent coasting. Locate motor in its own compartment on right end of screen unless otherwise indicated.
5. Screen Mounting: Top edge securely anchored to rigid metal roller and bottom edge formed into a pocket holding a 3/8-inch- diameter metal rod with ends of rod protected by plastic caps.
    a. Roller for end-mounted motor is supported by self-aligning bearings in brackets.
    b. Roller for motor in roller is supported by vibration- and noise-absorbing supports.
6. Tab Tensioning: Provide units that have a durable low-stretch cord, such as braided polyester, on each side of screen that is connected to edge of screen by tabs to pull screen flat horizontally. In lieu of tab tensioning, screens may be constructed from vinyl-coated screen cloth that contains horizontal stiffening monofilaments to resist edge curling.

B. Suspended, Electrically Operated Screens with Automatic Ceiling Closure, with Motor-in Roller, and with Tab Tensioning: Units designed and fabricated for suspended mounting; with bottom of case composed of two panels, fully enclosing screen, motor, and wiring; one panel hinged and designed to open and close automatically when screen is lowered and fully raised, the other removable or openable for access to interior of case.
1. Provide metal or metal-lined wiring compartment.
2. Screen Case: Made from metal, wood, wood products, and fire-retardant materials.
3. Provide screen case with trim flange to receive ceiling finish.
4. Finish on Exposed Surfaces: Prime painted.

2.2 FRONT-PROJECTION SCREEN MATERIAL

A. Wide-Angle Reflective Viewing Surface: Peak gain of not less than 1.5, and half-gain angle of at least 35 degrees from the axis of the screen surface.

B. Material: Vinyl-coated, glass-fiber fabric.

C. Mildew-Resistance Rating: Zero or 1 when tested according to ASTM G 21.

D. Flame Resistance: Passes NFPA 701.

E. Flame-Spread Index: Not greater than 75 when tested according to ASTM E 84.

F. Seamless Construction: Provide screens, in sizes indicated, without seams.

G. Edge Treatment: Black masking borders.

H. Provide extra drop length of dimensions and at locations indicated.
1. Color: Black.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install front-projection screens at locations indicated to comply with screen manufacturer's written instructions.

B. Install front-projection screens with screen cases in position and in relation to adjoining construction indicated. Securely anchor to supporting substrate in a manner that produces a smoothly operating screen with vertical edges plumb and viewing surface flat when screen is lowered.

1. Install low-voltage controls according to NFPA 70 and complying with manufacturer's written instructions.

a. Wiring Method: Install wiring in raceway except in accessible ceiling spaces and in gypsum board partitions where unenclosed wiring method may be used. Use UL-listed plenum cable in environmental air spaces, including plenum ceilings. Conceal raceway and cables except in unfinished spaces.

2. Test electrically operated units to verify that screen controls, limit switches, closures, and other operating components are in optimum functioning condition.

END OF SECTION

SECTION 11 5300 - LABORATORY EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes furnishing and installing equipment and accessories as shown on drawings and as specified herein. The Work includes the following:

EQ #	DESCRIPTION	FURNISH BY	REMARKS
E1	Emergency Shower / Eyewash Unit	CFCI	-
E2	Snorkel	CFCI	-
E3	Procedure Light	CFCI	-
E4	Cylinder Rack	CFCI	-
E5	Biological Safety Cabinet	OFOI	For reference only
E6	Animal Transfer Station	CFCI/OFOI	-See drawings for CFCI or OFOI designation
E7	Bottle Filler	CFCI	-
E8	Bedding Dispenser	CFCI	-
E9	Bedding Dump Station	CFCI	-
E10	Isolation Cubicle	CFCI	-
E11	Grossing Station	CFCI	-
E12A	Medium Steam Sterilizer	CFCI	-Cabinet enclosed, recessed through one wall
E12B	Medium Steam Sterilizer	CFCI	Recessed through two walls
E13	Cage and Rack Washer	CFCI	-
E14	Small Steam Sterilizer	CFCI	-
E15	Double Sided Cage Rack	CFCI	160 Cages
E16	Modular Wall	CFCI	-

E17	Scullery Sink	CFCI	-
E18	Glassware Washer	CFCI	-
E19	Ice Machine	CFCI	-
E20	Gas Cylinder Cabinets	CFCI	-
E21	Tall Flammable Storage Cabinet	CFCI	-
E22	Tall Corrosive Storage Cabinet	CFCI	-
E23	Mop Rack	CFCI	Vivarium only
E24	Clothes Washer	CFCI	Shall comply with CBC11B.611
E25	Clothes Dryer	CFCI	Shall comply with CBC11B.611
E26	Safety Center w/ Emergency Shower/ Eyewash and ~~Fire Extinguisher Cabinet~~	CFCI	
E27	Undercounter Glassware Washer	OFOI	
E28	Tunnel Washer	CFCI	

B. Related Sections:

1. Division 09 Section"Non-Structural Metal Framing" for reinforcements in metal-framed partitions for anchoring equipment.
2. Division 11 Section" Laboratory Fume Hoods".
3. Division 12 Section 12 3553 "Fixed Laboratory Casework" for tables, cabinets, work surface tops, sinks, and service fittings.
4. Division 23 Sections for rough-ins, controls, and final connections
5. Division 23 and 26 Sections for (dis)connecting service utilities at equipment.
6. Rough openings, pits, substrate preparation, and blocking for equipment installation shall be provided as specified in other Sections

C. Drawings and Specifications outline the design intent and the general requirements of laboratory equipment. Construction details and component specifications for each product may not be complete. Equipment furnished shall be complete for the intended function and operation.

1.2 REFERENCE

A. American National Standard Institute (ANSI)

B. Underwriter's Laboratories, Inc. (UL)

C. National Electric Code (NEC)

D. American Society for Testing and Materials (ASTM)

E. National Fire Protection Association (NFPA)

F. Industrial Ventilation Manual 17th Edition, or newer

G. American Society of Heating Refrigeration, and Air Conditioning Engineers, Inc. (ASHRAE)

H. As applicable to individual equipment

1.3 SUBMITTALS

A. Product Data: For each type of product indicated, including but not limited to installation instructions and equipment options.

B. Shop Drawings: For each type of equipment indicated.

1. Indicate details for anchoring equipment to permanent building construction including locations of blocking and other supports. Include calculations demonstrating that anchorages comply with seismic performance requirements.

2. Indicate locations and types of service fittings together with associated service supply connection required.

3. Indicate duct connections, electrical connections, and locations of access panels.

4. Include roughing-in information for mechanical, plumbing, and electrical connections.

5. Show adjacent walls, doors, windows, other building components, laboratory casework, and other laboratory equipment. Indicate clearances from above items.

6. Include coordinated dimensions for laboratory equipment specified in other Sections.

C. Samples for Initial Selection: For exposed equipment finishes, when requested by University's Representative, or when a full range of colors are available from manufacturer.

D. Non-Structural Lateral Force Design: Submit detailed seismic anchorage and attachment drawings and calculations provided by a California-licenses Structural Engineer in compliance with the most current California Building Code. The submittal shall include:

1. Dimensions and location of the center of gravity of the component.

2. Weight assumed in the calculations including contents.

3. Specification of anchorage to concrete in detail, including inspection and testing requirements, if any (inspection and testing to be furnished under this section, if required).
4. Reaction loads to the supporting structure or other component.
5. If a component other than the structure is used for seismic support, the submittal shall show the adequacy of the ad path to the structure or otherwise demonstrate compliance with limitations in the contract documents.
6. The submittal will be reviewed by the design professional responsible for this section of the specification to confirm that it is response to project specific context and criteria. The adequacy of the primary structure to resist the reacton loads imparted on the primary structure by shall be reviewed and approved by the project Structural Engineer.

E. Manufacturer's Qualifications: Submit evidence that manufacturer complies with specified requirements.

F. Applicable standards approval from NEMA, NEC, UL, ETL or as specified with the individual equipment items.

G. Written certification that manufactured finish complies with specified criteria.

H. Installer qualifications per paragraph 1.3, herein.

I. Operations and Maintenance Manuals: For each type of equipment indicated. Include operating procedures, maintenance requirements (including teardown), replacement schedules, components parts lists, nearest local factory representative (including phone number and email address) for components and emergency repair. Provide a minimum of three complete manuals of each, bound and indexed.

1.4 QUALITY ASSURANCE

A. Product Designations: Drawings indicate sizes, types, and configurations of equipment by referencing designated manufacturer's catalog numbers. Other manufacturers' products of similar sizes, types, and configurations, and complying with the Specifications, may be considered. See Division 01 Section "Product Requirements" for substitution requirements.

B. Equipment may be inspected by University's Representative at the manufacturer's plant prior to shipment. Provide 14 days advance notice to University's Representative.

C. Manufacturer Qualifications: Firm having an established organization and manufacturing facilities specializing in the type of equipment specified, having an experienced engineering department and an established history of six (6) similar installations of equal scope and complexity completed in the previous three (3) years. Manufacturer shall have the demonstrated ability to produce the specified equipment of the required quality and a proven capacity to complete an installation of this size and type within the required time limits.

1. Response time for telephone inquiry: Within 4 hours.
2. Response time for site visit: 24 hours from time of telephone inquiry.

D. Installer Qualifications: An authorized representative of manufacturer.

E. Pre-installation Conference: Conduct conference at Project site.

F. For fabrication and installation of Work, use personnel who have received training and have previously fabricated or installed the specified equipment.

G. A Quality Control (QC) Plan shall be implemented for this work in accordance with the provisions in Section 014000, Quality Requirements. Work of this Section shall be conducted in compliance with all relevant provisions contained in this section and section 013300, including shop drawings, product data and samples, testing and inspection, reports, quality assurance, as-built documents and warranties.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect finished surfaces during handling, installation and during entire duration of construction project with protective covering of polyethylene film or another suitable material. Protect installed laboratory equipment from debris, paint and damage in the course of construction sequencing. Repair/replace all damaged items not acceptable to University's Representative.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install equipment until building is enclosed, wet work and utility roughing-in are complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period. Report to The Owner's Representative, in writing, all items that may be detrimental to equipment delivery, installation or operation.

1.7 COORDINATION

A. Coordinate layout and installation of framing and reinforcements for lateral support of equipment.

B. Coordinate installation of equipment with laboratory casework, fume hood exhaust ducts, and plumbing and electrical work.

C. Drawings show arrangement and location of items of equipment. If it is necessary to vary from arrangement shown, because of structural, mechanical, electrical or other considerations, make such variations only after approval of The Owner's Representative and at no additional cost to The Owner.

D. Verify dimensions at building. Report to The Owner's Representative, in writing, that equipment will be able to be moved through the building in order to reach its designated location. Measure recesses and openings at building and provide trim pieces, fillers and closures in sizes required.

E. All equipment shall have integrated condensate cool-down systems prior to discharge to building drains.

1.8 WARRANTY

A. One (1) year manufacturer's warranty unless otherwise noted and identified by each specific piece of equipment.

1.9 MAINTENANCE SERVICE

A. Equipment supplier shall provide a technical response (actual presence or by phone) within 4 hours or the service call will be provided at no cost to The Owner.

B. Equipment supplier shall provide diagnostic equipment necessary for maintenance.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide equipment complete with necessary supports, anchorage, stands, gages, valves, parts, and accessories required for a complete operating installation.

B. Provide each item of equipment with internal electrical services necessary for proper operation including wiring, conduit, boxes, raceways, fittings, lamps, switches, device plates, etc., sized for single point connection to building services, complying with requirements of NEC and bearing UL labeling as required.

C. Provide each item of equipment with mechanical and plumbing services necessary for proper operation including piping, fittings, ductwork, troughs, accessories, and materials, installed for easy access and connection to respective building service.

D. Provide each item of equipment fully finished by manufacturer with no additional finish or painting required after installation.

2.2 IDENTIFICATION AND RESPONSIBILITY

A. Laboratory Equipment is specified with corresponding symbols designating responsibility which have the following meanings:

1. CFCI Contractor Furnished / Contractor Installed
2. CFOI Contractor Furnished / Owner Installed
3. OFCI Owner Furnished / Contractor Installed
4. OFOI Owner Furnished / Owner installed. (Information furnished to aid in installation of utilities and other construction.)

B. Contractor Furnished/Contractor Installed (CFCI): Contractor to purchase, receive, unload, dispose of crating materials, store, unpack, re-assemble, set-in-place, install, clean-up, and protect equipment. Deliver to site in manufacturer's original labeled containers. Contractor to provide fasteners, supports or other miscellaneous items necessary for complete installation. Provide and schedule on-site equipment demonstrations at the convenience of The Owner.

Where indicated manufacturer shall provide installation supervision coordinated by the Contractor.

C. Contractor Furnished/Owner Installed (CFOI): Contractor to purchase, receive, unload, dispose of crating materials, and store equipment. Deliver to site in manufacturer's original labeled containers. Rough-ins per drawings by Contractor. Contractor to use means necessary to protect materials of this section before receipt by The Owner. Scheduling of on-site equipment delivery shall be per Contractor's schedule at the convenience of The Owner.

D. Owner Furnished/Contractor Installed (OFCI): Contractor to receive, unload, store, unpack, dispose of crating materials, set-in-place, install, clean-up, and protect equipment. The Owner will deliver to site. Contractor to provide fasteners, supports or other miscellaneous items necessary for complete installation. Rough-ins and final connections by Contractor. Contractor to inspect The Owner's equipment to determine rough-in and installation. Scheduling of on-site equipment delivery to be per Contractor's schedule at the convenience of The Owner.

E. Owner Furnished/Owner Installed (OFOI): The Owner to receive, unload, and store equipment. The Owner will deliver to site. Rough-ins by Contractor. The Owner to install and provide final connections to equipment. Contractor to use means necessary to protect materials of this section before, during and after installation and to protect installed work and materials of other trades. Scheduling of on-site equipment delivery to be per Contractor's schedule at the convenience of The Owner.

F. Refer to drawings for equipment locations.

2.3 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide one of the specified products.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before the use of an unnamed manufacturer or product.

2.4 EQUIPMENT SCHEDULE

E1 EMERGENCY SHOWER & EYEWASH

A. Manufacturers:

1. Guardian Equipment Co.
   660 North Union Street
   Chicago, IL 60610
   Phone: 312-733-2626
   www.gesafety.com

2. Water Saver Faucet Co.
   701 West Erie Street
   Chicago, IL 60610

Phone: 312-666-5500
www.wsflab.com

3. Haws Corporation
1455 Kleppe Lane
Sparks, NV 89431
Phone: 775-359-4712
www.hawsco.com

B. Product Description:

1. Emergency shower and eyewash units to meet the requirements of ANSI Standard Z358.1.
2. Barrier-Free Combination Emergency Shower and Swing Down Eye/Face Wash: Recessed wall-mounted, swing down eye/face wash with recessed stainless steel cabinet and stainless steel shower head and nipple. Units shall meet the requirements of the Americans with Disabilities Act (ADA).
3. Piping and fittings by Division 22.
4. Division 11 Contractor to supply shower/eyewash unit for installation by plumbing sub-contractor. Plumbing connections by Division 22.
5. Utility Requirements:
   a. CW 1" IPS
   b. Drain 1-1/2” for eyewash pan
   c. Alarm wiring
6. Accessories: Provide audible and flow alarm.

C. Basis of Design: Guardian GBF2150. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E2 SNORKEL

A. Manufacturers:

1. Movex Inc.
104 Commerce Drive, Northampton, PA 18067
Phone: 610-440-0478
www.movexinc.com
2. Nederman LLC
102 Transit Avenue, Thomasville, NC 27360
Phone: 855-598-3171
www.nederman.com
3. Enviroflex International Inc.
1051 Clinton Street, Unit 217, Buffalo, NY 14206
Phone: 716-883-2319
www.enviroflex.com

B. Product Description:

1. Ceiling mounted 3” diameter scavenger arm (extraction arm, fume extractor, snorkel) shall be fabricated of white polypropylene or PVC articulated joints and hood, anodized aluminum arms and stainless steel threaded stays and springs.
2. Accessories:
   a. Wall Bracket where wall mounted indicated, exhaust ducting from wall bracket to ceiling connection.
   b. Aluminum Hood (10" dia. cone).
3. Installation: Verify adequate support framing has been installed above ceiling for ceiling mounted installations. Provide hood mounting bracket to facilitate easy removal and replacement of multiple hoods.
4. Services:
   a. Exhaust: 3" dia., 75-100 CFM
5. Ratings: UL rating on fan.

C. Basis of Design: Movex ME 75. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E3 PROCEDURE LIGHT

A. Manufacturers:

1. Berchtold Corporation
   1950 Hanahan Road, Charleston, SC 29406
   Phone: 800-243-5135
   www.berchtoldusa.com
2. Philips Burton Medical Products
   11500 Melrose Avenue, Franklin Park, IL 60131
   Phone: 800-444-9909
   www.burtonmedical.com
3. Skytron
   5085 Corporate Exchange Blvd. SE, Grand Rapids, MI 49512
   Phone: 800-759-8766
   www.skytron.us

B. Product Description:

1. Lighting system shall consist of a 13” beam diameter LED exam light. Includes polymer lighthead with a minimum of 3 high efficiency LED modules and a minimum life of 20,000 hours. Wall mounted with a total reach of 63”. 360° rotation of arms. Total system output is to be a minimum of 45,000 lux at a color temperature of 4,300°K.
2. CRI: 92; Color Temperature 4300K
3. Light to be of light weight polymer construction.
4. Provide sterilizable positioning handle.

5. Utility Requirements:
   a. Elec. 120V/60 Hz

C. Basis of Design: Berchtold Chromophare F 300 wall mount. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E4 GAS CYLINDER RACK

A. Manufacturers:

1. Safe-T-Rack™ Systems, Inc.
   4325 Dominguez Road, Suite A
   Rocklin, CA 95677
   Phone: 800-344-0619
   www.safe-t-racksystems.com

2. JT Racking Systems
   41551 Date Street
   Murrieta, CA 92562
   Phone: 888-921-9351
   www.certifiedmedicalsales.com/gas-cylinder-storage-racks.shtml

3. Matheson
   166 Keystone Dr, Montgomeryville, PA 18936
   Phone: 800-416-2505
   www.mathesongas.com

B. Product Description:

1. Product Description: Welded 2" x 2" x 1/8" tube steel construction with 5/16" steel welded link chain, electrically zinc plated. Model numbers to match configurations in the Contract Documents. Finish shall be factory applied exterior grade baked on polyurethane paint in manufacturer's standard gloss black.

C. Basis of Design: Safe-T-Rack Model Series 2400 with dual restraint. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E5 BIOSAFETY CABINET CLASS II/A2 CANOPY EXHAUST CONNECTION (OFOI- For Reference Only)

A. Manufacturers:

1. Thermo Fisher Scientific Inc.
   Phone: 800-556-2323
   www.thermoscientific.com

2. Baker

POB Drawer E,
Sanford, MA 04073
Phone: 800-992-2537
www.bakerco.com

3. Nuaire
2100 Fernbrook Lane,
Plymouth, MN 55447
Phone: 800-328-3352
www.nuaire.com

B. Product Description:

1. Provide a certified copy of the Personnel, Product and Cross-contamination (Biological) tests, equivalent to or more severe than as specified in NSF Standard #49, Performed on one unit from each production run from which cabinets have been manufactured. All units must meet NSF #49 performance requirements and have NSF #49 label attached.

2. Cabinet will have zoned or uniform down flow velocity profile relative to down flow velocity over the work surface. All biologically contaminated ducts and plenums maintained under negative pressure or enclosed within a negative pressure zone.

3. Sliding view screen of ¼"tempered glass capable of moving to a fully closed or open (20") position during shut down periods. Audible alarm to indicate when view screen is in unsafe position. Calculated intake velocity through front 10" access opening (in DCM area) and 8" access opening (in upper lab floors) maintained between 100-110 fpm.

4. Both exhaust and supply filters to be front loading and meet the zero-probed HEPA 99.99% efficient on all particles 0.3 micron by DOP test. Minihelic pressure gage (up to 2" W.G.) to monitor filter loading.

5. Cabinet constructed of #18 gage cold-rolled steel, with #16 gage stainless steel work surface and radius (rounded) corners on the work surface. Side walls and rear wall one-piece or welded construction. Stainless steel air diffuser and filter protector provided in work area. Stainless steel fixed or adjustable leg assembly will provide a work surface height of 30". Units must pass through an 84" high door opening.

6. Work area provided with two (2) externally mounted GFI duplex 120V outlets with drip-proof covers and circuit breakers. Provide one (1) vacuum (VAC) fixture. Provide fluorescent light (100 foot-candles of illumination at work surface). Provide UV light.

7. Unit capable of automatically handling a 60% minimum increase in filter loading without a decrease in total air delivery of more than 10%. Provide a voltage compensating motor speed controller that automatically compensates for voltage changes to maintain constant voltage to motor. Speed controller will permit manual adjustment to handle a 150% increase in filter loading and maintain total air delivery at or above 90%.

8. Provide low flow sensing device whose probe will be mounted in 12" high duct section to monitor total exhaust capacity. This device shall include the following factory wired and assembled components:

a. One monitor which includes LED indicator lights, (green: normal airflow; yellow: caution; red: low flow), electronic analog meter (with green, yellow and red zones) and audible alarm. In addition there shall be a switch to silence the audible alarm and a separate indication that the audible alarm has been silenced.
b. One (1) airflow sensor probe
c. One (1) Transformer: 120VAC input
d. Appropriate mounting brackets and hardware to install the monitor and probe to the bio safety cabinet.
e. The probe shall be factory calibrated to the monitor thereby eliminating field calibration.
f. The monitor shall have a factory reset operating range of 500-2000 feet per minute (FPM)
g. The unit shall have a night setback capability
h. The monitor shall have a relay output.

9. Unit shall be capable of operating at 10-30C
10. Unit completely factory pre-wired with 12' power cord. Supply a 0.1 Amp form "C" contact on the blower switch to interact with a potential room control package. Complete units, including flow alarm, listed as certified by IL or ETL, for electrical safety and integrity.
11. Provide pressure differential switch to automatically shut off supply blower in event of exhaust failure and a self-contained filter changing isolation system, including a disposable bag.
12. Provide manual adjustable stand.
13. Provide thimble duct exhaust transition for units as shown on drawings.
14. Unit to carry a three (3) year warranty.
15. Provide seismic anchorage.
16. Utility requirements:
    a. Elec.: 1/60/120V
    b. VAC: 3/8" NPT
    c. EXH: 10" dia.

C. Basis of Design: Thermo Fisher – Model 1300 Series A2 6' nominal length Class II, Type A2 Biological Safety Cabinet with 10" sash opening and thimble exhaust connection for units ash shown on drawings. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E6 ANIMAL TRANSFER STATION – CFCI/OFOI

A. Manufacturers:

1. Nuaire

2100 Fernbrook Lane, Plymouth, MN 55447
Phone: 800-328-3352
www.nuaire.com

2. Baker
POB Drawer E, Sanford, MA 04073
Phone: (800) 992-2537
www.bakerco.com

3. Allentown, Inc.
165 County Rd 526. Allentown, NJ 08501
Phone: 609-259-7951
www.allentowninc.com

B. Product Description:

1. Mobile animal transfer station providing high efficiency particulate air (HEPA) in a downward laminar airflow direction to an adjustable height work surface. Overall nominal unit dimensions 48" wide x 30" deep x 80-88"high. Work surface height adjustable from 33"-41" AFF. Include adjustable electric auto-lift system.

2. Unit construction 16 ga. Cold rolled tubular frame and cold rolled steel panel construction (Type 304, 16 ga. Stainless steel work surface). Supply plenum shall be supported by two slender tubes located at midpoint of 30" sides. No sash or enclosure between work surface and supply plenum. Stainless steel stem casters with 6" diameter phenolic wheels, brakes on all four casters and stainless steel Zerk fittings in axle and raceway.

3. Installation: Free-standing portable unit.

4. Unit to carry a three (3) year warranty.

5. See Drawings for CFCI vs. OFOI equipment locations.

6. Utility requirements:

a. Electrical: 1/60/115V

C. Basis of Design: 4' Nuaire AllerGard NU-619 Animal Transfer Station. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E7 BOTTLE FILLER

A. Manufacturers:

1. LYNX Product Group
650 Lake Street, Wilson, NY 14172
Phone: 716-751-3100
www.lynxpg.com

2. TBJ
1671 Orchard Drive,
Chambersburg, PA 17201
(717) 261-1730
www.tbjinc.com

3. Edstrom Industries,
   819 Bakke Ave.
   Waterford, WI 53185
   Phone: 262-534-5181
   www.edstrom.com

B. Product Description:

1. Application: Manual, conveyorized feeder bottle filling system utilizing manifold type fillers and transport baskets.
2. Size: 24”W x 48”H x 44”L
3. Basket: Vendor to confirm with Owner appropriate basket size and configuration without change in contract cost.
4. Bottles: 8 oz or 16 oz capacity.
5. Operation: Operator places empty racks of clean bottles on the conveyor. Bottles are positioned beneath the filler manifold and operator manually opens the fill valve. Water is dispensed through a pattern of individual nozzles located in the manifold suspended above the bottles, filling all bottles simultaneously.
6. Construction:
   a. Manual or auto fill operation: Standard units are provided with a manually operated ball valve to control filling of the racked bottles. Unit is provided with manual and auto-fill button with indicator light.
   b. Filler manifold height is adjustable to accommodate varying height bottle racks with identical filling patterns. Individually machined, brass-filling jets are provided in the filling header to fill each bottle.
   c. Splash hood, drain pan and legs are constructed of 14 gage type 314 stainless steel with no. 3 finish. Drain pan and legs are integrally welded with watertight welds for the drain pan. Legs are equipped with adjustable feet.
   d. Filler piping, ball valves and solenoid valve are type 304 stainless steel.
7. Accessories: Bottle basket transfer cart; (4) Bottle baskets
8. Options: Automatic operations; Stainless steel piping and components; Acid proportioner
9. Utility Requirements:
   a. RGW 1” NPT, 35 PIS +/- 5 PSI
   b. Drain 1-1/2” Connection.
   c. Elec: 120 VAC
10. Unit(s) to carry a one (1) year parts and labor warranty.

C. Basis of Design: LYNX 100LX Bottle Filler. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E8 BEDDING DISPENSER

A. Manufacturers:

1. LYNX Product Group
650 Lake Street, Wilson, NY 14172
Phone: 716-751-3100
www.lynxpg.com

2. SMC Schlyer
814 Wurlitzer Drive
North Tonawanda, NY 14120
Phone: 866-867-7660
www.smc-roe.com

3. TBJ
1671 Orchard Drive,
Chambersburg, PA 17201
(717) 261-1730
www.tbjinc.com

B. Product Description:

1. Unit shall have an integral dust collection system.

2. Stainless steel construction: Break apart design for maintenance.

3. Hopper Capacity: The bedding storage capacity is 12cu.ft.

4. Operator Control Panel: Stainless steel panel containing On/Off switches for bedding transfer is provided on the front of the unit. Operational indicating lights and a conveyor dispensing filling rate switch are provided.

5. Hopper Loading: Storage hopper located on the side of the unit is filled by dumping the bedding from the bag into the stainless steel hopper. The storage hopper is equipped with a stainless steel lid and safety gate if the gate is removed during the operation of the unit, the cycle will cease in operations until it is replaced protecting the operator from the moving dispensing mechanism.

6. Unit shall include (1) year warranty for parts and labor.

7. Provide the following:
   a. Dust Collection System
   b. Knocked Down Shipment
   c. Seismic Restraints

8. Utilities:
   a. Elec: 120V, 1PH, 60 Hz 30.0A
   b. Air: ½" NPT, 90 psi, 4 CFM Intermittent Usage

C. Basis of Design: LYNX Model 740LXv. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E9 BEDDING DUMP STATION

A. Manufacturers:

1. Nuaire
2100 Fernbrook Lane, Plymouth, MN 55447
Phone: 800-328-3352
www.nuaire.com

2. Baker
POB Drawer E, Sanford, MA 04073
Phone: (800) 992-2537
www.bakerco.com

3. Allentown, Inc.
165 County Rd 526. Allentown, NJ 08501
Phone: 609-259-7951
www.allentowninc.com

B. Product Description:

1. HEPA filtered waste animal bedding disposal unit with 100 FPM air barrier. 16" access opening. Stainless steel work surface, castered base cabinet, front filter removal, pre-filter, hinged viewing window, fluorescent light.

2. Utility requirements:

a. Elec.: 1/60/115V

C. Basis of Design: Nuaire Allergard NU-607 Animal Bedding Disposal Containment Unit. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E10 ISOLATION CUBICLE

A. Manufacturers:

1. Britz & Company
1302 9th St.
Wheatland, WY 82201
(800)-808-5609
www.britzco.com

2. LGL Animal Care Products, Inc.
721 Peach Creek Cut-Off Rd.
College Station, TX 77845
Phone: (979) 690-3434
www.lglacp.com

3. Lab Products, Inc.,
742 Sussex Avenue, PO Box 639,
Seaford, DE 19973
Phone: (800) 526-0469
www.labproductsinc.com

B. Description: The door rolls vertically and stores overhead, which maximizes the cubicle entry way. The unit also includes a motor and drive assembly and an electronic controller that provides for smooth door operation. The door is controlled via a touch screen. The system requires a 120VAC/15Amp/60HzCircuit for electrical requirements. Units may be attached to facility CMU walls or to Britz & Company sound dampening SIP walls. This unit does include integration with the building BAS system via the PLC. This is a basic feature of the PLC as a single discrete (digital) 24 volt DC contact that will active under any alarmed condition.

C. Basis of Design: Britz & Company Rollup Cubicle. Dimensions 84”x 48”x 111” and 84”x 42”x 111” as noted in contract documents. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E11 GROSSING STATION

A. Manufacturers:

1. TBJ
   1671 Orchard Drive,
   Chambersburg, PA 17201
   (717) 261-1730
   www.tbjinc.com

2. Scientek
   7943A Progress Way
   Delta, BC Canada V4G 1A3
   (604) 940-8084
   www.scientek.com

3. Mopec
   21750 Coolidge Highway,
   Oak Park, MI 48237
   Phone: 800-362-8491
   www.mopec.com

4. Mortech Manufacturing
   45 La Porte Street
   Arcadia, CA 91006
   (800) 410-0100
   www.mortechmfg.com

B. Product Description:

1. Backdraft table designed to provide a ventilated workstation for animal necropsies, surgeries, perfusions, and dissections. The table shall function to pull air, odors, vapors, and aerosols back and away from the face of personnel when connected to a negative air source.

2. Overall table dimensions shall be 48” wide x 28” deep. The work surface height shall be adjustable in height from 32” to 44” high

3. The table shall utilize Type 316 stainless steel construction for all welded-wetted sink and drain pan components. All welds shall be heliarc. All exposed welds shall be ground to a seamless polished finish.
4. The table shall utilize 18 gage T316 stainless steel, removable, perforated work surface panels. The panels shall be recessed 1/2" below the table perimeter to prevent fluids form escaping the work area.
5. The table shall utilize a stainless steel backdraft plenum that includes a removable perforated exhaust panel constructed of 18 gage T 316 stainless steel with a #4 finish to create a uniform backdraft air velocity across the entire work surface.
6. An 8" round exhaust connection shall be located on the top of the table with a neoprene exhaust bellows connection for the elevating height option.
7. The table shall utilize a control valve, vacuum breaker, and (2) flush down manifolds which horizontally run the length of each side of the table, below the work surface to rinse away fluids and debris.
8. The table shall include a hand spray gun assembly with a recoil hose for table cleanup.
9. The table shall be factory pre-plumbed and pre-wired ready for single-point connection of utilities on site.
10. Accessories:
    a. Ground-fault circuit interrupter (GFCI) receptacle
    b. Hand spray assembly
    c. Swing gooseneck, in-line vacuum breaker, and wrist blades
    d. Halogen task lamp with magnifier
    e. ANSI approved deck mounted eye wash
    f. Flexible neoprene exhaust bellows for elevating height option
11. Utility Requirements:
    a. Electrical: 115V, 60 Hz, 1 phase, 20A
    b. Hot Water: 1/2" N.P.S.
    c. Cold Water: 3/4" N.P.S.
    d. Drain: 1-1/2" N.P.S.
    e. Exhaust: 8" (O.D.)

C. Basis of Design: TBJ Grossing Table, model 28-48 BD. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E12 MEDIUM STEAM STERILIZER – DOUBLE DOOR PASS-THRU

A. Manufacturers:

1. Consolidated Sterilizer Systems
   76 Ashford Street,
   Boston, MA 02134-0003
   Phone: 617-782-6072

www.consteril.com

2. Steris Corporation
   5960 Heisley Road,
   Mentor, OH 44060
   Phone: 800-444-9009
   www.sterislifesciences.com

3. PRIMUS Sterilizer Company, LLC.
   6565 South 118th Street,
   Omaha, NE 68137
   Phone: 402-344-4200
   www.primus-sterilizer.com

4. Getinge USA
   1777 E. Henrietta Road,
   Rochester, NY 14623
   Phone: 800-475-9040
   www.getingeusa.com

5. ETC Sterilization Systems
   125 James Way,
   Southampton, PA 18966
   Phone: 215-355-9100
   www.etcsterilization.com

6. Steelco USA
   990 Stinson Way, Unit 307,
   West Palm Beach, FL 33411
   Phone: 561-791-8313
   www.steelcospa.com

B. Product Description

1. 24” x 36” x 60” cabinet enclosed pre-vacuum unit with Liquid Cycle unit with double radial arm doors, 316L stainless steel chamber. Controller shall provide option to pass contents through after sterilization cycle or contents can be removed from non-sterile side after sterilization cycle.

2. Unit shall carry a three (3) year warranty and vessel to carry a fifteen (15) year warranty.

3. Utility Requirements:
   a. Elec. for controls: 120 volt, 50/60 Hz, 1-phase, 2 amp.
   b. Elec. For Vacuum Pump: 208/480 volt, 60 Hz, 3 phase, 6/3 amps.
   c. Sterilizer feed water: 1” NPT, 20 - 50 psig dynamic (CW must meet manufacturer’s requirement for hardness). Consumption = 130 gal/hr., Peak Flow
   d. Sterilizer Drain: 2” connection.
   e. Steam (provided by steam generator): 3/4” NPT, 50 – 80 psig, 185 lb/hr., Peak Flow = 335 lb/hr.

4. E12A unit shall be cabinet enclosed, recessed through one wall.

5. E12B unit shall be recessed through one modular stainless steel wall and one architectural wall.
6. Accessories:
   a. Chamber rack and shelf,
   b. Loading car with two shelves.
   c. Transfer carriage
   d. Air differential seal on sterile side.
   e. Provide water conservation vacuum system.
   f. Drain discharge cooldown modified for use with recycled city water.
   g. Provide Seismic tie-down kit.
7. Steam Generator: Include one (1) 210 KW horizontal electric steam generator to provide steam for both medium sterilizers.
   a. Steam Generator Utility Requirements:
      1) Electrical: 100V/ 1 Ph
      2) Power Supply: 210 KW/480V/3Ph/253 Amps
      3) Feedwater: 1" NPT, 45 psi dynamic minimum 5 GPM Peak
      4) Drain: Open drain to funnel connection in floor, diameter 3" minimum, 2½" air gap.

C. Basis of Design: Consolidated Model # SR-24E Medium Lab Series Steam Sterilizer 24" x 36" x 60" prevacuum steam sterilizer. Double door pass-thru. One unit recessed through architectural wall and modular stainless steel wall. One unit cabinet enclosed, recessed through architectural wall on sterile end. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E13 CAGE AND RACK WASHER

A. Manufacturers

1. LYNX Product Group
   18 Mill Street, Middleport, NY 14105
   Phone: 716-735-9857
   www.lynxpg.com
2. Steris Corporation
   5960 Heisley Road, Mentor, OH 44060
   Phone: 800-444-9009
   www.sterislifesciences.com
3. Steelco USA
   990 Stinson Way, Unit 307, West Palm Beach, FL 33411
   Phone: 561-791-8313
   www.steelcospa.com

4. Tecniplast USA
   PO Box 1457, Exton, PA 19341
   Phone: 877-669-2243
   www.tecniplastusa.com

B. Product Description:

1. Application: Heavy duty, large capacity hydrospray batch-type washer designed for thorough, efficient cleaning of cages, racks, debris pans and miscellaneous items used in care of laboratory animals.
   a. Minimum Compartment: 46”W x 85”H x 92”L.
   b. Maximum External Size: 86”W x 104”H x 100”L.
   c. Maximum Pit: 78”W x 12”D x 101”L.
   d. Chamber inside bottom shall align with finished floor. Coordinate final pit dimensions, miscellaneous metal requirements and floor drain location.

2. Operation
   a. Operator places items to be cleaned within compartment, closes door and presses automatic cycle push button. Machine proceeds through treatment schedule and automatically shuts off at completion of the cycle. Operator then opens door and removes cleaned item. “Reusable-Throwaway” Alkaline and Acid Solution System: Provide capability to automatically return alkaline and/or acid solution to their respective reservoirs or pump to drain.
   b. Treatment Schedule: A multiple cycle treatment schedule automatically programmed into washer as follows(additional wash, soak and rinse cycles can be added):
      1) Pre-Wash: Water remaining in recirculating sump from final rinse of previous cycle or fresh hot water is recirculated through jet system under pump pressure then pumped to drain upon completion. Phase time is programmable from 0-60 minutes.
      2) Alkaline Wash: Hot alkaline from alkaline reservoir fills sump and is pumped through jet system. At end of treatment, alkaline solution is either returned to alkaline reservoir tank or pumped to drain at discretion of operator. Phase time and temperature are programmable from 0-60 minutes and to 190ºF.
      3) Acid Wash: Hot acid solution fills recirculating sump and is pumped through jet system. At end of treatment, water is pumped to drain upon completion.
      4) Phase time and temperature are programmable from 0-60 minutes and to 190ºF.
      5) First Rinse: Hot water from house supply fills recirculating sump and is pumped through jet system. At end of treatments, water is pumped to drain upon completion. Phase time and temperature are programmable from 0-60 minutes and to 190ºF.

6) Final Rinse: Same as first rinse except at end of treatment, water is retained in recirculating sump to be used as pre-wash water for subsequent load. Phase time and temperature are programmable from 0-60 minutes and to 190ºF.

c. Exhaust: Unit stands idle for a sufficient length of time to remove residual vapor from air with compartment. Phase time is programmable from 0-6 minutes.

3. Construction:

a. Base, washing chamber, detergent tank and recirculating sump of welded stainless steel construction. Washing chamber sections flanged and bolted using formed channels across joints. Base shall contain integral door gutters, recirculating sump and floor grating supports.

b. Each door of double wall construction, insulated with 2" thick rigid fiberglass insulation, and equipped with a double bulb sealing gasket, safety exit hardware, heavy duty stainless steel hinges, and a minimum 12"x12" tempered glass observation window.

c. Compartment floor shall consist of heavy-duty stainless steel grating sections covering the entire floor area and pitched 1" at unload end to accommodate poor draining cages, pans and racks. Grating sections easily removable without tools.

d. Recirculating sump equipped with an automatic solution level control, automatic rinse water fill, and stainless steel steam coil heating for recirculating treatment solutions. An automatic digital temperature controller mounted in operator's panel shall display and monitor recirculating solution temperature. Recirculating sump shall have no openings beyond base of machine to emit vapor from recirculating solutions.

e. Detergent reservoir minimum 250-gallon capacity, heated by stainless steel stem coils. Reservoir equipped with an automatic digital temperature controller, automatic water fill, automatic water level control, automatic drain valve, and overflow piping.

f. All treatments under pressure from one (1) 10 HP full draining type pumps, with no cross-contamination. Pumps are not acceptable if they employ extended shaft motors. The pump system shall be equipped with a direct reading pressure gage.

g. A stainless steel steam coil heating for recirculating sump complete with condensate return and steam traps. A by-pass system inter-piped into machine to remove suspended water droplets and minute particles of debris from incoming steam line and automatically flush to condensate return. Surface area of steam coils a minimum of 30 square feet for detergent tank and 60 square feet for recirculating sump. Steam coils designed to ASME Section VIII, Div 1, and Unfired Pressurized Vessel Code and be easily removable for cleaning or maintenance. Coils shall not be welded in place.

h. Each treatment pump equipped with a stainless steel automatic self cleaning screen, minimum 3-1/2" diameter x 18" long manufactured from perforated stainless steel. Screen shall have 1/16" diameter perforations and be interpiped and inter-wired with motor operated ball valves to collect debris during treatment portion of each cycle and direct debris to sewer when draining any treatment solution. Floor screens that accumulate debris from load to load will not be allowed.

i. Oscillating Jet System shall consist of the following:
   1) Eight (8) spray trees suspended from an oscillating carriage. A total of 80 machined jets each capable of 4 GPM @ 20 PSI mounted in the spray trees. Each spray tree shall be equipped with an additional jet spraying outward to rinse the inside cabinet walls.
   2) Oscillating system driven by a minimum 1/3 HP motor through a gear reducer. A reversible motor dive system is not acceptable. Driving the oscillating carriage by a rod less air cylinder is acceptable as well.
   3) Oil tight micro switches provided to guarantee oscillating reader system covers the entire length of the chamber.
   4) Temperature guarantees (defeated through microprocessor with password):
   5) 180ºF final Rinse. Final rinse timer will not start timing until recirculating water temperature has reached at least 180ºF thus assuring entire final rinse time 180ºF minimum. Recirculating temperature to reach 180ºF within 2-3 minutes after final rinse begins recirculation.
   6) 180ºF Wash Solution. Wash timer will not start timing until recirculating wash solution temperature has reached at least 180ºF, thus assuring entire wash time at 180ºF minimum. Recirculating temperature to reach 180ºF within 2-3 minutes after wash solution begins recirculation.
   7) Within control box is transformer for 1/60/115V control circuit, magnetic starters with overload protection for all motors and all other electrical components required for machine operation.

j. Safety features:
   1) Each door fitted with a magnetic reed switch, which will stop all machine operation, if door is opened during cycle. To resume operation door must be closed and start button must again be pressed.
   2) A stainless steel safety cable installed on both side inside the wash compartment approximately 3'-0" above floor and runs entire length. Cable is to be red in color. If cable is pulled, machine shall immediately cease all operations. To resume operation, power must first be turned off, then turned on again and start button depressed.
   3) Each door equipped with spring loaded, explosion relief typed latches that open readily when pushed from inside cabinet. Latches that lock and/or require additional hardware inside cabinet to open are not acceptable.
   4) Emergency stop buttons provided on load and unload end control panels. Circuitry connected to a normally-open relay for added system reliability.

k. Automatically actuated motor ball valves to control output of pump to jet system, drain, or detergent return system.

l. Inter-piped and inter-wired so that only one connection required for each service or utility.

m. Three (3) detergent injection ports and dry electrical contacts for installation of automatic detergent injection. Washer sump equipped with two (2) 1" NPT fittings/couplings for connection of external devices.

n. Water line to be protected from hammering by using slow closing valves.

o. Place all serviceable components on either right or left-hand side of washer as indicated on the Equipment Drawings.

p. Additional door for pass-through operation complete with safety switch and lights indicating washer is in operation or cycle is complete. Door shall meet all requirements stated above.

q. Top and sides insulated with minimum 2" thick rigid fiberglass covered by a protective stainless steel jacket.

r. Solid-state microcomputer control system that monitors and automatically controls all process operations and functions. Provide primary and secondary microprocessor control panels on load and unload ends, respectively. Cycle phase times, temperatures and other key process parameters are programmable and may be locked in by supervision. A 12 cycle menu of treatment processes may be programmed and retained to permit operating personnel to accommodate a wide variety of load and processing requirements. Cycle programming controlled by access code to insure process integrity. Each cycle program may be reviewed and printed on demand. Highly visible color touch panel screen shall display cycle program data on demand and real time in process cycle performance. Programming may be in standard AM/PM or military time, temperature in Fahrenheit or Centigrade. Times and temperatures expressed in minutes/seconds and tenths of degree increments respectively. An internal battery shall back up all cycle memory for up to one (1) year and permit completion of a cycle upon restoration of power after a power disruption. All cycle deviations are alarmed visually and audibly, recorded and must be acknowledged by operator. A built-in service diagnostic program, accessible by service access code, provided and displayed to permit system calibration and verification of satisfactory component operation. Provide a strip chart printer with paper take up and clear waterproof cover to record all cycle program and in process performance data. Provide an RS232 port to down load cycle data to a remote computer. All data from control system to communications port in ASCII format compatible with PC/DOS support software. Machine equipped with 0.1 amp Form C dry contacts to communicate with building DDC system and send a signal when the unit is turned on or off and a door is opened or closed.

s. Ship disassembled into sections that will pass through a 3'-6" x 6'-8" doorway.

t. Stainless steel barrier flanges on load and unload end and insulated stainless steel modular walls between CRW and ITW from floor to ceiling to enclose utilities.

u. Automatic motorized damper mounted in exhaust line and inter-wired with automatic cycle. Damper open during exhaust cycle and closed during machine operation.

v. External vapor proof light that shall illuminate the wash compartment.

w. Separate acid detergent treatment after alkaline wash. Treatment pump and all components and piping that come in contact with acid solutions furnished in stainless steel.

x. Cool-down system to reduce all sump drain discharges to 140ºF, or less, controlled by microprocessor. Water conservation system will utilize building 45ºF chilled water system for sump and vapor condenser.

y. Time-based, volumetric neutralization of sump controlled by microprocessor. If neutralizing agents are spent, an alarm will sound and machine will stop until neutralizing agents are replenished or system is manually overridden.

z. Instantaneous steam to water heat exchanger is raising hot water supply temperature at least 60-80ºF.

aa. Stationary spray header mounted in floor of unit to ensure complete exposure of underside of load to treatment schedule.

bb. Stainless steel entry/exit pit transition plates to bridge space between unit and pit. Chamber bottom shall align with finished floor +/-1/32".

cc. Minimum 70% efficient to pre-exhaust vapor condenser with coil using building chilled water at 45ºF.

dd. Rack manifold flush system capable of flushing two (2) automatic water racks with house automatic-watering (AW) water during the final rinse cycle. Provide two (2) quick disconnect hoses in wash compartment. System shall be inter-piped and inter-wired for automatic operation.

ee. Provide the following options:

1) Feeder bottle washing system.
2) Pan washing.
3) LYNX OPT-Wash System

ff. Provide the following accessories:

1) One (1) total, stainless steel feeder bottle-washing cart with a quick disconnect fitting designed to process six (6) baskets of bottles per load each. Coordinate basket size and configuration with Owner.
2) Four (4) total, heavy duty, stainless steel cage wash carts designed to hold rodent cages from 5"-8" in height, on four rows per side of cart. Cart shall accommodate up to 72 standard mouse cages or 48 standard rat boxes. Cart shall feature automatic swivel-type retainers to secure cages rigidly in place during cleaning and four swivel casters constructed of stainless steel with neoprene wheels. Cart shall be nominally 72"L x 82"H x 32"W.
3) Seismic tie-down kit.
4) Barrier wall flange assembly.
5) Drain discharge cool down with cold water

gg. Materials (all stainless steel, S.S., type 304):

Item		Material
1)	Base & Recirculating Sump	12 gage S.S. #2B Finish.
2)	Door Frames	2"x2"x3/16" S.S. Angle.
3)	Door Panels	16 gage S.S. #3 Finish.
4)	Side and Top Panels	14 gage S.S. #3 Finish.
5)	Recirculating Pump Piping	S.S.
6)	Internal Water & Steam Piping	S.S.
7)	External Steam Piping	Schedule 80 Black Iron.

8)	Steam Condensate	Schedule 80 Black Iron.
9)	External Water Piping	Brass
10)	Spray Jets	S.S.
11)	Grating	S.S.
12)	Steam Coils	S.S.
13)	Barrier Flange & Modular Wall	20 gage S.S. #3 Finish.
14)	Insulated Jacket	20 gage S.S. #3 Finish.

4. Utility Requirements:
   a. E 480V (18A).
   b. ST 2”NPT (1200#/hr @ 30-80 psig with a maximum of 80 psig)
   c. HW 1½” NPT (50 gpm, @ 140ºF, 35 psi).
   d. COND 1”NPT. Maximum lift 15’
   e. D 4”FD min, 120 gpm flow rate
   f. EXH 12” ID 450cfm
   g. CW 1½” NPT (60 gpm @ 50°F ±5°F, 35 psi).
   h. A ½”NPT, 100 PSI, 6 CFM Flow Rate
   i. SPCL Dry contacts for DDC

C. Basis of Design: Unit shall be LYNX Model 410LX Cage and Rack Washer, configuration as shown in drawings. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E14 SMALL STEAM STERILIZER

A. Manufacturer

1. Consolidated Sterilizers,
   76 Ashford Street,
   Boston, MA 02134
   Phone: 617-782-6072
   www.consteril.com
2. Steris Corporation
   5960 Heisley Road,
   Mentor, OH 44060
   Phone: 800-444-9009
   www.sterislifesciences.com
3. Getinge USA
   1777 E. Henrietta Road,
   Rochester, NY 14623
   Phone: 800-475-9040
   www.getingeusa.com
4. BetaStar
   584 Poplar Road,
   Honey Brook, PA 19344

Phone: 610-273-2457
www.betastar.com

B. Product Description

1. Product Description: Gravity/Vacuum Steam Sterilizer, single door
2. Chamber Size: 20" x 20" x 38" – Minor size variation based on Manufacturer's standard size chamber is acceptable.
3. Features and Options: Integral vacuum pump.
4. Units shall have Water Eco Basic option.
5. Vivarium Sterilizer shall be provided with the following design features:
   a. Control lockout to prevent cycle start up if door not sealed
   b. Printer to document alarms and cycle data
   c. Alarms – audible and documented acknowledgement
   d. Water Conservation System
   e. Programmable for automatic start up and shut down
   f. Non-proprietary PLC control system
   g. Solenoid control valves
   h. Vacuum level and pull-down to approximately 27" @ sea level within 5 minutes with empty chamber
   i. Manufacturer's standard finish on chamber interiors
   j. 316L stainless steel chamber and 304 stainless steel jacket
   k. Non-proprietary valves and components. All valves and components in contact with steam shall be of brass/bronze.
   l. Factory trained service technicians – local service available
   m. Provide service training for owner for operating equipment
6. Accessories: Rack with two shelves
7. Because each sterilizer manufacturer provides different options regarding utility needs and water conservation issues, bid information is to provide the following:
   a. Identify all utility requirements different from what is provided for in the construction documents.
   b. Description of manufacturer's standard water conservation features (if any) in base bid. Manufacturer to also provide a description of additional proposed option(s) with additional costs identified for manufacturer specific water conservation features available (such as a re-circulating water conservation vacuum system) as well as design implications for each water conservation option (for example: additional square footage needed or additional utility needs).
8. Unit shall carry a one (1) year warranty and preventative maintenance. Vessel to carry a fifteen (15) year warranty.
9. Service Connections: Building is to provide the following services for the sterilizer. Manufacturer shall verify requirements for unit and coordinate with general contractor for any required service revisions at no additional cost to the owner.

a. Wastewater cooling ½" NPT, 45 psig dynamic, 80 psig static max, 12 gpm
b. Elec. 1/60/110V, 20 amp min for controls
c. Ethernet RD-45
d. CW 1" NPT, 30-50 psig dynamic, (CW must meet manufacturers requirement for hardness)
e. Drain 1-1/2" ODT.
f. Steam ½" NPT, 50-80 psig, 180 lbs/hr capacity
g. Elec. 480V/3Ph/20 amp min for vacuum pump
h. Vacuum pump water ½" NPT, 45 psig dynamic, 80 psig static max, 12 gpm

10. Unit must fit through 42" door opening for installation.
11. Provide the following accessories:
    a. Seismic tie-down kit.
    b. Drain discharge cool down feature modified for use with recycled city water.
    c. Loading rack and two shelves.
12. Provide steam-to steam generator to deliver clean steam to the chamber.

C. Basis of Design: Consolidated Model SSR-3AV Small Lab Series Steam Sterilizer 20" x 20" x 38" Gravity/vacuum steam sterilizer unit with single door, recessed through stainless steel modular wall on operating end. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification

E15 DOUBLE SIDED CAGE RACK – 160 CAGES

A. Manufacturers:

1. Lab Products, Inc.,
   742 Sussex Avenue, PO Box 639,
   Seaford, DE 19973
   Phone: (800) 526-0469
   www.labproductsinc.com
2. Tecniplast USA, PO Box 1457
   Exton, PA. 19341
   Phone: 877-669-2243
   www.tecniplastusa.com
3. Allentown Inc.,
   Route 526, POB 698,
   Allentown, NJ 08501
   Phone: (360) 691-6364
   www.acecaging.com

B. Product Description:

1. Double sided IVC mouse cage rack, 160 cages.
2. Dimensions: 77"H x 31"D x 78"W.
3. Installation: Supply Blower / Direct Exhaust

4. Provide the following accessories:
    a. Rack mounted air supply blower
    b. Thimble connection
    c. Autowatering option
    d. Polycarbonate cages (complete unit with tops, water grommet and diet delivery system)

C. Basis of Design: Lab Products RAIR Super Mouse Double Sided Cage Rack, 160 Cage Capacity. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification

E16 MODULAR WALL SYSTEM

A. Manufacturers:

1. CLAD Industries
1704 Wayneport Rd,
Macedon, NY 14502
Phone: 585-413-4359
www.cladindustries.com

2. Kloppenberg & Co
2627 West Oxford,
Englewood, CO 80110
Phone: 303-761-1614
www.kloppenberg.com

3. LYNX Product Group
650 Lake Street,
Wilson, NY 14172
Phone: 716-751-3100
www.lynxpg.com

B. Product Description:

1. Modular wall must meet ASTM specification A167 for stainless steel, alloy 304. The panel box sections shall be finished on one side with type 304 stainless steel, #4 brush finish, 16 gage minimum. The brush finish grain shall be oriented vertically on all components, except head tracks and floor tracks. Wall panels shall be insulated with a polyurethane, moisture-resistant, sound-deadening insulation. Partition panels, vents, and doors shall be of the non-progressive installation type, capable of removal and/or relocation without disturbing other panels.

2. Sectional modular wall shall be as indicated on the drawings (length and height shall be field verified) and nominally 2" thick. Manufacturer will coordinate and provide rough openings for Glassware Washer, Sterilizer, and Drying Ovens in the Glasswash Room. Manufacturer will coordinate and provide rough openings for Cage and Rack Washer, Cage and Bottle Washer, and Large Steam Sterilizer in the Vivarium. Modular wall shall completely seal openings between equipment, walls, floors and ceiling.

3. Provide 36" x 84" stainless steel doors where noted with a 24" x 24" tempered glass vision window and 24" x 24" grille (50% free area). Door hardware to be selected by Architect and furnished and installed by manufacturer.
4. Provide louvers in wall above each appliance to capture vapor and steam and allow them to be drawn into the enclosure created by walls.
5. Provide all necessary ceiling and wall trim angles, integral leveling devices (attached to vertical panels and concealed by base; shims will not be acceptable), vertical panels, horizontal panels and sanitary bases (at floor/wall intersection) for a complete and tight installation. All components to be type 304 stainless steel. Fasteners, connectors, etc. exposed to the room are not acceptable.
6. Coordinate all equipment cutouts with selected vendor's submittal data.

C. Basis of Design: CLAD Industries Modular Wall System. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E17 SCULLERY SINK

A. Manufacturers:

1. Elkay Manufacturing Company
   2222 Camden Court
   Oak Brook, IL 60523
   Phone: 630-574-8484
   www.elkay.com
2. Just Manufacturing Company
   9232 King Street
   Franklin Park, IL 60131
   Phone: 847-678-5150
   www.justsinks.com
3. Kloppenberg & Company
   2627 West Oxford
   Englewood, CO 80110
   Phone: 303-761-1615
   www.kloppenberg.com

B. Product Description:

1. Provide a free-standing scullery type sink assembly fabricated completely of type 316L stainless steel. The sink basin (double compartments with double integral drain board) shall be approximately 24" wide x 24" front to back x 14" deep each. Provide one (1) drain outlet at center of sink compartment basin, pitched bottom to drain. Provide hot and cold water faucet(s) identical to that used on lab benches; as specified on Fixture Schedule. Provide full-length 8" high backsplash with 45° sloped top and 1-1/2" wide sloping top channel rims. Sink assembly shall be supported by eight (8) adjustable bullet type stainless steel tubular legs, 1-5/8" O.D., 16 ga., that have integral leveling devices. Provide polished satin finish to all exposed surfaces.

C. Basis of Design: Elkay Sturdibilt Scullery Sink, SS8248LR, total length of 96". Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E18 GLASSWARE WASHER/DRYER

A. Manufacturers:

1. Lancer USA
   1150 Emma Oaks Trail, Suite 140
   Lake Mary, FL 32746
   Phone: 800-332-1855
   www.lancer.com
2. Steris
   5960 Heisley Road
   Mentor, OH 44060
   Phone: 800-989-7575
   www.steris.com
3. Miele, Inc.
   9 Independence Way
   Princeton, NJ 08540
   Phone: 800-991-9380
   www.miele-pro.com

B. Product Description:

1. The overall dimension of the unit shall not exceed 24" W x 65" H x 29" D. The minimum chamber size shall be 20" W x 26" H x 20" D.
2. The door, and wash chamber shall be fabricated of type 316L stainless steel. Body shall have 304 stainless steel construction with #4 polish, double-wall construction with thermal and noise insulated construction of the cabinet minimizing heat loss while operating at 63dBA. Include 20-watt fluorescent interior light mounted within an explosion proof enclosure.
3. Door shall be a single drop down door. It shall have construction that insulates door from interior processes to minimize noise and increased exterior surface temperature.
4. Unit shall be equipped with a full microprocessor control package that includes sealed program; operation and status membrane touch pads, alpha/numeric display window, cycle end/low detergent audible/visual alarm and printer. Control system shall include at least 4 pre-programmed cycles (adjustable to meet user's needs) and 42 additional user-programmed cycles, retained in memory, and named by the customer
5. All control and service components shall be accessible from a front access panel.
6. Supply the following with each unit (one of each unless otherwise noted):
   a. Drain discharge cool-down system to reduce discharges to 140F or less.
   b. Seismic tie-down kit.
   c. Starter kit.
   d. Manual transfer cart.

7. Utility Requirements:
   a. Elec: 208V/60Hz/1Ph 2kW, 10A
   b. CW: 3/4" NPT. 6 gpm max. 30-87 psig
   c. HW: 3/4" NPT. 6 gpm max. 30-87 psig
   d. PW: 3/4" NPT. 6 gpm max. 30-87 psig
   e. Drain: 1-1/2" O.D. standpipe @ 31”-15” AFF
   f. Vent: 3" O.D., 60 CFM max.
   g. Steam: 29-87 psig, max consumption 265 lbs/hr (66 lbs/cycle) – typically 1 cycle per hour
8. Unit must fit through 42” door opening for installation.

C. Basis of Design: Lancer 1300LX. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E19 ICE FLAKER

A. Manufacturers:

1. Hoshizaki America, Inc.
   618 Hwy 74 South
   Peachtree City, GA 30269
   Phone: 800-438-6087
   www.hoshizakiamerica.com
2. Ice-O-Matic
   11100 E. 45th Ave
   Denver, CO 80239
   Phone: 303-371-3737
   www.iceomatic.com
3. Scotsman
   775 Corporate Woods Parkway
   Vernon Hills, IL 60061
   Phone: 847-215-4550
   www.scotsman-ice.com

B. Product Description:

1. Unit to be air-cooled free-standing ice flaker with up to 456 lbs. of ice production per 24 hours at 70ºF air temperature and 70ºF inlet water temperature, and 700 pound (65 kg) capacity, stainless steel self-contained insulated storage bin.
2. The ice making mechanism to have a heavy duty, hermetically sealed compressor; automatic expansion valve refrigerant control; safety control thermostat to turn off ice maker should inlet water pressure become insufficient for ice production or if storage bin reaches maximum capacity. Evaporator shall be close tolerance brass cylinder with brass shell, stainless steel auger, completely insulated with polyurethane foam. Auger shall be powered by belt-driven single reduction worm gear. Condensing unit shall be air-cooled.

3. System shall be designed to operate with R-404A non-ozone depleting refrigerant. An HFC (hydrofluorocarbon) or HCFC (hydrochlorofluorocarbon) type refrigerant shall be used. CFC (chlorofluorocarbon) type refrigerant is not acceptable.
4. UL rating, NSF.
5. Installation: Free standing.
6. Utility Requirements:
   a. Elec. 1PH / 60Hz / 115V / 11A, provide 20A circuit
   b. CW 3/8" OD (Provide pre-filter for water supply)
   c. Drain 3/4" IPS- Indirect
7. Unit shall be provided with a minimum of two (2) year parts and labor warranty and a five (5) year compressor warranty.

C. Basis of Design: Hoshizaki Model F-450MAJ Flake Ice Maker with B-700SF storage bin. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E20 GAS CYLINDER CABINET

A. Manufacturers:

1. Matheson
   6775 Central Avenue
   Newmark, CA 94560
   Phone: 510-793-2559
   www.mathesongas.com
2. Spectra Gases, Inc. (Linde)
   1224 So. Main Street
   Pohatcong, NJ 08865
   Phone: 510-793-2559
   www.linde-gas.com
3. Praxair
   39 Old Ridgebury Rd.
   Danbury, CT 06810
   Phone: 800-772-9247

B. Product Description:

1. Type: Two cylinder capacity, ventilated.
2. Construction:
   a. Cabinet frame and doors constructed of 11 gage cold rolled steel.
   b. Weather resistant white polyurethane paint.
   c. Rubber mat flooring
   d. 26" W x 76" H x 18" D.
   e. Self-closing, self-latching doors.
   f. 2 cylinder brackets

g. Vertical Unistrut for positioning panels and cylinder holders.

h. Access port designed to maintain a minimum air velocity of 200 feet/minute when wide open.

3. Installation: Floor mounted with seismic restraint.

4. Ventilation: 275 scfm @ 0.1inch water column, 6”

C. Basis of Design: Model 1178F by Matheson. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E21 TALL FLAMMABLE STORAGE CABINET

A. Manufacturers:

1. Justrite Manufacturing
2454 E Dempster St., Suite 300
Des Plaines, IL 60016
Phone: 847-298-9250
www.justritemfg.com

2. Securall
5122 North State Road 39
La Porte, IN 46350
Phone: 888-326-7890
www.securallproducts.com

3. Eagle Manufacturing Co.
2400 Charles Street
Wellsburg, West Virginia 26070
Phone: 304-737-3171
www.eagle-mfg.com

B. Product Description:

1. See Specification Section 12 3553 for flammable cabinet located beneath fume hoods.

2. Type: 45 gallon capacity. Yellow cabinet shall be double walled 18 gage steel with 1 1/2” airspace. Doors shall be self-closing and self-latching on fusible link. One adjustable/removable shelf to be included. One ABS tray that fits on shelf or on bottom of cabinet to be provided. Bottom of the cabinet shall be liquid tight to a height of 2". 2” dia. high and low vent ports with flame arrestors and caps. Label in 1" high, 1/4" stroke black letters "FLAMMABLE - KEEP FIRE AWAY."

3. Installation: Floor mounted with seismic restraint.

4. Ratings: OSHA and NFPA 30 compliant; UFC Article 79.

5. Ventilation: 2” exhaust duct to 2” inch diameter connection; 25-30 cfm. Provide two exhaust connections; one on each side of cabinet, one high and one low where shown on drawings.

6. Warranty: Cabinets shall include a Ten-Year (10) Warranty

C. Basis of Design: Justrite Sure-Grip EX model 8945201. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E22 TALL CORROSIVE STORAGE CABINET

A. Manufacturers:

1. Justrite Manufacturing
   2454 E Dempster St., Suite 300
   Des Plaines, IL 60016
   Phone: 847-298-9250
   www.justritemfg.com

2. Securall
   5122 North State Road 39
   La Porte, IN 46350
   Phone: 888-326-7890
   www.securallproducts.com

3. Eagle Manufacturing Co.
   2400 Charles Street
   Wellsburg, West Virginia, 26070
   Phone: 304-737-3171
   www.eagle-mfg.com

B. Product Description:

1. See Specification Section 116010 for corrosive cabinets located beneath fume hoods.

2. 45 gallon capacity, blue cabinet shall be double walled, 18 gage steel with 1-1/2" airspace. Doors shall be self-closing and self-latching on fusible link. Two adjustable/removable shelves to be included. One ABS tray that fits on shelf or on bottom of cabinet to be provided. Bottom of the cabinet shall be liquid tight to a height of 2". Apply silkscreen signage, color red, in a conspicuous size to cabinet doors indicating "CAUTION-ACIDS/CORROSIVES".

3. Installation: Floor mounted with seismic restraint.

4. Ratings: OSHA and NFPA 30 compliant.

5. Service Requirements:

6. Ventilation: 2" exhaust duct to 2" inch diameter connection; 25-30 cfm. Provide two exhaust connections; one on each side of cabinet, one high and one low. Provide escutcheons for exhaust duct ceiling penetrations.

7. Warranty: Cabinets shall include a Ten-Year (10) Warranty

C. Basis of Design: Justrite Sure-Grip EX model 8945221. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification.

E23 MOP RACK

A. Manufacturers:

1. Global Industrial
   11 Harbor Park Drive
   Port Washington, NY 11050
   Phone: 888-277-6995
   www.globalindustrial.com

2. Elkay Manufacturing Company
   2222 Camden Court
   Oak Brook, IL 60523
   Phone: 630-574-8484
   www.elkay.com

3. Grainger
   1151 E. Columbia Ave.
   Riverside, CA 92507-2113
   Phone: 800-472-4643
   www.grainger.com

B. Product Description:

1. Stainless steel construction
2. 24” long (min.) with (3) cam-type mop/broom handle clamps.
3. Wall mounted.
4. Constructed for ease of cleanability.
5. Installation:
   a. Mount with stainless steel screws.
   b. Seal edges after mounting to close spaces where vermin may be harbored.

C. Basis of Design: Global Industries A&J Washroom Mop Holder Strip UJ12A. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E24 CLOTHES WASHER

A. Manufacturers:

1. LG Electronics USA, Inc.
   1000 Sylvan Avenue
   Edgewood Cliffs, NJ 07632
   Phone: 800-243-0000
   www.lg.com

2. Maytag Commercial Laundry
   200 M63 North MD 8600

Benton Harbor, MI 49022
Phone: 800-662-3587

3. Speedqueen, Alliance Laundry Systems LLC
Shepard Street, PO Box 990
Ripon, WI 54971
Phone: 800-590-8872
www.speedqueencommercial.com

B. Product Description:

1. Large capacity washer with stainless steel, 3.6 cu. ft. drum
2. Direct Drive Motor
3. LED Display
4. Extra wide door opening
5. Low decibel quiet operation
6. Reversible doors
7. Overall size: 27”W x 38.7”H x 31”D
8. Service Connections:
   a. Cold Water: Yes
   b. Hot Water Yes
   c. Drain: Standpipe
   d. Electrical: 120V, 12A
9. Energy Star rated.
10. UL Listed

C. Basis of Design: LG Giant-C+. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E25 CLOTHES DRYER

A. Manufacturers:

1. LG Electronics USA, Inc.
1000 Sylvan Avenue
Edglewood Cliffs, NJ 07632
Phone: 800-243-0000
www.lg.com

2. Maytag Commercial Laundry
200 M63 North MD 8600
Benton Harbor, MI 49022
Phone: 800-662-3587
www.maytagcommerciallaundry.com

3. Speedqueen, Alliance Laundry Systems LLC
   Shepard Street, PO Box 990
   Ripon, WI 54971
   Phone: 800-590-8872
   www.speedqueencommercial.com

B. Product Description:

1. Large capacity dryer with stainless steel, 7.3 cu. ft. drum
2. Direct Drive Motor
3. LED Display
4. Extra wide door opening
5. Low decibel quiet operation
6. Overall size: 27”W x 38.7”D x 30.1”H
7. Service Connections:
   a. Vent: 4” diameter
   b. Elec: 220V, 5A
8. UL Listed

C. Basis of Design: LG Giant-C+. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E26 SAFETY CENTER W/ EMERGENCY SHOWER, EYEWASH, ~~FIRE EXTINGUISHER CABINET~~

A. Manufacturers:

1. Guardian Equipment Co.
   660 North Union Street
   Chicago, IL 60610
   Phone: 312-733-2626
   www.gesafety.com

2. Water Saver Faucet Co.
   701 West Erie Street
   Chicago, IL 60610
   Phone: 312-666-5500
   www.wsflab.com

3. Haws Corporation
   1455 Kleppe Lane
   Sparks, NV 89431
   Phone: 775-359-4712
   www.hawsco.com

B. Product Description:

1. Emergency shower and eyewash units to meet the requirements of ANSI Standard Z358.1.
2. Safety center with barrier-free combination emergency shower and swing down eye/face wash ~~and matching fire extinguisher housing~~. Recessed wall-mounted, swing down eye/face wash with recessed stainless steel cabinet and stainless steel shower head and nipple. Units shall meet the requirements of the Americans with Disabilities Act (ADA).
3. Piping and fittings by Division 22.
4. Division 11 Contractor to supply shower/eyewash unit for installation by plumbing sub-contractor. Plumbing connections by Division 22.
5. Utility Requirements:
   a. CW 1" IPS
   b. Drain 1-1/2” for eyewash pan
   c. Alarm wiring
6. Accessories: Provide audible and flow alarm.

C. Basis of Design: Guardian ~~GSC2650A~~ **GBF2150**. Units manufactured by others listed in “Manufacturers” will be considered an approved equivalent provided that they meet requirements of this specification.

E27 UNDER COUNTER GLASSWARE WASHER

E28 TUNNEL WASHER

A. Manufacturers:

1. Lynx Product Group
   18 Mill Street, Middleport, NY 14105
   Phone: 716-735-9857
   www.lynxpg.com

B. Product Description:

1. Application: Heavy duty, conveyorized, hydrospray washer designed for thorough, efficient cleaning of cages, debris pans, bottles, feeder bowls and miscellaneous items used in care of laboratory animals.
2. Size:
   a. Tunnel (minimum inside clear): 37”W x 25”H minimum
   b. Conveyor Size: 36”W belt.
   c. Conveyor Speed: Variable 2 to 10 feet/minute.
   d. Sections: 15’ washer, 7’ dryer, 3’ discharge conveyor.
3. Operation: Items to be cleaned are loaded manually in inverted position on load end of conveyor belt. Items are conveyed automatically through various treatments and discharged.

a. Treatment Schedule: A treatment schedule shall be automatically programmed as follows:

b. Pre-Wash: Water recovered from the recirculated rinse tank under pump pressure flushes items to remove gross debris. Spent solution is directed to automatic drain discharge cool down system.

c. Wash: Hot detergent solution is recirculated through the jet system under pump pressure. Temperature adjustable to 190F.

d. Recirculated Rinse: Hot water is recirculated through the jet system under pump pressure. Temperature adjustable to 190F.

e. Final Rinse: Hot water from house supply is heated through a steam heat exchanger and sprayed through the jet system. Spent solution drains to recirculated rinse tank. Temperature adjustable to 195F.

C. Construction:

1. Frame, recirculating tanks, and cabinet of one piece welded stainless steel construction. Frame equipped with adjustable legs and supports for pumps, steam heat exchanger and drive mechanism.

2. Top and sides insulated with 2" thick rigid fiberglass insulation covered by a protective stainless steel jacket.

3. Splash proof doors provided for access to jet systems and interior. Tempered glass, water tight windows provided in each door for observation of treatment process. Doors insulated with 2" thick rigid fiberglass insulation and equipped with silicone bulb sealing gaskets, latches and heavy-duty self-losing hinges. Doors removable for cleaning or maintenance.

4. Each recirculating tank equipped with an automatic solution level control, safety overflow piping, manual drain valve and stainless steel steam coil heating for the recirculating treatment solutions. Automatic digital temperature controllers mounted on the operator's panel will display and monitor recirculating solution temperatures.

5. Stainless steel steam coil heating for wash and recirculating rinse tanks complete with condensate return, steam traps and strainers. Steam coils shall be designed to ASME Section VIII, Div 1, Unfired Pressurized Vessel Code and be easily removable for cleaning or maintenance. Coils shall not be welded in place.

6. Wash solutions under pressure from a minimum 10 HP pump and recirculated rinse and pre-wash systems shall be under pressure from a minimum 3 HP pump. Both pumps Worthington close coupled "Monobloc" type, or approved equal, with mechanical seals. Each pump system with a direct reading pressure gauge.

7. Pre-wash, wash and recirculating rinse sections equipped with easily accessible stainless steel drawer type screens. Screens manufactured from perforated stainless steel with perforations smaller than machined jet orifices to filter solutions and prevent jets from clogging.

8. Jet systems for pre-wash, wash and recirculating rinse sections composed of machined jets fitted into headers. Each header equipped with a quick disconnect fitting and O-ring for easy removal without use of tools. Jet properly sized and feed lines contain throttle valves to hydraulically hold down light plastic cages and steel pans to conveyor belt. Additional jets strategically placed so water bottles in baskets can be processed through washer.

9. The washer is designed to automate the task of descaling the recirculated wash and rinse tanks. When activated, the wash tank drains and refills with fresh hot tap water. The pre-wash and final rinse are disabled, the recirculating pumps start, and descaling acid is added to each tank and sprayed while the belt runs continuously for a thorough cleaning. Descaling takes place for a preset time determined by the end-user. When each tank completes draining, internal spray jets are activated to assist in removing any remaining debris from the interior of the tank. The tank remains empty until the "complete" button is pressed, filling the tank and allowing the unit return to normal operation.

10. Electrical control system:
    a. Within control box are transformer for 1/60/115 volt control circuit, magnetic starters with overload protection for all motors and all other electrical components required for operation.
    b. Unload end is equipped with a drive system emergency stop button and warning lights.

11. Safety features:
    a. Emergency push/pull stop buttons at both load and unload ends of unit to terminate all process and conveyance functions. Processing resumed by resetting emergency stop button and activating cycle start button.
    b. Each chamber door with a disconnect switch to terminate all process and conveyance functions upon opening of any door. Processing cannot be resumed unless all doors are fully closed. All emergency conditions are audibly and visually enunciated.

12. Final rinse jet system consists of spray headers with machined jets and a throttle valve in the line for optimum water use. System equipped with a steam heat exchanger to raise house hot water supply temperature by 60-80F. Heat exchanger supplied with temperature gauge and steam throttle valve to adjust final rinse system temperature.

13. Provide PND modulating steam valve on final rinse water to insure constant pressure and temperature.

14. Drive system shall consist of a minimum 1/3 HP DC motor, gear reducer, automatic safety overload clutch and variable speed drive.

15. Conveyor system shall include a stainless steel flat wire mesh belt, sprockets at both drive and idler ends for positive tracking of belt, adjustable take-up bearings on idler end, and stainless steel guides and supports along entire length. A stainless steel drain pan with a 2" drain connection under the entire length of conveyor.

16. Three (3) detergent injection ports and dry electrical contacts for installation of automatic detergent injection. Washer sump equipped with two (2) 1" NPT fittings/couplings for connection of external devices.

17. Water line to be protected from hammering by using slow closing valves.

18. Low water cut-off for both recirculating that will cease operations and automatically fill tank to proper level. Status lights shall indicate which tank is low and operations will resume automatically when tank is full.

19. Stainless steel baffles and rubber curtains between each treatment section and at both ends. Curtains manufactured from 1/8" thick slit neoprene and with the baffles minimize the carry-over of water.

20. All serviceable components located on one side of washer inter-piped and inter-wired so that only one connection is required for each service and utility except drain.

21. Stainless steel trim flanges to enclose opening between machine and service wall opening.

22. Discharge of wash treatment pump equipped with a stainless steel automatic self-cleaning screen, 3-1/2" diameter X18" long manufactured from perforated stainless steel with 1/16" diameter perforations. Screen shall accumulate debris prior to jet system and be automatically flushed at time periodic intervals. Fully ported, motorized ball valves shall direct the solution flow to jet system or drain.

23. All pumps, valves, piping and other components that come in contact with recirculating solutions shall be furnished in stainless steel.

24. Shipped in sections for entry into building. Sections shall then be welded into place on site to eliminate any possibility of leakage.

25. 3' long powered discharge extending the main conveyor past the dryer section.

26. Temperature guarantee for both recirculating tanks. If recirculating solution temperature drops below set temperature, conveyor belt shall temporarily stop until recirculating solution reaches proper temperature. Status lights will indicate which tank is not at proper temperature.

27. 7' long insulated stainless steel hot air dryer section guaranteed to dry plastic cages 100%. The system shall consist of a steam to air heat exchanger, a plenum system and 5 HP minimum air blower capable of minimum 1600 CFM air flow under recirculation at 230F. An additional blower shall remove excess water remaining in plastic cages exiting recirculated air dryer. Blow-off system incorporates a pressure blower and air knife jets designed to evaporate remaining water in cage. This feature guarantees to deliver the plastic cage 100% dry at discharge of dryer, permitting immediate filling of cage. All air ducting shall be stainless steel, complete with dampers as required. Interior of dryer constructed to permit complete draining. Conveyor belt continuous through washer, dryer and discharge conveyor.

28. Exhaust plenum provided for exhausting all washer and dryer sections, including a canopy exhaust at load end, to single building exhaust connection. Top of exhaust plenum shall not exceed 8' AFF at connection to building exhaust. All exhaust connections to sections shall include manual dampers for balancing exhaust system.

29. Solid-state microcomputer control system that monitors and automatically controls all process operations and functions. Provide primary and secondary microprocessor control panels on load and unload ends of the washer, respectively. Cycle phase times, temperatures and other key process parameters are programmable and may be locked in by supervision. A 12 cycle menu of treatment processes may be programmed and

retained to permit operating personnel to accommodate a wide variety of load and processing requirements. Cycle programming shall be controlled by access code to insure process integrity. Each cycle program may be reviewed and printed on demand. The highly visible color touch panel screen or LED screen shall display cycle program data on demand and real time in process cycle performance. Programming may be in standard AM/PM or military time, temperature in Fahrenheit or Centigrade. Times and temperatures shall expressed in minutes/seconds and tenths of a degree increments respectively. An internal battery shall back up all cycle memory for up to one (1) year and permit completion of a cycle upon restoration of power after a power disruption. All cycle deviations are alarmed visually and audibly, recorded and must be acknowledged by the operator. A built-in service diagnostic program, accessible by service access code, shall be provided and displayed to permit system calibration and verification of satisfactory component operation. Provide an RS485 port to down load cycle data to a remote computer. All data from control system to communications port shall be in ASCII format compatible with PC/DOS support software. Provide 0.1 amp Form C dry contacts to communicate with building DDC system and send a signal when unit is turned on or off.

30. Cold water injection system to cool effluent from pre-wash section. System automatically activated when washer is turned on and controlled and recorded by microprocessor. In addition, a cold water injection system mounted in line to the drain line to cool spent recirculated treatments shall be controlled by an actuated ball valve which automatically opens when sump valves are open. By mixing with cold water, all drain discharges are cooled to a minimum of 140F, or less, before gravity draining.

31. Configured to accept future pH neutralization and detergent concentration control system with all necessary couplings, electrical and data connections.

32. A photoelectric switch shall be located at the end of discharge conveyor to stop powered conveyor drive when an item reaches end of conveyor. Photoelectric switch can be activated/deactivated by microprocessor and/or a control panel switch depending upon whether cage components continue through to the bedding dispenser or not.

33. ~~Equipped with a minimum 70% efficient vapor condenser with coil using building chilled water at 55F~~.

34. Integral air compressor, if required.

D. Materials (all stainless steel, S.S., type 304):

Item	Material
Frame	2”x2” x3/16” S.S. Angle
Tanks	12 Gauge S.S. #3 Fin.
Cabinets	14 Gauge S.S. #3 Fin.
Recirculating Pump Piping	S.S.
Internal Water & Steam Piping	S.S.
External Steam Piping	Schedule 80 Black Iron
External Water Piping	S.S.
Spray Jets	S.S.
Internal/External Drain Piping	S.S.
Steam Coils	7 gauge S.S. #2B Fin.
Barrier Flange/Insulated Jacket	20 Gauge S.S. #3 Fin.

Treatment Pump	S.S.

E. Utility Requirements:

E	3/60/480V.
ST	2" NPT (30-80 PSI dynamic, 1,000 lbs./hr).
Condensate	2 @ 1" NPT.
HW	1-1/2" NPT, 35-60 PSI, 50 GPM @ 140°F ± 5°F (fills only), HW 10-12 GPM continuous.
CW	1-1/2" NPT, 35-60 PSI, 35 GPM @ 50°F ± 5°F.
~~CHWS~~	~~2-1/2"FPT. (Required with vapor condenser #6ee.)~~
~~CHWR~~	~~2-1/2"FPT. (Required with vapor condenser #6ee.)~~
D	2 @ 4" Floor Drain (Minimum), 50 GPM.
EXH	18" I.D. (Flow Rate 2,200 CFM saturated vapor @ 180°F. Static Pressure: 2-3 IWC).
SPCL	Dry contacts for DDC.
DATA	Ethernet Jack

F. Basis of Design: shall be equal to Lynx 536LXi Tunnel Washer, robotic cage handling ready. Units manufactured by others listed in "Manufacturers" will be considered an approved equivalent provided that they meet requirements of this specification

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Check for shipping damage. Reject units with scratches, dents or other defects that cannot be readily corrected.

3.2 INSTALLATION

A. General:

1. Deliver equipment to the job site freight paid.
2. Uncrate equipment and place in locations shown on drawings. Remove crating materials and packing debris.
3. Install equipment according to Shop Drawings and manufacturer's written instructions. Install level, plumb, and true; shim as required, using concealed shims, and securely anchor to building and adjacent laboratory casework. Securely attach access panels, but provide for easy removal and secure reattachment. Where fume hoods abut other finished work, apply filler strips and scribe for accurate fit, with fasteners concealed where practical.
4. Comply with requirements in CBC for seismic anchorage of equipment.

5. Comply with requirements in Divisions 22, 23 and 26 Sections for installing water and steam service fittings and electrical devices.
6. Provide cooling water system for drain discharge exceeding 140 degrees F.
7. Install to meet Applicable Codes for seismic requirements.

3.3 ADJUSTING AND CLEANING

A. Verify installation and operation of all equipment. Replace items which do not operate properly, or have defacing marks or damage which cannot be repaired as determined by University's Representative. Replace items at no cost to University.

B. Clean finished surfaces, including both sides of glass; touch up as required; and remove or refinish damaged or soiled areas to match original factory finish, as approved by University's Representative.

3.4 PROTECTION

A. Protect laboratory equipment in place until Substantial Completion.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's personnel to operate, adjust, and maintain laboratory equipment.

B. Provide a hands-on, start-up session with supplier, maintenance personnel, and end users. There shall be a separate operational session and maintenance session.

C. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 11 5300

SECTION 11 5313 - LABORATORY FUME HOODS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Bench-top laboratory fume hoods.
2. Fume hood base cabinets.
3. Fume hood base stands.
4. Work tops within fume hoods.
5. Laboratory sinks and cup sinks in fume hoods.
6. Water, laboratory gas, and electrical service fittings in fume hoods.
7. Piping and wiring within fume hoods for service fittings, light fixtures, fan switches, and other electrical devices included with fume hoods.

B. Related Sections:

1. Division 09 Section "Non-Structural Metal Framing" for reinforcements in metal-framed partitions for anchoring fume hoods.
2. Division 09 Section "Resilient Base and Accessories" for resilient base applied to fume hood base cabinets.
3. Division 12 Section "Laboratory Casework" for fume hood base cabinets, including work tops, sinks, and service fittings.
4. Division 23 Sections for fume hood duct connections, including ducts and exhaust fans.
5. Division 23 and 26 Sections for connecting service utilities at back of fume hoods. Piping and wiring within fume hoods are specified in this Section.

1.2 PERFORMANCE REQUIREMENTS

A. Containment: Provide fume hoods that comply with the following when tested according to ASHRAE 110 at a release rate of 4.0L/min.:

1. Face-Velocity Variation: Not more than 20 percent of average face velocity.
2. Sash Position: Fully open.
3. As-Manufactured (AM) Rating: AM 0.01 (0.01 ppm)

B. Static-Pressure Loss: Not more than 1/2-inch wg at 100-fpm face velocity when measured at four locations 90 degrees apart around the exhaust duct and at least three duct diameters downstream from duct collar.

C. Structural Performance: Provide fume hood components capable of withstanding the following loads without permanent deformation, excessive deflection, or binding of cabinet drawers and doors:

D. Seismic Performance: Fume hoods, including attachments to other work, shall withstand the effects of earthquake motions determined according to California Building Code

1. Design earthquake spectral response acceleration, short period (Sds) for Project is as required by the California Building Code
2. Component Importance Factor is 1.5.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For laboratory fume hoods. Include plans, elevations, sections, details, and attachments to other work.

1. Provide 3/4 inch = 1'-0" (1:20) scale elevations of individual and battery of fume hoods showing cross sections, rough-in and anchor placements, tolerances, and clearances. Indicate relation to other laboratory equipment, surrounding walls, windows, doors, and other building components.
2. Provide ¼ inch = 1'-0" (1:50) rough-in plan drawings for coordination with trades.
3. Provide 3 full size sets of black line shop drawing prints.
4. Indicate details for anchoring fume hoods to permanent building construction including locations of blocking and other supports. Include calculations demonstrating that anchorages comply with seismic performance requirements, stamped by a licensed Professional Engineer. This engineer shall perform and submit structural calculations to document the fume hood systems and proper anchorage to building components..
5. Indicate locations and types of service fittings together with associated service supply connection required.
6. Indicate duct connections, electrical connections, and locations of access panels.
7. Include roughing-in information for mechanical, plumbing, and electrical connections.
8. Show adjacent walls, doors, windows, other building components, laboratory casework, and other laboratory equipment. Indicate clearances from above items.
9. Include layout of fume hoods in relation to lighting fixtures and air-conditioning registers and grilles.
10. Include coordinated dimensions for laboratory equipment specified in other Sections.

C. Samples for Initial Selection To be selected by Architect.

D. Samples for Verification: For fume hood exterior finishes and work top material, in manufacturer's standard sizes.

1. Work Surface Samples: Submit 3 inch by 5inch product sample of each color and type of work surface material.

2. Finish Samples: Submit 3 inch by 5 inch samples of color of finish for fume hoods, and for other pre-finished equipment and accessories for selection by Architect.

E. Product Test Reports: Showing compliance with specified performance requirements for as manufactured containment and static pressure loss based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing agency.

F. Source quality-control reports.

G. UL 1805: Submit written verification of compliance to UL 1805.

H. Life Cycle Tests: Provide independent test data for sash hardware components such as cables and pulleys.

I. Manufacturer’s Qualifications: Provide documentation from Fume Hood Manufacturer indicating they have supplied for installation, the product described in this section on six (6) similar projects in the past three (3) years.

J. Maintenance Manuals: Provide written instruction manuals outlining operating and safety instructions and proper maintenance procedures.

1.4 QUALITY ASSURANCE

A. Source Limitations for Laboratory Fume Hoods: Obtain fume hoods from single manufacturer.

1. Obtain from same source from same manufacturer as laboratory casework specified in Division 12 Section "Laboratory Casework."

B. Product Standards: Comply with SEFA 1, "Laboratory Fume Hoods - Recommended Practices." Provide fume hoods UL listed and labeled for compliance with UL 1805.

C. Manufacturer's Qualifications: Modern plant with proper tools, dies, fixtures, and skilled production staff to produce high quality laboratory casework and equipment, and shall meet the following minimum requirements:

1. Five years or more experience in manufacture of laboratory casework and equipment of type specified.

2. Ten installations of equal or larger size and requirements in the previous three years.

D. Installer's Qualifications: Factory trained and certified by the manufacturer.

E. Flammable Liquid Storage: Where cabinets are indicated for solvent or flammable liquid storage, provide units that are listed and labeled as complying with requirements of Underwriters Laboratories (UL) or another testing and inspecting agency acceptable to authorities having jurisdiction.

F. Safety Glass: Products complying with testing requirements in 16 CFR 1201 for Category II materials.

1. Permanently mark safety glass with certification label of Safety Glazing Certification Council or another certification agency acceptable to authorities having jurisdiction.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Schedule delivery of fume hoods and equipment so that spaces are sufficiently complete that material can be installed immediately following delivery.

B. Storage: If fume hoods must be stored in other than installation areas, store only in areas where it will prevent damage or soiling of fume hoods.

C. Handling: Keep covered with polyethylene film or other protective coating as necessary to protect fume hood from soiling or damage during handling and installation.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install fume hoods until building is enclosed, wet work and utility roughing-in are complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

1.7 COORDINATION

A. Coordinate layout and installation of framing and reinforcements for lateral support of fume hoods.

B. Coordinate installation of fume hoods with laboratory casework, fume hood exhaust ducts, and plumbing and electrical work.

C. All overhead mechanical, electrical and plumbing rough-in work shall be complete prior to fume hood delivery.

D. All mechanical, electrical and plumbing rough-in work required is to be complete prior to delivery of materials.

E. Walls and partitions must be in place and finished with at least the primer coat of paint. If finish painting is to take place after laboratory furnishing installation, protect the fume hoods by covering and masking prior to commencement.

F. All necessary blocking or backing must be installed within wall partitions prior to delivery of casework and furnishings.

G. Ceiling grid must be in place prior to fume hood installation.

H. Overhead lighting must be installed and connected prior to casework installation.

I. All flooring required to be placed under lab casework and furnishings must be installed prior to material delivery and casework installation.

J. Wet operations to be performed must be complete prior to material deliveries.

1.8 WARRANTY

A. Provide a 1-year warranty against defects in materials and workmanship.

1.9 EXTRA MATERIALS

A. Furnish complete touchup kit for each type and color of fume hood finish provided. Include fillers, primers, paints, and other materials necessary to perform permanent repairs to damaged fume hood finish.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Kewaunee Scientific Corporation - Laboratory Division
Statesville, North Carolina 28677
(704) 873-7202
www.kewaunee.com

2. Or Equal

2.2 MATERIALS

A. Steel Sheet: Cold-rolled, commercial steel (CS) sheet, complying with ASTM A 1008/A 1008M; matte finish; suitable for exposed applications.

B. Glass-Fiber-Reinforced Polyester: Polyester laminate with a chemical-resistant gel coat on the exposed face, and having a flame-spread index of 25 or less per ASTM E 84.

C. Epoxy: Factory molded, modified epoxy-resin formulation with smooth, non-specular finish.

1. As specified in Section 12 3553

D. Glass: Clear, laminated tempered glass complying with ASTM C 1172, Kind LT, Condition A, Type I, Class I, Quality-Q3; with two lites not less than 3.0 mm thick and with clear, polyvinyl butyral interlayer.

2.3 INTERIOR BYPASS

A. Restricted Bypass: Provide a restricted bypass on all variable air volume (VAV) with a vertical rising sash.

B. Bypass Material: Manufacturer’s standard material. If constructed with steel, provide with a urethane powder coat finish o match color of hood liner.

2.4 FABRICATION - BENCHTOP CHEMICAL FUME HOODS

A. General: Assemble fume hoods in factory to greatest extent possible. Disassemble fume hoods only as necessary for shipping and handling limitations. Fume hoods shall be capable of being partly disassembled as necessary to permit movement through a 35-by-79-inch door opening.

B. Steel Exterior: Fabricate from steel sheet, not less than 0.0478 inch thick, with component parts screwed together to allow removal of end panels, front fascia, and airfoil and to allow access to plumbing lines and service fittings. Apply chemical-resistant finish to interior and exterior surfaces of component parts before assembly.

C. Ends: Fabricate with double-wall end panels without projecting corner posts or other obstructions to interfere with smooth, even airflow. Close area between double walls at front of fume hood and as needed to house sash counterbalance weights, utility lines, and remote-control valves.

D. Splay top and sides of face opening to provide an aerodynamic shape to ensure smooth, even flow of air into fume hood.

E. Interior Lining: Provide one of the following unless otherwise indicated:

1. Polyester liner: Reinforced glass polyester panel; smooth finish and white color in final appearance. Flexural strength: 21,000 psi (144,790 kPa). Flame spread: 25 or less per UL 723 and ASTM E84-80. Manufactured by Rochling-Glastic, Haysite, Morrison Molded Fiberglass, WS Hampshire Inc. "Wesliner 1125". Provide gasketed access panels in the liner for access to valves and fixtures. Panels shall be of the same material as the liner and be provided with a PVC gasket to eliminate air leakage and retain liquids inside the hood.
2. Kemglass by Kewaunee

Punch fume hood lining side panels to receive service fittings and remote controls. Provide removable plug buttons for holes not used for indicated fittings.

F. Rear Baffle: Unless otherwise indicated, provide baffle, of same material as fume hood lining, at rear of hood with openings at top and bottom for airflow through hood. Secure baffle to cleats at rear of hood with stainless-steel screws. Fabricate baffle for easy removal for cleaning behind baffle.

1. Provide preset baffles.

G. Exhaust Plenum: Full width of fume hood and with adequate volume to provide uniform airflow from hood, of same material as hood lining, and with duct stub for exhaust connection.

1. Collar: Round. Fabricate collar of stainless steel and the same gage, 18 gage minimum, as the building exhaust duct connection.
2. Duct Transition: Round duct size as indicated in the Fume Hood Schedule. Fabricate transition of the same material and gage, 18 gage minimum, as the building exhaust duct connection.

H. Bypass Grilles: Provide grilles at bypass openings of bypass and restricted bypass fume hoods.

I. Sashes:

1. Full view type with clear, unobstructed, side to side view of fume hood interior and service fixture connections. Refer to the Fume Hood Schedule on the Drawings for type and height of sash at each fume hood.

2. Vertical Sliding Sash:

   a. 2 inches maximum height bottom sash rail, 18gage thick steel with a polyurethane powder coat finish. Provide integral formed flush pull the full width of bottom rail. Set safety glass into rails in deep form, extruded polyvinyl chloride glazing channels.

   b. Sash Stops: Provide sash stops at operating sash opening. Refer to the fume hood schedule for requirements. Sash stops shall be defeat-able to allow for fume hood set-up. Provide an acid resistant decal indicating the operating or design sash opening.

   c. Contractor to coordinate installation of automatic sash positioner system.

3. Glaze with 7/32” thick laminated safety glass.

4. Counterbalance vertical-sliding sash with sash weight and stainless-steel cable system to hold sash in place regardless of position. Provide ball-bearing sheaves, plastic glides in stainless-steel guides, and stainless-steel lift handles. Provide rubber bumpers at top and bottom of each sash unit.

J. Airfoil: Unless otherwise indicated, provide airfoil at bottom of fume hood face opening with 1-inch space between airfoil and work top. Sash closes on top of airfoil, leaving 1-inch opening for air intake. Airfoil directs airflow across work top to remove heavier-than-air gases and to prevent reverse airflow.

1. Fabricate airfoil from stainless steel.

K. Light Fixtures: Provide T-5 fluorescent light fixtures, of longest practicable length; complete with tubes at each fume hood. Shield tubes from hood interior with 1/4-inch- thick laminated glass or 3-mm-thick tempered glass, sealed into hood with chemical-resistant rubber gaskets. Provide units with fluorescent tubes easily replaceable from outside of fume hood.

1. Interior Fixture Finish: White, high reflecting plastic enamel.

2. Size: Largest possible up to 48 inches for hoods with superstructures up to 6 feet Provide (2) 36inch fixtures for hoods with 8 foot superstructures.

3. Illumination: 80 footcandle (860lx) minimum average at the work surface.

4. Light Switch: Toggle type, single pole 120 VAC, 20 AMP, Gray in color with stainless steel brushed finished flush face plate. Mount on left side of fume hood side post.

5. Provide fluorescent tubes with color temperature of 3500 K and minimum color rendering index of 85.

L. Receptacles:

1. Unless otherwise noted, provide each hood with receptacle quantities as follows:

   a. 48 inch wide hoods: Provide one duplex receptacle each side post near the bottom.

b. 60 inch wide and greater hoods: Provide two (2) duplex receptacles each side post near the bottom. Receptacles on each side shall be wired alternately.

c. Provide a dedicated receptacle on top of all hoods for safety monitor and alarm.

2. Receptacle: NEMA-5-20R, three wire grounding type receptacle rated at 120VAC at 20 AMP with ground fault interruption (GFI), Gray in color with a or white plastic flush face plate. Install receptacles with the ground outlet above the power slots. Label each receptacle per Division 26 specifications with the associated circuit number.

M. Factory install receptacles, lighting, electrical fixtures and wiring in accordance with all applicable state and local codes and Division 26 specifications. Terminate wiring in a single service junction box on top of the fume hood roof for in-the-field point of connection. All electrical fixtures shall be UL listed and labeled.

N. Service Fixtures and Piping:

1. Fume hoods shall be factory pre-piped in accordance to all state and local codes. Refer to the Drawings for services required at each fume hood. Terminate piping 2 inches above the fume hood roof for in-the-field point of connection. Install protective rubber piping end caps for shipment. Piping materials and installation for each type of service shall be as specified under Division 22. Pressure test all pre-piped lines in the factory.

2. Control Valves: Control valves shall be mounted on the front panel of the fume hood, with all components subject to wear accessible from the exterior of the hood. Straight or 45 degree angle mounted fixtures are acceptable. The centerline of the valve inlet and outlet shall be parallel and 1-1/8 inches apart. Valves shall have a threaded collar to hold the valve in place.

3. Service fixtures outlets within the fume hoods interior shall have color coded, acid and solvent resistant plastic coating, applied over fine sandblasted surface, properly cleaned. Surfaces to be coated shall be sprayed and baked three times with minimum coating thickness of 6 mil.

4. Color coding of hood interior service fixtures and remote control valves shall be as specified for Laboratory Service Fixtures in the Laboratory Casework and Furnishings Section of this Specification.

O. Base Cabinets: Comply with Division 12 Section "Laboratory Casework”.

P. Work Top:

1. As specified in Section 12 3553 Fixed Laboratory Casework.

Q. Cup Sinks: Material and size as indicated.

1. Provide epoxy cup sinks with polypropylene strainers and integral tailpieces.

2. As specified in Section 12 3553 Fixed Laboratory Casework.

R. Filler Strips: Provide as needed to close spaces between fume hoods or fume hood base cabinets and adjacent building construction. Fabricate from same material and with same finish as fume hoods or fume hood base cabinets, as applicable.

S. Ceiling Extensions: Provide filler panels matching fume hood exterior to enclose space above fume hoods at front and sides of fume hoods and extending from tops of fume hoods to ceiling.

T. Finished Back Panels: Where rear surfaces of fume hoods are exposed to view, provide finished back panels matching rest of fume hood enclosure.

U. Comply with requirements in Divisions 23 and 26 Sections for installing water and laboratory gas service fittings, piping, electrical devices, and wiring. Install according to Shop Drawings. Securely anchor fittings, piping, and conduit to fume hoods unless otherwise indicated.

V. Unit will be equal to Supreme Air LV as manufactured by Kewaunee.

2.5 ADA ACCESSIBLE HOODS

A. Accessible hoods shall be as detailed on the drawings and as described under Article 2.03, Bench-top Chemical Fume Hoods, unless modified under this Article.

B. Light switches, electrical receptacles, and service fixtures shall be mounted no higher than 48” above finished floor.

C. Operating controls shall be reachable per CBC 11B.308 reach requirements face of fume hood 48” max. Others obstructed high reach 11B.308.2.2.

D. Unit will be equal to Hopec as manufactured by Kewaunee.

2.6 CHEMICAL-RESISTANT FINISH

A. General: Prepare, treat, and finish welded assemblies after welding. Prepare, treat, and finish components that are to be assembled with mechanical fasteners before assembling. Prepare, treat, and finish concealed surfaces same as exposed surfaces.

B. Preparation: Clean steel surfaces, other than stainless steel, of mill scale, rust, oil, and other contaminants. After cleaning, apply a conversion coating suited to the organic coating to be applied over it.

C. Chemical-Resistant Finish: Immediately after cleaning and pretreating, apply fume hood manufacturer's standard two-coat, chemical-resistant, baked-on finish consisting of prime coat and thermosetting topcoat. Comply with coating manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 2 mils.

1. Chemical and Physical Resistance of Finish System: Finish complies with acceptance levels of cabinet surface finish tests in SEFA 8. Acceptance level for chemical spot test shall be no more than four Level 3 conditions.

2. Colors for Fume Hood Finish: As selected by Architect from manufacturer's full range.

2.7 ACCESSORIES

A. Provide service fittings with exposed surfaces, including fittings, escutcheons, and trim, finished with acid- and solvent-resistant powder coating complying with requirements in SEFA 7 for corrosion-resistant finishes or made from PVDF.

B. Airflow Indicator: Provide each fume hood with airflow indicator of one of the following type(s):

1. Indicator Type: Thermal anemometer that measures fume hood face velocity and indicates whether it is below normal, normal, or above normal.

2. Indicator Type: Thermal anemometer that measures fume hood face velocity and displays data as digital readout.

C. Safety Monitor/Alarm System

1. Variable Air Volume Hoods: Each fume hood shall be equipped with a velicity control and safety audible/visual alarm unit which is to be provided under Division 23. Provide factory cut outs in the front of the hood for field mounting of the unit. Coordinate location and size of cut out with Division 23. Connection of control and safety alarm unit to sensors and controls valves shall be under Division 23.

D. Sash Stops: Provide fume hoods with sash stops to limit hood opening to 50 percent of sash height. Sash stops can be manually released to open sash fully for cleaning fume hood and for placing large apparatus within fume hood.

E. Bypass Grille Blank-off Panel: Provide fume hoods with blank-off panel on bypass grille designed for use with sash stops to reduce exhaust air volume and provide design face velocity with sash at 50 percent open position.

F. Provide a permanent acid resistant decal or plate attached to fume hood exterior with condensed information covering the following:

1. Recommended locations for apparatus and accessories

2. Recommended safe operating procedures.

3. Use of sash

4. Baffle settings

2.8 FUME HOOD BASE AND SPECIAL CABINETS

A. Flammable Liquids Storage Cabinet:

1. Conform to OSHA Regulations and the requirements of NFPA 30-2003 Chapter 6-3, National Fire Protection Association, Flammable and Combustible Liquids Code. Cabinets shall be Factory Mutual (FM) approved or Underwriters Laboratories (UL) listed. Cabinets shall limit the internal temperature at the center, one inch (25mm) from the top to not more than 325 degrees Fahrenheit (162.8 degrees Celsius) when subjected to a ten-minute fire test that simulates the fire exposure of the standard time-temperature curve specified in NFPA 251.

2. Provide 1-1/2 inch diameter, minimal, insulated, NPT flexible stainless steel vent pipe routed from bottom of cabinet directly to the outside with make-up air supplied to the top, in accordance with NFPA91.

3. Casing: Bottom, top, back, door, and sides of cabinet shall be constructed of metal and finished in the same manner as the metal casework herein before specified, provided that the bottom, top, door, back and sides of the cabinet shall be at least 18 gage sheet steel and shall be double-walled, with 1-1/2 inch air space. Joints shall be riveted, welded or made tight by equally effective means.
4. Provide self-closing doors.
5. Ground (to structure) and bond cabinet.
6. Flame arrestor on cabinet vent outlet.
7. Adjustable, full width, metal shelf supported with “locking” clips to avoid inadvertent removal.
8. Apply silkscreen signage, color red, in a conspicuous size to cabinet doors indicating “FLAMMABLE – KEEP FIRE AWAY”.
9. Door: Provide with continuous piano hinge, three point latch mechanism integrated into lever handle with door sill raised at least 2 inches above the bottom of the cabinet to retain spilled liquid within the cabinet. When more than one door is used, there shall be a rabbetted overlap or not less than one inch Doors shall be equipped with a means of latching and hinges shall be constructed and mounted in such a manner as to not lose their holding capacity when subjected to fire exposure.
10. Finish: Finish as specified for metal laboratory casework except interior and shelf finish shall be three-mils thick. Color to match fume hood.

B. Corrosive Storage Cabinet

1. Provide 1/4 inch thick white polypropylene lining on interior surfaces.
2. Provide a 2 inch polypropylene vent pipe at the outside rear of the cabinet with one inlet. Secure vent pipe inlets to back of cabinet with polypropylene locking nuts. Extend vent pipe 2 inches above the work surface.
3. Doors: Provide with polypropylene or ABS roller catches with stainless steel screws.
4. Bottom: Provide with 1/4 inch thick heat welded, polypropylene or ABS plastic pan, liquid tight removable, 1 inch deep.
5. Removable back panel.
6. Finish: Finish as specified for metal laboratory casework. Color to match fume hood.
7. Identification: All under-counter ventilated cabinets shall be marked with conspicuous lettering: “CAUTION-ACIDS/CORROSIVES”.

2.9 CANOPY HOODS

1. Fabricate, as detailed, of (18 gauge) thick, Type 304 stainless steel with a Number 4 finish.
2. Weld all exposed corners and ground smooth.
3. Support from steel rods attached to structure above and from brackets attached to adjoining wall. Refer to detail on Drawings.

2.10 SOURCE QUALITY CONTROL TESTING OF EPOXY RESIN WORK SURFACE

1. As specified in Section 12 3553 Fixed Laboratory Casework.

2.11 SOURCE QUALITY CONTROL TESTING OF POLY RESIN LINER

1. Test Procedure:
   a. Test Number 1 - Spills and Splashes:
      1) Suspend in a vertical plane a 42 inch (horizontal) by 12 inch (vertical) panel divided into ¾ inch wide vertical columns.
      2) Apply 5 drops of each reagent listed with an eye dropper.
      3) Apply liquid reagents at top of panel and allow to flow down full panel height. (CAUTION! Flush away any reagent drops.)
   b. Test Number 2 - Fumes and Gases:
      1) Divide 24 inch by 12 inch panel into 2 inch squares.
      2) Place 25 milliliters of reagent into 100 milliliter beakers and position panel over beaker tops in the proper sequence. Note: Beaker pouring lip permits atmospheric oxygen to enter and participate in the reaction of the reagent fumes.
2. After 24 hours remove panel, flush with water, clean with naphtha and detergent, rinse, wipe dry and evaluate.
3. Evaluation ratings: Change in surface finish and function shall be described by the following ratings:
   a. No Effect: No detectable change in surface material.
   b. Excellent: Slight detectable change in color or gloss, but no change to the function or life of the work surface material.
   c. Good: Clearly discernible change in color or gloss, but no significant impairment of work surface function or life.
   d. Fair: Objectionable change in appearance due to surface discoloration or etch, possibly resulting in deterioration of function over an extended period.
   e. Failure: Pitting, cratering or erosion of work surface material; obvious and significant deterioration.
4. Test Results: Submit a report of the test results. The results shall be equal to or better than the following:

	REAGENT LIST CONCENTRATIONS BY WEIGHT	TEST 1 RATING SPILLS	TEST 2 FUMES
a.	Sodium Hydroxide Flake	No Effect	No Effect
b.	Sodium Hydroxide, 40%	No Effect	No Effect
c.	Sodium Hydroxide, 20%	No Effect	No Effect
d.	Sodium Hydroxide, 10%	No Effect	No Effect
e.	Ammonium Hydroxide, 28%	No Effect	No Effect
f.	Methylene Chloride	No Effect	No Effect
g.	Chloroform	No Effect	No Effect
h.	Carbon Tetrachloride	No Effect	No Effect

i.	Monochlorobenzene	No Effect	No Effect
j.	Tincture of Iodine	No Effect	Good
k.	Methyl Alcohol	No Effect	No Effect
l.	Ethyl Alcohol	No Effect	No Effect
m.	Butyl Alcohol	No Effect	No Effect
n.	Phenol, 85%	No Effect	Excellent
o.	Cresol	No Effect	No Effect
p.	Sodium Sulfide	No Effect	No Effect
q.	Furfural	Excellent	Excellent
r.	Dioxane	No Effect	No Effect
s.	Zinc Chloride	No Effect	Excellent
t.	Benzene	No Effect	No Effect

nn.	Sulfuric Acid, 93%	No Effect	No Effect
oo.	Hydrogen Peroxide, 30%	No Effect	No Effect
pp.	Acid Dichromate	No Effect	No Effect
qq.	Nitric Acid, 20%	No Effect	Excellent
rr.	Nitric Acid, 30%	No Effect	No Effect
ss.	mm & tt Equal Parts	No Effect	Good
tt.	Nitric Acid, 70%	No Effect	Good
uu.	Hydrofluoric Acid, 48%	No Effect	Excellent
vv.	Hydrochloric Acid, 37%	No Effect	Excellent

2.12 SOURCE QUALITY CONTROL

A. Demonstrate fume hood performance before shipment by testing one fume hood for each type required according to ASHRAE 110 as modified in "Performance Requirements" Article. Provide testing facility, instruments, equipment, and materials needed for tests.

B. Evaluation of standard product shall have been conducted in the manufacturer's test facility in accordance with the method prescribed in ANSI/ASHRAE 110-1995.

C. Hoods shall achieve a rating of 4.0 AM 0.05 with 4.0 being the tracer gas release rate in liters per minute, AM identifying an "As Manufactured" test, and 0.05 indicating the maximum level of tracer gas, in parts per million, in the breathing zone.

2.13 SOURCE TESTING OF FUME HOOD SOUND LEVELS

A. Provide the following historic certified sound test data for each size and type of fume hood:

1. Background sound pressure level readings for the test facility with exhaust system operating but without connection to the fume hood.

2. A second set of readings recorded with the fume hood connected and operating and the sensor located 36 inches (900 mm) in front of the sash assembly.

3. Certified report: Octave band sound pressure level, Db re 20 micro Pa in the 31.5 to 8,000 Hertz frequency range, for the fume hood operating.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of fume hoods.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install fume hoods according to Shop Drawings and manufacturer's written instructions. Install level, plumb, and true; shim as required, using concealed shims, and securely anchor to building and adjacent laboratory casework. Securely attach access panels, but provide for easy removal and secure reattachment. Where fume hoods abut other finished work, apply filler strips and scribe for accurate fit, with fasteners concealed where practical.

B. Accessory installation: Install accessories and fixtures in accordance with manufacturer's recommendations.

3.3 FIELD QUALITY CONTROL

A. Field test installed fume hoods according to "Flow Visualization and Velocity Procedure" requirements in ASHRAE 110.

1. Test one installed fume hood, selected by University’s Representative, for each type of hood installed, according to ASHRAE 110If tested hood fails to meet performance requirements, field test additional hoods as directed by University’s Representative.

2. Adjust fume hoods, hood exhaust fans, and building's HVAC system, or replace hoods and make other corrections until tested hoods perform as specified.

3. After making corrections, retest fume hoods that failed to perform as specified.

4. Provide written results of each fume hood test.

3.4 ADJUSTING AND CLEANING

A. Adjust moving parts for smooth, near silent, accurate sash operation with one hand. Adjust sashes for uniform contact of rubber bumpers. Verify that counterbalances operate without interference.

B. Clean finished surfaces, including both sides of glass; touch up as required; and remove or refinish damaged or soiled areas to match original factory finish, as approved by University's Representative.

3.5 PROTECTION OF FINISHED WORK

A. Provide all necessary protective measures to prevent damage to equipment from exposure to other construction activity.

B. Advise Contractor of procedures and precautions for protection of material and installed fume hoods from damage by work of other trades.

END OF SECTION 11 5313

SECTION 11 5325 – WALK-IN ENVIRONMENTAL ROOMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes Cold Room, accessory equipment, and components, for laboratories as indicated on the Drawings. The units shall be equipped with water-cooled condensers.

1. The Cold Room shall be designed to operate at 2-4 degrees Celsius; plus or minus 1 degree Celsius.
2. Cold Room equipment shall be connected to the emergency power.
3. The Cold Room shall be furnished complete and ready for installation with all accessories required for installation.
4. The equipment locations, as shown on the plans, shall be checked by the Cold Room manufacturer. Exact locations shall be determined by the dimensions of the equipment approved and the layout before apparatus is installed. The Cold Room manufacturer shall be solely responsible for the accurate installation and correct operational aspects of his equipment and shall correct deficiencies without any recourse to the Owner. Consult the architectural and structural drawings for all dimensions, locations of partitions, locations of pipes and duct work.
5. The Cold Room manufacturer shall furnish shop drawings for all equipment being furnished and shall also prepare and submit for approval scaled shop drawings representing the actual manner in which the systems and equipment are to be installed. Shop drawings shall show accurately and in detail the dimensions, section, arrangements and elevations of all prefabricated Cold Room and shall include all measurements, roughing-in diagrams and other necessary details for use by other trades. The Cold Room manufacturer shall obtain the Owner's Representative's approval for all routing and movement of materials into the building before any materials or equipment are purchased, fabricated, assembled or installed.
6. The Cold Room manufacturer shall have a factory trained field service technician on the premises to supervise the installation of all equipment and assist the other trades as to the proper piping rough-in for equipment.
7. A factory trained representative of the equipment manufacturer shall provide one (1) onsite equipment demonstration to Owner.
8. The Cold Room manufacturer shall be responsible for providing and field wiring all electrical devices provided with the room.
9. The CER manufacturer shall be responsible for all refrigeration piping and connections between condensing unit and evaporator and terminating condensate drain line at condensate drain. Location of condenser and routing of condensate drain line to condensate drain shall be coordinated with Owner's Representative and General Contractor.

10. The Cold Room manufacturer shall be responsible for blocking in the pre-fabricated partitions to mount any wall-mounted items. Coordinate blocking requirements for wall mounted items with the laboratory furniture manufacturer.
11. Delivery and installation of the equipment shall be so performed as to avoid delay to the work of other contractors. The Cold Room contractor shall be responsible for receiving, uncrating, and setting-in-place this equipment.
12. The Cold Room contractor shall coordinate their work with the General contractor and all supporting contractors, providing all information and supervision necessary as required to assure proper and timely installation without delay to the project or other contractors.
13. Provide supply and exhaust collars as required. All penetrations shall be sealed to prevent vapor/moisture condensation.

B. Related Sections include the following:

1. Division 03 Section "Cast-in-Place Concrete" for the following:
   a. Equipment bases.
   b. Requirements for slab depressions.
2. Division 05 Section "Metal Fabrications" for equipment supports.
3. Division 12: Laboratory casework and furnishings within Cold Room unless specified herein.
4. Division 21: Fire suppression systems and devices.
5. Division 22: Condenser water supply, return and condensate drain rough-in piping and final connections.
6. Division 22: Service lines to countertop mounted plumbing fixtures including final connections of fixtures.
7. Division 23 Sections for supply and exhaust ductwork; refrigeration tubing, insulation, service roughing-ins, vents; valves, pipes, and fittings; fire-extinguishing systems; and other materials required to complete Cold Room equipment installation.
8. Divisions 26 and 28 Sections for connections to fire alarm systems, wiring, disconnect switches, and other electrical materials required to complete equipment installation.

C. Related Documents:

1. Drawings and general provisions of Contract; including General and Supplementary Conditions and Division Specifications, apply to work of this section.

1.2 QUALIFICATIONS

A. Submit a statement of qualification showing adequate experience in manufacturing equipment of the type and scope called for with a minimum of 10 years experience. The statement of qualifications shall also include a list of a least twenty-five (25) comparable recent projects. Provide an instruction manual for the product the vendor intends to supply for this project.

B. Service and Maintenance: Vendor shall be a manufacturer of Cold Rooms who maintains factory parts and service. An extended warranty service contract shall be tendered at least one month prior to the end of the warranty periods for consideration by the Owner.

C. Standards: The Cold Room design and installation shall conform to applicable codes, ordinances and regulatory requirements governing the use and safety of refrigerants, including, but not necessarily limited to the following:

1. ASHRAE/ANSI Standard 15-70, ARI 520-78, ANSIB9.1-1971 and NFPA-70.
2. UL Listing under Standard 723 as a Class One Building Unit for all insulated panels.
3. Approval by Underwriter's Laboratory (UL), labeled and listed, for all parts and assemblies of the CER.
4. Complete control panel assembly shall be tested and certified by a Nationally Recognized Testing Laboratory (NRTL) to be in accordance with NFPA 70 and UL508A as required by the National Electric Code.

1.3 SUBMITTALS

A. Qualification Data: Prior to executing a contract for the work of this Section, submit qualification data for proposed manufacturer as specified under "Qualification" to demonstrate capabilities and experience. Include list of completed projects, and other information stipulated. Include manufacturer's technical data and specifications in sufficient detail for Owner's Representative and Owner to assess quality and suitability of products proposed.

B. Deviations: Any deviations from the Specifications, including type of finishes as set forth herein, must be listed in detail, separate from the literature furnished with the bid such that the Owner's Representative does not have to expend inordinate time in evaluating competitive bids. In bids, manufacturers should understand that the right is reserved to reject any and all bids. Any bid will rightfully be construed as being based on supplying the design, construction, and materials specified herein.

C. Product Data: For each type of product indicated. Include the following:

1. Manufacturer's Literature and Data.
2. Manufacturer's model number.
3. Cold room plan, room arrangement, including assembly instructions.
4. Condensing units, with mounting rack where required.
5. Evaporator units, with mounting supports, and brackets.
6. Temperature controls and alarms.
7. Diagrams and details of piping, wiring and controls.
8. Controls: Sequence of operation, start-up, shut-down, control data, and schematics
9. Operating Test Data.
10. Maintenance and operating manuals.
11. Options, accessories, and components that will be included for Project.
12. Clearance requirements for access and maintenance.
13. Utility service connections for water, drainage, power, and refrigerant tubing; include roughing-in dimensions.

D. Shop Drawings: For Cold Room and associated equipment. Include plans, elevations, sections, roughing-in dimensions, fabrication details, utility service requirements, anchorage and attachments to other work. Include details of seismic bracing for all equipment.

1. Include on the drawing, the performance requirements for each room.
2. Include service connection information for other trades.

E. Samples. Submit the following material, finish and color samples:

1. Insulated wall panel with exterior and interior finish.
2. Insulated floor panel with exterior and interior finish.
3. Flooring finish.

F. Coordination Drawings:

1. Include plans and elevations;
    a. Clearance requirements for equipment installation.
    b. Access and maintenance.
    c. Details of support for equipment.
    d. Reflected ceiling plan.
    e. Utility service characteristics.
    f. Routing of adjacent utilities, and communications.
    g. Indicate locations of cold room and connections to utilities.

G. Operation and Maintenance Data: Provide operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

1. Product Schedule:
    a. Designation indicated on Drawings.
    b. Manufacturer's name and model number.
    c. List of factory-authorized service agencies including their addresses and telephone numbers.
    d. Warranty: Special warranty specified in this Section.
2. Include instructions for sequential operation, start-up and shut down, with pertinent control data and schematics, room arrangement, and recommended maintenance of equipment. At completion of work, submit one copy of 3-ring binder containing: “as-built” drawings, product data and operation and maintenance information listed above. After Owner’s Representative’s acceptance is received, submit 4 copies for Owner’s use.

H. No portion of the work requiring a shop drawing or sample submission shall be commenced until the submission has been approved by the Owner’s Representative. All such portions of the work shall be in accordance with approved shop drawings and samples.

1.4 QUALITY ASSURANCE

A. UL Certification: Provide electric equipment and components that are evaluated by UL for fire, electric shock, and casualty hazards according to applicable safety standards and that are UL certified for compliance and labeled for intended use.

B. Regulatory Requirements: Install equipment to comply with the following:

1. ASHRAE 15, "Safety Code for Mechanical Refrigeration."

2. NFPA 70, "National Electrical Code."

C. Reference and Standards

1. Air-Conditioning and Refrigeration Institute
   a. (ARI): 420-00 Unit Evaporators for Refrigeration.
   b. 520-97 Positive Displacement Condensing Units.

2. American Society for Testing and Materials (ASTM).
   a. A167-99 Stainless and Heat-Resisting Chromium-Nickel Steel plate, Sheet and Strip.
   b. E84 Surface Burning Characteristics of Building Materials.

D. Acoustics: Indoor, room noise Criteria shall not exceed 45-50 NC.

E. Seismic Restraints: Comply with CBC requirements for seismic zone 4.

F. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 01 Section "Project Management and Coordination."

1.5 PROJECT CONDITIONS

A. Field Measurements: Indicate measurements on Coordination Drawings.

1.6 COORDINATION

A. Coordinate cold room equipment layout and installation with other work, including architectural elements, fire rated shafts and construction assemblies, structural members, framing, ceilings, concrete flooring, lighting fixtures, conduit, laboratory utilities, HVAC ductwork and equipment, rooftop equipment, utility risers and chases, and fire-suppression system components. The Cold Room contractor is responsible for physically measuring the area to assure that their equipment will fit in the designated location. Any dimensional corrections will be accomplished at no change in contract sum.

B. Coordinate location and requirements of utility service connections.

C. Coordinate size, location, and requirements of the following:

1. Overhead equipment supports.

2. Floor depressions.

3. Internal Ramp.

4. Insulated floor system.
5. Insulated walls and ceilings.
6. Fire Rated Assemblies: walls, floors, ceiling.
7. Drains.
8. Evaporators.
9. Condensers.
10. Drains.
11. Ductwork connections.
12. Dry pendant fire sprinkler heads.
13. Fire stopping.
14. Combination fire-smoke dampers if required.
15. Ventilation supply and exhaust ductwork, and controls.
16. Refrigeration tubing and dedicated tubing chase.
17. Maintenance access/path.
18. Alarm and communication connections.

1.7 WARRANTY

A. Provide warranty coverage in accordance with Division 1.

B. Submit warranty signed by Manufacturer and countersigned by Contractor, agreeing to replace / repair / restore defective equipment, components, materials and workmanship during the periods indicated for each item from date of Owner's acceptance. "Defective" is hereby defined to include (but not be limited to) operation or control system failures, performance below required standards, excessive wear, unusual deterioration or aging of materials or finishes, the need for excessive maintenance, and similar unusual, unexpected and unsatisfactory conditions. Prominently display in each room the name of installer/service agency to be contacted during warranty period.

1. Compressor units: five (5) years.
2. Panels or room construction: ten (10) years.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

1. R.W. Smith & Company
San Diego, CA
Phone: 858-530-1800,
www.rwsmithco.com

2. BioCold Environmental, Inc.
   Ellisville, MO
   Phone: 636-349-0300
   www.biocold.com

3. Environmental Growth Chambers
   Chagrin Falls, OH
   Phone: 800-321-6854
   www.egc.com

4. Bahnson Environmental Specialties, LLC.
   Raleigh, NC
   Phone: 800-688-5859
   www.eschambers.com

5. Harris Environmental Systems, Inc.
   Andover, MA
   Phone: 978-470-8600
   www.harrisenv.com

2.2 MATERIALS

A. Materials:

1. Galvanized Steel: ASTM A 653/A 653M, G90 coating designation; commercial-quality, cold-rolled steel that is zinc coated by the hot-dip process and chemically treated.

2.3 WALK-IN COLD ROOM CONSTRUCTION

A. General: Prefabricated, sectional, all-metal clad, modular, designed for easy accurate field assembly.

B. Room Dimensions: As indicated on sheet Q6-0.

1. Minimum clear ceiling height of 8’-0” below suspended ceiling.

C. Suspended ceilings: Provide an anodized aluminum with white painted finish exposed tee ceiling grid with an “egg crate” type white plastic panel ½” (12.7mm) thick that has ½” x ½” (12.7mm x 12.7mm) holes covering 90% of the surface area of the panel.

D. Floor Covering: Seamless inlaid sheet vinyl in each environmental room complying with the following:

1. Manufacturer: Medintech by Armstrong or equal.

2. Coving: Seamless corner coving, extending into the sidewalls a minimum height of 4 inches. Coving shall be vinyl capped.

3. Color: As selected by Architect from manufacturer’s full range of colors.

E. Metal Finishes:

1. Inside facing of walls, doors and ceiling, and outside facing of exposed doors, and walls: Smooth-faced aluminum sheet, 0.040 inch thick. Provide close-off panels, with supports, from exposed faces of walk-in to ceiling.
2. Concealed outside facings: Embossed aluminum sheet, 0.040 inch thick, or 26 gauge galvanized steel panel.
3. Interior floor: 16 gauge galvanized steel.
4. 36” high door guards: 1/8” thick aluminum diamond plate for protection against carts.

F. Panel Construction:

1. General: 4 inches thick, precisely formed interior and exterior metal pans, filled with foamed-in-place urethane foam, overall "U" factor 0.03, interchangeable, nominal 1, 2, 3 and 4 foot widths, without wood or metal structural members, quick-lock panel fasteners. Provide special locking wrench and press-fit caps to close wrench holes.
2. Corner panels: 90 degree angle, radiuses 0.5 inch inside and out-side, with 12-inch dimensions each side.
3. Panel edges: Foam-in-place, tongue-and-grooved urethane to assure tight joints. Provide gaskets on the interior and exterior of each panel along every tongue to provide a gasketed seal at each panel joint.
4. Insulation: "Pour-type" urethane, foamed-in-place thermal conductivity (k) not more than 0.12, 97 percent closed cell, flame spread rating 25 or less, when tested in accordance with ASTM E84. Fiberglass, polystyrene or similar materials are not acceptable. Cold Room manufacturer shall supply with their bid a certified statement by issuing agencies that the Cold Room manufacturer has been issued certificates of compliance.
5. Pressure relief port: Provide two-way type ports, to allow for an increase or decrease of air pressure on the interior of the freezer to equalize with air pressure on the exterior. Provide ports with automatically controlled, UL approved anti-sweat heaters. Complete device shall carry Underwriters Label and be assembled ready for connection. Install port in a wall panel away from the direct air stream flowing from the coils.
6. Floor panel strength: Capable of withstanding 600 pounds per square foot uniform load. Floor shall be 2” thick.

G. All Glass Entrance Doors

1. Provide a door gasket of thermoplastic material mounted along both sides and the top of the door. An adjustable rubber double wiper gasket shall be mounted along the door’s bottom edge.
2. Light switch with pilot light mounted on the outside of unit or on control panel.
3. Entrance openings shall be provided in 46” sections. The door shall be an in-fitting flush mounted type. It shall have a “U” channel type, reinforced carbon fiber frame around entire perimeter of the door opening to prevent racking and twisting. Sill plates shall include safety walk strips. Door to be capable of reversing swing, left or right, in the field.
4. Opening size: 36” wide x 78” high.
5. A continuous one-(1) piece extruded aluminum pull shall extend the full height of the door.

6. All Glass Entry Door comprised of sealed triple pane safety glass, with internal heat reflective coating; door shall appear frameless, with face glass across exterior surface. A fiber reinforced internal frame shall support the three-(3) safety glass panes. Exterior glass to be clear to allow a central clear viewing area.
7. The door shall incorporate a totally concealed internal hinge mechanism consisting of an integral torque rod closure device, and utilize a torque mechanism for door adjustment/tension. Exterior visible hinges are not acceptable.
8. Exterior surface of door must be capable of being condensation free when the building temperature and humidity is at +68°F. /60% RH. Door glass shall be covered by manufacturers Ten (10) Year Warranty. Door as manufactured by Anthony Manufacturing Corporation or approved equal.
9. All door panels shall conform to locally recognized electrical and building code.

H. Shelves and Casework: Shall not be furnished with the Cold Rooms. This shall be provided by the casework vendor as described in the stainless steel casework specification. All backing requirements are the responsibility of the vendor to coordinate. Wood backing for shelves and casework is not considered acceptable.

I. Rub rail wall protectors: Manufacturers standard, at floor line of walls exposed to traffic.

J. Entrance Transition Ramps: Shall not be required. Install units in recessed slab to allow level surface transition.

2.4 EVAPORATORS

A. Comply with ARI Standard 420. Units shall be UL listed, forced-ventilation type integral defrosting, internal or external refrigerant distributor, single or multiple fans and motors, drip-pan, deflectors, aluminum or baked-enamel steel housing, hangers, and all accessories.

B. Motors: Refer to “Motors” specification section 23 0513.

C. Coil: Copper Tube, aluminum fins, 8 fins per inch, minimum 4-rows, maximum velocity of 500 fpm.

D. Drain Pans: Heavy gage aluminum. Provide additional drain pans under uncovered refrigerant connections, and interconnect them with main drain pan.

E. If heaters are provided, they shall be integrated into the air flow system. The heaters shall be sized to provide adequate BTU’s of heat for the room design and shall have thermal safeties with a positive shut-off means.

F. A drip pan, drain connection and drain line shall be provided. Unit evaporators shall be equipped with mounting brackets for installation and all controls necessary for safe and satisfactory operation. When the Cold Room is used for freezing, an automatic system for defrosting the unit’s All condensate drain lines inside freezer rooms shall be insulated with ½” insulation. Each refrigerant system shall include a dehydrator, liquid line sight glass, shut-off valve, liquid line solenoid, thermostatic expansion valve at each evaporator, vibration isolator, and other fittings and accessories as required.

G. The entire system shall be cleaned, pressure tested, dehydrated, and separately vacuum tested each time for a period of five hours. The pressure test is to be at least 100 PSI (100kPa) above operating conditions and vacuum at 500 microns (formerly 28.5" of mercury or less. The required operating charge of refrigerant and oil shall then be added and the system tested for performance.

H. Condensate lines shall be routed out of the Cold Room and terminated at condensate drains. Drain Piping: 7/8" O.D., or greater, Type L copper tubing piped from evaporators to open floor drain, rigidly supported at walls 3' O.C. maximum. Adequately pitch piping toward floor drain, carry through wall of refrigerated areas properly trapped and discharged within 2" of floor drain. Provide chrome-plated escutcheons on both sides of wall penetrations. In the event condensate drain termination cannot be achieved by gravity, provide condensate pump.

I. Defrost Provision:

1. Provide electric heater type defroster. Defrost shall occur during compressor off cycle with evaporator fan running.

2.5 VENTILATION

A. General: Where ventilation, supply and exhaust, is indicated, provide a cutout for each in the ceiling of the room. The dimension of the cutout shall be coordinated with the Mechanical Contractor. The location of the supply cutout shall be as close as possible to the inlet of the fan coil unit to minimize the potential for condensation in the room.

2.6 CONTROLS

A. Main Temperature Control

1. Solid state, microprocessor-based, proportional, electronic controller, utilizing precision, platinum resistance thermometer (RTD) for sensing. Incorporate automatic reset and rate functions to compensate for error due to load variations.

2. Operating Temperatures: Adjustable by up-down keypad type indicator buttons, with values displayed by digital panel meter and actual temperature displayed on large, bright digital read out.

3. Provide system capable of setting and reading temperatures to readable accuracy of 1 degree C.

4. Defrost Functions: Controlled by solid-state programmable microprocessor.

5. Thermostat: Self-contained, one per cold room. Thermostat may be mounted on the unit cooler wall with sensor positioned in inlet air to the evaporator. Unit shall be controlled to plus or minus 1 degree Celsius.

B. Control Panel Enclosure

1. Enclose operating controls, instrumentation, functional switches, and control systems in single control panel center mounted at operator eye level.

2. Provide operating modes and functions clearly indicated by pilot lights and legibly identify with permanently engraved legends.

3. Mount functional switches and operational control settings in recessed area of enclosure behind lockable, hinged door for easy access by authorized maintenance personnel.

4. Panels: Power panels shall be welded steel with no visible hinges complying with requirements of NEMA-1. Finish shall be powder coated white.

2.7 ALARMS

A. Alarms: All rooms shall have adjustable high and low alarms for temperature. All alarm items shall have the features and functions described herein.

1. Digital edit and display of alarm setpoint and time delay on touch screen display.

2. Plain English text message to annunciate the occurrence of each alarm. Each alarm message shall be different from all others. Message shall remain on touch screen display until operator acknowledges alarm.

3. Audio annunciation of alarm occurrence by a piezo-electric device providing a warble tone with variable sound level.

4. An adjustable time delay which must elapse before alarm response or annunciation is executed. This shall be used to reduce the occurrence of nuisance alarms and allow alarm setpoints to be closer to the actual room operating condition.

5. Visual indication of alarm by flashing indicator on the touch screen display. Indicator shall appear to alert operator of an alarm condition, and remain visible until all alarms are cleared. Audio silence function shall not affect indicator status.

6. A reset function shall be provided on the touch screen display to allow the operator to immediately clear and reset all alarms.

B. Compressor Alarm: All rooms shall be provided with alarms for compressor failure to operate and short cycle. This alarm shall have all the features described herein for temperature alarms, but shall not require an adjustable setpoint on the touch screen display. Manufacturer shall preset this alarm.

C. Audio Silence: Provide an audio alarm silence feature, activated by the operator on the touch screen display, including all of the functions and features described herein. Regardless of the audio silence method selected, the occurrence of a new alarm condition will cause the audio alarm to sound. Each time the audio alarm sounds, the operator may specify a different silence method or duration. Silence options are as follows:

D. Audio is silenced until the occurrence of the next alarm.

1. Audio is silenced for a period of time specified by the operator at the time the silence button is pressed. The maximum silence time is 60 minutes and is digitally set in one minute increments on the touch screen display.

E. Remote Alarm Relay Contacts: Dry alarm contacts suitable for connection to remote alarm monitors shall transfer upon activation of selected alarms. Control system shall be provided with two SPDT (single pull, double throw) relays that are separately programmable to specify which alarm events will trigger their transfer. Remote alarm contacts shall automatically reset when all alarms are cleared.

2.8 ELECTRICAL AND LIGHTING

A. Lighting: Provide marine vapor-proof LED, for evenly distributed 70 foot candles. Provide exterior switching and pilot light, and top mounted junction box. This switch shall operate all lights in the walk-in cold room. Lighting systems shall be T-8, straight tube, rapid start, a correlated color temperature of 3500°K and a CRI of 85. Lamps shall be designed to pass the Federal TCLP test in effect at the time of manufacture. U-tube lamps shall not be used. The fixtures shall be UL approved and rated to operate at temperatures as low as –10°C. Light fixtures to be surface-mounted to ceiling. All lighting fixtures shall be high output low temperature ballast, moisture proof type units.

B. Light Cycle Timer: A 24 hour on/off cycle timer shall be provided on control panel for cycling interior lighting. Control light operation with the chamber automation controls.

C. Circuits: Provide electrical panel with circuits and spares as required in Division 23.

D. Electrical Outlets: Outlets shall be duplex NEMA watertight receptacles. Outlet circuits shall be 3wire grounded, 15 amp, 115 volt rated. Electrical outlets shall be connected to the emergency power. The color of outlets shall be Red. Provide flush-mounted vapor-proof duplex electrical outlets as shown on room elevation drawings and mounted 45” A.F.F. The 2”x 4 junction box for each outlet shall be foamed into the insulated panel with a ½” EMT conduit from the junction box and extended to the top of the room to allow for electrical connection of the outlet. All conduit shall be hidden within the walls of the room. All wiring and conduit from the outlet to the Cold Room’s central junction box shall be provided by the Cold Room vendor and must comply with local code. Provide seal-off fittings to prevent condensation.

E. Panels: Power panels shall be stainless steel complying with requirements of NEMA 4X.

2.9 MISCELLANEOUS MATERIALS

A. Elastomeric Joint Sealant: ASTM C 920; Type S (single component), Grade NS (nonsag), Class 25, Use NT (nontraffic) related to exposure, and Use M, G, A, or O as applicable to joint substrates indicated.

1. Requirements:
    a. Sealant is certified for compliance with NSF standards for end-use application indicated.
    b. Washed and cured sealant complies with the FDA's regulations for use in areas that come in contact with food.

2. Cylindrical Sealant Backing: ASTM C 1330, Type C, closed-cell polyethylene, in diameter larger than joint width.

2.10 WATER-COOLED CONDENSER

A. Water-Cooled Condenser: Mounted above the cold room with adjacent access panel.

B. Shall be provided complete with motor, water cooled condenser, receiver, compressor and all other necessary components mounted in a flexible manner on a common base with vibration isolation equal to Mason Industries SLRS. Compressor shall be semi-hermetic type and shall be designed for continuous operation at the specified evaporating temperature in a 105°F (40°C) ambient temperature. Motor starters and safety disconnects are required; they shall be furnished for installation in an electrical control panel enclosure. Units shall operate on condenser water (chilled water / glycol loop as specified in Division 23). Condenser water pressure drop shall not exceed 5 PSI (34kPa) based on water. Basis of design: Keeprite Model #KXSA010M6-IT3A as shown in the Basis of Design Appendix 9.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Assemble walk-in units and install refrigeration equipment as described in the respective manufacturer's instructions. Make panel joints tight and seal all panel penetrations to prevent condensation or frosting. Provide closed butt and contact joints that do not require filler.

B. To the extent feasible, mount pipe, conduit, and instrumentation on the exterior and pass thru neatly drilled penetrations to the lights or other devices.

C. Seal or otherwise insure that fastenings to rooms do not compromise vapor barriers or insulation. Seal between all piping and sleeves

D. Install refrigerant tubing per Division 23 Specification Section Refrigerant Piping.

E. Install chilled water and controls serving water-cooled condenser.

F. Install equipment with access and maintenance clearances that comply with manufacturer's written installation instructions and requirements of authorities having jurisdiction.

G. Install joint sealant in joints between equipment and abutting surfaces with continuous joint backing, unless otherwise indicated. Produce airtight, watertight, vermin-proof, sanitary joints. H. Connect equipment to utilities.

H. Pressurize and leak test entire system at not less than 100 psig, clean and dehydrate by maintaining a vacuum of 500 microns, or lower, for a 5 hour period. Add required charge or refrigerant, and oil if necessary, and test entire system for performance. Mark each system clearly as to refrigerant type used.

I. Provide filler panels to enclose spaces between tops of rooms and ceiling of surrounding area. Extend filler panels to underside of construction above if necessary.Loose Components: Install electrical components, devices, floor mounted shelving assemblies, and accessories that are not factory mounted.

3.2 CLEANING AND PROTECTING

A. After completing installation of equipment, repair damaged finishes.

B. Clean and adjust equipment as required to produce ready-for-use condition.

C. Protect equipment from damage during remainder of the construction period.

3.3 DEMONSTRATION, START-UP AND TESTING

A. Start-up Temperature Reduction: On start-up, reset the room thermostats daily for a maximum temperature drop 15 degrees F per day down to 37 degrees F.

B. Start unit according to manufacturer's written instructions and complete manufacturer's startup checklist.

C. Measure and record airflow over evaporator coils, and condenser coils.

D. Verify proper operation of condenser capacity control device.

E. Perform test in accordance with the following:

1. Temperature control of +/-1.0°C in Cold Rooms shall be temperature at the sensor and shall be the total variation in the temperature control of the room. It should not be confused with temperature uniformity as noted below.

2. Temperature uniformity of 0.5°C refers to the maximum allowable variation in temperature as measured on a horizontal plane 40” AFF and within 12” of walls throughout the entire room. Uniformity shall be measured by a multipoint strip chart recorder utilizing a minimum of 12 thermo-couples during a continuous 24-hour test period. Gradient from floor to ceiling shall not be more than 2°C.

3. Room shall recover preset operating temperature within 5 minutes after door has been fully opened to 75°F (24°C) ambient temperature for a period of 1 full minute. Repeat door opening operation, as described, 3 times during the 24 hour period, at least 1 hour apart.

4. After completion of installation, each room shall be tested for a minimum of 24 hours at extremes of temperature specified in Schedule of Rooms. Rooms specified to operate over a range of temperatures shall be tested for 24 hours at each of two set points (to be determined) with the second test at the set point designated for operation at acceptance of the unit.

F. Operate each system and record conditions hourly for 10 hours. Submit the following information:

1. Building and System Identification, Contractor, Factory Representative, Date and Time.

2. Compressor nameplate data: Make, model, horsepower, RPM, refrigerant and charge in pounds.

3. Compressor operation: Approximate percentage running time, pressure gage readings, actual amps (starting and running), condenser entering air temperature.

4. Room temperatures and ambient temperatures for Cold Rooms.

5. Defrost and drain functions of unit coolers.

G. Engage a factory-authorized service representative to demonstrate and train University's maintenance personnel to adjust, operate, and maintain equipment. Refer to Division 01 Section "Demonstration and Training."

1. Demonstrate thermostat temperature controls.
2. Demonstrate dry contact high temperature alarm notification functions:
   a. (2) Cold room audible alarm.
   b. (2) Cold room visual alarm.
   c. Silencer switch operation.
   d. Remote annunciation through BMS.
3. Demonstrate condensing unit failure alarm.
4. Demonstrate emergency power operation of the systems, including accessories.
5. Owner's representatives shall be given the option of witnessing and confirming test results. Notify Owner's representative in writing, prior to test.

END OF SECTION 11 5325

SECTION 12 2200 - CURTAINS AND DRAPES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Drapes.
    a. Vivarium Viewing
    b. Laboratory Blackout
2. Drapery tracks.

1.3 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For the following:

1. Drapery Tracks: Include maximum weights of drapes that can be supported.
2. Fabrics.

C. LEED Submittals:

1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.
2. Product Data for Credit MR 6: For products having rapidly renewable content, documentation showing compliance. Include statement indicating cost for each product having rapidly renewable content.

D. Shop Drawings:

1. Drapery Tracks: Show installation and anchorage details and locations of controls.
    a. Motorized Tracks: Indicate dimensions, weights, and required clearances for track and motor and differentiate between manufacturer-installed and field-installed wiring.
2. Drapes: Show sizes, locations, and details of installation.

E. Samples for Verification: As follows:

1. Drapery Tracks: 18 inches long, with carriers, controls, and accessories.
2. Drapery Fabrics: For each color and pattern indicated, full width by 36 inches long, from dye lot to be used for the Work and with specified textile treatments applied. Show complete pattern repeat if any. Mark top and face of fabric.
3. Drape Fabrication: For each heading, fabric, color, and pattern indicated, a complete full-size panel to verify details of fabrication and thread colors.

F. Product Schedule: For drapes and drapery tracks. Use same designations indicated on Drawings.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: For drapery track installation; reflected ceiling plans drawn to scale and coordinating track installation with openings and ceiling-mounted items, on which the following items are shown:

1. Suspended ceiling components.
2. Structural members to which motors are attached.
3. Size and location of motor access panel.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For products installed to include in maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Drapery Track Carriers: For each size indicated, equal to 5 percent of amount installed, but no fewer than 10 of each size.
2. Drapery Track Controls: For each type indicated, equal to 5 percent of amount installed, but no fewer than 10 of each type.
3. Drapery Fabrics: For each fabric, color, and pattern indicated, from the same product run, full-width lengths equal to 5 percent of amount installed, but no fewer than 10 yards of each fabric, color, and pattern.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: For drapes and drapery tracks, fabricator of drapes.

B. Provide the following upon request:

1. Product Certificates: For each drapery fabric treated with flame retardant, signed by fabric supplier and indicating treatment durability and cleaning procedures required to maintain treatment effectiveness.

1.8 FIELD CONDITIONS

A. Field Measurements: Verify dimensions by field measurements before drape fabrication, and indicate measurements on Shop Drawings.

B. Scheduling: Do not deliver or install drapes until after other finish work, including painting, is complete and spaces are otherwise ready for occupancy.

PART 2 - PRODUCTS

2.1 DRAPERY TRACKS

A. Manually Operated Track Insert drawing designation:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   a. Kirsch Window Fashions; a Newell Rubbermaid brand.
   b. Silent Gliss.
   c. Springs Window Fashions; SWFcontract.
2. Construction: Extruded aluminum, slotted for mounting at interval of not more than 24 inches o.c.
   a. Lengths and Configurations: As indicated on Drawings.
   b. Support Capability: Weight of drape indicated mounted on track length indicated.
   c. Finish: Clear anodic coating.
3. Mounting Brackets: Aluminum, of type suitable for fastening track to surface indicated and designed to support weight of track assembly and drape plus force applied to operate track.
   a. Mounting Surface: As indicated on Drawings .
   b. Size: Adjustable.
4. Installation Fasteners: Sized to support track assembly and drape, and fabricated from metal compatible with track, brackets, and supporting construction. Provide two fasteners to fasten each bracket to supporting construction.
5. Operation: Cord tension pulley complying with WCMA A 100.1.
   a. Pulley Mounting Location: Wall.
   b. Draw: One way, stack as indicated on Drawings.
   c. Operating Hardware Location: On stack side.
6. Carriers: Rollers with hooks .
   a. Master Carriers: Butt.
7. End Stops: Manufacturer's standard with track end cap.
8. Pulleys: Heavy duty.

2.2 DRAPES

A. Fire-Test-Response Characteristics: For fabrics treated with fire retardants, provide products that pass NFPA 701 as determined by testing of fabrics that were treated using treatment-application method intended for use for this Project by a testing and inspecting agency acceptable to authorities having jurisdiction.

B. Drape :

1. Heading:
   a. Accordion Pleats: 100 percent fullness.
   b. Heading Accessories:
      1) Woven snap tape, 7/8 inch wide, with nickel-plated snaps at 4 inches o.c..
2. Drapery Fabric: See Interior Finish Material Legend on drawings.
3. Textile Treatments: Stain repellent; and flame retardant, polymer type.
4. Lining Fabric:
   a. Lining Type: Blackout.
   b. Textile Treatments: Stain repellent; and flame retardant, polymer type.

C. Hem Weights: Tape type (string weights).Blackout Curtain Fabric:

1. Products: Subject to compliance with requirements, provide one of the following:
   a. PL Systems, 65 Bethpage Rd., Plainview, NY 11803
   b. Aero Shade Co., Inc., Los Angeles CA 90048
2. Fabric Composition: 38% SEF Modacrylic, 30% Saran Flat Monofilament, 26% Viscose Rayon and 6% Polyester. Provide double-vinyl black color laminated back for opacity. Flame-retardant complying with NFPA 701.

2.3 DRAPE FABRICATION

A. Fabricate drapes in heading styles and fullnesses indicated. Fabricate headings to stand erect. If less than a full width of fabric is required to produce panel of specified fullness, use equal widths of not less than one-half width of fabric located at ends of panel.

1. One-Way-Stacking Drapes: Add 5 inches to overall width for returns.

B. Seams: Sew vertical seams with twin-needle sewing machine with selvage trimmed and overlocked. Join widths so that patterns match and vertical seams lay flat and straight without puckering. Horizontal seams are unacceptable.

C. Side Hems: Double-turned, 1-1/2-inch- wide hems consisting of three layers of fabric, and blindstitched so that stitches are invisible on face of drape.

D. Bottom Hems: Double-turned, 4-inch- wide hems consisting of three layers of fabric, and weighted and blindstitched so that weights and stitches are invisible on face of drape.

E. Linings: Equal to widths of drapery fabric and joined to drapery fabric at top by inside invisible seam, and hand stitched at side hems and shadowed with 1-1/2-inch return of face fabric.

1. Bottom Hem: Blind stitch to drapery fabric.

F. Blackout Curtain Fabrication:

1. Outside vertical edges shall be supplied with "Velcro" quick-seal strips to facilitate "light-trap" overlaps for easy light-tight attachment to walls.

2. Curtain shall be supplied with minimum 11 inch high front and rear light-trap valances. The valances shall be made of the same black-out curtain materials, sewn flat (no fullness) with a sewn-on Velcro strip, and shall be mounted to the curtain track assembly using the "Light-Trap-Interface".

PART 3 - EXECUTION

3.1 DRAPERY TRACK INSTALLATION

A. Install track systems according to manufacturer's written instructions, level and plumb, and at height and location in relation to adjoining openings as indicated on Drawings.

B. Isolate metal parts of tracks and brackets from concrete, masonry, and mortar to prevent galvanic action. Use tape or another method recommended in writing by track manufacturer.

3.2 DRAPE INSTALLATION

A. Where drapes abut overhead construction, hang drapes so that clearance between headings and overhead construction is 1/4 inch .

B. Where drapes extend to floor, install so that bottom hems clear finished floor by not more than 1 inch and not less than 1/2 inch .

C. Where drapes extend to windowsill, install so that bottom hems hang above sill line and clear sill line by not more than 1/2 inch .

3.3 ADJUSTING

A. After hanging drapes, test and adjust each drapery track to produce unencumbered, smooth operation.

B. Steam and dress down drapes as required to produce crease- and wrinkle-free installation.

C. Remove and replace drapes that are stained or soiled.

END OF SECTION 12 2200

SECTION 12 2413 - ROLLER WINDOW SHADES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Manually operated roller shades with single rollers.
2. Motor-operated roller shades with single double rollers.

B. Related Requirements:

1. Section 061053 "Miscellaneous Rough Carpentry" for wood blocking and grounds for mounting roller shades and accessories.

1.3 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."{

B. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, features, finishes, and operating instructions for roller shades.

C. Shop Drawings: Show fabrication and installation details for roller shades, including shadeband materials, their orientation to rollers, and their seam and batten locations.

1. Motor-Operated Shades: Include details of installation and diagrams for power, signal, and control wiring.

D. Samples for Verification: For each type of roller shade.

1. Shadeband Material: Not less than 10 inches square. Mark interior face of material if applicable.
2. Roller Shade: Full-size operating unit, not less than 16 inches wide by 36 inches long for each type of roller shade indicated.
3. Installation Accessories: Full-size unit, not less than 10 inches long.

E. Product Schedule: For roller shades. Use same designations indicated on Drawings.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For roller shades to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Fabricator of products.

B. Provide the following upon request:

1. Qualification Data: For Installer.
2. Product Certificates: For each type of shadeband material.
3. Product Test Reports: For each type of shadeband material, for tests performed by manufacturer and witnessed by a qualified testing agency.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver roller shades in factory packages, marked with manufacturer, product name, and location of installation using same designations indicated on Drawings.

1.7 FIELD CONDITIONS

A. Environmental Limitations: Do not install roller shades until construction and finish work in spaces, including painting, is complete and dry and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

B. Field Measurements: Where roller shades are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operating hardware of operable glazed units through entire operating range. Notify Architect of installation conditions that vary from Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

PART 2 - PRODUCTS

2.1 MANUALLY OPERATED SHADES WITH SINGLE ROLLERS

A. Chain-and-Clutch Operating Mechanisms: With continuous-loop bead chain and clutch that stops shade movement when bead chain is released; permanently adjusted and lubricated.

1. Spring Lift-Assist Mechanisms: Manufacturer's standard for balancing roller shade weight and for lifting heavy roller shades.

B. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.

C. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated.

D. Shadebands:

1. Shadeband Material: Light-filtering fabric.

2.2 MANUALLY OPERATED SHADES WITH DOUBLE ROLLERS

A. Chain-and-Clutch Operating Mechanisms: With continuous-loop bead chain and clutch that stops shade movement when bead chain is released; permanently adjusted and lubricated.

1. Spring Lift-Assist Mechanisms: Manufacturer's standard for balancing roller shade weight and for lifting heavy roller shades.

B. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.

C. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller mounting configuration, roller assemblies, operating mechanisms, installation accessories, and installation locations and conditions indicated.

D. Inside Shadebands:

1. Shadeband Material: Light-filtering fabric.

E. Outside Shadebands:

1. Shadeband Material: Light-blocking fabric.

F. Installation Accessories:

1. Side Channels: With light seals and designed to eliminate light gaps at sides of shades as shades are drawn down. Provide side channels with shadeband guides or other means of aligning shadebands with channels at tops.

2. Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed.

2.3 MOTOR-OPERATED, SINGLE-ROLLER SHADES

A. Motorized Operating System: Provide factory-assembled, shade-operator system of size and capacity and with features, characteristics, and accessories suitable for conditions indicated, complete with electric motor and factory-prewired motor controls, power disconnect switch, enclosures protecting controls and operating parts, and accessories required for reliable operation without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.

1. Electrical Components: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2. Remote Control: Electric controls with NEMA ICS 6, Type 1 enclosure for recessed or flush mounting. Provide the following for remote-control activation of shades:
    a. Individual/Group Control Station: Momentary-contact, three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for individual and group control.
3. Crank-Operator Override: Crank and gearbox operate shades in event of power outage or motor failure.
4. Limit Switches: Adjustable switches interlocked with motor controls and set to stop shades automatically at fully raised and fully lowered positions.
5. Operating Features:
    a. Group switching with integrated switch control; single faceplate for multiple switch cutouts.
    b. Capable of interface with audiovisual control system.
    c. Capable of accepting input from building automation control system.

B. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.

C. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated.

D. Shadebands:
1. Shadeband Material: Light-filtering fabric.

2.4 MOTOR-OPERATED, DOUBLE-ROLLER SHADES

A. Motorized Operating Systems: Provide factory-assembled, shade-operator systems of size and capacity and with features, characteristics, and accessories suitable for conditions indicated, complete with electric motor and factory-prewired motor controls, power disconnect switch, enclosures protecting controls and operating parts, and accessories required for reliable operation without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.
1. Electrical Components: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Remote Control: Electric controls with NEMA ICS 6, Type 1 enclosure for recessed or flush mounting. Provide the following for remote-control activation of shades:
    a. Individual/Group Control Station: Momentary-contact, three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for individual and group control.
3. Crank-Operator Override: Crank and gearbox operate shades in event of power outage or motor failure.

4. Limit Switches: Adjustable switches, interlocked with motor controls and set to stop shade movement automatically at fully raised and fully lowered positions.
5. Operating Features:
    a. Group switching with integrated switch control; single faceplate for multiple switch cutouts.
    b. Capable of interface with audiovisual control system.
    c. Capable of accepting input from building automation control system.
    d. Override switch.

B. Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shades for service.

C. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller mounting configuration, roller assemblies, operating mechanisms, installation accessories, and installation locations and conditions indicated.

D. Inside Shadebands:
1. Shadeband Material: Light-filtering fabric.

E. Outside Shadebands:
1. Shadeband Material: Light-blocking fabric.

F. Installation Accessories:
1. Side Channels: With light seals and designed to eliminate light gaps at sides of shades as shades are drawn down. Provide side channels with shadeband guides or other means of aligning shadebands with channels at tops.
2. Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed.

2.5 SHADEBAND MATERIALS

A. Shadeband Material Flame-Resistance Rating: Comply with NFPA 701. Testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

B. Light-Filtering Fabric: Woven fabric, stain and fade resistant.

C. Light-Blocking Fabric: Opaque fabric, stain and fade resistant.

2.6 ROLLER SHADE FABRICATION

A. Product Safety Standard: Fabricate roller shades to comply with WCMA A 100.1, including requirements for flexible, chain-loop devices; lead content of components; and warning labels.

B. Unit Sizes: Fabricate units in sizes to fill window and other openings as follows, measured at 74 deg F:

1. Between (Inside) Jamb Installation: Width equal to jamb-to-jamb dimension of opening in which shade is installed less 1/4 inch per side or 1/2-inch total, plus or minus 1/8 inch . Length equal to head-to-sill or -floor dimension of opening in which shade is installed less 1/4 inch , plus or minus 1/8 inch .

2. Outside of Jamb Installation: Width and length as indicated, with terminations between shades of end-to-end installations at centerlines of mullion or other defined vertical separations between openings.

C. Shadeband Fabrication: Fabricate shadebands without battens or seams to extent possible, except as follows:

1. Vertical Shades: Where width-to-length ratio of shadeband is equal to or greater than 1:4, provide battens and seams at uniform spacings along shadeband length to ensure shadeband tracking and alignment through its full range of movement without distortion of the material.

2. Railroaded Materials: Railroad material where material roll width is less than the required width of shadeband and where indicated. Provide battens and seams as required by railroaded material to produce shadebands with full roll-width panel(s) plus, if required, one partial roll-width panel located at top of shadeband.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, operational clearances, locations of connections to building electrical system, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 ROLLER SHADE INSTALLATION

A. Install roller shades level, plumb, and aligned with adjacent units according to manufacturer's written instructions.

1. Opaque Shadebands: Located so shadeband is not closer than 2 inches to interior face of glass. Allow clearances for window operation hardware.

B. Electrical Connections: Connect motor-operated roller shades to building electrical system.

C. Roller Shade Locations: As indicated on Drawings.

3.3 ADJUSTING

A. Adjust and balance roller shades to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.

3.4 CLEANING AND PROTECTION

A. Clean roller shade surfaces, after installation, according to manufacturer's written instructions.

B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that roller shades are without damage or deterioration at time of Substantial Completion.

C. Replace damaged roller shades that cannot be repaired, in a manner approved by Architect, before time of Substantial Completion.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain motor-operated roller shades.

END OF SECTION

SECTION 12 3553 – FIXED LABORATORY CASEWORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this section.

1.2 WORK INCLUDED

A. Furnishing of materials, products, accessories, tools, equipment, services, scaffolding, ladders, transportation, supervision, labor, product protection, and other items that may not be specifically mentioned, but are necessary for the fabrication and installation of laboratory casework.

B. Furnish and install laboratory casework including, but not limited to, work surfaces, adjustable shelves, tables, standards, slotted studs, filler panels, scribes, knee space panels, accessories, casework in environmental rooms, utility space framing, utility space closure panels between base cabinets and at exposed ends of utility spaces, laboratory sinks, cup sinks, cup drains, strainers, overflows and sink outlets with integral or separate pieces, and miscellaneous items of equipment as listed in these specifications and as shown on drawings, including delivery to the building, unpacking, installing, leveling and scribing to walls and floors as required.

C. Furnish and deliver packed in boxes for receipt, handling and installation by others; electrical service fixtures, task lights including fluorescent bulbs, electrical receptacles and switches listed in these specifications and as shown on drawings as part of the laboratory casework. The above-defined items are to be supplied, not attached, and loose in boxes, properly marked for tailgate delivery.

D. Furnish and set in place for final installation and connection by other trades; service fittings where part of the laboratory casework, listed in the specifications or shown on drawings. Tailpieces shall be furnished less couplings required to connect to the trap or drain piping system. Install service fittings “finger-tight”.

E. Furnish and mount plumbing and electrical fixtures on fume hood superstructure.

1.3 RELATED WORK BY OTHER SPECIFICATION SECTIONS

A. Furnishing, installation and connection of “Service Lines” within and/or attached to equipment, slotted studs, partitions, or service tunnels, through, under or along backs of working surfaces as required for “Service Fixtures.”

B. Final installation, tightening and connecting “Service Fixtures” furnished by laboratory casework manufacturer including the pulling of wire and connecting of electrical fixtures in service lines.

C. Receiving, handling, installing and connecting separate laboratory sinks, cup sinks or drains, overflows, sink outlets and tail-pieces furnished by the laboratory casework manufacturer.

D. Furnishing, installing and connecting vents and drain lines.

E. Furnishing, installing, setting and connecting special electrical and plumbing fixtures and piping to meet local codes, even though not specifically called for in specifications and shown on drawings.

F. Furnishing, installing and connecting of ducts from fume hoods to blowers and from blowers to atmosphere.

G. Furnishing, handling and installing fans with motors (blowers).

H. Furnishing, and installation of framing or reinforcements for wall, floors and ceilings to adequately support laboratory equipment and brick, plaster, metal or wood grounds required for proper anchoring of the equipment.

I. Furnishing and installation of pipe hangers.

J. Furnishing and installation of resilient base on walls and fixed laboratory casework after laboratory casework installation is completed.

K. Furnishing in-wall exhaust duct and connection to vented cabinets.

L. Related Sections include the following:

1. Division 01 Section "Sustainable Design Requirements" for additional LEED requirements.
2. Division 06 Section "Miscellaneous Carpentry" for wood blocking for anchoring laboratory casework.
3. Division 06 Section “Interior Architectural Woodwork”.
4. Division 09 Section "Non-Structural Metal Framing" for reinforcements in metal-framed partitions for anchoring laboratory casework.
5. Division 09 Section “Gypsum Wallboard Assemblies” for reinforcements in gypsum board partitions for anchoring casework.
6. Division 09 Section "Resilient Base and Accessories" for resilient base applied to metal laboratory casework.
7. Division 11 Section "Laboratory Fume Hoods" for fume hoods.
8. Division 12 Section “Metal Laboratory Casework and Furnishings” for movable lab tables and movable base cabinets.
9. Division 22 and 26 Sections for installation of service fittings specified in this section.
10. Divisions 22 and 26 for connecting service utilities at indicated points. Piping and wiring for service fittings within casework up to point of connection are specified in this Section.

1.4 DEFINITIONS

A. MDF: Medium-density fiberboard is unacceptable material for laboratory casework.

B. Exposed Surfaces of Casework: Surfaces visible when doors and drawers are closed, including bottoms of cabinets more than 48 inches above floor, and visible surfaces in open cabinets or behind glass doors.

1. Ends of cabinets, including those installed directly against walls or other cabinets, are defined as "exposed."

C. Semi-exposed Surfaces of Casework: Surfaces behind opaque doors, such as cabinet interiors, shelves, and dividers; interiors and sides of drawers; and interior faces of doors. Tops of cabinets 78 inches or more above floor are defined as "semi-exposed."

D. Concealed Surfaces of Casework: Include sleepers, web frames, dust panels, and other surfaces not usually visible after installation.

E. Hardwood Plywood: A panel product composed of layers or plies of veneer, or of veneers in combination with lumber core, hardboard core, MDF core, or particleboard core, joined with adhesive and faced both front and back with hardwood veneers.

F. Service Fixture: Gas, air, and vacuum cocks; hot and cold reagent grade water faucets; remote control valves; electrical receptacles with necessary flush mounting boxes, conduit or pedestals and plates; light fixtures and switches; motor controls, and other items that serve as a functional part of the laboratory equipment.

G. Service Lines: Gas, air, vacuum, hot and cold reagent grade and reference grade water piping, drain lines, fittings, and shut-off valves necessary to carry respective services from the building rough-in at floor or wall through the equipment to the Service Fixture; conduit and conduit fittings, junction boxes, disconnect switches and fuses or circuit breakers necessary to carry electrical power from building rough-in at floor or wall through equipment to Service Fixtures.

H. Standards: Wall-mounted, twin-tracked supports for shelving or cabinets.

I. Slotted Studs: Double-faced, twin tracked framing members acting as a frame spanning between the utility chase and the building wall or work station at the peninsula bench assembly.

J. Laboratory Casework Contractor: The manufacturer and/or manufacturer’s representative furnishing and installing the laboratory casework, equipment, and accessories listed under these specifications, laboratory equipment schedule, and/or shown on drawings.

1.5 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Laboratory casework and support framing system, including attachments to other work, shall withstand the effects of earthquake motions determined according to California Building Code (CBC).

1.6 SUBMITTALS

A. Refer to submittal section of the General and Supplementary Specifications in Division 1 for requirements and procedures. Fabrication or purchase of any items prior to approval will be at the manufacturer's risk.

B. Product Data: For each type of product indicated.

C. LEED Submittals:

1. Product Data for Credit EQ 4.4:
    a. For composite wood products, indicating that bonding agents contain no urea formaldehyde.
    b. For adhesives used, indicating that products contain no urea formaldehyde.

D. Shop Drawings: For laboratory casework. Include plans, elevations, sections, details, and attachments to other work.

1. Indicate locations of hardware.
2. Indicate locations and types of service fittings.
3. Indicate locations of blocking and reinforcements required for installing laboratory casework.
4. Include details of utility spaces showing supports for conduits and piping.
5. Include details of support framing system.
6. Include details of exposed conduits, if required, for service fittings.
7. Indicate locations of and clearances from adjacent walls, doors, windows, other building components, and other laboratory equipment.
8. Include coordinated dimensions for laboratory equipment specified in other Sections.

E. Samples for Initial Selection: For factory-applied finishes and other materials requiring color selection.

F. Samples for Verification: For each type of cabinet finish and each type of countertop material indicated, in manufacturer's standard sizes.

G. Samples for Verification: Provide in-place mockup as described in sub section 1.8 below.

H. Stain and Finish Samples for wood Components

1. Stain for casework and miscellaneous items, shall be selected by the Architect. The laboratory casework manufacturer shall furnish stain and finish samples on same material from which the casework and miscellaneous items will be constructed for apporoval before fabrication of casework starts. Samples shall be clearly identified.
2. Stain and finish samples will be retained by University's Representative.

I. Non-Structural Lateral Force Design: Submit detailed seismic anchorage and attachment drawings and calculations provided by a California-licensed Structural Engineer in compliance with the most recent California Building Code. The submittal shall include:

1. Dimensions and location of the center of gravity of the component.
2. Weight assume dint he calculations including contents.
3. Specification of the anchorage to concrete in detail, including section and testing requirements, if any (inspection and testing to be furnished under this section, if required.)
4. Reaction loads to the supporting structure or other component.
5. If a component other than the structure is used for seismic support, the submittal shall show the adequacy of the load path to the structure or otherwise demonstrate compliance with limitations in the contract documents.
6. The submittal will be reviewed by the design professional responsible for this section of the specification to confirm that it is responsive to project specific context and criteria. The adequacy of the primary structure to resist the reaction loads imparted on the primary structure shall be reviewed and approved by the project Structural Engineer.

J. Qualification Data: For qualified manufacturer. Submit a list of at least five projects of comparable installations of similar size and scope.

K. Product Test Reports for Casework: Based on evaluation of comprehensive tests performed by a qualified testing agency, indicating compliance of laboratory casework with requirements of specified product standard and system structural performance specified in "Performance Requirements" Article.

L. Product Test Reports for Countertop Surface Material: Based on evaluation of comprehensive tests performed by a qualified testing agency, indicating compliance of laboratory countertop surface materials with requirements specified for chemical and physical resistance.

1.7 QUALITY ASSURANCE

A. Manufacturer Qualifications: A qualified manufacturer that produces casework of types indicated for this Project that has been tested for compliance with SEFA 8 and is certified for chain of custody by an FSC-accredited certification body.

B. Installer Qualifications: An authorized representative of the casework manufacturer for installation and maintenance of units required for this project.

C. Source Limitations: Though products may be manufactured by different manufacturers, obtain and install all casework, including work surfaces, sinks, service fittings and accessories, and fume hoods through one source from a single Laboratory Furniture Contractor.

D. Movable Laboratory Bench Systems must be MET Laboratories or Underwriters Laboratories (UL) 61010A-1 approved and listed. Other UL listings may be acceptable as long as the electrical requirements as shown on the drawings are satisfied. UL label shall be attached to the product.

E. Electrical components, Devices and Accessories: Listed and labeled as define in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction and marked for intended use.

F. Pre-installation Conference: Conduct a conference at the Project Site to comply with requirements in Division 1 Section “Project Management and Coordination.

G. Product Standard: Comply with SEFA 8, “Laboratory Furniture-Casework, Shelving and Tables-Recommended Practices”.

H. Product Designations: Drawings indicate sizes and configurations of laboratory casework by referencing designated manufacturer's catalog numbers. Other manufacturers' laboratory casework of similar sizes and similar door and drawer configurations and complying with the Specifications may be considered. Refer to Division 01 Section "Product Requirements."

I. Quality Standards: Comply with the following standards:

1. SEFA 1, “Laboratory Fume Hoods”
2. SEFA 2.3, “Scientific Laboratory Furniture and Equipment.”
3. SEFA 3, “Work Surfaces.”
4. SEFA 7, “Laboratory and Hospital Fixtures.”
5. SEFA 8, "Laboratory Furniture - Casework, Shelving and Tables - Recommended
6. Practices."
7. Woodwork Institute Manual of Millwork, 11th edition or American Woodworking
8. Institute, 8th edition (AWI). Includes certification.
9. ASTM A240, Heat Resistant Chromium and Chromium, Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels
10. ASTM A312, Seamless and Welded Austenitic Stainless Steel Pipe
11. ASTM D570, Water Adsorption of Plastics
12. ASTM D695, Compressive Properties of Rigid Plastics
13. ASTM D790, Fluctural Properties of Un-reinforced and Reinforced Plastics and Electrical Insulating Materials
14. ASTM E84, Test Method for Surface Burning Characteristics of Building Materials
15. ASTM A554, Standard Specification for Welded Stainless Steel Mechanical Tubing
16. ASTM A513, Standard Specification for Electric-Resistance Welded Carbon and Alloy Steel Mechanical Tubing
17. Builders Hardware Manufacturers Association (BHMA)
18. National Electrical Manufacturers Association (NEMA)
19. National Fire Protection Association (NFPA0 30, Flammable Liquid Storage
20. National Fire Protection Assocation (NFPA) 70, Electrical Components, Devices, and Accessories
21. National Particleboard Association (NPA) 8-Voluntary Standard for Formaldehyde Emission from Particleboard

1.8 MOCK-UP

A. Mockups: Construct a Type 1 (in-place) mockup of laboratory casework indicated on the Drawings, or, if not indicated, as directed by University's Representative. Refer to Division 01 Section "Quality Requirements" for additional requirements.

1. Mockup will be used to verify compliance with design intent and confirm procedures prior to completion of utility rough-ins and to serve as the standard of quality for the casework installation.

2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.9 EXCEPTIONS TO DRAWINGS AND SPECIFICATIONS

A. All exceptions shall be subject to written approval prior to receipt of bid. If no written communication is received prior to receipt of bid and approval indicated in an addendum, it is assumed that bidder will be in total compliance with specifications and will be held responsible for default or delay, regardless of any statement to the contrary in their written proposal.

B. Deviations to approved submittals without prior written approval from University shall be at risk to contractor/vendor. University Representative shall make final determination of remediation.

1.10 TESTING

A. The laboratory casework manufacturer shall be required to include in their initial submittals, certified test reports indicating compliance of their laboratory casework finish and work top materials with requirements specified for chemical and physical resistance; and confirmation of load performance for movable tables. The material test reports shall be performed by an independent testing agency qualified for testing indicated, as documented according to ASTM E548.

1.11 FIELD MEASUREMENTS

A. It is the laboratory casework manufacturer's responsibility to verify field measurements and that equipment will fit through entryways, corridors, and door openings enabling a smooth flow of equipment to its proper location in the building. Wall-to-wall counter tops are to be installed with maximum ¼" gap.

1.12 DELIVERY, STORAGE, AND HANDLING

A. Delivery of Casework shall only occur after building is entirely enclosed from exterior elements.

B. Deliver casework only after painting, utility rough-ins and similar operations that could damage, soil or deteriorate casework have been completed in installation areas.

C. If casework must be stored in other than installation areas, store only in areas where environmental conditions meet requirements specified in "Project Conditions" Article of this specification sections.

D. Keep finished surfaced covered with polyethylene film or other protective covering during handling and installation.

1.13 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install laboratory casework until building is enclosed, utility roughing-in and wet work are complete and dry, and temporary HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

B. Field Measurements: Where laboratory casework is indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication, and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

1. Locate concealed framing, blocking, and reinforcements that support laboratory casework by field measurements before being enclosed, and indicate measurements on Shop Drawings.

2. Verify field measurements and that equipment will fit through entry ways, corridors, and door openings enabling a smooth flow of equipment to its proper location in the building Wall-to-wall countertops to be installed with a maximum 1/4 inch gap.

C. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating laboratory casework without field measurements. Provide allowance for trimming at site, and coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.14 COORDINATION

A. Coordinate installation of laboratory casework with installation of fume hoods and other laboratory equipment.

1.15 WARRANTY

A. Special Warranty: Furnish a written warranty that Work performed under this Section to be and remain free from defects as to materials and workmanship for a period of one (1) years from date of acceptance. Defects in materials and workmanship that may develop within this time are to be replaced without cost or expense to the University. Manufacturer's standard form, without monetary limitation, in which manufacturer agrees to repair or replace components of laboratory casework that fail in materials or workmanship within specified warranty period. Failure includes:

1. Ruptured, cracked or stained coating.

2. Discoloration or lack of finish integrity.

3. Cracking or peeling of finish.

4. De-lamination of plastic laminate or edge banding.

5. Slippage, shift or failure of attachment to wall, floor or ceiling.

6. Weld or structural failure (visible weld marks).

7. Warping or unloaded deflection of components.
8. Sealant deterioration, shrinkage or failure.
9. Failure of hardware

1.16 EXTRA MATERIALS

A. Furnish complete touchup kit for each type and color of wood laboratory casework provided. Include scratch fillers, stains, finishes, and other materials necessary to perform permanent repairs to damaged laboratory casework finish.

B. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Cabinet Mounting Clips and Related Hardware: Quantity equal to 5 percent of amount installed, but no fewer than 20 of each type.
2. Modular Countertop Units: Two extra units of each length and material installed.

1.17 WOOD PRODUCTS

A. Wood products shall utilize an environmentally friendly, low VOC (under 2 lbs. Per gallon). Finish process, stains and finishes, shall be executed with the use of compression spray equipment capable of providing high-transfer efficiency and low waste generation. Finish material shall meet SEFA 8 chemical testing requirements.

B. Adhesive manufacturer’s product data sheets are to be provided indicating that the adhesive does not contain urea formaldehyde.

C. All plywood cores are required to have no added urea formaldehyde. This means all veneer cores and/or cross banded panels must use PVA glue lines and all composite core binders must be formaldehyde free.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 Articles, subject to compliance with requirements, provide products by one of the manufacturers specified.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term “or equal”, comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before the use of an unnamed manufacturer or product.

B. Epoxy Resin Work Surfaces and Sinks: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but are not limited to the following:

1. Kewaunee Scientific Corporation – Laboratory Division (Statesville, NC)

2. Or Equal

C. The naming of a manufacturer and designation of a product is for the purpose of identifying a basis of design. Other manufacturers capable of producing the same appearance and having the same quality, durability, and performance may be proosed for use on this project subject to approval of the University's Representative, prior to the receipt of bid.

D. Qualified Bidders must submit with their bid evidence of the successful completion of at least five (5) projects using laboratory casework s ystems and furniture of the type specified for this project.

2.2 CASEWORK RELATED MATERIALS

A. Stainless Steel:

1. Work surfaces, sinks, stainless steel accessories, shelves and shelf supports noted on drawings as "Stainless Steel" shall be type 302/304, austenitic chromium nickel stainless steel in accordance with A.I.S.I. specification containing 8% nickel and 18% chromium. Where noted as such, stainless steel components and shelf supports shall be constructed exactly as those fabricated of cold rolled sheet steel and the same gages. Exposed surfaces shall have #4 finish.

2. Work surfaces and sinks noted on drawings as "Type 316 Stainless Steel" shall be similar to type 302/304 except molybdenum is added to improve the general corrosion and pitting resistance.

B. Clear Float Glass: Complying with ASTM C 1036, Type I, Class 1, Quality q3 not less than 3.0mm thick.

C. Clear Tempered Glass: Complying with ASTM C 1048, Kind FT, Condition A, Type I, Class 1, Quality q3, not less than 3.0mm thick.

D. Clear Laminated Safety Glass: Complying with ASTM C1172, Kind LT, Condition A, Type 1, Class 1 with 2 lites not less than 3.0mm thick with clear, polyvinyl butyl interlayer.

E. Wood Door and Drawer Front Materials:

1. General: Provide materials that are selected and arranged for compatible grain and color. Do not use materials adjacent to one another that are noticeably dissimilar in color, grain, figure, or natural character markings.

2. Wood Species: White maple

3. Adhesives: Do not use adhesives that contain urea formaldehyde.

4. Hardwood Plywood: ANSI/HPVA HP-1, either veneer core or particleboard core, unless otherwise indicated, made without urea formaldehyde with face veneer of species indicated, selected for compatible color and grain. Grade A exposed faces at least 1/50 inch thick, and Grade A crossbands. Provide backs of same species as faces.

a. Face Veneer Cut: Plain sliced.

b. Particleboard: ANSI A208.1, Grade M-2, made with binder containing no urea formaldehyde. Particleboard to be used with plastic laminate work surfaces and shelves shall be of 45lb. (20.4 kg) density, and balanced. Particleboard shall meet the following requirements. Submit compliance data from the manufacturer prior to fabrication:

1)	Screw-holding, Face	247 lbs.
2)	Screw-holding, Edge	225 lbs.
3)	Modulus of Rupture	2,393 psi
4)	Modulus of Elasticity	398,900 psi
5)	Internal Bond	80 psi
6)	Surface Hardness	500 lbs.

5. Solid Wood: Clear hardwood lumber of species indicated and selected for grain and color compatible with exposed hardwood plywood, selected for compatible grain and color, with moisture content not more than 7 percent.
6. Edgebanding for Wood-Veneered Construction: 1/8” thick, continuous hardwood strip of same species as face veneer.
7. Hardboard shall meet or exceed ANSI/AHA A135.4-2012 Untempered hardboard ¼ inch (6.35mm), SIS, nominal thickness, smooth exposed side.

2.3 WOOD CABINET MATERIALS

A. General:

1. Adhesives: Do not use adhesives that contain urea formaldehyde.
2. Maximum Moisture Content for Lumber: 7 percent for hardwood and 12 percent for softwood.
3. Hardwood Plywood: HPVA HP-1, either veneer core or particleboard core, unless otherwise indicated, made without urea formaldehyde.
4. Particleboard: ANSI A208.1, Grade M-2, made with binder containing no urea formaldehyde.
5. Hardboard: AHA A135.4, Class 1 Tempered.
6. Edgebanding for Wood-Veneered Construction: Minimum 1/8” thick, continuous hardwood strip of same species as face veneer.

B. Exposed Materials:

1. General: Provide materials that are selected and arranged for compatible grain and color. Do not use materials adjacent to one another that are noticeably dissimilar in color, grain, figure, or natural character markings. No water stains, no sharp contrasts at veneer joints will be accepted.
2. Wood Species: White maple.
3. Stain Colors and Finishes: As selected by the Architect from manufacturer’s full range.

4. Plywood: Hardwood plywood with face veneer of species indicated, selected for compatible color and grain. Grade A exposed faces at least 1/50 inch thick, and Grade J crossbands. Provide backs of same species as faces; Grade A.
   a. Face Veneer Cut: Plain sliced.
5. Solid Wood: Clear hardwood lumber of species indicated and selected for grain and color compatible with exposed hardwood plywood, selected for compatible grain and color.

C. Semi-exposed Materials:
1. Solid Wood: Sound hardwood lumber, selected to eliminate appearance defects, of any species similar in color and grain to same species as exposed solid wood.
2. Plywood: Hardwood plywood of any species similar in color and grain to same species as exposed plywood. Grade 1 faces and Grade B crossbands. Provide backs of same species as faces.
3. Provide solid wood or hardwood plywood for semi-exposed surfaces unless otherwise indicated.

D. Concealed Materials:
1. Solid Wood: Any species, with no defects affecting strength or utility.
2. Plywood: Hardwood plywood. Provide backs of same species as faces.
3. Particleboard.
4. Hardboard.
5. MDF is prohibited.

2.4 AUXILIARY CABINET MATERIALS

A. Acid Storage-Cabinet Lining: 1/4-inch- thick, polyethylene or polypropylene lining material.

B. Glass for Glazed Doors: Clear laminated tempered glass complying with ASTM C 1172, Kind LT, Condition A, Type I, Class I, Quality-Q3; with 2 lites not less than 3.0 mm thick and with clear, polyvinyl butyral interlayer.

2.5 COUNTERTOP, SHELF, AND SINK MATERIALS

A. Epoxy: Factory-molded, modified epoxy-resin formulation with smooth, nonspecular finish.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Kewaunee Scientific, Kemresin
   b. Durcon Company (The).
2. Physical Properties:
   a. Compressive Strength: 38,400 psi
   b. Flexural Strength: 14,900 psi
   c. Tensile Strength: 14,000 psi

d. Modulus of Elasticity: Not less than 2,000,000 psi.

e. Hardness (Rockwell M): Not less than110.

f. Water Absorption (24 Hours): 0.008%

g. Heat Distortion Point: 325 degrees F

h. Fore Resistance: Self-Extinguishing

3. Chemical Resistance: Epoxy-resin material has the following ratings when tested with indicated reagents according to NEMA LD 3, Test Procedure 3.4.5:

a. No Effect: Acetic acid (98 percent), acetone, ammonium hydroxide (28 percent), benzene, carbon tetrachloride, dimethyl formamide, ethyl acetate, ethyl alcohol, ethyl ether, methyl alcohol, nitric acid (70 percent), phenol, sulfuric acid (60 percent), and toluene.

b. Slight Effect: Chromic acid (60 percent) and sodium hydroxide (50 percent).

4. Color: Black.

2.6 WOOD CABINETS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Kewaunee Scientific Corporation, Laboratory Products Group

2. OC River

3. Mott

4. Or equal.

B. Design: Cabinet construction shall meet AWI or WI, Flush Overlay.

1. Cabinet construction shall meet AWI/WI, Flush Overlay, requirements and specifically meet the following tolerances: The gap between doors, drawers, and pull out boards shall be consistently straight and not exceed 1/8 inch. It is intended that the vertical gap between door, drawer head and pull out boards between adjacent cabinets shall not exceed 1/8 inch. These criteria will require the doors, drawer heads and pull out boards be no further than 1/16 inch from the exterior vertical edge of the cabinet. To achieve these tolerances, the hinge must be countersunk into the door side. Wall cabinets with hinged doors shall meet the same gap tolerances as base cabinets.

2. The top edge of drawers must be no more than 1/8 inch below the top panel of movable cabinets.

3. See subsection 3.2 – Install level, plumb and true using shims as required.

4. Grain Direction: Aligned vertically.

5. Vertical on both doors and drawer fronts, with continuous vertical matching.

6. Lengthwise on face frame members.

7. Vertical on end panels.

8. Side to side on bottoms and tops of units.

9. Vertical on knee-space panels.

10. Horizontal on aprons and table frames.

Where noted as such, provide wall-mounted casework that matches all other laboratory casework in design and material. The assembly must be capable of supporting an equipment load of at least 150lb per running foot above and beyond the weight of the assembly.

C. Sides of all sectional units shall be considered exposed and shall be finished accordingly.

D. Veneer Matching:

1. Veneers on doors, drawer heads, cabinet sides, inside and out, and other exposed surfaces shall be Grade A plain sliced maple with grains vertical. Door and drawer heads within the same cabinet shall be cut and vertically matched from the same sheet of veneer and book matched.

2. Provide veneers for each cabinet from a single flitch, slip and running matched

E. Units, except cabinets with casters or glides, shall have backs with removable panels for access to the pipe spaces at the rear of the units. Removable panels shall be provide in sides of units where units occur in the corners of the rooms and access is required to the pipe spaces. These removable panels shall be designed to permit removable utilizing only a screwdriver through the front of the units and no intermediate rails between drawers are required. Construction: Provide wood-faced laboratory casework of the following minimum construction:

1. Bottoms of Base Cabinets and Tall Cabinets: 3/4-inch- thick hardwood with exposed edge faced with ¼" continuous hardwood strip of same species as exposed providing a flush integral part of the case.

2. Tops and Bottoms of Wall Cabinets and Tops of Tall Cabinets: 1-inch- thick 9-ply veneer-core hardwood plywood with exposed edge faced with 1/8 inch minimum continuous hardwood strip of same species as exposed.

3. Ends of Cabinets: 3/4-inch- thick hardwood plywood with front exposed edges faces with a 1/8 inch minimum continuous hardwood strip of same species as exposed. End panels shall be glued to horizontal frame units and to solid bottom panels. Joint construction shall be blind, not extended to face of cases. Joinery shall be blind mortise and tenon, multiple doweled, interlocking mechanical or stopped tongue and groove

4. Shelves: 3/4-inch thick veneer-core hardwood plywood. Provide hardwood edgebanding on front and back.

5. Base Cabinet Top Frames: ¾-inch-by-2-1/2 inch solid wood with mortise and tenon or doweled connections, glued and pinned or screwed.

6. Toe spaces shall be nominally 3-inches deep and 4-inches high, fully enclosed and in top.
   a. Horizontal Front and Rear: 2-1/2" x 1" hardwood.
   b. Side: 3/4" x 1-1/2" hardwood.
   c. Intermediate Horizontal Front and Rear: 1-1/2" x 3/4" hardwood (where locks are required or over cupboards).

7. Base Cabinet Stretchers: 3/4-by-4-1/2-inch panel product strips or solid wood boards at front and back of cabinet, glued and pinned or screwed.

8. Backs of Cabinets: 3/4-inch- thick, hardwood plywood where exposed, 1/4-inch- thick hardboard dadoed into sides, bottoms, and tops where not exposed, dadoed into sides, bottoms and tops. Removable backs shall be removable from inside the cabinet with aminimal use of tools. Provide 1 inch x 1 inch cleats, top, bottom, and sides, at the rear corners of the cabinet to fasten the removable panel.

9. Fixed Backs of Movable Cabinets: ¾ inch thick 7-ply veneer faced plywood where exposed, doweled, and rabbeted into end panels.

10. Drawer Fronts: 3/4-inch- thick, hardwood plywood with hardwood faced veneers, edge banded with 1/8 inch solid hardwood. Drawer fronts shall be fastened to the drawer bodies with screws.

11. Drawer Sides and Backs: 1/2-inch-thick, solid hardwood or 9 ply veneer-core hardwood plywood with Baltic birch veneer, with glued dovetail or multiple-dowel joints.

12. Drawer Bottoms: 1/4-inch- thick, veneer core hardwood plywood bottoms glued and dadoed into front, back, and sides of drawers. Use 1/4-inch-thick material for drawers 36 inches wide or greater.

13. Doors 48 Inches High or Less: 3/4 inch thick, with particleboard cores and hardwood face veneers and crossbands.

14. Doors More Than 48 Inches High: 3/4 inch thick, five ply lumber core, and hardwood face veneers and crossbands.

15. Stiles and Rails of Glazed Doors 48 Inches High or Less: 3/4-inch- five ply lumber core with hardwood face veneers and crossbands. Mechanical joint fasteners not permitted. Joints shall be mortise and tenon. Sawing pattern on stiles and rails shall match the veneer cut of panel products.

16. Stiles and Rails of Glazed Doors More Than 48 Inches High: 3/4-inch- thick, solid wood with hardwood face veneers.

2.7 WOOD CABINET FINISH

A. Preparation: Sand lumber and plywood before assembling. Sand edges of doors, drawer fronts, and molded shapes with profile-edge sander. Sand after assembling for uniform smoothness at least equivalent to that produced by 600-grit sanding and without machine marks, cross sanding, or other surface blemishes.

B. Staining: Remove fibers and dust and apply stain to exposed and semi-exposed surfaces as necessary to match approved Samples. Apply stain in a manner that will produce a consistent appearance.

1. Exposed and semi exposed surfaces shall be first coated with a stain or toner to secure the desired color. The color coat shall be thoroughly dried. Wood finish shall consist of two coats of a chemical resistant finish applied and thoroughly dried and cured providing a semi-gloss finish. When a natural finish is required, the color coat is omitted. Stain shall be as selected by the Architect.

2. Concealed Surfaces shall receive a double pass coat of resinous sealer.

3. Stain Color: As selected by University’s Representative from manufacturer's full range.

C. Chemical-Resistant Finish: Apply laboratory casework manufacturer's standard two-coat, chemical-resistant, transparent finish. Sand and wipe clean between coats. Topcoat(s) may be omitted on concealed surfaces.

1. Chemical and Physical Resistance of Finish System: Finish complies with acceptance levels of cabinet surface finish tests in SEFA 8. Acceptance level for chemical spot test shall be no more than four Level 3 conditions.

2.8 HARDWARE

A. General: Provide laboratory casework manufacturer's standard, satin-finish commercial-quality, heavy-duty hardware complying with requirements indicated for each type.

B. Hinges: Stainless-steel, 5-knuckle hinges complying with BHMA A156.9, Grade 1, with antifriction bearings and rounded tips. Provide 2 for doors 48 inches high or less and 3 for doors more than 48 inches high.

C. Hinged Door and Drawer Pulls: Stainless steel back-mounted pulls. Provide 2 pulls for drawers more than 24 inches wide.

1. Design: Wire pulls.
2. Overall Size: 1 by 4 inches.
3. Fastened to the back with two screws.
4. Drawer and pullout board pulls shall be installed horizontally, door pulls shall be installed vertically. Wall cabinets and floor storage cabinet pulls should be located for reaching convenience and ADA accessibility guidelines.

D. Door Catches: Nylon-roller spring catches. Provide 2 catches on doors more than 48 inches high.

E. Drawer Slides: Shall be self-closing, ball bearing, full extension zinc plated assembly that will allow the drawer body to be completely exposed and physically accessible. Drawer slides shall have an integral stop mechanism to avoid inadvertent removal. Assembly shall be typically rated for 100 lbs. at full extension, dynamic load. Slides shall be Accuride Model 3832-SC, or equal as manufactured by Kewaunee Scientific. Drawer slides for file or bind drawers shall be ball bearing, full extension size plated assembly that will allow the drawer body to be completely exposed and physically accessible. Assembly shall be typically rated for 150 lbs. at full extension, dynamic load. Slide shall be Accuride Model 4034, or equal as manufactured by Kewaunee Scientific.

F. Label Holders: Stainless steel, aluminum, or chrome plated; sized to receive standard label cards approximately 1 by 2 inches, attached with screws or rivets. Provide where indicated.

G. Standards: Surface mounted adjustable shelves, shall be mounted to twin-tracked standards. Standards shall be coated with an epoxy powder coating complying with BHMA A156.9 Types B04102 with a nominal cross section of 1-1/2 inch x 1/2 inch (38.1mm x 12.7mm). Acceptable manufacturers shall be Reeve, Fixture Hardware Manufacturing Corporation, and Knape and Vogt. Standards and slotted studs shall have a fully compatible slot pattern. Fasten standards to concrete masonry walls or properly blocked steel studded walls with appropriate flat head screws. Adjustable shelves, wall cabinets and drying racks will be furnished with integral mounting brackets or clips.

H. Slotted Studs: Adjustable shelves, wall cabinets and drying rack boards mounted above peninsula or island benches shall be mounted to a welded double-sided, twin tracked stud assembly. Assembly shall be fabricated of 14 gage, fully welded with welds concealed, steel tube with slots laser cut into uprights and be coated with an epoxy powder coat. Acceptable manufacturers shall be Reeve, Fixture Hardware Manufacturing Corporation, and Knape and Vogt. Slotted studs and standards shall have a fully compatible slot pattern. Adjustable shelves, wall cabinets and drying racks shall be furnished with integral mounting brackets or clips to meet design load.

I. Glazing in doors shall be installed on a foam cushion with the glazing tape installed on sides trimmed below the level of the frame and glazing stops. Glazing stops shall be of the same material and finish as the cabinet door.

J. Locks for Wood Cabinets: Cam type, five-pin tumbler type brass with chrome-plated finish; complying with BHMA A156.11, Type E07281.Locks and lock housings shall be fully concealed within the drawer heads and doors. The lock tongues shall engage the rails or stiles when in locked position. Install theft panels above each drawer or cupboard segment in order to isolate locked section.

1. Provide a minimum of two keys per lock and two master keys.
2. Provide where shown.
3. Keying: Key each lock separately.
4. Master Key System: Key all locks to be operable by master key.

2.9 COUNTERTOPS, SHELVES, AND SINKS

A. Countertops, General: Provide units with smooth surfaces in uniform plane free of defects. Make exposed edges and corners straight and uniformly beveled. Provide front and end overhang of 1 inch, with continuous drip groove on underside 1/2 inch from edge.

B. Sinks, General: Provide sizes indicated or laboratory casework manufacturer's closest standard size of equal or greater volume, as approved by University’s Representative.

1. Outlets: Provide with strainers and tailpieces, NPS 1-1/2, unless otherwise indicated.
2. Overflows: Provide with stainless-steel strainers and tailpieces. Sinks shall be equipped with an overflow that is connected directly to the tailpiece. Overflow shall consist of an outlet located 2 inches below the sink rim and ½ inch diameter minimum flexible typgon or polypropylene tubing to connect to overflow to tailpiece whichs hal be modified to accept tubing. For ADA Accessible sinks, provide standpipe correctly sized for depth of sink.

3. Provide with stainless-steel strainers and tailpieces. Sinks shall be equipped with an overflow that is connected directly to the tailpiece. For ADA Accessible sinks, provide standpipe correctly sized for depth of sink.

C. Epoxy Countertops and Sinks:

1. Countertop Fabrication: Fabricate with factory cutouts for sinks, holes for service fittings and accessories, and with butt joints assembled with epoxy adhesive and concealed metal splines. Provide work surfaces in maximum lengths as possible to minimize seams.
   a. Countertop Configuration: Flat, 1 inch thick, with beveled edge and corners, and with drip groove and applied backsplash. At fume hoods, tops shall be 1 ¼ inch thick.
   b. Countertop Construction: Uniform throughout full thickness.
   c. Curbs shall be 4 inches high and ¾ inch thick of the same material as the work surfaces and shall be provided at the rear of work surfaces on end returns. Curbs shall be bonded to the surface of the top using epoxy adhesive to form a square joint.The gap betweent he curb and wall is to be sealed with silicone sealant, color matched to the work surface.
   d. Joints between work surfaces shall be smooth, even, square, 1/8 inch wide maximum.
2. Sink Fabrication: Molded in 1 piece with smooth surfaces, radiused corners, and bottom sloped to outlet; 1/2-inch minimum thickness, the same color as the surrounding work surface.
   a. Provide with an outlet, removable polypropylene disc strainers and tailpieces. ADA sink trap covers shall be specified under Division 22.
3. Provide raised (marine) edge around perimeter of countertops at sinks, where indicated; pitch two ways to sink to provide drainage without channeling or grooving.
4. Punch holes for service fittings at factory.
5. Reinforce underside of countertop with channels or use thicker metal sheet where necessary to insure rigidity without deflection.
6. Weld shop-made joints.
7. Where field-made joints are required, provide hairline butt-joints mechanically bolted through continuous channels welded to underside at edges of joined ends. Keep field jointing to a minimum.
8. After fabricating and welding, grind surfaces smooth and polish as needed to produce uniform, directionally textured finish with no evidence of welds and free of cross scratches. Passivate and rinse surfaces; remove embedded foreign matter and leave surfaces clean.
9. Provide sinks for drop-in installation with ¼ thick (6mm) thick lip around perimeter of sink. Top edge of sink shall be positioned 1/8 inch below the work surface with a 30 degree bevel from the top of the work surface to the top of the sink rim.
10. Sink supports: Epoxy sinks mounted in epoxy resin work surfaces shall be supported on steel channels under the sink and compressed by screw type rods to insure a tight fit to the underside of the work surface with a waterproof compound.

11. .Provide with integral rims except where located in stainless-steel countertops.
12. Apply 1/8-inch- thick coating of heat-resistant, sound-deadening mastic to undersink surfaces.
13. Traps furnished under Division 22.

D. Cup Sinks

1. Epoxy 3 by 6 inch oval. Provide with polypropylene strainers and integral tailpieces.

2.10 MOVABLE BASE CABINETS

A. Movable Base Cabinets: Cabinets with casters or otherwise noted shall be constructed as follows:

1. Movable cabinet shall be nominally 34 inches high. The top of the base cabinet shall be plastic laminate (color selected by the Architect) with 3/4 (19mm) wide x 5/32 inch (4 mm) thick edge banding on four sides. Movable cabinets shall have a finished 12 gage metal plate across the full bottom face of the cabinet through which casters shall be attached. Interior bolt heads for casters shall be countersunk.
2. Where noted on the drawings, cabinets with casters shall be constructed without toe spaces. The cabinet shall be constructed with a reinforced base capable of supporting a 4 inch (100mm) high caster assembly in each corner. Casters shall be swivel, locking type on front and fixed type on rear, rated for minimum 250 pounds (113.4 KG) load each. Casters shall be equal to Algood Model S5033-SRG, soft rubber wheeled casters. The entire assembly shall be reinforced to permit mobility without twisting. Casters shall be through-bolted through bottom of cabinet at all four bolts and interior bolt heads shall be countersunk to conceal bolt heads. Allow sufficient clearance between top of cabinet and underside of work surfaces or apron to facilitate movement. Cabinets with casters shall be completely finished including 3mm edge banding on four sides, top and bottom since surfaces are considered exposed. Cabinets shall have a minimum 45 lbs. counterweight in the rear of the cabinet to help prevent tip over of the cabinet.
3. Drawer units must be equipped with a drawer interlock mechanism so that only one drawer in a vertical stack can be opened at one time. Interlock unit shall be integral part of the drawer slide unit equal to Accuride Model 3641 and companion slide Model 3642.

2.11 MECHANICAL SERVICE FITTINGS (PROVIDED BY DIV. 22)

A. Manufacturers. Service fittings shall be manufactured by:

1. Water Saver Corporation
2. Chicago Faucets
3. Broen Faucets
4. Or Equal

B. Mechanical service fixtures shall comply with SEFA 7, “Laboratory and Hospital Fixtures-Recommended Practices. Fixtures for liquids and gaseous mixtures shall have lettered and colored indexes for each service. Handles shall be the four-arm type, with color coded index tabs identifying utility. Serrated hose ends shall have seven (7) serrations. Fixtures for gas, air and vacuum shall be needle valve, large type. Water fixtures shall be compression type. Drain fittings shall be polypropylene unless otherwise noted. Fixtures that serve special gases (N2, O2, etc.) and instrument air shall be lubricated, cleaned, capped protected, and delivered certified for “Oxygen” service.

1. Provide fittings complete with washers, locknuts, nipples and other installation accessories necessary for final connection. Include the deck flanges, escutcheons, handle extension rods and similar items.

C. Materials: Plumbing fixtures, except for drain fixtures and fittings, shall be a forged red-brass composition containing at least 85% copper with washers and seats, of maximum wear resistant materials for the specific use. Reagent grade water fixture to be brass gooseneck type with an internal polypropylene lining that permits recirculation to the manual outlet.

D. Needle Valves (Large): Provide large needle valves with a renewable valve seat and floating cone made of stainless steel or Monel metal with removable serrated outlet.

E. Compression Water Valves: Provide units complying with ASME A112.18.1. Compression water valves shall have a renewable unit containing all working parts, including a stainless steel replaceable seat and valve disc. Unit shall be broached on the outside for permanent position in the valve body. The unit shall contain an integral control device for volume of water discharged by the faucet. The valve shall have a removable serrated hose unless otherwise noted. Valve shall be rated for 125 psi (857 kPa) operating pressure with a max of 190 psi (1303 kPa) for intermittent use.

F. Faucet Accessories: Hot and cold water combination sink faucets shall have aerator tips. Cup sink and reagent grade water faucets to have serrated hose ends. Faucets are to be swivel type except reagent grade water.

G. Industrial Water Sign: 1/8 inch thick black laminated plastic with engraved white letters “INDUSTRIAL WATER DO NOT DRINK”. Provide a sign at all industrial hot and industrial cold water valves. At panel mounted valves mount sign on panel above valve handle and at all gooseneck fixtures provide with 3/8 inch thick split ring mounting bracket.

H. Hand Held Eye Wash: Where indicated with designation “EW” on floor plans, provide a unit that consists of a dual head eye wash assembly, 6 feet (1828.8mm) length of rubber hose, work surface mounting stand, slip ring mechanism to allow for hands free operation and in-line vacuum breaker. Unit’s finish to match other service fittings.

I. Service Identification. Index buttons mounted in fixture handles shall identify the following services. Buttons shall be color-coded and lettered.

	SERVICE	LETTERING	DISC COLOR
1.	Hot Water	HW	Red
2.	Cold Water	CW	Green

3.	Gas	Gas	Blue
4.	Air	Air	Orange
5.	Vacuum	Vac	Yellow
6.	Reagent Grade Water	RO	White
7.	Nitrogen	N2	Brown
8.	Carbon Dioxide	CO2	Pink

J. Service Fixture Finish. Laboratory brass service fixtures shall be ground smooth, coated with polished chromium plated finish with a clear epoxy coating. Fixtures shall receive multiple applications of coating and are baked for polymerization. Units must be assembled before coating and pressure tested before shipment.

K. Fixture Shipment. Fixtures shall be assembled in factory and supplied loose except for fume hood factory mounted fixtures.

2.12 DRYING RACKS

A. Stainless Steel drying racks, as manufactured by Inter Dyne Systems, Inc. (Norton Shores, MI.) or ISEC, Inc shall be furnished with removable rounded-tip white polypropylene pegs.

B. Stainless steel drip trough, 1/4 inch (6mm) diameter drip trough outlet and flexible clear rubber tubing between drip trough outlet and sink (cut as required). Provide anti-splash screen in trough.

C. Drying racks at umbilical shall be furnished with integral clips to attach to standards. Drying rack size and configuration shall be as indicated on the Drawings.

D. Provide continuous silicone sealant at intersection between drying rack and trough.

2.13 ELECTRICAL FIXTURES

A. General: Provide electrical fixtures in accordance with requirements in Division 26, complete with metal enclosure boxes, receptacles, terminals, switches, pilot lights, device plates, accessories and grommets. Cover plates to be stainless steel. Standard receptacles shall be black, receptacles connected to emergency power shall be red.

B. Electrical Raceways: Electrical raceways mounted directly to partitions, reagent shelves or slotted studs will be supplied and installed under Division 26 Electrical.

C. Task Lights. Task lights located at desks and under first shelf shall be [supplied] and [installed] by the casework manufacturer. Provide cutout at rear of desks to facilitate conduit connection to task lighting. Units shall be as follows:

1. ETL Listed LED Fixtures: Unit to be Reed Premier high output unit, as manufactured by Light Corp, Grand Haven, MI. Task lights by other manufacturers must be equal in appearance, light type, and performance (light level and quality at work surface, actuation.)

2. Dimensions: 2” wide by 17” or 30” long. Nominal Dimensions: Fixtures to be manufacturer’s standard lengths in longest possible size as appropriate for shelf length. Daisy chain multiple fixtures on each lab bench or wall elevation.
3. Housing: Clean anodized aluminum.
4. Color: Silver aluminum with white end caps. Power cord shall be black.
5. Cord: Length of cord shall be 9’-0” with 15W power supply. Provide cord management.
6. Unit must include a single touch on/off switch with touch-and-hold dimmer switch, allowing for 100% to 15% intensity. Fixture must include automatic turn off function after 10 hours (±15 minutes)
7. LED rated lifespan: 50,000 hours
8. Color Temperature: 3500K
9. Color Rendering Index: 84
10. Installation: Fixtures shall be mechanically fastened to underside of bottom shelf.

D. Pedestal Outlets. Pedestal outlets shall be provided where noted (E1, E2). They shall be fabricated of cast aluminum, sloped single face or two faces, as indicated, with neoprene gasket under base and with concealed mounting holes in base for attaching to laboratory casework. Provide holes tapped for conduit. and be finished with a brushed finish to match the Electrical Raceway. The “E1” designation indicates that is a double duplex 110v, 20 amp outlet single (Double) face. The “E2” designation indicates that it is a 220v, 20 amp outlet single (Double) face.

E. Receptacles: Comply with NEMA WD 1, NEMA WD6, FS W-596 and UL 498, duplex type, Configuration 5 20R. Casework manufacturer will be responsible for providing appropriate cutout in their equipment to accommodate the outlet.

1. Receptacle Grade: Hospital grade, unless otherwise noted.
2. GFCI Receptacles: Comply with UL 943, Hospital grade.

F. Cover Plates: Provide satin finish, Type 304 stainless steel cover plates with formed, beveled edges.

G. Cover Plate Identification: Use 1/4 inch (6mm) high letters. On stainless steel or chrome- plated metal, stamp or etch plate and fill in letters with black enamel. Provide at the following locations:

1. Receptacles other than standard 120v duplex, grounding type. Indicate voltage and phase.
2. Switches and thermal overload switches. Indicate equipment being controlled.
3. Pilot lights when located remotely from associated equipment or switch, where function is not obvious. Indicate equipment being controlled.
4. Receptacles, switches and other locations indicated.

2.14 WALL MOUNTED CASEWORK

A. Where noted on drawings, provide wall-mounted casework that matches all other laboratory casework in design and material. The assembly's construction however, must be modified to withstand the rigors of being mounted directly to the wall and suspended above the floor, without sagging or effecting the door or drawer operation. The assembly must be capable of supporting an equipment load of at least 150 lb. (68.04kg) per running foot (304.8mm) above and beyond the weight of the assembly.

2.15 WIRE SHELVING

A. Where noted on the Drawings, provide a wire shelving assembly that is 18 inches deep and 74 inches high. The entire assembly, consisting of a series of shelving units, shall be bolted together for overall stability and be installed in accordance with local seismic requirements.

B. Shelving assembly shall consist of five tiers of wire shelving mounted on steel posts; one in each corner of each shelf. Each post shall have a leveling device. Shelves shall be adjustable in 1inch increments.

C. Each four-foot length of shelf shall support up to 400 lbs.

D. Shelving material shall be steel wire with polished chrome finish.

E. Units shall be similar to Super Erecta Shelving as manufactured by InterMetro Wire Corporation (Wilkes Barre, PA.)

2.16 OVERHEAD SERVICE CARRIER

A. Description: Construct of metal framing system components as manufactured by Unistrut Corporation, Elcen, Grinnell Power-Strut, or equal. Unistrut part numbers are referenced.

B. The entire assembly, including diagonal braces, shall be securely and rigidly fastened to structural slab above or to a structural grid where provided.

C. Paint assembly with color selected by the Architect.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances, location of reinforcements, and other conditions affecting performance of laboratory casework.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 JOB SITE CONDITIONS

A. Coordinate with the General Contractor to verify that required backing and reinforcements are in place, secure, and accurately located and that project is ready for installation of laboratory casework.

B. Proceed with work when conditions permit Work to be installed in complete accordance with the original design, accepted submittals, and the manufacturer's written instructions.

C. In the event of discrepancy, immediately notify the Architect in writing. Do not proceed with the installation in areas of discrepancy until issues have been resolved.

3.3 INSTALLATION OF CABINETS

A. Comply with installation requirements in SEFA 2.3. Install level, plumb, and true; shim as required, using concealed shims. Where laboratory casework abuts other finished work, apply filler strips and scribe for accurate fit, with fasteners concealed where practical. Do not exceed the following tolerances:

1. Variation of Tops of Base Cabinets from Level: 1/16 inch in 10 feet.
2. Variation of Bottoms of Upper Cabinets from Level: 1/8 inch in 10 feet.
3. Variation of Faces of Cabinets from a True Plane: 1/8 inch in 10 feet.
4. Variation of Adjacent Surfaces from a True Plane (Lippage): 1/32 inch.
5. Variation in Alignment of Adjacent Door and Drawer Edges: 1/16 inch.

B. Utility-Space Framing: Secure to floor with two fasteners at each frame. Fasten to partition framing, wood blocking, or metal reinforcements in partitions and to base cabinets.

C. Base Cabinets: Fasten cabinets to utility-space framing, partition framing, wood blocking, or reinforcements in partitions with fasteners spaced not more than 24 inches o.c. Bolt adjacent cabinets together with joints flush, tight, and uniform.

D. Where base cabinets are installed away from walls, fasten to floor at toe space at not more than 24 inches o.c. and at sides of cabinets with not less than 2 fasteners per side.

E. Wall Cabinets: Fasten to hanging strips, masonry, partition framing, blocking, or reinforcements in partitions. Fasten each cabinet through back, near top, at not less than 24 inches o.c.

F. Install hardware uniformly and precisely. Set hinges snug and flat in mortises.

G. Adjust laboratory casework and hardware so doors and drawers align and operate smoothly without warp or bind and contact points meet accurately. Lubricate operating hardware as recommended by manufacturer.

3.4 INSTALLATION OF COUNTERTOPS

A. Comply with installation requirements in SEFA 2.3. Abut top and edge surfaces in one true plane with flush hairline joints and with internal supports placed to prevent deflection. Locate joints only where shown on Shop Drawings.

B. Field Jointing: Where possible, make in same manner as shop-made joints using dowels, splines, fasteners, adhesives, and sealants recommended by manufacturer. Prepare edges in shop for field-made joints.

1. Use concealed clamping devices for field-made joints in plastic-laminate countertops. Locate clamping devices within 6 inches of front and back edges and at intervals not exceeding 24 inches. Tighten according to manufacturer's written instructions to exert a uniform heavy pressure at joints.

C. Fastening:

1. Secure countertops, except for epoxy countertops, to cabinets with Z-type fasteners or equivalent, using two or more fasteners at each cabinet front, end, and back.

2. Secure epoxy countertops to cabinets with epoxy cement, applied at each corner and along perimeter edges at not more than 48 inches o.c.

3. Where necessary to penetrate countertops with fasteners, countersink heads approximately 1/8 inch and plug hole flush with material equal to countertop in chemical resistance, hardness, and appearance.

D. Provide required holes and cutouts for service fittings.

E. Seal unfinished edges and cutouts in plastic-laminate countertops with heavy coat of polyurethane varnish.

F. Provide scribe moldings for closures at junctures of countertop, curb, and splash with walls as recommended by manufacturer for materials involved. Match materials and finish to adjacent laboratory casework. Use chemical-resistant, permanently elastic sealing compound where recommended by manufacturer.
1. Gap between countertop and adjacent wall shall not exceed ¼-inch.

G. Carefully dress joints smooth, remove surface scratches, and clean entire surface.

3.5 INSTALLATION OF SINKS

A. Comply with installation requirements in SEFA 2.3.

B. Drop-in Installation of Epoxy Sinks: Rout groove in countertop to receive sink rim if not prepared in shop. Set sink in adhesive and fill remainder of groove with sealant or adhesive. Use procedures and products recommended by sink and countertop manufacturers. Remove excess adhesive and sealant while still wet and finish joint for neat appearance.

3.6 INSTALLATION OF LABORATORY ACCESSORIES

A. Install accessories according to Shop Drawings, installation requirements in SEFA 2.3, and manufacturer's written instructions.

B. Securely fasten adjustable shelving supports, stainless-steel shelves, and pegboards to partition framing, wood blocking, or reinforcements in partitions.

C. Install shelf standards plumb and at heights to align shelf brackets for level shelves. Install shelving level and straight, closely fitted to other work where indicated.

D. Securely fasten pegboards to partition framing, wood blocking, or reinforcements in partitions.

3.7 ADDITIONAL LABORATORY CASEWORK

A. Furnish additional laboratory casework over and above the quantities indicated on the Drawings. All components are to be supplied loose and will be stored in a location to be designated by the University. Include delivery and all handling necessary to satisfy the storage requirements of the University. All components shall be stored with protective packaging and clearly marked for future identification.

3.8 CLEANING AND PROTECTING

A. Clean finished surfaces, touch up as required, and remove or refinish damaged or soiled areas to match original factory finish, as approved by University's Representative.

B. Clean work surfaces leaving tops free of grease and streaks. Use no wax or oils.

C. Protect against soiling and deterioration during remainder of construction period.

D. Protect work surfaces and ledges for the remainder of the construction period with ¼ inch corrugated cardboard or equal completely covering the top and securely taped to edges. Mark cardboard in large lettering "No Standing,"

END OF SECTION 12 3553

SECTION 12 3553.13 METAL LABORATORY CASEWORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 WORK INCLUDED

A. Furnishing of materials, products, accessories, tools, equipment, services, scaffolding, ladders, transportation, supervision, labor, product protection, and other items that may not be specifically mentioned, but are necessary for the fabrication and installation of laboratory casework.

B. Furnish and install laboratory casework including, but not limited to, work surfaces, adjustable shelves, tables, standards, slotted studs, filler panels, scribes, knee space panels, accessories, casework in controlled environment rooms, utility space framing, utility space closure panels between base cabinets and at exposed ends of utility spaces, laboratory sinks, strainers, overflows and sink outlets with integral or separate pieces, and miscellaneous items of equipment as listed in these specifications and as shown on drawings, including delivery to the building, unpacking, installing, leveling and scribing to walls and floors as required.

C. Furnish and deliver packed in boxes for receipt, handling and installation by others; electrical service fixtures, task lights, electrical receptacles and switches listed in these specifications and as shown on drawings as part of the laboratory casework. The above-defined items are to be supplied, not attached, and loose in boxes, properly marked for tailgate delivery.

D. Furnish and set in place for final installation by other trades; service fittings where part of the laboratory casework, listed in the specifications or shown on drawings. Tailpieces shall be furnished less couplings required to connect to the trap or drain piping system. Install service fittings “finger-tight”.

E. Furnish and mount plumbing and electrical fixtures on fume hood superstructure.

1.3 RELATED WORK BY OTHER SPECIFICATION SECTIONS

A. Furnishing, installation and connection of “Service Lines” within and/or attached to equipment, slotted studs, partitions, service tunnels or service turrets, through, under or along backs of working surfaces as required for “Service Fixtures.”

B. Final installation, tightening and connecting “Service Fixtures” furnished by laboratory casework manufacturer including the pulling of wire and connecting of electrical fixtures in service lines.

C. Receiving, handling, installing and connecting separate laboratory sinks, drains, overflows, sink outlets and tail-pieces furnished by the laboratory casework manufacturer.

D. Furnishing, installing and connecting vents and drain lines.

E. Furnishing, installing, setting and connecting special electrical and plumbing fixtures and piping to meet local codes, even though not specifically called for in specifications and shown on drawings.

F. Furnishing, installing and connecting of ducts from fume hoods to blowers and from blowers to atmosphere.

G. Furnishing, handling and installing fans with motors (blowers).

H. Furnishing, and installation of framing or reinforcements for wall, floors and ceilings to adequately support laboratory equipment and brick, plaster, metal or wood grounds required for proper anchoring of the equipment.

I. Furnishing any miscellaneous materials generally classified as maintenance or supply items.

J. Furnishing and installation of pipe hangers.

K. Furnishing and installation of resilient base on walls and fixed laboratory casework after laboratory casework installation is completed.

L. Furnishing in-wall exhaust duct and connection to vented cabinets.

M. Related Sections include the following:

1. Division 1 Section "Sustainable Design Requirements" for additional LEED requirements.
2. Division 6 Section "Miscellaneous Carpentry" for wood blocking for anchoring laboratory casework.
3. Division 6 Section “Interior Architectural Woodwork”.
4. Division 9 Section "Non-Structural Metal Framing" for reinforcements in metal-framed plaster partitions for anchoring laboratory casework.
5. Division 9 Section "Gypsum Wallboard Assemblies" for reinforcements in metal-framed gypsum board partitions for anchoring laboratory casework.
6. Division 9 Section "Resilient Base and Accessories" for resilient base applied to laboratory casework.
7. Division 11 Section "Laboratory Fume Hoods" for fume hoods.
8. Division 12 Section “Fixed Laboratory Casework and Furnishings”.
9. Divisions 22 and 26 Sections for installing service fittings specified in this Section.
10. Divisions 22 and 26 Sections for connecting service utilities at indicated points. Piping and wiring for service fittings within laboratory casework up to point of connection are specified in this Section.

1.4 DEFINITIONS

A. “Laboratory Casework Contractor” is defined as the manufacturer and/or manufacturer’s representative furnishing and installing the laboratory casework, equipment, and accessories listed under these specifications, laboratory equipment schedule and/or shown on drawings.

B. "Service Fixtures" are defined as gas, air, and vacuum valves, hot, cold, reagent grade water faucets, remote control valves, electrical receptacles with necessary flush mounting boxes, conduits or pedestals and plates, light fixtures, light switches and/or motor switches for hoods and other items which serve as a functional part of the equipment.

C. "Service Lines" are defined as gas, air, vacuum, hot, cold, reagent grade and reference grade water piping, drain lines, fittings and shut off valves necessary to carry respective services from building roughing-in floors or walls through equipment to "service fixture".

D. "Service Lines" also include conduit, junction boxes, conduit fitting, wire disconnect switches and fuse or circuit breakers necessary to carry electrical services from building roughing-in outlets in floors or walls through equipment to "service fixtures."

E. "Standards" are wall mounted, twin-tracked shelf supports.

F. "Slotted Studs" are double-faced, twin-tracked studs comprising the frame spanning between the utility chase and the building wall or workstation at peninsula bench assemblies.

G. Exposed Portions of Cabinets: Surfaces visible when doors and drawers are closed, including bottoms of cabinets more than 48 inches (1220 mm) above floor, and surfaces visible in open cabinets. This also includes tops and bottoms of shelving in open or glass doored units and open wall shelving.

H. Semi-exposed Portions of Cabinets: Surfaces behind opaque doors, such as interiors of cabinets, shelves, dividers, interiors and sides of drawers, and interior faces of doors. Tops of cases 78 inches (1980 mm) or more above floor are defined as semi-exposed.

I. Concealed Portions of Cabinets: Surfaces nor usually visible after installation, including sleepers, web frames, dust panels, and ends and backs that are placed directly against walls or other cabinets.

1.5 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Laboratory casework components and assemblies shall meet local seismic restraint requirements.

1.6 SUBMITTALS

A. Refer to submittal section of the General and Supplementary Specifications in Division 1 for requirements and procedures. Fabrication or purchase of any items prior to approval will be at the manufacturer's risk.

B. Product Data: For each type of product indicated.

C. Samples for Initial Selection:

1. For factory-applied finishes:
    a. Plastic-laminate countertops
    b. Epoxy sinks
    c. Epoxy countertops

d. Phenolic-composite countertops.

2. Samples for Verification:
   a. For each type of finish, including countertop material, in manufacturer's standard sizes, for approval by Architect.
   b. One full-size, finished base cabinet complete with hardware, doors, and drawers
   c. Reviewed samples will be retained by Architect.

D. Shop Drawings: The laboratory casework manufacturer shall furnish shop drawings showing enclosures, cabinets, hardware, and service banks complete with numbers and names of items and details including construction kinds and gages of materials for hood, cabinets, benches and other items necessary to complete the work. In addition, it is the responsibility of the casework manufacturer to flag any deviations in dimension, material, detail, etc. that is not exactly the same as shown on the contract documents. Those deviations not flagged will be considered "not reviewed", even if missed during the approval process and will have to be changed. Provide number of copies of drawings and data sheets in accordance with Division 1 requirements.

1. Indicate locations of blocking and reinforcements required for installing laboratory casework.
2. Indicate locations and types of service fittings, together with associated service supply connection required.
3. Include details of utility spaces showing supports for conduits and piping.
4. Include details of support framing system.
5. Include details of exposed conduits, if required, for service fittings.
6. Indicate locations of and clearances from adjacent walls, doors, windows, other building components, and other laboratory equipment.
7. Include coordinated dimensions for laboratory equipment specified in other Sections.

E. Non-Structural Lateral Force Design: Submit detailed seismic anchorage and attachment drawings and calculations provided by a California-licensed Structural Engineer. The submittal shall include:

1. Dimensions and location of the center of gravity of the component.
2. Weight assumed in the calculations including contents.
3. Specification of anchorage to concrete in detail, including inspection and testing requirements, if any (inspection and testing to be furnished under this section, if required).
4. Reaction loads to the supporting structure or other component.
5. If a component other than the structure is used for seismic support, the submittal shall show the adequacy of the load path to the structure or otherwise demonstrate compliance with limitations in the contract documents.
6. The submittal will be reviewed by the design professional responsible for this section of the specification to confirm that it is responsive to project specific context and criteria. The adequacy of the primary structure to resist the reaction loads imparted on the primary structure by shall be reviewed and approved by the project Structural Engineer.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative of the casework manufacturer for installation and maintenance of units required for this Project.

B. Source Limitations: Though products may be manufactured by different manufacturers, obtain and install all laboratory casework, including work surfaces, sinks, service fittings and accessories, and fume hoods through one source from a single Laboratory Furniture Contractor.

C. Testing Agency Qualifications: An independent agency qualified for testing indicated, as documented according to ASTM E 548.

D. Movable Laboratory Bench Systems must be MET laboratories or Underwriters Laboratories (UL) 61010A-1approved and listed. Other UL listings may be acceptable as long as the electrical requirements as shown on the drawings are satisfied. UL label shall be attached to the product.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

F. Product Standard: Comply with SEFA 8, "Laboratory Furniture--Casework, Shelving and Tables--Recommended Practices."

G. Pre-installation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

H. Quality Standards: Comply with the following standards:

1. SEFA 1, “Laboratory Fume Hoods”
2. SEFA 2.3, “Scientific Laboratory Furniture and Equipment.”
3. SEFA 3, “Work Surfaces.”
4. SEFA 7, “Laboratory and Hospital Fixtures.”
5. SEFA 8, "Laboratory Furniture - Casework, Shelving and Tables - Recommended
6. Practices."
7. Woodwork Institute Manual of Millwork, 11th edition or American Woodworking
8. Institute, 8th edition (AWI). Includes certification.
9. ASTM A240, Heat Resistant Chromium and Chromium, Nickel Stainless Steel Plate, Sheet, and Strip for pressure Vessels
10. ASTM A312, Seamless and Welded Austenitic Stainless Steel Pip
11. ASTM D570, Water Adsorption of Plastics
12. ASTM D695, Compressive Properties of Rigid Plastics
13. ASTM D790, Fluctural Properties of Un-reinforced and Reinforced Plastics and Electrical Insulating Materials
14. ASTM E84, Test Method for Surface Burning Characteristics of Building Materials

15. ASTM A554, Standard Specification for Welded Stainless Steel Mechanical Tubing
16. ASTM A513, Standard Specification for Electric-Resistance Welded Carbon and Alloy Steel Mechanical Tubing
17. Builders Hardware Manufacturers Association (BHMA)
18. National Electrical Manufacturers Association (NEMA)
19. National Fire Protection Association (NFPA0 30, Flammable Liquid Storage
20. National Fire Protection Association (NFPA) 70, Electrical Components, Devices, and Accessories
21. National Particleboard Association (NPA) 8-Voluntary Standard for Formaldehyde Emission from Particleboard

1.8 MOCK-UP

A. Laboratory casework manufacturer shall erect a laboratory casework mock-up at the location as indicated on the Drawings. Once selected, the assembly shall be constructed and assembled in accordance with the construction documents. Modifications required to meet this specification shall be incorporated into the overall design of the project without change in contract sum. Mockup shall include ALL laboratory casework components including fume hoods, fixtures and casework to represent a completed laboratory module. Utilities and hoods do not have to be operable.

B. Once installed and approved, the mock-up shall be maintained at the project site during construction as a standard for judging the completed work.

C. Mockup will be used to verify compliance with design intent and confirm procedures prior to completion of utility rough-ins and to serve as the standard of quality for the casework installation.

D. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.9 EXCEPTIONS TO DRAWINGS AND SPECIFICATION

A. All exceptions shall be subject to written approval prior to receipt of bid. If no written communication is received prior to receipt of bid and approval indicated in an addendum, it is assumed that bidder will be in total compliance with specifications and will be held responsible for default or delay, regardless of any statement to the contrary in their written proposal.

B. Requests for a substitution must be made directly to the Owner’s Representative’s office for consideration no later than fifteen (15) working days prior to bid receipt date.

C. Requests for a substitution following the bid opening will be rejected.

D. Substitutions approved prior to bid date will be handled as an addendum and be sent to all bidders.

E. Deviations to approved submittals without prior written approval from University shall be at risk to contractor/vendor. University Representative shall make final determination of remediation.

1.10 TESTING

A. The laboratory casework manufacturer shall be required to include in their initial submittals, certified test reports indicating compliance of their laboratory casework finish and work top materials with requirements specified for chemical and physical resistance; and confirmation of load performance for movable tables. The material test reports shall be performed by an independent testing agency qualified for testing indicated, as documented according to ASTM E548.

1.11 FIELD MEASUREMENTS

A. It is the laboratory casework manufacturer's responsibility to verify field measurements and that equipment will fit through entryways, corridors and door openings enabling a smooth flow of equipment to its proper location in the building. Wall-to-wall counter tops are to be installed with a maximum ¼" gap.

B. Where casework is indicated to fit to other construction, verify dimensions by field measurements before fabrication and indicate measurements on Shop Drawings.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating the casework without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.12 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Deliver casework only after painting, utility rough-ins and similar operations that could damage, soil or deteriorate casework have been completed in installation areas.

B. Storage: If casework must be stored in other than installation areas, store only in areas where environmental conditions meet requirements specified in "Project Conditions" Article of this specification section.

C. Handling: Keep finished surfaces covered with polyethylene film or other protective covering during handling and installation.

D. Delivery of casework shall only occur after building is entirely enclosed from exterior elements.

1.13 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install laboratory casework until building is enclosed, wet work and utility roughing-in are complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

1.14 COORDINATION

A. Coordinate layout and installation of metal framing and reinforcements in wall assemblies for support of the laboratory casework.

B. Coordinate installation of laboratory casework with installation of fume hoods and other laboratory equipment including rough-in locations and requirements.

1.15 WARRANTY

A. Furnish a written warranty that Work performed under this Section to be and remain free from defects as to materials and workmanship for a period of one (1) year from date of acceptance. Defects in materials and workmanship that may develop within this time are to be replaced without cost or expense to the Owner. Defects include, but are not limited to:

1. Ruptured, cracked, or stained coating
2. Discoloration or lack of finish integrity
3. Cracking or peeling of finish
4. De-lamination of components or edge banding
5. Slippage, shift, or failure of attachment to wall, floor, or ceiling
6. Weld or structural failure (visible weld marks)
7. Warping or unloaded deflection of components
8. Sealant deterioration, shrinkage or failure.
9. Failure of hardware

1.16 EXTRA MATERIALS

A. Furnish complete touchup kit for each type and color of metal laboratory casework provided. Include scratch fillers, primers, paints, and other materials necessary to perform permanent repairs to damaged laboratory casework finish.

B. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Cabinet Mounting Clips and Related Hardware: Quantity equal to 5 percent of amount installed, but no fewer than 20 of each type.
2. Modular Countertop Units: Two extra units of each length and material installed.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Or Equal: Where products are specified by manufacturers name and accompanied by the term “or equal”, comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before the use of an unnamed manufacturer or product.

B. Metal Laboratory Casework, Movable Laboratory Benches and Tables: Subject to compliance with requirements, provide products by one of the following:

1. Kewaunee Scientific Corporation - Laboratory Division
Statesville, NC 28677
(877) 572-6610
www.kewaunee.com

2. Or Equal

C. Epoxy Resin Work Surfaces and Sinks: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but are not limited to, the following:

1. Kewaunee Scientific Corporation – Laboratory Division
Statesville, NC 28677
(877) 572-6610
www.kewaunee.com

2. Or Equal

D. The naming of a manufacturer and designation of a product is for the purpose of identifying a basis of design. Other manufacturers capable of producing the same appearance and having the same quality, durability and performance may be proposed for use on this project subject to approval of the Owner's Representative, prior to receipt of bids.

2.2 CASEWORK RELATED MATERIALS

A. Metal: Cold-rolled commercial steel sheet, complying with ASTM A 1008/A 1008M; matte finish; suitable for exposed applications.

B. Minimum Metal Thickness:

1. Sides, Ends, Fixed Backs, Bottoms, Tops, Soffits, and Items Not Otherwise Indicated: 0.0428 inch. Except for flammable liquid-storage cabinets, bottoms may be 0.0329 inch if reinforced.

2. Back Panels, Doors, Drawer Fronts and Bodies, and Shelves: 0.0329 inch except 0.0428 inch for back panels and doors of flammable liquid-storage cabinets and for un-reinforced shelves more than 36 inches long.

3. Intermediate Horizontal Rails, Table Aprons and Cross Rails, Center Posts, and Top Gussets: 0.0528 inch.

4. Drawer Runners, Sink Supports, and Hinge Reinforcements: 0.0677 inch.

5. Leveling and Corner Gussets: 0.0966 inch.

C. Stainless Steel:

1. Work surfaces, sinks, stainless steel accessories, shelves and shelf supports noted on drawings as “Stainless Steel” shall be type 304, austenitic chromium nickel stainless steel in accordance with A.I.S.I. specification containing 8% nickel and 18% chromium. Where noted as such, stainless steel components and shelf supports shall be constructed exactly as those fabricated of cold rolled sheet steel and the same gages. Exposed surfaces shall have #4 satin finish.
2. Work surfaces and sinks noted on drawings as “Type 316 Stainless Steel” shall be similar to type 304 except molybdenum is added to improve the general corrosion and pitting resistance.

D. Clear Float Glass: Complying with ASTM C 1036, Type I, Class 1, Quality q3 not less than 3.0mm thick.

E. Clear Tempered Glass: Complying with ASTM C 1048, Kind FT, Condition A, Type I, Class 1, Quality q3, not less than 3.0mm thick.

F. Clear Laminated Safety Glass: Complying with ASTM C1172, Kind LT, Condition A, Type 1, Class 1 with 2 lites not less than 3.0mm thick with clear, polyvinyl butyl interlayer.

G. Epoxy Resin- Refer to Section 12 3553 Fixed Laboratory Casework.

2.3 WORK SURFACES AND CURBS

A. Epoxy Resin: Refer to Section 12 3553 Fixed Laboratory Casework.

2.4 ADJUSTABLE SHELVES

A. Adjustable shelves shall be depth as noted on the Drawings.

B. Adjustable shelves shall be mounted to surface type steel standards at wall condition and slotted studs at movable tables and island bench conditions. Adjustable shelves shall be supported by steel shelf brackets not to exceed 42 inches on center. Brackets shall be 11 gage cold rolled steel with epoxy powder coated finish, complying with BHMA A156.9, Types B04102 and B04112. Shelves shall be fastened to brackets with two stainless steel screws per bracket.

C. Adjustable shelves mounted on slotted studs shall be supplied with a continuous 2 inch high band to create a 1 inch high curb at the rear of the shelf. The curb along the back shall be of similar material as the shelf.

D. Exterior adjustable shelves, those not in cabinets, shall be equipped with a 3/8 inch diameter, 2 inch high stainless steel rail at the front of the shelf. Provide ¾” stainless steel turret at mid-span for rail lengths exceeding 24” in nominal length. Turrets shall be fastened to the shelf in a similar manner as wire pulls are fastened to drawers and doors. Stainless steel screws to be accessible from underside of shelf. Press fit rails are not acceptable.

E. Stainless-Steel Shelves: Made not less than 0.050-inch nominal thickness. Fold down front edge 3/4 inch, fold up back edge 3 inches. Provide integral stiffening brackets, formed by folding up ends 3/4 inch.

2.5 CABINET DESIGN

A. Casework shall be fabricated as sectional units, ready for placement in the laboratory as a complete integral rigid unit permitting relocation at any subsequent time. Component parts of the unit shall be manufactured ensuring uniformity, interchangeability and accurate alignment. All base cabinets to have integral enclosed bases.

B. Where noted as such, provide wall-mounted casework that matches all other laboratory casework in design and material. The assembly must be capable of supporting an equipment load of at least 150 lb. per running foot above and beyond the weight of the assembly.

C. Sides of all sectional units shall be considered exposed and shall be finished accordingly.

2.6 CABINET CONSTRUCTION

A. General: Assemble and finish units at point of manufacture. Use precision dies for interchangeability of like-size drawers, doors, and similar parts. Perform assembly on precision jigs to provide units that are square. Reinforce units with angles, gussets, and channels. Integrally frame and weld to form a dirt and vermin-resistant enclosure. Where applicable, reinforce base cabinets for sink support. Maintain uniform clearance around door and drawer fronts of 1/16 to 3/32 inch.

B. Flush Doors: Outer and inner pans that nest into box formation, with full-height channel reinforcements at all four sides of door. Fill doors with noncombustible, sound-deadening material.

C. Drawers: Fronts made from outer and inner pans that nest into box formation, with no raw metal edges at top. Front, sides, and back fabricated in one piece with rolled or formed top of sides for stiffening and comfortable grasp for drawer removal. Provide drawers with rubber bumpers, ball-bearing slides, and positive stops to prevent metal-to-metal contact or accidental removal.

D. Adjustable Shelves: Front, back, and ends formed down, with edges returned horizontally at front and back to form reinforcing channels.

1. Adjustable shelves shall be depth as noted on the drawings.

2. Adjustable shelves shall be mounted to surface type steel standards (wall condition) or slotted studs (above peninsula benches). Adjustable shelves shall be supported by steel shelf brackets. Brackets shall be cold rolled steel with epoxy powder coated finish, complying with BHMA A156.9, Types B04102 and B04112. Shelves shall be fastened to brackets with two stainless steel screws per bracket.

3. Adjustable shelves mounted on slotted studs shall be supplied with a continuous 2” high band to create a 1” high curb at rear of shelf. The curb along the back shall be of similar material as the shelf.

E. Toe Space: Fully enclosed, 4 inches high by 3 inches deep, with no open gaps or pockets.

F. Utilities: Provide space, cutouts, and holes for pipes, conduits, and fittings in cabinet bodies to accommodate utility services and their support-strut assemblies.

G. Framing below is used to support utility services between back-to-back base cabinets and between base cabinets and walls where utilities are not within walls.

H. Utility-Space Framing: Laboratory casework manufacturer's standard steel framing units consisting of 2 steel slotted channels complying with MFMA-2, not less than 1-5/8 inches (41 mm) square by 0.0966 inch (2.5 mm) thick, and connected together at top and bottom by U-shaped brackets made from 1-1/4-by-1/4-inch (32-by-6-mm) steel flat bars. Framing units may be made by welding specified channel material into rectangular frames instead of using U-shaped brackets.

I. Base Molding: As specified by Division 9. Provide on fronts and exposed sides of floor-mounted laboratory casework.

J. Filler Strips and Utility-Space Closure Panels: Provide as needed to close spaces between cabinets and walls, ceilings, and indicated equipment. Fabricate from same material and with same finish as cabinets and with hemmed or flanged edges.

2.7 MOVABLE BASE CABINETS

A. Movable Base Cabinets: Cabinets with casters or otherwise noted shall be constructed as follows:

1. Movable cabinet shall be nominally 34 inches high. The top of the base cabinet shall be phenolic resin (color selected by the Architect) ¾” thick. Base cabinets shall have a finished 12 gage metal plate across the full bottom face of the cabinet through which casters shall be attached. Interior bolt heads for casters shall be countersunk.

2. Where noted on the drawings, cabinets with casters shall be constructed without toe spaces. The cabinet shall be constructed with a reinforced base capable of supporting a 4 inch high caster assembly in each corner. Casters shall be swivel, locking type on front and fixed type on rear, rated for minimum 250 pounds load each. Casters shall be equal to Algood Model S5033-SRG, soft rubber wheeled casters. The entire assembly shall be reinforced to permit mobility without twisting. Casters shall be through-bolted through bottom of cabinet at all four bolts and interior bolt heads shall be countersunk to conceal bolt heads. Allow sufficient clearance between top of cabinet and underside of work surfaces or apron to facilitate movement. Cabinets shall have a minimum 45 lbs. counterweight in the rear of the cabinet to help prevent tip over of the cabinet.

3. Drawer units must be equipped with a drawer interlock mechanism so that only one drawer in a vertical stack can be opened at one time. Interlock unit shall be integral part of the drawer slide unit equal to Accuride Model 3641 and companion slide Model 3642.

2.8 WALL MOUNTED CASEWORK

A. Where noted as such, provide wall-mounted casework that matches all other laboratory casework in design and material. The assembly’s construction however, must be modified to withstand the rigors of being mounted directly to the wall and suspended above the floor, without sagging or effecting the door or drawer operation. The assembly must be capable of supporting an equipment load of at least 150 lb. per running foot above and beyond the weight of the assembly.

2.9 METAL FINISH

A. Finish casework support structure and other laboratory furnishings.

B. Preparation: Spray clean metal with a heated cleaner / phosphate solution, pretreat with iron phosphate spray, water rinse, and neutral final seal. Immediately dry in heated ovens, gradually cooled, prior to application of finish.

C. Application: Electrostatically applied epoxy or urethane powder coat painting process that coats all hidden and exposed surfaces with an acid and abrasion resistant coating. Bake in a controlled high temperature oven to ensure a smooth, hard satin finish. Surfaces shall have a chemical resistant, high grade laboratory furniture quality finish of the following thicknesses:

1. Exterior and interior surfaces exposed to view: 1.5 mil average and 1.2 mil minimum.
2. Backs of cabinets and other surfaces not exposed to view: 1.0 mil average.
3. Finish drawer bodies in matching or harmonizing color and apply corrosion resistant treatment to selected, concealed interior parts.

D. All steel laboratory products shall utilize a dry powder coat paint process by means of electrostatically spray, providing high-transfer efficiency low waste generation. Any liquid-applied coatings shall not be acceptable. Manufacturer shall supply documentation that waste generated during the painting process, is a solid, nonhazardous material.

E. Pretreatment: Finish process shall incorporate a phosphate conversion coating during the pretreatment/cleaning operation. Electrostatic application of dry powder shall follow. Coated parts shall pass through curing ovens, which shall cause the powder to melt, flow, gel, cure and bond onto the phosphatized steel substrate.

F. Chemically Resistant Finish: Only highly chemically resistant, dry powder coated finishes that passes the SEFA 8 casework specifications for chemical and durability resistance, will be acceptable. Submit a letter from a third-party validator, verifying independent test results, to the Owner’s Representative for approval - at time of bid submittal.

G. Operator Protection: The application is convenient and easily mastered through robotic application plus manual detailing. The painting process is cleanly contained and has no solvent odor and is performed in an air conditioned room.

H. Overspray Powder Paint: Captured and resprayed. Efficiency; 99.99 percent effective in coating usage, reducing waste generation. Utilize a closed collection system for overspray that is not reused. Powder overspray, which cannot escape the facility, is collected in bulk, eliminating the need for daily replacement/disposal of filter media.

I. VOC Emissions: Provide powder paint sprayed and baked with a near zero (0.29 pounds per gallons maximum) VOC (Volatile Organic Compounds) emissions.

J. Off gassing: Provide firm and stable coating after all steel powder coated parts have cooled from the curing ovens. No further emissions or "Off gassing/Decomposition" vapors shall occur at room temperature.

K. Metal Finish Performance Requirements:

1. Abrasion Resistance: Maximum weight loss of 5.5 mg per 100 cycle when tested on a Taber Abrasion Tester Number E40101 with 1000 gm wheel pressure and Calibrase Number CS10 wheel.

2. Hardness: Surface hardness equivalent to 4H or 5H pencil.
3. Humidity Resistance: Withstand 1,000 hour exposure in saturated humidity at 100 degrees Fahrenheit (38 degrees Celsius).
4. Moisture Resistance: No visible effect to surface finish after boiling water trickled over test panel inclined at 45 degrees Fahrenheit for 5 minutes. No visible effect to surface finish following 100 hour continuous application of a water soaked cellulose sponge, maintained in a wet condition throughout the test period.
5. Adhesion: Score finish surface of test panel with razor blade into 100 squares, 1/16 inch by 1/16 inch, cutting completely through the finish but with minimum penetration of the substrate, and brush away particles with soft brush. Minimum 95 squares shall maintain their finish.
6. Salt Spray: Withstand minimum 200 hour salt spray test, conforming to ASTM B117-59 procedure.

L. Chemical and Physical Resistance of Finish System: Finish complies with acceptance levels of cabinet surface finish tests in SEFA 8. Acceptance level for chemical spot test shall be no more than four Level 3 conditions. Cured films shall be unaffected by 2 ft-lbs impact or ½" mandrel bend when supported on 18 gage steel panel and shall have a pencil hardness of 8H to 9H. The finished product shall have a smooth, hard and flexible finish that has superior resistance to abrasion, corrosion and chemical activity. The polymerized film shall resist the action of the following reagents without any effect other than loss of luster or slight discoloration when subjected to a one c.c. puddle test for one hour:

1. Acetic Acid; 1% to glacial
2. Sulfuric Acid; 25%
3. Sulfuric Acid: 50%
4. Sulfuric Acid: 85%
5. Hydrochloric Acid: 10%
6. Hydrochloric Acid: 37%
7. Nitric Acid: 10%
8. Nitric Acid: 25%
9. Nitric Acid: 60%
10. Phosphoric Acid: 85%
11. Perchloric Acid: 60%
12. Formaldehyde: 37%
13. Phenol: 85%
14. Ammonium Hydroxide Concentrate
15. Carbon Tetrachloride
16. Chloroform
17. Acetone
18. Xylol

19. Furfural
20. Sodium Hypochlorite

M. Color: Selection by the Owner's Representative from manufacturer's standard colors.

2.10 SOURCE QUALITY CONTROL TESTING OF EPOXY RESIN WORK SURFACE

A. Test procedure: Apply 5 drops of each reagent to surface and cover with 25 mm watch glass, convex side down; test volatiles using 1 ounce bottle stuffed with saturated cotton. After 24 hour exposure flush surface, clean, rinse and wipe dry.

B. Evaluation ratings: Change in surface finish and function shall be described by the following ratings:

1. No Effect: No detectable change in surface material.
2. Excellent: Slight detectable change in color or gloss, but no change to the function or life of the work surface material.
3. Good: Clearly discernible change in color or gloss, but no significant impairment of work surface function or life.
4. Fair: Objectionable change in appearance due to surface discoloration or etch, possibly resulting in deterioration of function over an extended period.
5. Failure: Pitting, cratering or erosion of work surface material; obvious and significant deterioration.

C. Test Results: Submit a report of the test results. The results shall be equal to or better than the following:

REAGENT	RATING
1. Hydrochloric Acid, 37 %	Excellent
2. Sulfuric Acid, 33 %	No Effect
3. Sulfuric Acid, 77 %	No Effect
4. Sulfuric Acid, 96 %	Failure
5. Formic Acid, 90 %	Excellent
6. Nitric Acid, 20 %	Excellent
7. Nitric Acid, 30 %	Excellent
8. Nitric Acid, 70 %	Good
9. Hydrofluoric Acid, 48 %	Fair
10. Phosphoric Acid, 85 %	No Effect
11. Chromic Acid, 60 %	Failure
12. Acetic Acid, 98 %	Excellent
13. 3 8 Equal Parts	Excellent
14. Ammonium Hydroxide, 28 %	No Effect
15. Sodium Hydroxide, 10 %	No Effect
16. Sodium Hydroxide, 20 %	No Effect
17. Sodium Hydroxide, 40 %	No Effect
18. Sodium Hydroxide Flake	No Effect
19. Sodium Sulfide	Excellent
20. Zinc Chloride	No Effect

21.	Tincture of Iodine	Excellent
22.	Silver Nitrate	No Effect
23.	Methyl Alcohol	No Effect
24.	Ethyl Alcohol	No Effect
25.	Butyl Alcohol	No Effect
26.	Benzene	Excellent
27.	Xylene	No Effect
28.	Toluene	Excellent
29.	Gasoline	No Effect
30.	Dichloroacetic Acid	Good
31.	Dimethylformamide	Excellent
32.	Ethyl Acetate	No Effect
33.	Amyl Acetate	Excellent
34.	Acetone	Excellent
35.	Chloroform	Excellent
36.	Carbon Tetrachloride	No Effect
37.	Phenol	Excellent
38.	Cresol	Excellent
39.	Formaldehyde	No Effect
40.	Trichlorethylene	Excellent
41.	Ethyl Ether	Excellent
42.	Furfural	Good
43.	Methylene Chloride	Excellent
44.	Monochlorobenzene	Good
45.	Dioxane	Excellent
46.	Methylethyl Ketone	Excellent
47.	Acid Dichromate	Fair
48.	Hydrogen Peroxide	No Effect
49.	Naphthalene	Excellent

2.11 MOVABLE TABLES

A. Moveable tables shall be constructed as indicated on the Drawings.

B. Moveable tables shall have a 1-1/2 inch apron front and 7 inch apron on sides and back. It shall have 2 inch outside diameter painted steel tube and 1-3/4 inch inner painted steel telescoping leg.

C. Levelers: 1-1/2 inch round – 16 NC x 2-1/2 inch long levelers with non-marring floor glides at each leg complete with locking nut.

D. Moveable tables shall have the ability to be adjusted in height from 30 inches to 37 inches in 1 inch increments inclusive of 1 inch thick work surface.

E. Moveable tables shall be installed at height indicated on Drawings. Fixed metal section of leg shall be set at height appropriate for a 30 inch high table top. Coordinate the under-counter clearance with casework and refrigerators.

F. Moveable tables shall be reinforced with a deep welded steel channel frame appropriate for the load bearing requirements. Load capacity of tables shall be 1,000 lb. uniformly loaded and support a 250 lb. concentrated load at mid-space with deflection not to exceed 1/8 inch.

G. Moveable table shall be equipped with an epoxy work surface unless otherwise noted.

2.12 MOVABLE LABORATORY BENCH SYSTEM

A. General

1. Work surface support frame: 11 gage cold rolled steel
2. Finish: Chemical resistant epoxy in color selected by the Owner's Representative from manufacturer's standard selection.
3. Table height, to top of work surface, shall be set at either 30 inches or 37 inches to allow a refrigerator to be installed below. The table shall have a 4 inch solid apron on the sides.

B. Work Surface Table Frame:

1. Nominal table frame dimensions:
   a. Widths and Depths as indicated on the drawings
   b. Adjustable Height: 30 inch to 37 inch AFF including 1 inch thick work surface.
2. Front upright member are 2 inch outside diameter tube and 1-3/4 inch inner telescoping leg steel tubing. Capable of vertical adjustment in one-inch increments. Fasteners to be stainless steel pan head screws.
3. Levelers: 1-1/2 inch round - 16 NC x 2-1/2 inch long levelers with non-marring floor glides at each leg complete with locking nut.
4. Rear corners shall have 2-1/4 inch diameter x 6 inch high 11-gage collar. Front half of the collar shall be welded to the work surface frame with supporting gussets and the back half mechanically fastened to the rear uprights with socket head button cap and bolt.
5. Back stop angle, with full length bumper, shall be located under the work surface frame to position the 24 inch deep mobile base cabinet 1 inch behind the front edge of the work surface.
6. Load Rating: 100 lbs per linear foot of width to maximum of 800 lbs. With 800 lbs of uniformly distributed load applied to an 8 foot wide work surface, the maximum allowable deflection shall be 1/8 inch measured at the front center rail.

C. Rear Frame Support Structure

1. Nominal dimensions:
   a. Width: As indicated on the drawings.
   b. Height: 84 inches
2. Rear upright supports shall be 11 gage tubular steel, 2 inches outside diameter.
3. Levelers: 1-1/2 inch round – 16 NC x 3.5 inch long, model # 23015T56 as distributed by McMaster-Carr Supply Company, New Brunswick, NJ, or equal.

4. Rear frames: All units shall have a center support to accommodate split shelving. Back-to-back tables shall share a common center shelf support that acts as a conduit for piped services, electrical and data.
    a. Specific tables shown on drawings shall have the ability to remove the shelving, with no center support or raceway, to allow users to place deep bench top equipment on the tables without interference at the rear of the unit. These tables shall have power outlets and data on the vertical uprights.
5. Uprights have slots punched on 1 inch increments starting at nominal 55 inch above the floor to the top of the upright.
6. Upper and lower horizontal cross rails shall be 11 gage steel.
7. Lower structural cross rail shall support an integral single-channel raceway.
8. Raceway to have two (2) 20 amp hospital grade duplex receptacles on 42 inch, 48 inch and 60 inch wide units, three (3) 20 amp hospital grade duplex receptacles on 72 inch wide units, and (1) 20 amp duplex receptacle located in the vertical upright under the work surface.
9. Provide GFI receptacles on all benches within 6’ of water source.
10. Frames shall be pre-wired and pre-plumbed in accordance with MET or UL certified requirements.

D. Plumbing Fixtures
1. Maximum of three plumbing services available.
2. Valves shall be straight pattern instrumentation needle valves with serrated hose ends.
3. Plumbing lines shall be 0.25 inch OD x .035 inch wall thickness of 316 stainless steel tubing with quick disconnect attached to the tube with compression fittings at the top of the upright. Each half of the quick disconnect, coupler and nipple shall be valved.
4. The plumbing lines with the quick disconnects are to be arranged so services cannot be intermixed.

E. Electrical, Data and Phone Connections
1. Electrical power services shall have a 20-amp twist lock plug. The NEMA type for the plug shall be as specified in Division 26 and matches the receptacle configuration in the ceiling service panel. Provide an adequate cord length extending from the top of the upright to the ceiling service panel.
2. Data line shall be provided by the University.

F. Shelves
1. As described under article “Adjustable Shelving” within this section, unless modified under this Article.
2. Shelves on moveable tables shall overhang 1 inch behind the face of the vertical tubular support and be notched around the support.
3. Shelf brackets shall be 11-gage cold rolled powder coated steel. Shelf bracket shall be “L” shaped.

G. Task Lights

1. As described in Specification section 12 3553 Fixed Laboratory Casework.

H. Service Line Assembly

1. Tubing: Fre-Thane 95A Durometer Polyurethane tubing as manufactured by Freelin-Wade Co. (McMinnville, Oregon) Tubing shall be 3/8 inch O.D. with a 1/4 inch I.D. rated for 170 psi working pressure. Provide a 316L stainless steel fitting both ends (3/8 inch O.D. compression to 1/4 inch MNPT). Tubing shall be straight type, light gray in color. Manufacturer to provide sleeve for tubing management.

2. Quick-Disconnect Couplers: Keyed, color coded, 316L stainless steel mechanical quick disconnect couplings (sockets and plugs) shall be used to connect between the Ceiling Service Panel and the Moveable Table. Couplers shall connect only with properly keyed mate and be color-coded to identify different key combinations. Each half of the quick disconnect couplers (socket and plug) shall be valved. Socket keyed quick couplers subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include, but are not limited to, the following: Staubli (Duncan, South Carolina).

I. Four Leg Adjustable-Height Add-A-Leg Table

1. Nominal table frame dimensions:
   a. Width and depth as indicated on the drawings.
   b. Adjustable Height: 30 inch to 37 inch AFF including 1 inch thick work surface.
2. Work surface table frame shall be able to detach from the rear frame and form a four-leg adjustable height table with the addition of two Add-A-Legs.
3. Add-A-Leg member shall be the same construction and finish as the front upright member.

J. Cord Sleeve Management: Provide cord management sleeve to bundle service drops from the ceiling service panel to the table, Model Nu-Guard G, as manufactured by Delfingen Sofanou (716) 215-0330 or approved equal. Color selected by Owner’s Representative.

2.13 TABLE LIFT MECHANISM

A. Provide one (1) scissor-type lift cart, capable of raising movable tables off floor without marring finish in order to permit height adjustment. Unit shall be capable of operating at both sitting and standing height. Unit shall be fabricated of materials compatible with decontamination procedures involving the use of steam and para-formaldehyde application.

B. Unit shall be equal to R.S. Material Handling, Inc, St. Catherine, Ontario, Canada (905.687.7176) catalog # BX50 or approved equal.

2.14 CEILING SERVICE PANELS

A. The Ceiling Service Panel (CSP) is a rigid mounting surface for laboratory utilities distributed along the centerline of a laboratory bench group. Panels are designed to accommodate standard junction boxes for electrical and data as well as medical grade quick connect fittings for the distribution of specialty gases, compressed air, and vacuum. CSP is designed to fit most suspended t-bar grid ceiling systems and is specified in a 6 inch width. Panel lengths will be as noted on drawings.

B. A CSP is used in conjunction with a steel frame laboratory table which is vertically adjustable. Utilities on the laboratory table connect to the CSP via cables incorporating twist-lock or flexible tubing with quick-disconnect fittings. Overhead utility supply from the CSP allows for flexibility and mobility of laboratory services without the need to penetrate floors and walls.

C. CSP shall be fabricated from 14-gauge cold rolled steel with urethane or epoxy powder coated finish. All four edges of each panel shall be flanged to a depth of 3/4 inch. Flanges shall have a maximum 1/16 inch radius and shall be welded at intersecting corners to improve rigidity. Height of the panel varies with the size of junction boxes and utility fittings attached. Panels shall be fabricated with openings and mounting holes for all junction boxes and utility fittings. Provide a bushing at opening for data cables to eliminate abrasion of data cables on metal edge. Final finish shall be applied after all flanges, openings and holes are fabricated. Color selected by University's Representative.

D. CSP will be detailed in the laboratory construction documents to include various combinations of utilities by group designation (CSP1, CSP2, etc…) to support a number of laboratory types and bench arrangements. All quick disconnect fittings, distribution tubing and gas hoses shall be supplied with the CSP by Division 12. Division 22 shall supply connections to vacuum at the CSP. Electrical receptacles, cables, communication wiring, faceplates and corresponding connections to those devices shall be supplied by Division 26. Data jacks shall be supplied by Division 27. Identify each service at ceiling service panel. All receptacles shall be labeled with the corresponding circuit number. Identify data receptacles both at the table and the ceiling service panel. Submit label sample for approval by University's Representative.

E. Laboratory casework components and assemblies shall meet local seismic restraint requirements.

2.15 HARDWARE AND ACCESSORIES

A. As described in Specification section 12 3553 Fixed Laboratory Casework unless modified herein.

B. Door catches: cam action positive catch. Provide 2 catches on doors more than 48 inches high.

2.16 MECHANICAL SERVICE FITTINGS

A. As described in Specification section 12 3553 Fixed Laboratory Casework.

2.17 SINKS

A. As described in Specification section 12 3553 Fixed Laboratory Casework.

2.18 ELECTRICAL FIXTURES

A. As described in Specification section 12 3553 Fixed Laboratory Casework.

2.19 CONTROLLED ENVIRONMENT ROOM WALL MOUNTED SHELVING

A. Where noted on drawings, provide full height 14 gage heavy duty rolled stainless steel channel type standards capable of mounting brackets for shelves and counter top at full length of the standard. They shall be bolted into blocking located in wall provided by Controlled Environment Room vendor.

B. Shelving shall be 18 gage type 304 stainless steel at depth as noted in drawings and be fabricated with a grid of oblong slots, ¾" x1 ¾" with 2 ½" lateral spacing to promote ventilation. Each shelf shall be supported with two brackets and be fastened to it.

C. Brackets shall be 12 gage type 304 stainless steel.

D. Where stainless steel work surface is indicated on drawings, provide an appropriate set of brackets to support it without movement.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances, location of reinforcements, and other conditions affecting performance of laboratory casework.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 JOB SITE CONDITIONS

A. Coordinate with the General Contractor to verify that required backing and reinforcements are in place, secure, and accurately located and that project is ready for installation of laboratory casework.

B. Proceed with work when conditions permit Work to be installed in complete accordance with the original design, accepted submittals, and the manufacturer's written instructions.

C. In the event of discrepancy, immediately notify the Owner's Representative in writing. Do not proceed with the installation in areas of discrepancy until issues have been resolved.

3.3 INSTALLATION OF CABINETS

A. The assemblies listed below are to be fastened together with devices of adequate strength to support cabinet or shelf fully loaded. Fully loaded is defined as twenty-five (25) pounds per linear foot per shelf for enclosed wall cabinets or open adjustable shelves not inclusive of cabinet, shelf and bracket weight. Securely fasten wall-mounted items to solid supporting material only. Installation to meet seismic requirements:

1. Wall cabinet to wall.
2. Adjustable shelf to wall.
3. Adjustable shelf to slotted stud.

B. Wall Cabinets: Adjust fronts and bottoms within 1/16 inch of a single plane. Fasten to hanging strips, masonry, partition framing, blocking, or reinforcements in partitions. Fasten each cabinet through back, near top, at not less than 24 inches o.c. Align similar adjoining doors to a tolerance of 1/16 inch.

C. Install hardware uniformly and precisely. Set hinges snug and flat in mortises.

D. Utility-Space Framing: Secure to floor with two fasteners at each frame. Fasten to partition framing, wood blocking, or metal reinforcements in partitions and to base cabinets.

E. Adjust laboratory casework and hardware so doors and drawers align and operate smoothly without warp or bind and contact points meet accurately. Lubricate operating hardware as recommended by manufacturer.

3.4 WORK SURFACE INSTALLATION

A. Work surface lengths shall be fabricated as specified and indicated on the drawings with ends abutting tightly in a hairline joint, single true plane, smooth and level with no raised edges at the joints and with internal supports placed to prevent deflection. All joints are to be sealed with corrosion resistant sealants. Wall-to-wall work surfaces are to be installed with a maximum ¼ inch gap. All back splashes to be sealed at wall surfaces with corrosion resistant sealants.

B. Make field jointing in the same manner as factory jointing using dowels, splines, adhesives, and fasteners recommended by manufacturer. Locate field joints as shown on accepted submittal drawings. Joints shall be factory prepared requiring no job site processing of top and edge surfaces.

1. Use concealed clamping devices for field joints in plastic-laminate countertops. Locate clamping devices within 6 inches of front and back edges and at intervals not exceeding 24 inches Tighten according to manufacturer's written instructions to exert a uniform heavy pressure at joints.

C. Work surfaces shall be anchored to base cabinets. Secure work surfaces to cabinets/supports with concealed “Z” type angles or equal fastening devices spaced no more than 24 inches on center, with one located within 6 inches of front and back edge. Tighten according to manufacturer’s written instructions to exert a uniform heavy pressure at joints. Where necessary to penetrate work surface with fasteners, countersink exposed heads approximately 1/8 inch and plug hole flush with material equal to work surface in chemical resistance, hardness, and appearance to adjoining surface. Where work surface is intended to be movable, use a clamping device that is removable. Secure epoxy work surfaces to cabinets with epoxy cement, applied at each corner and along perimeter edges at not more than 48 inch O.C.

D. Provide holes and cutouts as required for equipment and service fittings and fixtures. Verify size of opening with actual size of item to be used, prior to making openings. Form inside corners to a radius of not less than 1/8 inch. After cutting, rout and file cutouts to ensure smooth, crack-free edges. Seal exposed edges after cutting with a chemical resistant sealer recommended by the manufacturer.

E. Seal unfinished edges and cutouts in plastic-laminate countertops with heavy coat of polyurethane varnish.

F. Provide scribe moldings for closures at junctures of work surface, curb, and splash, with walls as recommended by manufacturer for materials involved. Match materials and finish to adjacent laboratory casework. Use chemical-resistant, permanently elastic sealing compound where recommended by manufacturer.

G. Carefully dress joints smooth, remove surface scratches, and clean entire surface.

3.5 INSTALLATION OF SINKS

A. Drop-in Installation of Epoxy Sinks: Rout groove in countertop to receive sink rim if not prepared in shop. Set sink in adhesive and fill remainder of groove with sealant or adhesive. Use procedures and products recommended by sink and countertop manufacturers. Remove excess adhesive and sealant while still wet and finish joint for neat appearance.

3.6 INSTALLATION OF ACCESSORIES

A. Install accessories according to Shop Drawings and manufacturer's written instructions. Turn screws to a flat seat; do not drive. Adjust moving parts to operate freely without excessive bind.

B. Securely fasten adjustable shelving supports and shelves to partition framing, wood blocking, or reinforcements in partitions.

C. Install shelf standards plumb and at heights to align shelf brackets for level shelves. Install shelving level and straight, closely fitted to other work where indicated.

3.7 INSTALLATION OF SERVICE FITTINGS

A. Comply with requirements in Divisions 22 and 26 Sections for installing water and laboratory gas service fittings, piping, electrical devices, and wiring.

B. Install fittings according to Shop Drawings and manufacturer's written instructions. Set bases and flanges of sink- and countertop-mounted fittings in sealant recommended by manufacturer of sink or countertop material. Securely anchor fittings, piping, and conduit to laboratory casework, unless otherwise indicated.

3.8 CLEANING AND PROTECTING

A. Clean finished surfaces, touch up as required, and remove or refinish damaged or soiled areas to match original factory finish, as approved by Owner’s Representative. Clean units, including wiping out of drawers and cabinet shelves. Clean counter tops per manufacturer’s instructions leaving tops free of grease and streaks.

B. Protect against soiling and deterioration during remainder of construction period. Protect work surfaces during construction period with ¼ inch (6mm) corrugated cardboard or equal completely covering the top and securely taped to underside of work surface at minimum of 48 inches (1200 mm) o.c. Mark cardboard in large lettering “NO STANDING”.

END OF SECTION 123553.13

SECTION 12 3560 - STAINLESS STEEL VIVARIUM CASEWORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 DESCRIPTION OF WORK

A. All laboratory casework, working surfaces and other items specified herein shown on the drawings shall be furnished, installed and shall be demonstrated to properly perform in accordance with the function specified herein. Provide all necessary fillers, scribes and miscellaneous accessories and hardware to provide a complete installation.

B. Furnish and deliver packed in boxes for receipt, handling and installation by others; electrical service fixtures, task lights, electrical receptacles and switches listed in these specifications and as shown on drawings as part of the laboratory casework. The above-defined items are to be supplied, not attached, and loose in boxes, properly marked for tailgate delivery.

C. Furnish and set in place for final installation by other trades; service fittings where part of the laboratory casework, listed in the specifications or shown on drawings. Tailpieces shall be furnished less couplings required to connect to the trap or drain piping system. Install service fittings “finger-tight”.

D. Furnish and mount plumbing and electrical fixtures on fume hood superstructure.

1.3 RELATED WORK BY OTHER SPECIFICATION SECTIONS

A. Furnishing, installation and connection of “Service Lines” within and/or attached to equipment, slotted studs, partitions, service tunnels or service turrets, through, under or along backs of working surfaces as required for “Service Fixtures.”

B. Final installation, tightening and connecting “Service Fixtures” furnished by laboratory casework manufacturer including the pulling of wire and connecting of electrical fixtures in service lines.

C. Receiving, handling, installing and connecting separate laboratory sinks, drains, overflows, sink outlets and tail-pieces furnished by the laboratory casework manufacturer.

D. Furnishing, installing and connecting vents and drain lines.

E. Furnishing, installing, setting and connecting special electrical and plumbing fixtures and piping to meet local codes, even though not specifically called for in specifications and shown on drawings.

F. Furnishing, handling and installing fans with motors (blowers).

G. Furnishing, and installation of framing or reinforcements for wall, floors and ceilings to adequately support laboratory equipment and brick, plaster, metal or wood grounds required for proper anchoring of the equipment.

H. Furnishing any miscellaneous materials generally classified as maintenance or supply items.

I. Furnishing and installation of pipe hangers.

J. Furnishing and installation of resilient base on walls and fixed laboratory casework after laboratory casework installation is completed.

1.4 SECTION INCLUDES

A. Stainless Steel casework

B. Work surfaces and sinks

C. Movable tables

D. Wire shelving units

E. Adjustable Shelving

1.5 RELATED SECTIONS

A. Section 07 9200: Joint Sealants

B. Division 09: “Non-Structural Metal Framing” for Backing in Walls for Laboratory Casework and Accessory Anchorage

C. Division 09: Resilient Base and Accessories

D. Section 11 5313: Lab Fume Hoods

E. Section12 3553: Fixed Laboratory Casework

F. Section 22 4400: Lab Fittings and Fixtures

G. Division 22: Plumbing

H. Division 23: Mechanical

I. Division 26: Electrical

1.6 DELIVERY, STORAGE AND HANDLING

A. Schedule delivery of casework and equipment so that spaces are sufficiently complete to allow for installation immediately following delivery.

B. Protect finished surfaces from soiling or damage during handling and installation. Cover working surfaces with cardboard. Mark in large lettering "NO STANDING".

1.7 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Laboratory casework components and assemblies shall meet local seismic restraint requirements.

1.8 DEFINITIONS

A. “Laboratory Casework Contractor” is defined as the manufacturer and/or manufacturer’s representative furnishing and installing the laboratory casework, equipment, and accessories listed under these specifications, laboratory equipment schedule and/or shown on drawings.

B. “Service Fixtures” are defined as gas, air, and vacuum valves, hot, cold, reagent grade water faucets, remote control valves, electrical receptacles with necessary flush mounting boxes, conduits or pedestals and plates, light fixtures, light switches and/or motor switches for hoods and other items which serve as a functional part of the equipment.

C. “Service Lines” are defined as gas, air, vacuum, hot, cold, reagent grade and reference grade water piping, drain lines, fittings and shut off valves necessary to carry respective services from building roughing-in floors or walls through equipment to “service fixture”.

D. “Service Lines” also include conduit, junction boxes, conduit fitting, wire disconnect switches and fuse or circuit breakers necessary to carry electrical services from building roughing-in outlets in floors or walls through equipment to “service fixtures.”

E. “Standards” are wall mounted, twin-tracked shelf supports.

F. “Slotted Studs” are double-faced, twin-tracked studs comprising the frame spanning between the utility chase and the building wall or workstation at peninsula bench assemblies.

G. Exposed Portions of Cabinets: Surfaces visible when doors and drawers are closed, including bottoms of cabinets more than 48 inches (1220 mm) above floor, and surfaces visible in open cabinets. This also includes tops and bottoms of shelving in open or glass doored units and open wall shelving.

H. Semi-exposed Portions of Cabinets: Surfaces behind opaque doors, such as interiors of cabinets, shelves, dividers, interiors and sides of drawers, and interior faces of doors. Tops of cases 78 inches (1980 mm) or more above floor are defined as semi-exposed.

I. Concealed Portions of Cabinets: Surfaces nor usually visible after installation, including sleepers, web frames, dust panels, and ends and backs that are placed directly against walls or other cabinets.

1.9 REFERENCE STANDARDS

A. Scientific Equipment & Furniture Association (SEFA)

1. SEFA 1 Laboratory Fume Hoods

2. SEFA 2.3 Scientific Laboratory Furniture And Equipment
3. SEFA 3 Work surfaces
4. SEFA 7 Laboratory and Hospital Fixtures
5. SEFA 8 Laboratory Furniture-Casework-Shelving and Tables – Recommended Practices.

B. American Society for Testing and Materials (ASTM)

1. A240-Heat Resistant Chromium and Chromium – Nickel Stainless Steel Plate, Sheet, and Strip for pressure Vessels
2. A312-Seamless and Welded Austenitic Stainless Steel Pipe
3. D570-Water Adsorption of Plastics
4. D695-Compressive Properties of Rigid Plastics
5. D790-Fluctural Properties of Un-reinforced and Reinforced Plastics and Electrical Insulating Materials
6. E84-Test Method for Surface Burning Characteristics of Building Materials
7. A554 Standard Specification for Welded Stainless Steel Mechanical Tubing
8. A513 Standard Specification for Electric-Resistance Welded Carbon and Alloy Steel Mechanical Tubing.

C. Builders Hardware Manufacturers Association (BHMA)

D. National Electrical Manufacturers Association (NEMA)

E. National Fire Protection Association (NFPA) 30 Flammable Liquid Storage

F. National Fire Protection Association (NFPA) 70 Electrical Components, Devices and Accessories.

1.10 PROJECT CONDITIONS

A. Do not deliver or install equipment until the following conditions have been met:

1. Windows and doors are installed and the building is secure and weather tight.
2. Ceiling, overhead ductwork, and lighting are installed.
3. All painting is completed and floor finish is installed.
4. Casework and related materials require the interior building temperature not to exceed 80 degrees (F) to avoid undue structural fatigue and damage. Additionally, frequent and/or excessive changes in temperature and/or humidity levels during the course of the material installation, or once materials are installed, must be avoided to prevent damage to equipment.

B. Under no conditions should moisture levels exceed 50% relative humidity.

1.11 SUBMITTALS

A. Refer to submittal section of the General and Supplementary Specifications in Division 1 for requirements and procedures. Fabrication or purchase of any items prior to approval will be at the manufacturer's risk.

B. Product Data: Submit manufacturer's data for each item of vivarium furnishings and equipment. Include component dimensions, configurations, construction details, joint details and attachments. Indicate location, size and service requirement for each utility connection. See Specification Division 1 for additional general requirements.

C. Shop Drawings: Provide 1/2" = 1'0" scale elevations of each individual and battery of casework units showing cross sections, rough-in and anchor placements, tolerances and clearances. Indicate relationship of units to fume hoods, other laboratory equipment, surrounding walls, ceilings, windows, doors and other building components. Provide 1/4" = 1'0" rough-in plan drawings for coordination with trades. Rough-in shall show free area. In addition, it is the responsibility of the casework manufacturer to flag any deviations in dimension, material, detail, etc. that is not exactly the same as shown on the contract documents. Those deviations not flagged will be considered "not reviewed", even if missed during the approval process and will have to be changed. Provide number of copies of drawings and data sheets in accordance with Division 1 requirements.

1. Indicate locations of blocking and reinforcements required for installing laboratory casework.
2. Indicate locations and types of service fittings, together with associated service supply connection required.
3. Include details of utility spaces showing supports for conduits and piping.
4. Include details of support framing system.
5. Include details of exposed conduits, if required, for service fittings.
6. Indicate locations of and clearances from adjacent walls, doors, windows, other building components, and other laboratory equipment.
7. Include coordinated dimensions for laboratory equipment specified in other Sections.

D. Samples: Contractor shall submit the following samples for approval by The Owner's Representative, prior to fabrication of the specified mock-up:

1. One (1) 24" (600 mm) wide full height base cabinet consisting of one (1) drawer, one (1) door, one (1) cupboard with adjustable half/full depth shelf and related hardware (pulls, hinges, etc.), complete with finish.
2. One (1) 24" (600 mm) long standard, and one (1) end bracket, with specified finish.
3. Adhesives and sealants.
4. Countertop material (one of each specified): 12" x 12" x 1" (300 mm x 300 mm x 25 mm) thick, showing top, marine edge, drip edge, front edge and backsplash construction.

E. Hardware Samples: Provide samples of door and drawer pulls, locks and hinges.

F. Finish Samples: Submit samples of finish. Verify required sample sizes with University Representative.

G. Submit detailed seismic anchorage and attachment drawings and calculations complying with all California Building Code requirements and regulations for seismic restraint. The submittal shall include:

1. Dimensions and location of the center of gravity of the component.
2. Weight assumed in the calculations including contents.
3. Specification of anchorage to concrete in detail, including inspection and testing requirements, if any (inspection and testing to be furnished under this section, if required).
4. Reaction loads to the supporting structure or other component.
5. If a component other than the structure is used for seismic support, the submittal shall show the adequacy of the load path to the structure or otherwise demonstrate compliance with limitations in the contract documents.
6. The submittal will be reviewed by the design professional responsible for this section of the specification to confirm that it is responsive to project specific context and criteria. The adequacy of the primary structure to resist the reaction loads imparted on the primary structure by shall be reviewed and approved by the project Structural Engineer.

1.12 QUALITY ASSURANCE

A. The supplier for work in this section shall use manufacturers with production facilities including all tools, equipment and special machinery necessary for specializing in the fabrication and installation of the type of equipment specified, with skilled personnel, factory trained workmen and an experienced engineering department. Each shall have the demonstrated knowledge, ability and the proven capability to complete an installation of this size and type within the required time limits: Ten years or more experience in manufacture of laboratory casework and equipment of type specified; and ten installations of equal or larger size and requirements within the last five years.

B. Testing Agency Qualifications: An independent agency qualified for testing indicated, as documented according to ASTM E 548.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. Product Standard: Comply with SEFA 8, "Laboratory Furniture--Casework, Shelving and Tables--Recommended Practices."

E. Pre-installation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

1.13 WARRANTY

A. Furnish to The owner's representative a written guarantee for work performed under this section against all defects in materials and workmanship, including against warping, twisting, discoloration, delaminating, for one (1) year from date of acceptance.

1.14 TESTING

A. Include in initial submittals, certified test reports indicating compliance of their laboratory casework finish and work top materials with requirements specified for chemical and physical resistance. The material test reports shall be performed by an independent testing agency qualified for testing indicated, as documented according to ASTM E548.

1.15 FIELD MEASUREMENTS

A. Verify field measurements and that equipment will fit through docks, entryways, elevators, corridors and door openings enabling a smooth flow of equipment to its proper location in the building. Wall-to-wall counter tops are to be installed with a maximum 1/4" (6.35 mm) gap.

1.16 DELIVERY, STORAGE AND HANDLING

A. Deliver casework only after painting, utility rough-ins and similar operations that could damage, soil or deteriorate casework have been completed in installation areas. If casework shall be stored in other than installation areas, store only in areas where environmental conditions meet requirements specified in "Project Conditions" Article of this specification section.

B. Keep finished surfaces covered with polyethylene film or other protective covering during handling and installation.

1.17 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install casework until building is enclosed, wet work is complete and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

B. Field Measurements: Where casework is indicated to fit to other construction, verify dimensions by field measurements before fabrication and indicate measurements on Shop Drawings.

C. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating the casework without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.18 COORDINATION

A. Coordinate layout of metal framing and reinforcements in wall assemblies for support of the casework.

B. Coordinate installation of casework with installation of fume hoods and other laboratory equipment including rough-in locations and requirements.

1.19 EXTRA MATERIALS

A. Furnish complete touch-up kit for each type and finish of the casework provided. Include scratch fillers, stains, finishes, and other materials necessary to perform permanent repairs to damaged casework finish as well as epoxy tops.

B. Furnish 20 pieces of extra casework hardware (pulls, hinges, glides, casters, etc…) which matches products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.20 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

B. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal;" , comply with provisions in Division 1, Section 01600, "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Kewaunee (Represented by ISEC)
Contact: Bob Bell
Phone: 858.279.9085
Email: RBBell@isecinc.com

B. Or Equal

2.2 DESIGN REQUIREMENT

A. Counter tops, sinks, stainless steel accessories, shelves and shelf supports noted on drawings as "Stainless Steel" shall be type 302/304, austenitic chromium nickel stainless steel in accordance with A.I.S.I. specification containing 8% nickel and 18% chromium. Where noted as such, stainless steel components and shelf supports shall be constructed exactly as those fabricated of cold rolled sheet steel and the same gages. Exposed surfaces shall have # 4 finish.

B. Door and drawer design: Inset flush.

C. Self-supporting units capable of interchangeable use.

D. Flush interiors: Set cupboard bottom flush with front end facers. Surface mounted bottoms and offsets caused by front face frames which interfere with ease of cleaning are not acceptable.

E. All casework components to be stainless steel. No wood or non stainless metal components are acceptable in the casework and related components.

2.3 CABINET CONSTRUCTION

A. Construction and design shall develop maximum strength and rigidity in each sectional unit. Each sectional unit shall be completely fabricated ready for placement in the laboratory casework and equipment assembly and shall be a complete integral rigid unit in itself to permit relocation at any subsequent time. Component parts of the sectional unit shall be die formed insuring uniformity and interchangeability and shall be assembled in jigs for accurate alignment. Joints shall be notched, keyed and overlapped forming interlocking joint construction. Vertical and horizontal members shall be spot welded and shall be both spot welded and arc welded at stress points. The cabinet shall be fabricated in two (2) sections with a removable 6" (152mm) high drawer apron at the top of 36" (914mm) high cabinets except as noted herein.

B. Screws shall not be used in the construction of the unit proper and shall only be used where backs, pans and panels are required to be removable for accessibility. Sectional units to be located on the laboratory floor shall be equipped with leveling devices easily adjustable from within the units, to compensate for unevenness in the laboratory floor. Access to leveling bolts shall be through holes in the cabinet bottoms directly above the leveling bolts. These access holes shall be provided with removable snap-on covers.

C. Base cabinets to be constructed to achieve an industry standard height of 30" or 36" (762mm or 914mm), not including the 1" (25.4mm) counter top, without raising the cabinet off the floor beyond the height required for normal leveling conditions (1" (25.4mm) nominal) and incorporate the full over face design in which the cabinet body is completely concealed.

D. Stainless steel cabinets shall be constructed of type 302/304 stainless steel with joints and seams butt-welded, ground smooth and polished. Exposed surfaces shall have a #4 finish.

2.4 HARDWARE

A. Drawer pulls: Drawer and hinged door pulls shall be 4” stainless steel wire pulls, all horizontal at doors and drawers.

B. Hinges: (1) Heavy duty, exposed 5 knuckle stainless steel hinge attached with stainless steel metal screws. Provide two hinges for doors up to 36" high. Three hinges for doors over 36" high.

C. Elbow catches: Spring type with strike.

D. Drawer suspension: Mechanical slides shall be full extension 100 lb. Drawer bodies less than 3-1/2" high (including pull out boards) to be furnished with full extension 100 lb. zinc plated Accuride 3832 series, or equal.

E. Shelf supports: Single pin stainless steel metal support.

2.5 LOCKS

A. Locks (installed on all cabinet doors, UON) shall be 5-disc tumbler for master key system. Master Key System: Master key system shall have 5-disc tumbler locks with capacity for 225 primary key changes. Master key one level with the potential of 40 different, non-interchangeable master key groups. Keys: Stamped brass available from manufacturer or local locksmith, and supplied in the following quantities unless otherwise specified: 2 for each keyed different lock; 3 for each group keyed alike locks; 2 for master keys for each system. Lock types shall have heavy duty cylinder. Exposed lock nose finish to be dull nickel (satin) plated. Provide locks by National or equal. For cabinets in Procedure Rooms and Surgery room, each individual cabinet shall be keyed the same for all drawers and doors.

2.6 STAINLESS STEEL WORK SURFACE

A. Counter tops and curbs noted on drawings as “Stainless Steel”, (Type 302/304) shall be constructed of 16 gauge (1.6 mm) nominal thickness, stainless steel sheet, ASTM A666. Exposed surfaces shall have # 4 satin finish.

B. Extend top down 1 inch (25 mm) at edges with a 1/2 inch (13 mm) return flange under frame. Apply heavy (2-3 mm) coating of heat-resistant, sound-deadening mastic to undersurface.

C. Form curb coved to and integral with top surface of one piece, without seams or joints. The top of the curb shall be chamfered 45 degrees.

D. Provide raised (marine) edge around perimeter of countertops containing sinks; pitch two ways to sink to provide drainage without channeling or grooving.

E. Reinforce underside of countertop with channels where necessary to insure rigidity without deflection and coat with a sound deadening material where not exposed to view. Cap ends of channels and stiffeners to prevent rodent entry.

F. Tops shall be as long as practical to permit access to the building and room. Where field-made joints are required, provide continuous channels welded to the underside of the counter for reinforcing and aligning the butt-joints.

G. Electrically weld shop and field made joints, and grind and polish surfaces to produce uniform, directionally textured finish, free of cross scratches. When polishing is completed rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

2.7 STAINLESS STEEL SINKS

A. Material: 16 gauge, Type 304 stainless steel with No. 4 satin finish on all exposed surfaces and edges.

B. Sinks to be integral with adjacent tops. All seams to be welded and ground smooth. Tops shall be adequately reinforced to accept sinks.

C. Sink bowls: Electrically weld stainless steel bowls to opening in top. Grind welds flush and polish to a satin finish to produce an integral unit with invisible joint line. Coat underside of sink bowls with sound dampening material.

D. Joints: Electrically weld all shop joints; grind smooth and polish. Weld all field joints. Make weld without discolorations and grind, polish to blend harmoniously with a No. 4 satin finish.

2.8 STAINLESS-STEEL SHELVES

A. Adjustable shelves shall be depth as noted on the Drawings.

B. Adjustable shelves shall be mounted to surface type stainless steel standards at wall conditions. Adjustable shelves shall be supported by stainless steel shelf brackets not to exceed 42 inches on center. Brackets shall be 11 gage stainless steel. Shelves shall be fastened to brackets with two stainless steel screws per bracket.

C. Exterior adjustable shelves, those not in cabinets, shall be equipped with a 3/8 inch diameter, 2 inch (50 mm) high stainless steel rail at the front of the shelf. Provide ¾" stainless steel turret at mid-span for rail lengths exceeding 24" in nominal length. Turrets shall be fastened to the shelf in a similar manner as wire pulls are fastened to drawers and doors. Stainless steel screws to be accessible from underside of shelf. Press fit rails are not acceptable.

D. Made not less than 0.050 inch (1.3 mm) nominal thickness. Fold down front edge 3/4 inch (19 mm); fold up back edge 3 inches (75 mm). Provide integral stiffening brackets, formed by folding up ends 3/4 inch (19 mm) and welding to upturned back edge. Weld shop made joints, grind smooth and polish.

E. In all vivarium spaces provide closed-cell neoprene between shelf standards and wall for vermin control.

2.9 STAINLESS STEEL CASEWORK REQUIREMENTS

A. General:

1. Where noted on the drawings, cabinets with casters shall be constructed without toe spaces. The cabinet shall be constructed with a reinforced base capable of supporting a 4" high caster assembly in each corner. Casters shall be swivel locking type at front, fixed in rear, and rated for minimum 250 pounds load each. Casters shall be capable of being processed through the cage washing equipment. The entire assembly shall be reinforced to permit mobility without twisting. Height as per Drawings to fit beneath the casework height of 34" including the 1" counter top. Allow sufficient clearance between top of cabinet and underside of countertop or apron to facilitate movement. Cabinets with casters shall be completely finished on four sides, tops and bottoms to prevent vermin access. Cabinets with casters shall not be fabricated with removable backs. Cabinets shall be constructed of type 302/304 stainless steel with joints and seams welded, ground smooth and polished. Exposed surfaces shall have a #4 finish.

2. Stainless steel surfaces to be cleanable without removal of items and with standard cleaning brushes.

2.10 MOVABLE TABLES:

A. Movable tables shall be constructed as indicated on the Drawings.

B. Movable tables shall have a 1.5 inch apron front and 7 inch sides and backs. It shall have a 1 inch by 1 inch tubular stainless steel telescoping legs fitted with a 1-1/2 inch diameter adjustable non-marring floor glides.

C. Levelers: 1-1/2 inch round – 16 NC x 2-1/2 inch long levelers with non'marring floor glides at each leg complete with locking nut.

D. Movable tables shall have the ability to be adjusted in height from 30 inches to 37 inches in 1 inch increments inclusive of 1 inch thick work surface.

E. Movable adjustable tables shall be installed at height indicated on Drawings. Fixed stainless steel section of leg shall be set at height appropriate for a 30" high table top. Coordinate the under-counter clearance with casework and refrigerators.

F. Movable tables shall be reinforced with a deep welded steel channel frame and corner brackets appropriate for the load bearing requirements. Load capacity of tables shall be 1,000 lb. (453.6kg) uniformly loaded and support a 250 lb. (113.4kg) concentrated load at mid-space with deflection not to exceed 1/8" (3.18mm).

G. Movable table shall be equipped with stainless steel top in vivarium unless otherwise noted.

2.11 WIRE SHELVING UNITS

A. Where noted on drawings, provide a wire shelving assembly that is 18" deep and 74" high. The entire assembly, consisting of a series of shelving units, shall be bolted together for overall stability and be installed in accordance with local seismic requirements.

B. Shelving assembly shall consist of five tiers of wire shelving mounted on steel posts; one in each corner of each shelf. Each post shall have a leveling device. Shelves shall be adjustable in 1" increments.

C. Each 4'-0" length of shelf shall support up to 400 lbs.

D. Shelving material shall be steel wire with polished chrome finish.

E. Units shall be similar to Super Erecta Shelving as manufactured by InterMetro Wire

2.12 MECHANICAL SERVICE FIXTURES

A. Refer to 12 3553 Fixed Laboratory Casework Specification

2.13 ELECTRICAL FIXTURES

A. Refer to 12 3553 Fixed Laboratory Casework Specification

PART 3 – EXECUTION

3.1 JOB SITE CONDITIONS

A. Verify that required backing and reinforcements are in place, secure, and accurately located and that project is ready for installation of laboratory casework.

B. Proceed with work when conditions permit work to be installed in complete accordance with the original design, accepted submittals, and the manufacturer's written instructions.

C. In the event of discrepancy, immediately notify The Owner's Representative in writing. Do not proceed with the installation in areas of discrepancy until issues have been resolved.

3.2 INSTALLATION

A. Set casework components plumb, square, and straight with no distortion and securely anchored. Shim as required using concealed phenolic resin shims and or leveling bolts.

B. Screw continuous cabinets together with joints flush, tight and uniform, and with alignment of adjacent units within 1/16" tolerance.

C. Secure wall cabinets to solid supporting backing material, not to plaster, lath or gypsum board.

D. Secure work surfaces to casework and equipment components with material and procedures recommended by the manufacturer.

E. Accessory Installation: Install accessories and fittings in accordance with manufacturer's recommendations. Turn screws to seat flat; do not drive.

F. Seal all joints where dissimilar materials meet with Sanitary Sealant.

G. Prevention of vermin infestation: Close ends of all tube components; cover or seal holes; seal all metal seams; on fixed and mobile cabinets on all sides, seal cabinet perimeter to wall.

H. Base Cabinet Casework shall be located in their designated positions, leveled, and plumbed true and straight by means of the micro-adjustment device located in each bottom corner of the cabinet. Adjust top rails and sub-tops within 1/16 inch (1.5 mm) of a single plane. Fasten cabinets to utility space framing, partition framing, blocking or reinforcements in partitions with fasteners spaced not more than 24 inches (600 mm) o.c. Align similar adjoining doors to a tolerance of 1/16 inch (1.5 mm).

I. Counter top lengths shall be fabricated as specified and indicated on the drawings with ends abutting tightly, and sealed with corrosion resistant sealants. The horizontal surface shall be smooth and level with no raised edges at the joints. Tops shall be anchored to base cabinets.

J. Install miscellaneous filler panels and scribe as required for a continuous tight and accurate fitting installation with fasteners concealed where practical, without gaps or spaces between cabinetwork or counters and adjoining surfaces. All back splashes to be sealed at wall surfaces with corrosion resistant sealants.

K. Assemblies are to be fastened together with devices of adequate strength to support cabinet or shelf fully loaded. Fully loaded will be defined as twenty-five (25) pounds per linear foot per shelf for enclosed wall cabinets or open adjustable shelves not inclusive of cabinet, shelf and bracket weight. Securely fasten wall-mounted items to solid supporting material only. Installation to meet local seismic requirements.

L. Wall Cabinets: Adjust fronts and bottoms within 1/16 inch (1.5 mm) of a single plane. Fasten to hanging strips, masonry, partition framing, blocking or reinforcements in partitions. Fasten each cabinet through back, near top, at not less than 24 inches (600 mm) o.c. Align similar adjoining doors to a tolerance of 1/16 inch (1.5 mm).

M. Utility Space Framing: Secure to floor with two fasteners at each frame. Fasten to partition framing, wood blocking, or metal reinforcements in partitions and to base cabinets.

N. Install hardware uniformly and precisely. Set hinges snug and flat in mortises.

O. Adjust laboratory casework and hardware so doors and drawers align and operate smoothly without warp or bind and contact points meet accurately. Lubricate joints only where shown on Shop Drawings.

3.3 INSTALLATION OF ACCESSORIES

A. Install in accordance with manufacturer’s directions. Turn screws to a flat seat; do not drive. Adjust moving parts to operate freely without excessive bind.

B. Securely fasten adjustable shelving supports, shelves and pegboards to partition framing, blocking or reinforcements in partitions.

C. Install shelf standards plumb and at heights to align shelf brackets for level shelves. Install shelving level and straight, closely fitted to other work where indicated.

3.4 ADJUSTING

A. Repair or remove and replace defective work, as directed by University's Representative upon completion of installation.

B. Adjust doors, drawers, hardware, fixtures and other moving or operating parts to function smoothly.

3.5 CLEANING

A. Clean shop finished casework, work surfaces, and accessories; touch up as required, wipe down and broom clean interior and exterior of equipment.

3.6 PROTECTION OF FINISHED WORK

A. Provide all necessary protective measures to prevent exposure of casework and equipment from exposure to other construction activity during installation.

B. Advise contractor of procedures and precautions for protection of material, installed laboratory casework and fixtures from damage by work of other trades.

END OF SECTION 12 3560

SECTION 12 3623.13 - PLASTIC-LAMINATE-CLAD COUNTERTOPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes plastic-laminate countertops.

1.3 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For each type of productpanel products high-pressure decorative laminate.

C. LEED Submittals:

1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.
2. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regional materials, certificates indicating location of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include statement indicating distance to Project, cost for each regional material, and fraction by weight that is considered regional.
3. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regionally manufactured materials. Include statement indicating cost for each regionally manufactured material.
    a. Include statement indicating location of manufacturer and distance to Project for each regionally manufactured material.
    b. Include statement indicating location of manufacturer and point of extraction, harvest, or recovery for each raw material used in regionally extracted and manufactured materials. Indicate distance to Project and fraction by weight of each regionally manufactured material that is regionally extracted.
4. Certificates for Credit MR 6: Chain-of-custody certificates indicating that products specified to be made from certified wood comply with forest certification and chain-of-custody requirements. Include statement indicating cost for each certified wood product.
5. Product Data for Credit IEQ 4.1: For installation adhesives, including printed statement of VOC content.

6. Laboratory Test Reports for Credit IEQ 4.1: For adhesives, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
7. Product Data for Credit IEQ 4.4: For adhesives and composite wood products, documentation indicating that products contain no urea formaldehyde.
8. Laboratory Test Reports for Credit IEQ 4.4: For composite wood products, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

D. Shop Drawings: Show location of each item, dimensioned plans and elevations, large-scale details, attachment devices, and other components.
1. Show locations and sizes of cutouts and holes for plumbing fixtures electrical switches and outlets and other items installed in plastic-laminate countertops.
2. Apply WI Certified Compliance Program label to Shop Drawings.

E. Samples for Verification:
1. Plastic laminates, 12 by 12 inches, for each type, color, pattern, and surface finish, with one sample applied to core material and specified edge material applied to one edge.

1.4 QUALITY ASSURANCE

A. Fabricator Qualifications: Shop that employs skilled workers who custom fabricate products similar to those required for this Project and whose products have a record of successful in-service performance. Shop is a licensee of WI's Certified Compliance Program.

B. Installer Qualifications: Licensee of WI's Certified Compliance Program.

C. Provide the following upon request:
1. Qualification Data: For fabricator.
2. Product Certificates: For each type of product.
3. Woodwork Quality Standard Compliance Certificates: WI Certified Compliance Program certificates.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Do not deliver countertops until painting and similar operations that could damage countertops have been completed in installation areas. If countertops must be stored in other than installation areas, store only in areas where environmental conditions comply with requirements specified in "Field Conditions" Article.

1.6 FIELD CONDITIONS

A. Environmental Limitations: Do not deliver or install countertops until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

B. Environmental Limitations: Do not deliver or install countertops until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature between 60 and 90 deg F and relative humidity between 43 and 70 percent during the remainder of the construction period.

C. Field Measurements: Where countertops are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication, and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

D. Established Dimensions: Where countertops are indicated to fit to other construction, establish dimensions for areas where countertops are to fit. Provide allowance for trimming at site, and coordinate construction to ensure that actual dimensions correspond to established dimensions.

PART 2 - PRODUCTS

2.1 PLASTIC-LAMINATE COUNTERTOPS

A. See Interior Finish Material Legend on drawings.

B. Quality Standard: Unless otherwise indicated, comply with the "Architectural Woodwork Standards" for grades indicated for construction, installation, and other requirements.

1. Provide labels and certificates from WI certification program indicating that countertops, including installation, comply with requirements of grades specified.

2. The Contract Documents contain selections chosen from options in the quality standard and additional requirements beyond those of the quality standard. Comply with those selections and requirements in addition to the quality standard.

C. Grade: Custom.

D. Certified Wood: Plastic-laminate countertops shall be made from wood products certified as "FSC Pure" or "FSC Mixed Credit" according to FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship," and FSC STD-40-004, "FSC Standard for Chain of Custody Certification."

E. High-Pressure Decorative Laminate: NEMA LD 3, Grade HGS .

F. Chemical-Resistant, High-Pressure Decorative Laminate: NEMA LD 3, Grade HGP, and as follows:

G. Colors, Patterns, and Finishes: Provide materials and products that result in colors and textures of exposed laminate surfaces complying with the following requirements:

1. As indicated by manufacturer's designations.

H. Edge Treatment: 3-mm PVC edging.

I. Core Material: Particleboard or medium-density fiberboard.

J. Core Material at Sinks: exterior-grade plywood.

K. Core Thickness: 3/4 inch.

1. Build up countertop thickness to 1-1/2 inches at front, back, and ends with additional layers of core material laminated to top.

L. Backer Sheet: Provide plastic-laminate backer sheet, NEMA LD 3, Grade BKL, on underside of countertop substrate.

2.2 WOOD MATERIALS

A. Wood Products: Provide materials that comply with requirements of referenced quality standard unless otherwise indicated.

1. Wood Moisture Content: 8 to 13 percent.

B. Composite Wood and Agrifiber Products: Provide materials that comply with requirements of referenced quality standard for each type of woodwork and quality grade specified unless otherwise indicated.

1. Composite Wood and Agrifiber Products: Products shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2. Medium-Density Fiberboard: ANSI A208.2, Grade 130 , made with binder containing no urea formaldehyde.

3. Particleboard: ANSI A208.1, Grade M-2, made with binder containing no urea formaldehyde.

4. Softwood Plywood: DOC PS 1.

2.3 ACCESSORIES

A. Grommets for Cable Passage through Countertops: 2-inch OD, black, molded-plastic grommets and matching plastic caps with slot for wire passage.

2.4 MISCELLANEOUS MATERIALS

A. Adhesives: Do not use adhesives that contain urea formaldehyde.

B. Adhesives: Use adhesives that meet the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

C. VOC Limits for Installation Adhesives and Sealants: Use products that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

1. Wood Glues: 30 g/L.
2. Multipurpose Construction Adhesives: 70 g/L.
3. Structural Wood Member Adhesive: 140 g/L.
4. Architectural Sealants: 250 g/L.

2.5 FABRICATION

A. Fabricate countertops to dimensions, profiles, and details indicated. Provide front and end overhang of 1 inch over base cabinets. Ease edges to radius indicated for the following:

1. Solid-Wood (Lumber) Members: 1/16 inch unless otherwise indicated.

B. Complete fabrication, including assembly, to maximum extent possible before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.

1. Notify Architect seven days in advance of the dates and times woodwork fabrication will be complete.
2. Trial fit assemblies at fabrication shop that cannot be shipped completely assembled. Install dowels, screws, bolted connectors, and other fastening devices that can be removed after trial fitting. Verify that various parts fit as intended and check measurements of assemblies against field measurements before disassembling for shipment.

C. Shop cut openings to maximum extent possible to receive appliances, plumbing fixtures, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs.

1. Seal edges of openings in countertops with a coat of varnish.

PART 3 - EXECUTION

3.1 PREPARATION

A. Before installation, condition countertops to average prevailing humidity conditions in installation areas.

B. Before installing countertops, examine shop-fabricated work for completion and complete work as required, including removal of packing and backpriming.

3.2 INSTALLATION

A. Grade: Install countertops to comply with same grade as item to be installed.

B. Assemble countertops and complete fabrication at Project site to the extent that it was not completed in the shop.

1. Provide cutouts for appliances, plumbing fixtures, electrical work, and similar items.
2. Seal edges of cutouts by saturating with varnish.

C. Field Jointing: Where possible, make in the same manner as shop jointing, using dowels, splines, adhesives, and fasteners recommended by manufacturer. Prepare edges to be joined in shop so Project-site processing of top and edge surfaces is not required. Locate field joints where shown on Shop Drawings.

1. Secure field joints in plastic-laminate countertops with concealed clamping devices located within 6 inches of front and back edges and at intervals not exceeding 24 inches. Tighten according to manufacturer's written instructions to exert a constant, heavy-clamping pressure at joints.

D. Install countertops level, plumb, true, and straight. Shim as required with concealed shims. Install level and plumb to a tolerance of 1/8 inch in 96 inches.

E. Scribe and cut countertops to fit adjoining work, refinish cut surfaces, and repair damaged finish at cuts.

F. Countertops: Anchor securely by screwing through corner blocks of base cabinets or other supports into underside of countertop.

1. Install countertops with no more than 1/8 inch in 96-inch sag, bow, or other variation from a straight line.
2. Secure backsplashes to tops with concealed metal brackets at 16 inches o.c. and to walls with adhesive.
3. Seal junctures of tops, splashes, and walls with mildew-resistant silicone sealant or another permanently elastic sealing compound recommended by countertop material manufacturer.

3.3 ADJUSTING AND CLEANING

A. Repair damaged and defective countertops, where possible, to eliminate functional and visual defects; where not possible to repair, replace woodwork. Adjust joinery for uniform appearance.

B. Clean countertops on exposed and semiexposed surfaces. Touch up shop-applied finishes to restore damaged or soiled areas.

END OF SECTION

SECTION 12 3661.16 - SOLID SURFACING COUNTERTOPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Solid surface material countertops.
2. Solid surface material backsplashes.
3. Solid surface material end splashes.

1.3 ACTION SUBMITTALS

A. Submittal Compliance Form: If Basis-of-Design products are provided, Submittal Compliance Form may be submitted in lieu of required Product Data submittal and Samples submittal. Ensure compliance with requirements included in Section 01 3300 "Submittal Procedures."

B. Product Data: For countertop materials.

C. Sustainable Design Submittals:

1. Chain-of-Custody Certificates: For certified wood products. Include statement of costs.
2. Product Data: For adhesives, indicating VOC content.
3. Laboratory Test Reports: For adhesives, indicating compliance with requirements for low-emitting materials.
4. Laboratory Test Reports: For composite wood products, indicating compliance with requirements for low-emitting materials.

D. Shop Drawings: For countertops. Show materials, finishes, edge and backsplash profiles, methods of joining, and cutouts for plumbing fixtures.

1. Show locations and details of joints.
2. Show direction of directional pattern, if any.

E. Samples for Verification: For the following products:

1. Countertop material, 6 inches square.
2. One full-size solid surface material countertop, with front edge and backsplash, 8 by 10 inches , of construction and in configuration specified.

1.4 CLOSEOUT SUBMITTALS

A. Maintenance Data: For solid surface material countertops to include in maintenance manuals. Include Product Data for care products used or recommended by Installer and names, addresses, and telephone numbers of local sources for products.

1.5 QUALITY ASSURANCE

A. Fabricator Qualifications: Shop that employs skilled workers who custom-fabricate countertops similar to that required for this Project, and whose products have a record of successful in-service performance.

B. Installer Qualifications: Fabricator of countertops.

C. Provide the following upon request:

1. Qualification Data: For fabricator.

1.6 FIELD CONDITIONS

A. Field Measurements: Verify dimensions of countertops by field measurements after base cabinets are installed but before countertop fabrication is complete.

1.7 COORDINATION

A. Coordinate locations of utilities that will penetrate countertops or backsplashes.

PART 2 - PRODUCTS

2.1 SOLID SURFACE COUNTERTOP MATERIALS

A. See Interior Finish Material Legend on drawings.

B. Solid Surface Material: Homogeneous-filled plastic resin complying with ICPA SS-1.

1. Type: Provide Standard type unless Special Purpose type is indicated.

2. Colors and Patterns: As selected by Architect from manufacturer's full range.

C. Particleboard: ANSI A208.1, Grade M-2.

D. Plywood: Exterior softwood plywood complying with DOC PS 1, Grade C-C Plugged, touch sanded.

2.2 COUNTERTOP FABRICATION

A. Fabricate countertops according to solid surface material manufacturer's written instructions and to the AWI/AWMAC/WI's "Architectural Woodwork Standards."

1. Grade: Custom.

B. Configuration:

1. Front: Straight, slightly eased at top.
2. Backsplash: Straight, slightly eased at corner.
3. End Splash: Matching backsplash.

C. Countertops: 1/2-inch- thick, solid surface material.

D. Backsplashes: 1/2-inch- thick, solid surface material.

E. Fabricate tops with shop-applied edges and backsplashes unless otherwise indicated. Comply with solid surface material manufacturer's written instructions for adhesives, sealers, fabrication, and finishing.

1. Fabricate with loose backsplashes for field assembly.

F. Joints: Fabricate countertops without joints.

G. Cutouts and Holes:

1. Undercounter Plumbing Fixtures: Make cutouts for fixtures in shop using template or pattern furnished by fixture manufacturer. Form cutouts to smooth, even curves.
   a. Provide vertical edges, slightly eased at juncture of cutout edges with top and bottom surfaces of countertop and projecting 3/16 inch into fixture opening.
2. Counter-Mounted Plumbing Fixtures: Prepare countertops in shop for field cutting openings for counter-mounted fixtures. Mark tops for cutouts and drill holes at corners of cutout locations. Make corner holes of largest radius practical.
3. Fittings: Drill countertops in shop for plumbing fittings, undercounter soap dispensers, and similar items.

2.3 INSTALLATION MATERIALS

A. Adhesive: Product recommended by solid surface material manufacturer.

1. Adhesives shall have a VOC content of 70 g/L or less.
2. Adhesive shall comply with the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

B. Sealant for Countertops: Comply with applicable requirements in Section 07 9200 "Joint Sealants."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates to receive solid surface material countertops and conditions under which countertops will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of countertops.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install countertops level to a tolerance of 1/8 inch in 8 feet, 1/4 inch maximum. Do not exceed 1/64-inch difference between planes of adjacent units.

B. Fasten countertops by screwing through corner blocks of base units into underside of countertop. Predrill holes for screws as recommended by manufacturer. Align adjacent surfaces and, using adhesive in color to match countertop, form seams to comply with manufacturer's written instructions. Carefully dress joints smooth, remove surface scratches, and clean entire surface.

C. Fasten subtops to cabinets by screwing through subtops into cornerblocks of base cabinets. Shim as needed to align subtops in a level plane.

D. Secure countertops to subtops with adhesive according to solid surface material manufacturer's written instructions. Align adjacent surfaces and, using adhesive in color to match countertop, form seams to comply with manufacturer's written instructions. Carefully dress joints smooth, remove surface scratches, and clean entire surface.

E. Bond joints with adhesive and draw tight as countertops are set. Mask areas of countertops adjacent to joints to prevent adhesive smears.

1. Clamp units to temporary bracing, supports, or each other to ensure that countertops are properly aligned and joints are of specified width.

F. Install backsplashes and end splashes by adhering to wall and countertops with adhesive. Mask areas of countertops and splashes adjacent to joints to prevent adhesive smears.

G. Install aprons to backing and countertops with adhesive. Mask areas of countertops and splashes adjacent to joints to prevent adhesive smears. Fasten by screwing through backing. Predrill holes for screws as recommended by manufacturer.

H. Complete cutouts not finished in shop. Mask areas of countertops adjacent to cutouts to prevent damage while cutting. Make cutouts to accurately fit items to be installed, and at right angles to finished surfaces unless beveling is required for clearance. Ease edges slightly to prevent snipping.

1. Seal edges of cutouts in particleboard subtops by saturating with varnish.

I. Apply sealant to gaps at walls; comply with Section 07 9200 "Joint Sealants."

END OF SECTION

SECTION 12 4813 - ENTRANCE FLOOR MATS AND FRAMES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Floor mats EM-1 and EM-2.
2. Recessed frames.

1.3 COORDINATION

A. Coordinate size and location of recesses in concrete to receive floor mats and frames.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for floor mats and frames.

B. Shop Drawings:

1. Items penetrating floor mats and frames, including door control devices.
2. Divisions between mat sections.

C. Samples: For the following products, in manufacturer's standard sizes:

1. Floor Mat: Assembled sections of floor mat.
2. Frame Members: Sample of each type and color.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance Data: For floor mats and frames to include in maintenance manuals.

PART 2 - PRODUCTS

2.1 ENTRANCE FLOOR MATS AND FRAMES, GENERAL

A. Structural Performance: Provide roll-up rail mats and frames capable of withstanding the following loads and stresses within limits and under conditions indicated:

1. Uniform floor load of 300 lbf/sq. ft..
2. Wheel load of 350 lb per wheel.

B. Regulatory Requirements: Comply with applicable provisions in the 2010 ADA Standards and CBC 11B.

2.2 RESILIENT ENTRANCE MATS

A. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:

1. C/S Group. Floormations
2. Mats Inc. Chicago Collection

B. EM-2: Recessed walk off mats.

1. Color: As selected by Architect from full range of industry colors.
2. Mat Size: As indicated.

2.3 CERAMIC-TILE ENTRANCE MATS

A. Basis-of-Design Product: Subject to compliance with requirements, provide the product indicated on Drawings or a comparable product by one of the following:

1. Construction Specialties, Floorometry

B. EM-1: Ceramic Tiles: Large format porcelain tile infill.

1. Daltile Portfolio, colors as scheduled.
2. Tile Size: As indicated.

2.4 FRAMES

A. Recessed Frames: Manufacturer's standard extrusion.

1. Extruded Aluminum: ASTM B 221, Alloy 6061-T6 or Alloy 6063-T5, T6, or T52.
   a. Color: Mill finish .

2.5 FABRICATION

A. Floor Mats: Shop fabricate units to greatest extent possible in sizes indicated. Unless otherwise indicated, provide single unit for each mat installation; do not exceed manufacturer's recommended maximum sizes for units that are removed for maintenance and cleaning. Where joints in mats are necessary, space symmetrically and away from normal traffic lanes. Miter corner joints in framing elements with hairline joints or provide prefabricated corner units without joints.

B. Recessed Frames: As indicated, for permanent recessed installation, complete with corner pins or reinforcement and anchorage devices.

1. Fabricate edge-frame members in single lengths or, where frame dimensions exceed maximum available lengths, provide minimum number of pieces possible, with hairline joints equally spaced and pieces spliced together by straight connecting pins.

C. Coat concealed surfaces of aluminum frames that contact cementitious material with manufacturer's standard protective coating.

2.6 ALUMINUM FINISHES

A. Mill finish.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and floor conditions for compliance with requirements for location, sizes, minimum recess depth, and other conditions affecting installation of floor mats and frames.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install recessed mat frames to comply with manufacturer's written instructions. Set mat tops at height recommended by manufacturer for most effective cleaning action; coordinate tops of mat surfaces with bottoms of doors that swing across mats to provide clearance between door and mat.

1. Install necessary shims, spacers, and anchorages for proper location, and secure attachment of frames.

2. Install grout and fill around frames and, if required to set mat tops at proper elevations, in recesses under mats. Finish grout and fill smooth and level.

3.3 PROTECTION

A. After completing frame installation and concrete work, provide temporary filler of plywood or fiberboard in recesses and cover frames with plywood protective flooring. Maintain protection until construction traffic has ended and Project is near Substantial Completion.

END OF SECTION

SECTION 12 9300

SITE FURNITURE

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:

1. Bike Racks
2. Trash Receptacles
3. Recycling Receptacles
4. Security Phones.
5. Bollards.
6. As indicated on the drawing schedule [A-00].

B. Related Sections:

1. Section 32 13 16: Decorative Concrete.
2. Section 32 14 13: Unit Pavers.

1.2 REFERENCES

A. ASTM — ASTM International:

1. C 881 — Specification for Epoxy-Resin-Base Bonding Systems for Concrete.
2. D 1557 — Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort.
3. F 593 — Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
4. F 594 — Specification for Stainless Steel Nuts.

1.3 DEFINITIONS

A. Acceptance, Acceptable, or Accepted: Acceptance by the Landscape Architect in writing.

B. Excessive Compaction: Planting area soil compaction greater than 75 percent of maximum dry density as determined by ASTM D 1557.

C. Landscape Architect: Landscape Architect employed by the Owner to provide professional landscape architectural services for the Project.

1.4 SUBMITTALS

A. General Requirements: Refer to Division 1.

B. Product Data:

1. For all items specified.

C. Shop Drawings: For all items specified showing elevations, plans details, information for fabrication and installation and coordination with utilities.

D. Samples: Three applied paint samples or finish chips for easch item specified.

E. Manufacturer's Current Printed Instructions:

1. Furniture Manufacturer's Cleaning Instructions.
2. Furniture Manufacturer's Installation Instructions.

1.5 QUALITY ASSURANCE:

A. Regulatory Requirements:

1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over such Work.
2. Provide for inspections and permits required by Federal, State and local authorities in furnishing, transporting, and installing materials.

1.6 WARRANTY

A. General Description: In addition to manufacturer's warranties, warrant Work for a period of one year from date of Final Completion against defects in materials and workmanship.

B. Additional Items Covered: Warranty shall also cover repair of damage to other materials and workmanship resulting from defects in materials and workmanship.

C. Exceptions: Contractor shall not be held responsible for failures due to normal wear, abuse or neglect by others, vandalism and other causes outside the Contractor's control.

PART 2 PRODUCTS

2.1 MANUFACTURERS AND SUPPLIERS

A. See drawings.

2.2 MANUFACTURED UNITS

A. Refer to Drawings for design, sizes, and quantities.

2.3 MATERIALS

A. Anchor Bolt Adhesive: ASTM C 881, 2-component, chemical resistant, structural epoxy bonding system designed for use in anchoring threaded rods, bolts, reinforcing bars, and smooth dowels into solid material.

B. Threaded Rod: ASTM F 593, Type 316, stainless steel.

C. Nuts for Threaded Rod: ASTM F 594, Type 316, stainless steel.

D. Anchor Bolts: As supplied by furniture manufacturer.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.

B. Notification of Unsuitable Conditions: Before proceeding with Work, notify the Owner in writing of unsuitable conditions.

3.2 PREPARATION

A. Protection:

1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, irrigation systems, plant materials and paving on or adjacent to the site of the Work.
2. Use every possible precaution to prevent excessive compaction of planting area soil within or adjacent to the areas of Work.
3. Provide barricades, fences or other barriers as necessary to protect existing conditions to remain from damage during construction.
4. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
5. Submit written notification of conditions damaged during construction to the Owner’s Designated Representative immediately.

3.3 INSTALLATION

A. Bench: Install in locations as shown in the drawings.

B. Fixed Bollards: Install in locations as shown in the drawings.

C. Bike Racks: Install in locations as shown in the drawings.

D. Fire Pits: Install in locations as shown in the drawings with coordinated utility stub outs.

E. Fiberglass Planters: Install in locations as shown in the drawings.

F. Bar tops and supports: Install in locations as shown in the drawings.

3.4 CLEANING

A. General: Clean and keep clean until date of Final Completion.

B. Furniture Cleaning Method: Meet requirements of manufacturer's current printed instructions.

3.5 PROTECTION

A. Furniture Storage: Protect furniture from damage due to construction Work operations and vandalism until date of Final Completion.

END OF SECTION

SECTION 14 2100.13 – ELECTRIC TRACTION ELEVATORS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section specifies electric traction elevators.

B. Work Required:

1. Elevators 1 & 2.
2. The work required under this section consists of all labor, materials and services required for the complete installation (including operational verification) of all the equipment required for the elevator(s) as herein specified.
3. In all cases where a device or part of the equipment is herein referred to in the singular, it is intended that such reference shall apply to as many of such devices or parts as are required to make complete installation.

C. Related work not specified herein: The following sections contain requirements that relate to this section and are performed by trades other than the elevator manufacturer/installer.

1. Hoistway and Pit:
   a) Clear, plumb, substantially flush hoistway with variations not to exceed 1" at any point.
   b) Bevel cants not less than 75 degrees from the horizontal on any rear or side wall ledges and beams that project or recess 2" or more into the hoistway. Not required on hoistway divider beams.
2. Divider beams between adjacent elevators at each floor, pit, and overhead. Supports at each floor for car and counterweight guide rail fastening. Intermediate car guide rail support when floor heights exceed 14'-0" (non-applicable on OSHPD projects). Building supports not to deflect in excess of 1/8" under normal conditions, ¼" under applicable seismic conditions.
3. Continuous vertical car and counterweight guide rail support between floors shown on Contract Documents.
4. Installation of guide rail bracket supports in concrete. Inserts or embeds, if used will be furnished under this Section.
5. Wall blockouts and fire rated closure for control and signal fixture boxes which penetrate walls.
6. Cutting and patching walls and floors.
7. Structural slab, concrete wall pockets and/or structural steel beams for support of hoist machine, rope sheaves, and dead-end hitch beams. Support deflection shall not exceed 1/1666 of span under static load. Concrete or structural steel machine hold down means for hoist machine mounted offset from hoistway or below bottom landing.
8. Erect front hoistway wall after elevator entrances are installed.
9. Grout floor up to hoistway sills.
10. Pit access ladder for each elevator.
11. Structural support at pit floor for buffer impact loads, guide rail loads.
12. Waterproof pit. Indirect waste drain or sump with flush grate and pump.
13. Protect open hoistways and entrances during construction per OSHA Regulations.
14. Protect car enclosure, hoistway entrance assemblies, and special metal finishes from damage.
15. Hoistway venting.

16. Seal fireproofing to prevent flaking.
17. Full width hoistway header to support each entrance assembly.
18. Fire caulking, fire sealing, fire stopping, fire pads and patching of fireproofing.
19. Pit screen between adjacent elevators.
20. Fire and/or smoke doors.
21. Hoisting of machine beams, machines and controllers.
22. Finished flooring in elevator cabs.

D. Applicable Codes: Comply with applicable building and elevator codes at the project site, including but not limited to the following:

1. 2010 ADA Standards.
2. CBC Chapter 11B for Accessibility.
3. California Building Code (CBC).
4. ANSI/NFPA 70, National Electrical Code.
5. ANSI/NFPA 80, Fire Doors and Windows.
6. ASME/ANSI A17.7, Safety Code for Elevators and Escalators.
7. ANSI/UL 10B, Fire Tests of Door Assemblies.
8. EN 12016 (May 1998): "EMC Product Family Standards for lifts, escalators, and passenger
9. conveyors Part 2 – immunity"
10. Guide for Inspection of Elevators, Escalators and Moving Walks, ASME A17.2
    Elevator and Escalator Electrical Equipment, ASME A17.5
11. Requirements of IBC, OSHPD, and all other codes, ordinances and laws applicable within the
12. governing jurisdiction.
13. Life Safety Code, NFPA 101, and California Code Regulations Title 19
    Uniform Federal Accessibility Standard, UFAS
14. California Code of Regulations Title 8 and Title 24
15. Local Building Codes/Fire Authority
16. All other local applicable codes.

1.2 SYSTEM DESCRIPTION

A. Equipment Description: Gen2® gearless machine-room less elevator where all components fit inside the hoistway.

B. Equipment Control: Elevonic® Control System.

C. Drive: Regenerative

D. Quantity of Elevators: (2) Two

E. Elevator Stop Designations: Front only at LL, 1, 2, 3, 4

F. Stops : (5) Five

G. Openings: (5) Five in line.

H. Travel (maximum): 63 ft.

I. Rated Capacity: 3500 lb.

J. Rated Speed: 350 fpm.

K. Platform Size: 6'-6 ¾" W x 6'-1 1/8" D

L. Clear Inside Dimensions: 6'-5 9/16" W x 5'-5 9/16" D

M. Cab Height: 9'9"

N. Clear Cab Height: 9'-3 3/8" with 1-1/4" floor recess and dropped 6 LED

O. Entrance Type and Width: Center-Open Doors 42"

P. Entrance Height: 8'-0"

Q. Main Power Supply: 480 Volts + or - 5% of normal, three-Phase, with a separate equipment grounding conductor.

R. Car Lighting Power Supply: 120 Volts, Single-phase, 15 Amp, 60 Hz.

S. Machine Location: Inside the hoistway at the top of the hoistway.

T. Signal Fixtures: As described in Paragraph 2.05

U. Controller Location: Controller(s) Shall be Located on floor one in an Adjacent Machine Room Housing the Controllers for Elevators #1, #2

V. Performance:

1. Car Speed: ± 3 % of contract speed under any loading condition or direction of travel.
2. Car Capacity: Safely lower, stop and hold up to 120% of rated load. (code required).
3. Ride Quality:
   a. Vertical Vibration (maximum): 20 milli-g
   b. Horizontal Vibration (maximum): 12 milli-g
   c. Vertical Jerk (maximum): 4.59 □□1.0 ft./ sec^3 (1.4 □□0.3 m/ sec^3)
   d. Acceleration/Deceleration (maximum): 2.62 ft./ sec^2 (0.8 m/ sec^2)
   e. In Car Noise: 55 – 60 dB(A)
   f. Stopping Accuracy: □□0.375 in. (□□10 mm) max, □□0.25 in. (□□6 mm) Typical
   g. Re-leveling Distance: □□0.5 in. (□□12 mm)

W. Operation: Duplex Collective Operation: Using a microprocessor-based controller, the operation shall be automatic by means of the car and hall buttons. In the absence of system activity, one car can be made to park at the pre-selected main landing. The other (free) car shall remain at the last landing served. Only one car shall respond to a hall call. If either car is removed from service, the other car shall immediately answer all hall calls, as well as its own car calls.

X. Operating Features – Standard
1. Full Collective Operation
2. Anti-nuisance.
3. Fan and Light Protection.
4. Load Weighing Bypass.
5. Independent Service.
6. Full Collective Operation.
7. Firefighters' Service Phase I and Phase II

8. Top of Car Inspection.
9. Zoned Car Parking.
10. Relative System Response Dispatching.

Y. Door Control Features:
1. Door control to open doors automatically when car arrives at a landing in response to a normal hall or car call.
2. Elevator doors shall be provided with a reopening device that will stop and reopen the car door(s) and hoistway door(s) automatically should the door(s) become obstructed by an object or person.
Door protection shall consist of a two dimensional, multi-beam array projecting across the car door opening.
3. Door nudging operation to occur if doors are prevented from closing for an adjustable period of time.

Z. Provide equipment according to Seismic Zone 4.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's product data for each system proposed for use. Include the following:
1. Signal and operating fixtures, operating panels and indicators.
2. Cab design, dimensions and layout.
3. Hoistway-door and frame details.
4. Electrical characteristics and connection requirements.
5. Expected heat dissipation of elevator equipment in hoistway (BTU).
6. Color selection chart for Cab and Entrances.

B. Shop Drawings: Submit approval layout drawings. Include the following:
1. Car, guide rails, buffers and other components in hoistway.
2. Maximum rail bracket spacing.
3. Maximum loads imposed on guide rails requiring load transfer to building structure.
4. Clearances and travel of car.
5. Clear inside hoistway and pit dimensions.
6. Location and sizes of access doors, hoistway entrances and frames.

C. Operations and Maintenance Manuals: Provide manufacturer's standard operations and maintenance manual.

1.4 QUALITY ASSURANCE

A. Manufacturer: Minimum of fifteen years experience in the fabrication, installation and service of elevators of the type and performance of the specified. The manufacturer shall have a documented quality assurance program. ISO 9001 Certified

B. Installer: Elevators shall be installed by the manufacturer.

C. Permits, Inspections and Certificates: The Elevator Contractor shall obtain and pay for necessary Municipal or State Inspection and permit as required by the elevator inspection authority, and make such tests as are called for by the regulations or such authorities. These tests shall be made

in the presence of such authorities or their authorized representatives.

1.5 DELIVERY, STORAGE AND HANDLING

A. Should the building or the site not be prepared to receive the elevator equipment at the agreed upon date, the General Contractor will be responsible to provide a proper and suitable storage area on or off the premises.

Should the storage area be off-site and the equipment not yet delivered, then the elevator contractor, upon notification from the General Contractor, will divert the elevator equipment to the storage area. If the equipment has already been delivered to the site, then the General Contractor shall transport the elevator equipment to the storage area. The cost of elevator equipment taken to storage by either party, storage, and redeliver to the job site shall not be at the expense of the elevator contractor.

1.6 WARRANTY

A. The elevator contractor's acceptance is conditional on the understanding that their warranty covers defective material and workmanship. The warranty period shall not extend longer than one (1) year from the date of completion or acceptance thereof by beneficial use, whichever is earlier, of each elevator. The warranty excludes: ordinary wear and tear, improper use, vandalism, abuse, misuse, or neglect or any other causes beyond the control of the elevator contractor and this express warranty is in lieu of all other warranties, express or implied, including any warranty of merchantability or fitness for a particular purpose.

1.7 MAINTENANCE and SERVICE

A. Maintenance service consisting of regular examinations and adjustments of the elevator equipment shall be provided by the elevator contractor for a period of twelve (12) months after the elevator has been turned over for the customer's use. This service shall not be subcontracted but shall be performed by the elevator contractor. All work shall be performed by competent employees during regular working hours of regular working days. This service shall not cover adjustments, repairs or replacement of parts due to negligence, misuse, abuse or accidents caused by persons other than the elevator contractor. Only genuine parts and supplies as used in the manufacture and installation of the original equipment shall be provided.

B. The periodic lubrication of elevator components shall <u>not</u> be required, including: Sheaves, Rails, Belts, Ropes, Car and CWT guides, etc

C. The elevator control system must:

1) Provide in the controller the necessary devices to run the elevator on inspection operation.
2) Provide on top of the car the necessary devices to run the elevator in inspection operation.
3) Provide in the controller an emergency stop switch. This emergency stop switch when opened disconnects power from the brake and prevents the motor from running.
4) Provide in the event of a power outage, means from the controller to electrically lift and control the elevator brake to safely bring the elevator to the nearest available landing.
5) Provide the means from the controller to reset the governor over speed switch and also trip the governor.
6) Provide the means from the controller to reset the emergency brake when set because of an

unintended car movement or ascending car over speed.
7) Provide the means from the controller to reset elevator earthquake operation.

D. Provide system capabilities to enable a remote expert to create a live, interactive connection with the elevator system to enable the following functions:

1. Remotely diagnose elevator issues with a remote team of experts
2. Remotely return an elevator to service
3. Provide real-time status updates via email
4. Remotely make changes to selected elevator functions including:
    a. Control building traffic: Restrict floor access, remove car from group operation, shut down elevator, select up peak/down peak mode, activate independent service
    b. Conserve energy: Activate cab light energy save mode, activate fan energy save mode, shut down car(s)
    c. Improve passenger experience: Extend door open times, change parking floor, activate auto car full, activate anti-nuisance, advance door opening, door nudging, extend specific floor extended opening time, release trapped passengers

PART 2 - PRODUCTS

2.1 DESIGN AND SPECIFICATIONS

A. Provide machine-roomless Gen2™ traction passenger elevators from Otis Elevator Company. The control system and car design based on materials and systems manufactured by Otis Elevator Company. Specifically, the system shall consist of the following components:
1. An AC gearless machine using embedded permanent magnets mounted at the top of the hoistway.
2. Polyurethane Coated-Steel Belts for elevator hoisting purposes.
3. Regenerative drive that captures normally wasted energy and feeds clean power back into the building's power grid.
4. LED lighting standard in ceiling lights and elevator fixtures.
5. Sleep mode operation for LED ceiling lights and car fan.

B. Approved Installer: Otis Elevator Company

2.2 EQUIPMENT: CONTROLLER COMPONENTS

A. Controller: A microcomputer based control system shall be provided to perform all of the functions of safe elevator operation. The system shall also perform car and group operational control.
1. All high voltage (110V or above) contact points inside the controller shall be protected from accidental contact when the controller doors are open.
2. Controller shall be separated into two distinct halves; Motor Drive side and Control side. High voltage motor power conductors shall be routed so as to be physically segregated from the rest of the controller.

3. Field conductor terminations points shall be segregated; high voltage (>30 volts DC and 110 VAC,) and low voltage (< 30 volts DC)
4. Controllers shall be designed and tested for Electromagnetic Interference (EMI) immunity according to the EN 12016 (May 1998): "EMC Product Family Standards for lifts, escalators, and passenger conveyors Part 2 – immunity"
5. Controller shall be located inside the wall next to the top landing entrance frame. Emergency access shall be provided through an access panel in the entrance frame secured by a key lock.
6. A separate control room or cabinet should not be required.

B. Drive: A Variable Voltage Variable Frequency AC drive system shall be provided. The drive shall be set up for regeneration of AC power back to the building grid.

2.3 EQUIPMENT: MACHINE AND GOVERNOR

A. Machine: AC gearless machine, with a synchronous permanent-magnet motor, dual solenoid service and emergency disc brakes, mounted at the top of the hoistway.

B. Governor: The governor shall be a tension type car-mounted governor.

C. Buffers, Car and Counterweight: Polyurethane type buffers shall be used.

C. Hoistway Operating Devices:
1. Emergency stop switch in the pit
2. Terminal stopping switches.

D. Positioning System: Consists of an encoder, reader box, and door zone vanes.

E. Guide Rails and Attachments: Guide rails shall be Tee-section steel rails with brackets and fasteners. Side counterweight arrangements shall have a dual-purpose bracket that combines both counterweight guide rails, and one of the car guide rails to building fastening.

F. Coated-Steel Belts: Polyurethane coated belts with high-tensile-grade, zinc-plated steel cords and a flat profile on the running surface and the backside of the belt. All driving sheaves and deflector sheaves should have a crowned profile to ensure center tracking of the belts. A continuous 24/7 monitoring system using resistance based technology has to be installed to continuously monitor the integrity of the coated steel belts and provide advanced notice of belt wear.

G. Governor Rope: Governor rope shall be steel and shall consist of at least eight strands wound about a sisal core center.

H. Fascia: Galvanized sheet steel shall be provided at the front of the hoistway.

I. Hoistway Entrances:

1. Frames: Entrance frames shall be of bolted construction for complete one-piece unit assembly. All frames shall be securely fastened to fixing angles mounted in the hoistway and shall be of UL fire rated steel.
2. Sills shall be extruded aluminum.

3. Doors: Entrance doors shall be of metal construction with vertical channel reinforcements.
4. Fire Rating: Entrance and doors shall be UL fire rated for 1-1/2 hour(for M1,M2, M3, D1, D2; 1 hour for D3 Entrance Arrangements.
5. Entrance and Door Frame Finish: Otis #4 Satin Stainless Steel
6. Entrance marking plates: Entrance jambs shall be marked with 4" x 4" (102 mm x 102 mm) plates having raised floor markings with Braille located adjacent to the floor marking. Marking plates shall be provided on both sides of the entrance.
7. Sight Guards: sight guards will be furnished with all doors- #4 stainless steel.

2.4 EQUIPMENT: CAR COMPONENTS

A. Car frame and Safety: A car frame fabricated from formed or structural steel members shall be provided with adequate bracing to support the platform and car enclosures. The car safety shall be integral to the car frame and shall be Type "B", flexible guide clamp type.

B. Cab Options: Premium Cab Options: Vertical raised panels faced with Stainless Steel with black reveals between panels. Brushed Stainless Steel finished base plate located at top and bottom

C. Car Front Finish: Otis #4 Satin Stainless Steel.

D. Car Door Finish: Otis #4 Satin Stainless Steel.

E. Ceiling Type: Dropped Brushed Steel Finish with 6 LED lights.

F. Emergency Car Lighting: An emergency power unit employing a 6-volt sealed rechargeable battery and totally static circuits shall be provided to illuminate the elevator car in the event of building power failure.

G. Fan: A one-speed 120 VAC fan will be mounted to the ceiling to facilitate in-car air circulation, meeting A17.1 code requirements. The fan shall be rubber mounted to prevent the transmission of structural vibration and will include a baffle to diffuse audible noise. A switch shall be provided in the car-operating panel to control the fan.

H. Handrail: Handrails shall be provided on side and rear walls of the car enclosure. Handrails shall be 1 ½" diameter (38.1 mm) Round bar handrail with a Brushed Steel.

I. Threshold: Extruded Aluminum.

J. Emergency Exit Contact: An electrical contact shall be provided on the car-top exit.

K. Guides: The car shall have 3" diameter roller guides at top and bottom and the counterweight shall have slide type guides at the top and the bottom.

L. Platform: The car platform shall be constructed of metal. Load weighing device shall be mounted on the belts at the top of the hoistway.

M. Certificate frame: Provide a Certificate frame with a satin stainless steel finish.

N. The LED ceiling lights and the fan should automatically shut off when the system is not in use and be powered back up after a passenger calls the elevator and pushes a hall button.

O. Finished Flooring: To be furnished and installed by others. Set car sill recess at 1-1/4".

2.5 EQUIPMENT: SIGNAL DEVICES AND FIXTURES

A. Car Operating Panel: A car operating panel shall be provided which contains all push buttons, key switches, and message indicators for elevator operation. The car operating panel shall have a satin stainless steel finish.

B. A car operating panel shall be furnished. It shall contain a bank of round stainless steel, mechanical LED illuminated buttons. Flush mounted to the panel and marked to correspond to the landings served. All buttons to have raised numerals and Braille markings with 1/8" (3mm) satin stainless steel projecting button with blue illuminating halo. The car operating panel shall be equipped with the following features:

1. Raised markings and Braille to the left hand side of each push-button.
2. Car Position Indicator at the top of an integral to the car operating panel.
3. Door open and door close buttons.
4. Inspection key-switch.
5. Elevator Data Plate marked with elevator capacity and car number.
6. Help Button: The help button shall initiate two-way communication between the car and a location inside the building, switching over to another location if the call is unanswered, where personnel are available who can take the appropriate action. Visual indicators are provided for call initiation and call acknowledgement.
7. Landing Passing Signal: A chime bell shall sound in the car to signal that the car is either stopping at or passing a floor served by the elevator.
8. In car stop switch (toggle or key unless local code prohibits use)
9. Firefighter's hat
10. Firefighter's Phase II Key-switch
11. Call Cancel Button
12. Firefighter's Phase II Emergency In-Car Operating Instructions: worded according to A17.1 2000, Article 2.27.7.2.
13. Please Exit Symbol: provided in the hall.

C. Car Position Indicator: A digital, LED car position indicator shall be integral to the car operating panel.

D. Hall Fixtures: Hall fixtures shall be provided with necessary push buttons and key switches for elevator operation. Hall fixtures shall have #4 satin stainless steel.

1. Hall position indicator at: LL

Integral Hall fixtures shall feature round stainless steel, mechanical buttons marked to correspond to the landings. Hall fixtures to be located in the wall. Buttons shall be in vertically mounted fixture. Fixture shall be satin stainless steel.

Button Options:

1/8" (3mm) satin stainless steel projecting button with blue or white illuminating halo or gold satin button with white illuminating halo>

E. Car Lantern and Chime: A directional lantern visible from the corridor shall be provided in the car entrance. When the car stops and the doors are opening, the lantern shall indicate the direction in which the car is to travel and a chime will sound.
F. Access key-switch at top floor in entrance jamb.
G. Access key-switch at lowest floor in entrance jamb.
H. Card Reader Provision in traveling cable (Card Reader furnished and installed by others)

PART 3 - EXECUTION

3.1 PREPARATION

A. Take field dimensions and examine conditions of substrates, supports, and other conditions under which this work is to be performed. Do not proceed with work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Installation of all elevator components except as specifically provided for elsewhere by others.

B. Installation of equipment shall be based upon Otis' FIT installation method which states that the following conditions are agreed upon and required by others before manning the job: Clear, completed hoistways, control room walls up, lobby floors poured/constructed at all landings, three (3) phase power of permanent characteristics to run elevators, storage area adjacent to hoistways at lowest landing, uninterrupted use of hoistways, and properly located supports for rails and entrances.

3.3 DEMONSTRATION

A. The elevator contractor shall make a final check of each elevator operation with the Owner or Owner's representative present prior to turning each elevator over for use. The elevator contractor shall determine that control systems and operating devices are functioning properly.

END OF SECTION

SECTION 14210.16 – ELECTRIC TRACTION ELEVATORS

PART 1 - GENERAL

1.1 SUMMARY

A. Elevator #3.

B. This Section specifies electric traction elevators.

C. Related work not specified herein: The following sections contain requirements that relate to this section and are performed by trades other than the elevator manufacturer/installer.

a. Hoistway and Pit:

1. Section 01500 - Construction Facilities and Temporary Controls: protection of floor openings and personnel barriers; temporary power and lighting.
2. Section 02200 - Earthwork: excavation for elevator pit.
3. Section 03300 - Cast-In-Place Concrete: elevator pit, and elevator machine foundation.
4. Section 04200 - Unit Masonry: masonry hoistway enclosure, building-in and grouting hoistway doorframes, and grouting of sills.
5. Section 05500 - Metal Fabrications: pit ladder, divider beams, and supports for entrances, rails and hoisting beam at top of elevator hoistway.
6. Section 07145 - Cementitious Waterproofing: waterproofing of elevator pit.
7. Section 15500 - Heating, Ventilating, and Air Conditioning: ventilation and temperature control of elevator equipment areas.
8. Section 16100 - Electrical:
   a. Main disconnects for each elevator.
   b. Electrical power for elevator installation and testing.
   c. Disconnecting device to elevator equipment prior to activation of sprinkler system.
   d. The installation of dedicated GFCI receptacles in the pit and overhead.
   e. Lighting in controller area, machine area and pit.
   f. Wiring for telephone service to controller.
9. Section 16610 – Emergency (Standby) Power Supply Systems: emergency generator for elevator operation.
10. Section 16720 - Fire Alarm Systems: The installation of fire and smoke detectors at required locations and interconnecting devices; fire alarm signal lines to contacts in the machine area.
11. Section 16740 - Telephone Systems: ADAAG-required emergency communications equipment.

D. Applicable Codes: Comply with applicable building and elevator codes at the project site, including but not limited to the following
1. 2010 ADA Standards.
2. CBC Chapter 11B for Accessibility.
3. ANSI/NFPA 70, National Electrical Code.
4. ANSI/NFPA 80, Fire Doors and Windows.
5. ASME/ANSI A17.7, Safety Code for Elevators and Escalators.
6. ANSI/UL 10B, Fire Tests of Door Assemblies.
7. EN 12016 (May 1998): "EMC Product Family Standards for lifts, escalators, and passenger
8. conveyors Part 2 – immunity"
9. Local Building Codes
10. All other local applicable codes.

1.2 SYSTEM DESCRIPTION

A. Equipment Description: Gen2® gearless traction elevator
B. Equipment Control: Elevonic® Control System.
C. Drive: Regenerative
D. Quantity of Elevators: 1
E. Elevator Stop Designations: Front Only At LL,1,2,3,4,R
F. Stops : 6
G. Openings: Front Only
H. Travel: 77 ft 8 in
I. Rated Capacity: 5000 lbs Service
J. Rated Speed: 200 fpm
K. Platform Size:6' 0-1/2" wide x 9' 1-1/4" deep
L. Clear Inside Dimensions: 5'-11 5/16" W x 8'-4 3/16" D
M. Cab Height: 9'-9"
N. Clear Cab Height: 9' 3 3/8" with 1-1/4" floor recess and dropped 6 LED
O. Entrance Type and Width: Two Speed Side Slide 54" doors
P. Entrance Height: 8'-0"
Q. Main Power Supply: 480 Volts + or - 5% of normal, three-Phase, with a separate equipment grounding conductor.
R. Car Lighting Power Supply: 120 Volts, Single-phase, 15 Amp, 60 Hz.
S. Signal Fixtures: As described in paragraph 2.05.
T. Controller Location: Controller(s) shall be located in the machine room
U. Performance:
1. Car Speed: $\pm$3 % of contract speed under any loading condition or direction of travel.
2. Car Capacity: Safely lower, stop and hold up to 120% of rated load. (code required).
V. Ride Quality:
1. Vertical Vibration (maximum): 20 milli-g

2. Horizontal Vibration (maximum): 12 milli-g
3. Vertical Jerk (maximum): 4.59 □□1.0 ft./ sec3 (1.4 □□0.3 m/ sec3)
4. Acceleration/Deceleration (maximum): 2.62 ft./ sec2 (0.8 m/ sec2)
5. In Car Noise: 55 – 60 dB(A)
6. Stopping Accuracy:: ± 0.375 in. (± 10 mm) max, ± 0.25 in. (± 6 mm) Typical
7. Re-leveling Distance: □□0.5 in. (□□12 mm)

W. Simplex Collective Operation:
1. Using a microprocessor-based controller, operation shall be automatic by means of the car and hall buttons. If all calls in the system have been answered, the car shall park at the last landing served.

X. Operating Features – Standard
1. Full Collective Operation
2. Anti-nuisance.
3. Fan and Light Protection.
4. Load Weighing Bypass.
5. Full Collective Operation.
6. Firefighters' Service Phase I and Phase II:
7. Top of Car Inspection.

Y. Operation Features – Optional
1. Zoned Access at Bottom Landing.
2. Zoned Access at Upper Landing.

Z. Door Control Features:
1. Door control to open doors automatically when car arrives at a landing in response to a normal hall or car call.
2. Elevator doors shall be provided with a reopening device that will stop and reopen the car door(s) and hoistway door(s) automatically should the door(s) become obstructed by an object or person.
   Door protection shall consist of a two dimensional, multi-beam array projecting across the car door opening.
3. Door nudging operation to occur if doors are prevented from closing for an adjustable period of time.

AA. Provide equipment according to: Seismic Zone 4

1.3 SUBMITTALS

A. Product Data: Submit manufacturer’s product data for each system proposed for use. Include the following:
1. Signal and operating fixtures, operating panels and indicators.
2. Cab design, dimensions and layout.
3. Hoistway-door and frame details.
4. Electrical characteristics and connection requirements.

5. Expected heat dissipation of elevator equipment in control room space and machine space (BTU).
6. Color selection chart for Cab and Entrances.

B. Shop Drawings: Submit approval layout drawings. Include the following:
1. Car, guide rails, buffers and other components in hoistway.
2. Maximum rail bracket spacing.
3. Maximum loads imposed on guide rails requiring load transfer to building structure.
4. Clearances and travel of car.
5. Clear inside hoistway and pit dimensions.
6. Location and sizes of access doors, hoistway entrances and frames.

C. Operations and Maintenance Manuals: Provide manufacturer's standard operations and maintenance manual.

1.4 QUALITY ASSURANCE

A. Manufacturer: Elevator manufacturer shall be ISO 9001 certified.

B. Permits, Inspections and Certificates: The Elevator Contractor shall obtain and pay for necessary Municipal or State Inspection and permit as required by the elevator inspection authority, and make such tests as are called for by the regulations or such authorities. These tests shall be made in the presence of such authorities or their authorized representatives.

1.5 DELIVERY, STORAGE AND HANDLING

A. Should the building or the site not be prepared to receive the elevator equipment at the agreed upon date, the General Contractor will be responsible to provide a proper and suitable storage area on or off the premises.
1. Should the storage area be off-site and the equipment not yet delivered, then the elevator contractor, upon notification from the General Contractor, will divert the elevator equipment to the storage area. If the equipment has already been delivered to the site, then the General Contractor shall transport the elevator equipment to the storage area. The cost of elevator equipment taken to storage by either party, storage, and redeliver to the job site shall not be at the expense of the elevator contractor.

1.6 WARRANTY

A. The elevator contractor’s acceptance is conditional on the understanding that their warranty covers defective material and workmanship. The guarantee period shall not extend longer than one (1) year from the date of completion or acceptance thereof by beneficial use, whichever is earlier, of each elevator. The guarantee excludes: ordinary wear and tear, improper use, vandalism, abuse, misuse, or neglect or any other causes beyond the control of the elevator contractor and this express warranty is in lieu of all other warranties, express or implied, including any warranty of merchantability or fitness for a particular purpose.

1.7 MAINTENANCE and SERVICE

A. Maintenance service consisting of regular examinations and adjustments of the elevator equipment shall be provided by the elevator contractor for a period of 12 months after the elevator has been turned over for the customer's use. This service shall not be subcontracted but shall be performed by the elevator contractor. All work shall be performed by competent employees during regular working hours of regular working days and shall include emergency 24- hour callback service. This service shall not cover adjustments, repairs or replacement of parts due to negligence, misuse, abuse or accidents caused by persons other than the elevator contractor. Only genuine parts and supplies as used in the manufacture and installation of the original equipment shall be provided.

B. The periodic lubrication of elevator components shall not be required, including: Sheaves, Rails, Belts, Ropes, Car and CWT guides, etc.

C. The elevator control system must:
1. Provide in the controller the necessary devices to run the elevator in inspection operation.
2. Provide on top of the car the necessary devices to run the elevator in inspection operation.
3. Provide in the controller an emergency stop switch. This emergency stop switch when opened disconnects power from the brake and prevents the motor from running.
4. Provide in the event of a power outage, means from the controller to electrically lift and control the elevator brake to safely bring the elevator to the nearest available landing.
5. Provide the means from the controller to reset the governor over speed switch and also trip the governor.
6. Provide the means from the controller to reset the emergency brake when set because of an unintended car movement or ascending car over speed.

D. Provide the means from the controller to reset elevator earthquake operation.

E. Provide system capabilities to enable a remote expert to create a live, interactive connection with the elevator system to enable the following functions:
1. Remotely diagnose elevator issues with a remote team of experts
2. Remotely return an elevator to service
3. Provide real-time status updates via email
4. Remotely make changes to selected elevator functions including:
   a. Control building traffic: Restrict floor access, remove car from group operation, shut down elevator, select up peak/down peak mode, activate independent service
   b. Conserve energy: Activate cab light energy save mode, activate fan energy save mode, shut down car(s)
   c. Improve passenger experience: Extend door open times, change parking floor, activate auto car full, activate anti-nuisance, advance door opening, door nudging, extend specific floor extended opening time, release trapped passengers

PART 2 - PRODUCTS

2.1 DESIGN AND SPECIFICATIONS

A. Provide Provide Gen2™ traction passenger elevators from Otis Elevator Company. The control system and car design based on materials and systems manufactured by Otis Elevator Company. Specifically, the system shall consist of the following components:
1. An AC gearless machine using embedded permanent magnets mounted at the top of the hoistway.
2. Polyurethane Coated-Steel Belts for elevator hoisting purposes.
3. Regenerative drive that captures normally wasted energy and feeds clean power back into the building's power grid.
4. LED lighting standard in ceiling lights and elevator fixtures.
5. Sleep mode operation for LED ceiling lights and car fan.

B. Approved Installer: Otis Elevator Company

2.2 EQUIPMENT: CONTROLLER COMPONENTS

A. Controller: A microcomputer based control system shall be provided to perform all of the functions of safe elevator operation. The system shall also perform car and group operational control.
1. All high voltage (110V or above) contact points inside the controller shall be protected from accidental contact when the controller doors are open.
2. Controller shall be separated into two distinct halves; Motor Drive side and Control side. High voltage motor power conductors shall be routed so as to be physically segregated from the rest of the controller.
3. Field conductor terminations points shall be segregated; high voltage (>30 volts DC and 110 VAC,) and low voltage (< 30 volts DC.
4. Controllers shall be designed and tested for Electromagnetic Interference (EMI) immunity according to the EN 12016 (May 1998): "EMC Product Family Standards for lifts, escalators, and passenger conveyors Part 2 – immunity"
5. Controller shall be located inside the wall next to the top landing entrance frame. Emergency access shall be provided through an access panel in the entrance frame secured by a key lock.
6. A separate control room or cabinet should not be required.

B. Drive: A Variable Voltage Variable Frequency AC drive system shall be provided. The drive shall be set up for regeneration of AC power back to the building grid.

2.3 EQUIPMENT: MACHINE AND GOVERNOR

A. Machine: AC gearless machine, with a synchronous permanent-magnet motor, dual solenoid service and emergency disc brakes, mounted at the top of the hoistway.
B. Governor: The governor shall be a tension type car-mounted governor.
C. Buffers, Car and Counterweight: Polyurethane type buffers shall be used.
D. Hoistway Operating Devices:

1. Emergency stop switch in the pit
2. Terminal stopping switches.

E. Positioning System: Consists of an encoder, reader box, and door zone vanes.

F. Guide Rails and Attachments: Guide rails shall be Tee-section steel rails with brackets and fasteners. Side counterweight arrangements shall have a dual-purpose bracket that combines both counterweight guide rails, and one of the car guide rails to building fastening.

G. Coated-Steel Belts: Polyurethane coated belts with high-tensile-grade, zinc-plated steel cords and a flat profile on the running surface and the backside of the belt. All driving sheaves and deflector sheaves should have a crowned profile to ensure center tracking of the belts. A continuous 24/7 monitoring system using resistance based technology has to be installed to continuously monitor the integrity of the coated steel belts and provide advanced notice of belt wear.

H. Governor Rope: Governor rope shall be steel and shall consist of at least eight strands wound about a sisal core center.

I. Fascia: Galvanized sheet steel shall be provided at the front, and rear, of the hoistway.

J. Hoistway Entrances:

1. Frames: Entrance frames shall be of bolted construction for complete one-piece unit assembly. All frames shall be securely fastened to fixing angles mounted in the hoistway and shall be of UL fire rated steel.
2. Sills shall be extruded aluminum.
3. Doors: Entrance doors shall be of metal construction with vertical channel reinforcements.
4. Fire Rating: Entrance and doors shall be UL fire rated for 1-1/2 hour (for M1, M2, M3, D1, and D2 Entrance Arrangements or 1 hour for D3 Entrance Arrangement.
5. Entrance Finish
   Stainless Steel at Front LL,1,2,3,4,R
6. Frame Finish
   Stainless Steel at Front LL,1,2,3,4,R
7. Entrance marking plates: Entrance jambs shall be marked with 4” x 4” (102 mm x 102 mm) plates having raised floor markings with Braille located adjacent to the floor marking. Marking plates shall be provided on both sides of the entrance.
8. Sight Guards: Black sight guards will be furnished with all doors.

2.4 EQUIPMENT: CAR COMPONENTS

A. Carframe and Safety: A carframe fabricated from formed or structural steel members shall be provided with adequate bracing to support the platform and car enclosures. The car safety shall be integral to the carframe and shall be Type "B", flexible guide clamp type.

B. Cab Options: Premium Cab Options: Vertical raised panels faced with Stainless Steel with black reveals between panels. Brushed Stainless Steel finished base plate located at top and bottom.

C. Car Front Finish: Satin Stainless Steel.

D. Car Door Finish: Satin Stainless Steel

E. Ceiling Type: Brushed Steel Finish (BSF) Dropped Steel Ceiling with 6 LED Lights

F. Emergency Car Lighting: An emergency power unit employing a 6-volt sealed rechargeable battery and totally static circuits shall be provided to illuminate the elevator car in the event of building power failure.

G. Fan: A one-speed 120 VAC fan will be mounted to the structural ceiling to facilitate in-car air circulation, meeting A17.1 code requirements. The fan shall be rubber mounted to prevent the transmission of structural vibration and will include a baffle to diffuse audible noise. A switch shall be provided in the car-operating panel to control the fan.

H. Handrails: Handrails shall be provided on the Side & Rear walls of the car enclosure. Handrails shall be 1 ½" (38.1mm) dia. Round Bar with a Brushed Steel Finish

I. Threshold: Extruded Aluminum

J. Emergency Exit Contact: An electrical contact shall be provided on the car-top exit.

K. Guides: The car shall have 3" diameter roller guides at top and bottom and the counterweight shall have slide type guides at the top and the bottom.

L. Platform: The car platform shall be constructed of metal. Load weighing device shall be mounted on the belts at the top of the hoistway.

M. Zoned Certificate frame- Provide a Certificate frame with a satin stainless steel finish.

N. The LED ceiling lights and the fan should automatically shut off when the system is not in use and be powered back up after a passenger calls the elevator and pushes a hall button.

O. Finished Flooring: To be furnished and installed by others. Set car sill recess at 1-1/4".

2.5 EQUIPMENT: SIGNAL DEVICES AND FIXTURES

A. Car Operating Panel: A car operating panel shall be provided which contains all push buttons, key switches, and message indicators for elevator operation. The car operating panel shall have a satin stainless steel finish.

1. A car operating panel shall be furnished. It shall contain a bank of round stainless steel, mechanical LED illuminated buttons. Flush mounted to the panel and marked to correspond to the landings served. All buttons to have raised numerals and Braille markings with these options:
   a. 1/8" (3mm) satin stainless steel projecting button with blue illuminating halo
2. The car operating panel shall be equipped with the following features:
   a. Raised markings and Braille to the left hand side of each push-button.
   b. Car Position Indicator at the top of and integral to the car operating panel.
   c. Door open and door close buttons.
   d. Inspection key-switch.
   e. Elevator Data Plate marked with elevator capacity and car number.
   f. Help Button: The help button shall initiate two-way communication between the car and a location inside the building, switching over to another location if the call is unanswered, where personnel are available who can take the appropriate action. Visual indicators are provided for call initiation and call acknowledgement.
   g. Landing Passing Signal: A chime bell shall sound in the car to signal that the car is either stopping at or passing a floor served by the elevator.
   h. In car stop switch (toggle or key unless local code prohibits use)
   i. Firefighter's hat
   j. Firefighter's Phase II Key-switch
   k. Call Cancel Button
3. Optional
   a. Firefighter's Phase II Emergency In-Car Operating Instructions: worded according to A17.1 2000, Article 2.27.7.2.
   b. Please Exit Symbol provided in the hall.

B. Car Position Indicator: A digital, LED car position indicator shall be integral to the car operating panel.
   1. Hall Fixtures: Hall fixtures shall be provided with necessary push buttons and key switches for elevator operation. Hall fixtures shall feature:
      a. Stainless Steel Hall Position Indicators at: LL
   2. Integral Hall fixtures shall feature:
      a. Round stainless steel, mechanical buttons marked to correspond to the landings.
      b. Hall fixtures to be located in the entrance frame face. Therefore, separate wiring and installation of electrical boxes inside the wall for the hall buttons are not required.
      c. Buttons shall be in vertically mounted fixture. Fixture shall be satin stainless steel finish.
   3. Button Options:
      a. 1/8" (3mm) satin stainless steel projecting button with blue illuminating halo

C. Car Lantern and Chime: A directional lantern visible from the corridor shall be provided in the car entrance. When the car stops and the doors are opening, the lantern shall indicate the direction in which the car is to travel and a chime will sound.

D. Access key-switch at top floor in entrance jamb.

E. Access key-switch at bottom floor in entrance jamb.

F. Card reader provisions in traveling cable (Card Reader furnished and installed by others)

PART 3 - EXECUTION

3.1 PREPARATION

A. Take field dimensions and examine conditions of substrates, supports, and other conditions under which this work is to be performed. Do not proceed with work until unsatisfactory conditions are corrected.

3.2 INSTALATION

A. Installation of all elevator components except as specifically provided for elsewhere by others.

B. Installation of equipment shall be based upon Otis' FIT installation method which states that the completed hoistways, control room walls up, lobby floors poured/constructed at all landings, three at lowest landing, uninterrupted use of hoistways, and properly located supports for rails and entrances.

3.3 DEMONSTRATION

A. The elevator contractor shall make a final check of each elevator operation with the Owner or Owner's representative present prior to turning each elevator over for use. The elevator contractor shall determine that control systems and operating devices are functioning properly.

END OF SECTION

SECTION 14 2400 – HYDRAULIC ELEVATORS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section specifies hydraulic elevators.
B. Elevator #4.
C. Work Required:
1. The work required under this section consists of all labor, materials and services required for the complete installation (including operational verification) of all the equipment required for the elevator(s) as herein specified.
2. All work shall be performed in a first class, safe and workmanlike manner.
3. In all cases where a device or part of the equipment is herein referred to in the singular, it is intended that such reference shall apply to as many of such devices or parts as are required to make complete installation.

D. Related work not specified herein: The following sections contain requirements that relate to this section and are performed by trades other than the elevator manufacturer/installer.
1. Division 01 - Construction Facilities and Temporary Controls: protection of floor openings and personnel barriers; temporary power and lighting.
2. Division 31 - Earthwork: excavation for cylinder well casing.
3. Division 03 - Cast-In-Place Concrete: elevator pit, elevator motor and pump foundation, and grouting thresholds.
4. Division 04 - Unit Masonry: masonry hoistway enclosure, building-in and grouting hoistway door frames, grouting thresholds.
5. Division 05 - Metal Fabrications: pit ladder, divider beams, support for entrances and rails, hoisting beam at top of hoistway.
6. Division 07 - Cementitious Waterproofing: waterproofing of elevator pit.
7. Division 26 - Electrical: Section 16100 - Electrical:
a. Main disconnects for each elevator.
b. Electrical power for elevator installation and testing.
c. Disconnecting device to elevator equipment prior to activation of sprinkler system.
d. The installation of dedicated GFCI receptacles in the pit and overhead.
e. Lighting in controller area, machine area and pit.
f. Wiring for telephone service to controller.
8. Division 26 - Standby Power Supply Systems: emergency generator for elevator operation.
9. Division 28 - Fire Alarm Systems: fire and smoke detectors and interconnecting devices; fire alarm signal lines to contacts in the machine area.
10. Division 27 - Telephone Systems: ADAAG-required emergency communications equipment.

E. Applicable Codes: Comply with applicable building and elevator codes at the project site,

including but not limited to the following:

1. 2010 ADA Standards.
2. CBC Chapter 11B for Accessibility.
3. ANSI/NFPA 70, National Electrical Code.
4. ANSI/NFPA 80, Fire Doors and Windows.
5. ASME/ANSI A17.7, Safety Code for Elevators and Escalators.
6. ANSI/UL 10B, Fire Tests of Door Assemblies.
7. EN 12016 (May 1998): "EMC Product Family Standards for lifts, escalators, and passenger
8. conveyors Part 2 – immunity"
9. Local Building Codes.
10. All other local applicable codes.

1.2 SYSTEM DESCRIPTION

A. Equipment Description: Equipment Description: Holeless Hydraulic elevator
B. Equipment Control: Elevonic® Control System.
C. Quantity of Elevators: 1
D. Elevator Stop Designations: Front Only At LL,1
E. Stops : 2
F. Openings: In Line
G. Travel: 19 ft 0 in 0
H. Rated Capacity: 4500 lbs Service
I. Rated Speed: 125 fpm
J. Platform Size: 5' 6- 3/4" wide x 8' 8- 1/16" deep
K. Clear Inside Dimensions: 5 ft 5 in 9/16 wide x 7 ft 10 in 15/16 deep
L. Cab Height: 93"
M. Clear Cab Height: 7' 7- 1/16"
N. Entrance Type and Width: Two Speed Side Slide 48" doors
O. Entrance Height: 7' 0"
P. Main Power Supply: 480 Volts + or - 5% of normal, three-Phase, with a separate equipment grounding conductor.
Q. Car Lighting Power Supply: 120 Volts, Single-phase, 15 Amp, 60 Hz.
R. Machine and Controller Location at landing: LL
S. Signal Fixtures: As Decribed in paragraph 2.05
T. Stopping Accuracy: ±1/4" (6.4 mm) under any loading condition or direction of travel.
U. Operation: Simplex Collective Operation- Using a microprocessor-based controller, operation shall be automatic by means of the car and hall buttons. If all calls in the system have been answered, the car shall park at the last landing served.
V. Operating Features – Standard
   1. Full Collective Operation
   2. Fan and Light Protection, Sleep Mode
   3. Independent Service.
   4. Full Collective Service.

5. Firefighters' Service Phase I and Phase II.
6. Top of Car Inspection.

W. Operation Features – Optional
1. Zoned Access at Bottom Landing.
2. Zoned Access at Upper Landing.

X. Door Control Features:
1. Door control to open doors automatically when car arrives at a landing in response to a normal hall or car call.
2. Elevator doors shall be provided with a reopening device that will stop and reopen the car door(s) and hoistway door(s) automatically should the door(s) become obstructed by an object or person.
   Door protection shall consist of a two dimensional, multi-beam array projecting across the car door opening.
3. Door nudging operation to occur if doors are prevented from closing for an adjustable period of time.

Y. Provide equipment according to: Seismic Zone 4

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's product data for each system proposed for use. Include the following:
1. Signal and operating fixtures, operating panels and indicators.
2. Cab design, dimensions and layout.
3. Hoistway-door and frame details.
4. Electrical characteristics and connection requirements.
5. Expected heat dissipation of elevator equipment in hoistway (BTU).
6. Color selection chart for Cab and Entrances.

B. Shop Drawings: Submit approval layout drawings. Include the following:
1. Car, guide rails, buffers and other components in hoistway.
2. Maximum rail bracket spacing.
3. Maximum loads imposed on guide rails requiring load transfer to building structure.
4. Clearances and travel of car.
5. Clear inside hoistway and pit dimensions.

6. Location and sizes of access doors, hoistway entrances and frames.

C. Operations and Maintenance Manuals: Provide manufacturer's standard operations and maintenance manual.

1.4 QUALITY ASSURANCE

A. Manufacturer: Elevator manufacturer shall be ISO 9001 certified.
B. Installer: Elevators shall be installed by the manufacturer.
C. Permits, Inspections and Certificates: The Elevator Contractor shall obtain and pay for necessary Municipal or State Inspection and permit as required by the elevator inspection authority, and make such tests as are called for by the regulations or such authorities. These tests shall be made in the presence of such authorities or their authorized representatives.

1.5 DELIVERY, STORAGE AND HANDLING

A. Should the building or the site not be prepared to receive the elevator equipment at the agreed upon date, the General Contractor will be responsible to provide a proper and suitable storage area on or off the premises.
   1. Should the storage area be off-site and the equipment not yet delivered, then the elevator contractor, upon notification from the General Contractor, will divert the elevator equipment to the storage area. If the equipment has already been delivered to the site, then the General Contractor shall transport the elevator equipment to the storage area. The cost of elevator equipment taken to storage by either party, storage, and redeliver to the job site shall not be at the expense of the elevator contractor.

1.6 WARRANTY

A. The elevator contractor's acceptance is conditional on the understanding that their warranty covers defective material and workmanship. The warranty period shall not extend longer than one (1) year from the date of completion or acceptance thereof by beneficial use, whichever is earlier, of each elevator. The warranty excludes: ordinary wear and tear, improper use, vandalism, abuse, misuse, or neglect or any other causes beyond the control of the elevator contractor and this express warranty is in lieu of all other warranties, express or implied, including any warranty of merchantability or fitness for a particular purpose.

1.7 MAINTENANCE and SERVICE

A. Maintenance service consisting of regular examinations and adjustments of the elevator equipment shall be provided by the elevator contractor for a period of 12 months after the elevator has been turned over for the customer's use. This service shall not be subcontracted but shall be performed by the elevator contractor. All work shall be performed by competent employees during regular working hours of regular working days. This service shall not cover adjustments, repairs or replacement of parts due to negligence, misuse, abuse or accidents caused by persons other than the elevator contractor. Only genuine parts and supplies as used in the manufacture and installation of the original equipment shall be provided.
B. The elevator control system must:
   1. Provide in the controller the necessary devices to run the elevator on inspection operation.
   2. Provide on top of the car the necessary devices to run the elevator in inspection operation.
   3. Provide in the controller an emergency stop switch. This emergency stop switch when

opened disconnects power from the brake and prevents the motor from running.

C. Provide system capabilities to enable a remote expert to create a live, interactive connection with the elevator system to enable the following functions:

1. Remotely diagnose elevator issues with a remote team of experts
2. Remotely return an elevator to service
3. Provide real-time status updates via email
4. Remotely make changes to selected elevator functions including:
   a. Control building traffic: Restrict floor access, remove car from group operation, shut down elevator, select up peak / down peak mode, activate independent service
   b. Conserve energy: Activate cab light energy save mode, activate fan energy save mode, shut down car(s)
   c. Improve passenger experience: Extend door open times, change parking floor, activate auto car full, activate anti-nuisance, advance door opening, door nudging, extend specific floor extended opening time, release trapped passengers

PART 2 - PRODUCTS

2.1 DESIGN AND SPECIFICATIONS

A. Provide holeless hydraulic elevators from Otis Elevator Company. The control system and car design based on materials and systems manufactured by Otis Elevator Company. Specifically, the system shall consist of the following components:

1. Sleep mode operation for LED ceiling lights and car fan.
2. LED lighting standard in ceiling lights and elevator fixtures.
3. Sleep mode operation for LED ceiling lights and car fan.

B. Approved Installer: Otis Elevator

2.2 EQUIPMENT: MACHINE COMPONENTS

A. The hydraulic system shall be of compact design suitable for operation under the required pressure. The power component shall be mounted in the hydraulic-fluid storage tank. The control valve shall control flow for up and down directions hydraulically and shall include an integral check valve. A control section including control solenoids shall direct the main valve and control: up and down starting, acceleration, transition from full speed to leveling speed, up and down stops, pressure relief and manual lowering. All of these functions shall be fully adjustable for maximum smoothness and to meet contract conditions. System to be provided with a low- pressure switch and a shut-off valve.

B. A microprocessor-based controller shall be provided, including necessary starting switches together with all relays, switches, solid-state components and hardware required for operation, including door operation, as described herein. A three (3) phase overload device shall be provided to protect the motor against overloading.

C. A manual lowering feature shall permit lowering the elevator at slow speed in the event of power failure or for adjusting purposes.
D. Pressure Switch
E. Low-oil control.

2.3 EQUIPMENT: HOISTWAY COMPONENTS

A. Plunger(s) and Cylinder(s): Each cylinder shall be constructed of steel pipe of sufficient thickness and suitable for the operating pressure. The top of each cylinder shall be equipped with a cylinder head with a drip ring to collect any oil seepage as well as an internal guide ring and self-adjusting packing. Each plunger shall be constructed of selected steel tubing or pipe of proper diameter machined true and smooth with a fine polished finish. Each plunger shall be provided with a stop ring electrically welded to it to prevent the plunger from leaving the cylinder. Each plunger and cylinder shall be installed plumb and shall operate freely with minimum friction.
B. Car Guide Rails: Tee-section steel rails with brackets and fasteners.
C. Polyurethane type buffers shall be used.
D. Wiring: Wiring for hoistway electrical devices included in scope of the elevator system, hall panels, pit emergency stop switch, and the traveling cable for the elevator car.
E. Hoistway Entrances:
1. Frames: Entrance frames shall be of bolted construction for complete one-piece unit assembly. All frames shall be securely fastened to fixing angles mounted in the hoistway and shall be of UL fire rated steel.
2. Sill Finish(es):
Extruded Aluminum at Front LL,1
3. Doors: Entrance doors shall be of metal construction with vertical channel reinforcements.
4. Fire Rating: Entrance and doors shall be UL fire rated for 1-1/2 hour (for M1, M2, M3, D1, and D2 Entrance Arrangements or 1 hour for D3 Entrance Arrangement.
5. Entrance Finish(es):
Stainless Steel at Front LL,1
6. Frame Finish(es):
Stainless Steel at Front LL,1
7. Entrance marking plates: Entrance jambs shall be marked with 4” x 4” (102 mm x 102 mm) plates having raised floor markings with Braille located adjacent to the floor marking. Marking plates shall be provided on both sides of the entrance.
8. Sight Guards: Black sight guards will be furnished with all doors.

F. Fascia: Galvanized sheet steel shall be provided at the front, and rear, of the hoistway.

2.4 EQUIPMENT: CAR COMPONENTS

A. Cab Options: Premium Cab Options: Vertical raised panels faced with Stainless Steel with black revels between panels. Brushed Stainless Steel finished base plate located at top and bottom.

B. Car Front Finish: Satin Stainless Steel.
C. Car Door Finish: Satin Stainless Steel.
D. Ceiling Type: Brushed Steel Finish (BSF) Dropped Steel Ceiling with 6 LED Lights
E. Emergency Car Lighting: An emergency power unit employing a 6-volt sealed rechargeable battery and totally static circuits shall be provided to illuminate the elevator car in the event of building power failure.
F. Fan: A one-speed 120 VAC fan will be mounted to the structural ceiling to facilitate in-car air circulation, meeting A17.1 code requirements. The fan shall be rubber mounted to prevent the transmission of structural vibration and will include a baffle to diffuse audible noise. A switch shall be provided in the car-operating panel to control the fan.
G. Handrails: Handrails shall be provided on the Side & Rear walls of the car enclosure. Handrails shall be 1 ½" (38.1mm) dia. Round Bar with a Brushed Steel Finish
H. Threshold: Extruded Aluminum
I. Emergency Exit Contact: An electrical contact shall be provided on the car-top exit.
J. Guides: Car roller type guides at the top and the bottom.
K. Platform: Car platform shall be constructed of metal.
L. Certificate frame- Provide a Certificate frame with a satin stainless steel finish.
M. The LED ceiling lights and the fan should automatically shut off when the system is not in use and be powered back up after a passenger calls the elevator and pushes a hall button.
N. Finished Flooring: To be furnished and installed by others, Set car recess at 1-1/4".

2.5 EQUIPMENT: SIGNAL DEVICES AND FIXTURES

A. Car Operating Panel: A car operating panel shall be provided which contains all push buttons, key switches, and message indicators for elevator operation. The car operating panel shall have a satin stainless steel finish.
   1. A car operating panel shall be furnished. It shall contain a bank of round stainless steel, mechanical LED illuminated buttons. Flush mounted to the panel and marked to correspond to the landings served. All buttons to have raised numerals and Braille markings with:
      a. 1/8" (3mm) satin stainless steel projecting button with blue illuminating halo
   2. The car operating panel shall be equipped with the following features:
      a. Raised markings and Braille to the left hand side of each push-button.
      b. Car Position Indicator at the top of and integral to the car operating panel.
      c. Door open and door close buttons.
      d. Inspection key-switch.
      e. Elevator Data Plate marked with elevator capacity and car number.
      f. Help Button: The help button shall initiate two-way communication between the car and a location inside the building, switching over to another location if the call is unanswered, where personnel are available who can take the appropriate action. Visual indicators are provided for call initiation and call acknowledgement.
      g. Landing Passing Signal: A chime bell shall sound in the car to signal that the car is either stopping at or passing a floor served by the elevator.
      h. In car stop switch (toggle or key unless local code prohibits use)
      i. Firefighter's hat

j. Firefighter's Phase II Key-switch
k. Call Cancel Button

3. Optional
   a. Firefighter's Phase II Emergency In-Car Operating Instructions: worded according to A17.1 2000, Article 2.27.7.2.
   b. Please Exit Symbol provided in the hall.

B. Car Position Indicator: A digital, LED car position indicator shall be integral to the car operating panel.

C. Hall Fixtures: Hall fixtures shall be provided with necessary push buttons and key switches for elevator operation.
   1. Hall fixtures shall feature:
      a. Stainless Steel Hall Position Indicators at: LL
   2. Integral Hall fixtures shall feature:
      a. Round stainless steel, mechanical buttons marked to correspond to the landings.
      b. Hall fixtures to be located in the entrance frame face. Therefore, separate wiring and installation of electrical boxes inside the wall for the hall buttons are not required.
      c. Buttons shall be in vertically mounted fixture.
      d. Fixture shall be satin stainless steel finish.
   3. Button Options:
      a. 1/8" (3mm) satin stainless steel projecting button with blue illuminating halo

D. Car Lantern and Chime: A directional lantern visible from the corridor shall be provided in the car entrance. When the car stops and the doors are opening, the lantern shall indicate the direction in which the car is to travel and a chime will sound.
E. Access key-switch at top floor in entrance jamb.
F. Access key-switch at bottom floor in entrance jamb.
G. Card reader provisions in traveling cable (Card Reader furnished and installed by others)

PART 3 - EXECUTION

3.1 PREPARATION

A. Take field dimensions and examine conditions of substrates, supports, and other conditions under which this work is to be performed. Do not proceed with work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Installation of all elevator components except as specifically provided for elsewhere by others.
B. Installation of equipment shall be based upon Otis' FIT installation method which states that the completed hoistways, control room walls up, lobby floors poured/constructed at all landings, three at lowest landing, uninterrupted use of hoistways, and properly located supports for rails and entrances.

3.3 DEMONSTRATION

A. The elevator contractor shall make a final check of each elevator operation with the Owner or Owner's representative present prior to turning each elevator over for use. The elevator contractor shall determine that control systems and operating devices are functioning properly.

END OF SECTION

SECTION 21 1000 - WATER-BASED FIRE-SUPPRESSION SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following fire-suppression piping inside the building:

1. Manual wet-type, Class I standpipe systems.
2. Wet-pipe sprinkler systems.
3. Combined Standpipe and Sprinkler Systems.
4. Construction Standpipe System in accordance with 2007 California Building Code (CBC) section 904.6.

B. Related Sections include the following:

1. Division 10 Section "Fire Extinguisher Cabinets" and "Fire Extinguishers" for cabinets and fire extinguishers.
2. Division 28 Section "Fire Detection and Alarm" for alarm devices not specified in this Section.
3. Division 07 Section "Penetration Firestopping" for materials and methods for sealing pipe penetrations through fire and smoke barriers.
4. Division 33 Section "Facility Water Distribution Piping" for piping outside the building.

1.2 DEFINITIONS

A. CR: Chlorosulfonated polyethylene synthetic rubber.

B. High-Pressure Piping System: Fire-suppression piping system designed to operate at working pressure higher than standard 175 psig.

C. C. PE: Polyethylene plastic.

D. Underground Service-Entrance Piping: Underground service piping below the building.

1.3 SYSTEM DESCRIPTIONS

A. Combined Standpipe and Sprinkler System: Fire-suppression system with both standpipe and sprinkler systems. Sprinkler system is supplied from standpipe system.

B. Manual Wet-Type, Class I Standpipe System: Includes NPS 2-1/2 hose connections. Has small water supply to maintain water in standpipes. Piping is wet, but water must be pumped into standpipes to satisfy demand.

C. Wet-Pipe Sprinkler System: Automatic sprinklers are attached to piping containing water and that is connected to water supply. Water discharges immediately from sprinklers when they are opened. Sprinklers open when heat melts fusible link or destroys frangible device. Hose connections are included if indicated.

1.4 PERFORMANCE REQUIREMENTS

A. Standard Piping System Component Working Pressure: Listed for at least 175 psig.

B. Fire-suppression standpipe system design shall comply with Campus Fire Marshal requirements and be approved by Campus Fire Marshal.

1. Minimum residual pressure at each hose-connection outlet is the following:

a. NPS 1-1/2 Hose Connections: 65 psig
b. NPS 2-1/2 Hose Connections: 100 psig

2. Unless otherwise indicated, the following is maximum residual pressure at required flow at each hose-connection outlet:

a. NPS 1-1/2 Hose Connections: 100 psig
b. NPS 2-1/2 Hose Connections: 175 psig

C. Fire-suppression sprinkler system design shall be approved by Campus Fire Marshal.

1. Margin of Safety for Available Water Flow and Pressure 10 percent, including losses through water-service piping, valves, and backflow preventers.
2. Sprinkler Occupancy Hazard Classifications:
3. The maximum design pressure available at the fire department connection is 150 psig. The calculation shall not exceed this pressure under any circumstances.

4. Minimum Density for Automatic-Sprinkler Piping Design: Provide per revised BOD
a. Extra-Hazard, Group 2 Occupancy: [0.40 gpm over 2500-sq. ft.] area.
b. Group L or B, Laboratory Area Occupancy: 0.17 gpm/sq. ft. over 3,000 sq. ft. Other portions of the building not classified as Laboratory shall be Ordinary Hazard, Group 1 Occupancy: 0.12 gpm/sq. ft. over 3,000 sq. ft.
c. Special Occupancy Hazard: As determined by Campus Fire Marshal.

5. Maximum Protection Area per Sprinkler: 130 sq. ft.

a. Office Spaces: 130 sq. ft.
b. Storage Areas: 130 sq. ft..
c. Mechanical Equipment Rooms: 130 sq. ft..
d. Electrical Equipment Rooms: 130 sq. ft..
e. Other Areas: 130 sq. ft., unless otherwise required by Campus Fire Marshal.
f. Reduction in area for use of quick response sprinklers is not allowed.
g. Upon delivery of materials provide welded outlet inspection

6. Total Combined Hose-Stream Demand Requirement: According to NFPA 13, unless otherwise indicated:
a. Ordinary-Hazard Occupancies: 250 gpm for 60 to 90 minutes
b. Extra-Hazard Occupancies: 500 gpm for 90 to 120 minutes.

D. Seismic Performance: Fire-suppression piping shall be capable of withstanding the effects of earthquake motions determined according to NFPA 13 and California Building Code (CBC) for Seismic zone 4.

1.5 SUBMITTALS

A. Product Data: Clearly indicate and highlight standards required to be met and California State Fire Marshal (CSFM) listing numbers for the following:

1. Pipe hangers and supports, including seismic restraints.
2. Alarm devices, including electrical data

B. Product Data: For the following:

1. Piping materials, including dielectric fittings, flexible connections, and sprinkler specialty fittings.
2. Pipe hangers and supports**,** including seismic restraints.
3. Listed fire-protection valves, and specialty valves and trim.
4. Sprinklers, escutcheons, and guards. Include sprinkler flow characteristics, mounting, finish, and other pertinent data.
5. Hose connections, including size, type, and finish.
6. Hose stations, including size, type, and finish of hose connections; type and length of fire hoses; finish of fire hose couplings; type, material, and finish of nozzles; and finish of rack.
7. Roof hose cabinets.
8. Fire department connections, including type; number, size, and arrangement of inlets; caps and chains; size and direction of outlet; escutcheon and marking; and finish.
9. Alarm devices, including electrical data.

C. Shop Drawings: Diagram power, signal, and control wiring.

D. Fire-hydrant flow test report.

E. Approved Sprinkler Piping Drawings: Working plans, prepared according to NFPA 13, that have been approved by Campus Fire Marshal and University Representative, including hydraulic calculations.

F. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 13 and NFPA 14. Include "Contractor's Material and Test Certificate for Aboveground Piping" and "Contractor's Material and Test Certificate for Underground Piping."

G. G. Welding certificates.

H. Field quality-control test reports.

I. Operation and Maintenance Data: For standpipe and sprinkler specialties to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Installer Qualifications:

1. Installer's responsibilities include designing, fabricating, and installing fire-suppression systems and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test.

a. Engineering Responsibility: Preparation of working plans, calculations, and field test reports by a qualified professional engineer or C-16 California licensed contractor who has been in business for at least last three years.

B. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.

C. NFPA Standards: Fire-suppression-system equipment, specialties, accessories, installation, and testing shall comply with the following:

1. NFPA 13, "Installation of Sprinkler Systems."
2. NFPA 14, "Installation of Standpipe, Private Hydrant, and Hose Systems."
3. NFPA 24, "Installation of Private Fire Service Mains and Their Appurtenances."
4. NFPA 25, “Inspection, Testing and Maintenance of Water Based Fire Protection Systems.”

1.7 COORDINATION

A. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including light fixtures, HVAC equipment, and partition assemblies.

B. Sprinkler heads are required to be laid out in an orderly symmetrical pattern. Locate sprinkler heads centered in suspended ceiling tiles or for tiles wider than two feet, quarter points may be acceptable.

C. Participate in Construction Detailing Activity (CDA) in accordance with Division 01 Section “Construction Detailing Activity.”

1.8 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Sprinkler Cabinets: Finished, wall-mounting, steel cabinet with hinged cover, with space for minimum of six spare sprinklers plus sprinkler wrench. Include number of sprinklers required by NFPA 13 and sprinkler wrench. Include separate cabinet with sprinklers and wrench for each type of sprinkler on Project.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Piping, Valves and Fittings shall be manufactured in USA, Australia, Canada or Japan only.
3. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer

2.2 DUCTILE-IRON PIPE AND FITTINGS

A. Mechanical-Joint, Ductile-Iron Pipe: AWWA C151, minimum thickness class 52 with mechanical-joint bell end and plain end.

1. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110**,** epoxy coated ductile- iron standard pattern, bell and plain end. [**AWWA C110, ductile- standard pattern or AWWA C153, ductile-iron compact pattern**].
2. Glands, Gaskets, and Bolts: AWWA C111, epoxy coated ductile-iron gland, rubber gasket, and stainless steel bolts and nuts.
3. Underground piping shall be epoxy coated on interior and exterior.

B. Ductile iron fittings using push-on joint or grooved-end are not acceptable.

2.3 STEEL PIPE AND FITTINGS

A. Threaded-End, Schedule 40, Steel Pipe: ASTM A 53/A 53M, ASTM A 135, or ASTM A 795 grade A with factory- or field-formed threaded ends. Grade A may be used for pipe 2” and smaller.

1. Cast-Iron Threaded Flanges: ASME B16.1.
2. Malleable-Iron Threaded Fittings: ASME B16.3.
3. Steel Threaded Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M or ASTM A 106, Schedule 40, seamless steel pipe. Include ends matching joining method.
4. Steel Threaded Couplings: ASTM A 865.

B. Plain-End, Schedule 40, Steel Pipe: ASTM A 53/A 53M, ASTM A 135, or ASTM A 795.

1. Steel Welding Fittings: ASTM A 234/A 234M, and ASME B16.9 or ASME B16.11.
2. Steel Flanges and Flanged Fittings: ASME B16.5.

C. Roll-Grooved-End, Schedule 40, Steel Pipe: ASTM A 53/A 53M, ASTM A 135, or ASTM A 795 with factory- or field-formed, roll-grooved ends. Cut-Grooved piping shall not be used.

D. Roll- Grooved End Schedule 10 Steel Pipe Astma-53 used 2 ½” and Larger

1. Roll-Grooved-Joint Piping Systems:

    a. Manufacturers:

        1) Anvil International, Inc.
        2) Central Sprinkler Corp.
        3) M & H Valve Co. Division of McWane Inc. Style 4067 National Fittings Inc.
        4) Shurjoint Piping Products, Inc.
        5) Southwestern Pipe, Inc.
        6) Star Pipe Products; Star Fittings Div.
        7) Victaulic Co. of America.
        8) Ward Manufacturing. 9) Or equal**.**

    b. Roll-Grooved-End Fittings: UL-listed, ASTM A 536, ductile-iron casting with OD matching steel-pipe OD.

    c. Roll-Grooved-End-Pipe Couplings: UL 213 and AWWA C606, rigid pattern, unless otherwise indicated; gasketed fitting matching steel-pipe OD. Include ductile-iron housing with keys matching steel-pipe and fitting grooves, prelubricated rubber gasket listed for use with housing, and steel bolts and nuts.

2.4 COPPER TUBE AND FITTINGS

A. Plain-End, Hard Copper Tube: ASTM B 88, Type K], water tube, drawn temper.

1. Copper Fittings: ASME B16.22, wrought-copper, solder-joint pressure type. Furnish only wrought-copper fittings.
2. Bronze Flanges: ASME B16.24, Class 150, with brazed-joint end. Furnish Class 300 flanges if required to match tubing system.
3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body with ball-and socket metal-to-metal seating surfaces, and brazed-joint or threaded ends.
4. Copper, Mechanically Formed Tee Option: shall not be used on Campus..
5. Brazing Filler Metals: AWS A5.8, BCuP-3 or BCuP-4.

B. Roll-Grooved-End, Hard Copper Tube: ASTM B 88, Type K , water tube, drawn temper; with factory- or field-formed, roll-grooved ends.

1. Copper, Mechanically Formed Tee Option: Shall not be used on Campus.
2. Roll-Grooved-Joint Systems:

    a. Manufacturers:

        1) Anvil International, Inc.
        2) Victaulic Co. of America.
        3) Or equal**.**

    b. Roll-Grooved-End Copper Fittings: ASTM B 75, copper tube or ASTM B 584, bronze casting. Fittings may have ends factory or field expanded to steel-pipe OD if required for copper tube systems using roll-grooved-end-pipe couplings.

c. Roll-Grooved-End-Tube Couplings: UL 213, rigid pattern, unless otherwise indicated; gasketed fitting equivalent to AWWA C606, but made to match coppertube OD. Include ductile-iron housing with keys matching steel-pipe and fitting grooves, prelubricated, rubber gasket listed for use with housing, and steel bolts and nuts. Use roll-grooved-end-pipe couplings for tube and fitting that have expanded ends.

2.5 DIELECTRIC FITTINGS

A. Assembly shall be copper alloy, ferrous, and insulating materials with ends matching piping system.

B. Dielectric Unions: Shall not be used on Campus.

C. Dielectric Flanges: Factory-fabricated companion-flange assembly, for 175-psig minimum working-pressure rating as required for piping system.

1. Manufacturers:

a. Capitol Manufacturing Co.
b. Central Plastics Company.
c. Epco Sales, Inc.
d. Watts Industries, Inc.; Water Products Div.
e. Or equal**.**

D. Dielectric Flange Insulation Kits: Components for field assembly shall include CR or phenolic gasket, PE or phenolic bolt sleeves, phenolic washers, and steel backing washers.

1. Manufacturers:

a. Advance Products and Systems, Inc.
b. Calpico, Inc.
c. Central Plastics Company.
d. Pipeline Seal and Insulator, Inc.
e. Or equal**.**

E. Dielectric Couplings: Galvanized steel with inert and non-corrosive thermoplastic lining and threaded ends and 300-psig working-pressure rating at 225 deg F.

1. Manufacturers:

a. Calpico, Inc.
b. Lochinvar Corp.
c. Or equal**.**

F. Dielectric Nipples: Electroplated steel with inert and non-corrosive thermoplastic lining, with combination of plain, threaded, or roll-grooved ends and 300-psig working-pressure rating at 225 deg F.
   1. Manufacturers:

      a. Perfection Corporation.
      b. Precision Plumbing Products, Inc.
      c. Victaulic Co. of America.
      d. Or equal**.**

2.6 FLEXIBLE CONNECTORS

A. Flexible connectors shall have materials suitable for system fluid. Include 175-psig minimum working-pressure rating and ends according to the following:

   1. NPS 2 and Smaller: Threaded.
   2. NPS 2-1/2 and Larger: Flanged.
   3. Option for NPS 2-1/2 and Larger: Roll-grooved for use with roll-grooved-end-pipe couplings.

B. Manufacturers:

   1. Anamet Inc.
   2. Flex-Hose Co., Inc.
   3. Flexicraft Industries.
   4. Flex-Pression, Ltd.
   5. Flex-Weld, Inc.
   6. Hyspan Precision Products, Inc.
   7. Mercer Rubber Co.
   8. Metraflex, Inc.
   9. Proco Products, Inc.
   10. Unaflex Inc.
   11. Or equal**.**

C. Bronze-Hose, Flexible Connectors: Corrugated, bronze, inner tubing covered with bronze wire braid. Include copper-tube ends or bronze flanged ends, braze welded to hose.

D. Stainless-Steel-Hose/Steel Pipe, Flexible Connectors: Corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Include steel nipples or flanges, welded to hose.

E. Stainless-Steel-Hose/Stainless-Steel Pipe, Flexible Connectors: Corrugated, stainless-steel, inner tubing covered with stainless-steel wire braid. Include stainless-steel nipples or flanges, welded to hose.

2.7 CORROSION-PROTECTIVE ENCASEMENT FOR PIPING

A. Encasement for Underground Metal Piping: ASTM A 674 or AWWA C105, PE film, 0.008inch minimum thickness, black tube.

2.8 SPRINKLER SPECIALTY FITTINGS

A. Sprinkler specialty fittings shall be UL listed or FM approved, with 175-psig minimum working-pressure rating, and made of materials compatible with piping. Sprinkler specialty fittings shall have 250-psig minimum working-pressure rating if fittings are components of high-pressure piping system.

B. Outlet Specialty Fittings:

1. Manufacturers:

   a. Anvil International, Inc.
   b. Central Sprinkler Corp.
   c. National Fittings, Inc.
   d. Shurjoint Piping Products, Inc.
   e. Southwestern Pipe, Inc.
   f. Tyco Fire and Building Products.
   g. Victaulic Co. of America.
   h. Ward Manufacturing.
   i. Or equal**.**

2. Mechanical-T and -Cross Fittings, bushings, reducing couplings: Shall not be used on Campus.
3. Snap-On and Strapless Outlet Fittings: Shall not be used on Campus.

C. Sprinkler Drain and Alarm Test Fittings: Cast- or ductile-iron body; with threaded or lockinglug inlet and outlet, test valve, and orifice and sight glass.

1. Manufacturers:

   a. Central Sprinkler Corp.
   b. Fire-End and Croker Corp.
   c. Viking Corp.
   d. Victaulic Co. of America.
   e. Or equal**.**

D. Sprinkler Branch-Line Test Fittings: Brass body with threaded inlet, capped drain outlet, and threaded outlet for sprinkler.

1. Manufacturers:

   a. Elkhart Brass Mfg. Co., Inc.
   b. Fire-End and Croker Corp.
   c. Potter-Roemer; Fire-Protection Div.
   d. Or equal**.**

E. Sprinkler Inspector's Test Fitting: Cast- or ductile-iron housing with threaded inlet and drain outlet and sight glass.

1. Manufacturers:

a. AGF Manufacturing Co.
b. Central Sprinkler Corp.
c. G/J Innovations, Inc.
d. Triple R Specialty of Ajax, Inc.
e. Or equal**.**

F. Drop-Nipple Fittings: UL 1474, adjustable with threaded inlet and outlet, and seals.

1. Manufacturers:

a. CECA, LLC.
b. Merit.
c. Or equal**.**

2.9 LISTED FIRE-PROTECTION VALVES

A. Valves shall be UL listed or CSFM approved, with 175-psig minimum pressure rating. Valves shall have 250-psig minimum pressure rating if valves are components of high-pressure piping system.

B. Gate Valves:

1. Gate Valves: UL 262, cast-iron body, bronze mounted, with solid disc, non-rising stem, operating nut, and flanged ends.
2. Indicator Posts: UL 789, horizontal-wall type, cast-iron body, with operating wrench, extension rod, locking device, and cast-iron barrel.
3. Manufacturers:

a. McWane, Inc.; Kennedy Valve Div.
b. NIBCO.
c. Stockham.
d. Or equal**.**

C. Ball Valves: Comply with UL 1091, except with ball instead of disc.

1. NPS 1-1/2 and Smaller: Bronze body with threaded ends.
2. NPS 2 and NPS 2-1/2: Bronze body with threaded ends or ductile-iron body with roll grooved ends.
3. NPS 3: Ductile-iron body with roll-grooved ends.
4. Manufacturers:

a. NIBCO.

b. Victaulic Co. of America.
c. Or equal**.**

D. Butterfly Valves: Sizes 2 ½" through 6" UL/ FM approved Victaulic or Equal

E. Check Valves NPS 2 and Larger: UL 312, swing type, cast-iron body with flanged or roll grooved ends.

1. Manufacturers:

a. American Cast Iron Pipe Co.; Waterous Co.
b. Central Sprinkler Corp.
c. Clow Valve Co.
d. Crane Co.; Crane Valve Group; Crane Valves.
e. Crane Co.; Crane Valve Group; Jenkins Valves.
f. Globe Fire Sprinkler Corporation.
g. Hammond Valve.
h. McWane, Inc.; Kennedy Valve Div.
i. Mueller Company.
j. NIBCO.
k. Potter-Roemer; Fire Protection Div.
l. Reliable Automatic Sprinkler Co., Inc.
m. Star Sprinkler Inc., Tyco Fire and Building Products.
n. Stockham.
o. United Brass Works, Inc.
p. Victaulic Co. of America.
q. Watts Industries, Inc.; Water Products Div.
r. Or equal**.**

F. Gate Valves: UL 262, OS&Y type.

1. NPS 2 and Smaller: Bronze body with threaded ends.

a. Manufacturers:

1) Crane Co.; Crane Valve Group; Crane Valves.
2) Hammond Valve.
3) NIBCO.
4) United Brass Works, Inc.
5) 5) Or equal**.**

2. NPS 2-1/2 and Larger: Cast-iron body with flanged ends.

a. Manufacturers:

1) Clow Valve Co.
2) Crane Co.; Crane Valve Group; Crane Valves.
3) Crane Co.; Crane Valve Group; Jenkins Valves.
4) Hammond Valve.

5) Milwaukee Valve Company.
6) Mueller Company.
7) NIBCO.
8) United Brass Works, Inc.
9) Or equal**.**

G. Indicating Valves: UL 1091, with integral indicating device and ends matching connecting piping.
1. Indicator: Electrical, 115-V ac, pre-wired, 2-circuit, supervisory switch.
2. NPS 2 and Smaller: Ball valve with bronze body and threaded ends.

a. Manufacturers:

1) Milwaukee Valve Company.
2) NIBCO.
3) Victaulic Co. of America.
4) Or equal.

3. NPS 2-1/2 and Larger: Gate valve with cast- or ductile-iron body; with flanged or grooved ends.

a. Manufacturers:

1) Central Sprinkler Corp.
2) Grinnell Fire Protection.
3) McWane, Inc.; Kennedy Valve Div.
4) Milwaukee Valve Company.
5) NIBCO.
6) Victaulic Co. of America.
7) Or equal.

2.10 SPECIALTY VALVES

A. Sprinkler System Control Valves: UL listed or CSFM approved, cast- or ductile-iron body with flanged or roll-grooved ends, and 175-psig minimum pressure rating. Control valves shall have 300-psig pressure rating if valves are components of high-pressure piping system.

1. Manufacturers:
a. Central Sprinkler Corp.
b. Globe Fire Sprinkler Corporation.
c. Reliable Automatic Sprinkler Co., Inc.
d. Tyco Fire and Building Products.
e. Victaulic Co. of America.
f. Viking Corp.
g. Or equal**.**

2. Alarm Check Valves: UL 193, designed for horizontal or vertical installation, with bronze roll-grooved seat with O-ring seals, single-hinge pin, and latch design. Include trim sets

for bypass, drain, electrical sprinkler alarm switch, pressure gages, retarding chamber, and fill-line attachment with strainer.

a. Drip Cup Assembly: Pipe drain without valves and separate from main drain piping.

B. Pressure-Regulating Valves: UL 1468, brass or bronze, NPS 2-1/2, 400-psig minimum rating. Include female NPS inlet and outlet, adjustable setting feature, and straight pattern design.
1. Finish: Rough metal.
2. Manufacturers:
a. Elkhart Brass Mfg. Co., Inc.
b. Fire-End and Croker Corp.
c. Grinnell Fire Protection.
d. Potter-Roemer; Fire Protection Div.
e. Zurn Industries, Inc.; Wilkins Div.
f. Or equal**.**

C. Automatic Drain Valves: UL 1726, NPS 3/4, ball-check device with threaded ends.

1. Manufacturers:

a. AFAC Inc.
b. Or equal**.**

2.11 SPRINKLERS

A. Sprinklers shall be UL listed or CSFM approved, with 175-psig minimum pressure rating.

B. Manufacturers:

1. Central Sprinkler Corp.
2. Globe Fire Sprinkler Corporation.
3. Reliable Automatic Sprinkler Co., Inc.
4. Star Sprinkler Inc., Tyco Fire and Building Products.
5. Victaulic Co. of America.
6. Viking Corp.
7. Or equal**.**

C. Automatic Sprinklers: With heat-responsive element complying with the following:

1. UL 199, for nonresidential applications.
2. UL 1767, for early-suppression, fast-response applications.

D. Sprinkler Types and Categories: Nominal 1/2-inch orifice for "Ordinary" temperature classification rating, unless otherwise indicated or required by application.

E. Sprinkler types, features, and options as follows:

1. Concealed ceiling sprinklers, including cover plate.
2. Flush ceiling sprinklers, including escutcheon.

3. .
4. Pendent sprinklers.
5. Quick-response sprinklers.
6. Recessed sprinklers, including escutcheon.
7. Sidewall sprinklers.
8. Upright sprinklers.

F. Sprinkler Finishes: Chrome plated in finished areas, bronze in exposed building services areas, and, when approved by the University's Representative, painted.

G. Special Coatings: Provide Teflon-coated sprinklers heads and polished stainless steel escutcheons for exterior and corrosive atmospheres applications.

H. Sprinkler Escutcheons: Materials, types, and finishes for the following sprinkler mounting applications. Escutcheons for concealed, flush, and recessed-type sprinklers are specified with sprinklers.

1. Ceiling Mounting: Chrome-plated steel, one piece, flat.
2. Sidewall Mounting: Chrome-plated steel, one piece, flat.

I. Sprinkler Guards: Wire-cage type, including fastening device for attaching to sprinkler.

J. Extended coverage type sprinklers shall not be used.

2.12 HOSE CONNECTIONS

A. Manufacturers:

1. Central Sprinkler Corp.
2. Elkhart Brass Mfg. Co., Inc.
3. Fire-End and Croker Corp.
4. Fire Protection Products, Inc.
5. Guardian Fire Equipment Incorporated.
6. McWane, Inc.; Kennedy Valve Div.
7. Mueller Company.
8. Potter-Roemer; Fire-Protection Div.
9. United Brass Works, Inc.
10. Or equal**.**

B. Description: UL 668, brass or bronze, 300-psig minimum pressure rating, hose valve for connecting fire hose. Include gate pattern design; female NPS inlet and male hose outlet; and lugged cap, gasket, and chain. Include NPS NPS 2-1/2 as indicated, and hose valve threads according to NFPA 1963 and matching local fire department threads.

1. Valve Operation: Nonadjustable type, unless pressure-regulating type is indicated.
2. Finish: Rough metal.

2.13 FIRE DEPARTMENT CONNECTIONS

A. Manufacturers:

1. Central Sprinkler Corp.
2. Elkhart Brass Mfg. Co., Inc.
3. Fire-End and Croker Corp.
4. Fire Protection Products, Inc.
5. Guardian Fire Equipment Incorporated.
6. Potter-Roemer; Fire-Protection Div.
7. Reliable Automatic Sprinkler Co., Inc.
8. United Brass Works, Inc.
9. Or equal**.**

B. Wall-Type, Fire Department Connection

C. Exposed, Freestanding-Type, Fire Department Connection: Four inlet, UL 405, 300-psig minimum pressure rating; with corrosion-resistant-metal body, brass inlets with threads according to NFPA 1963 and matching sizes and threads, and bottom outlet with pipe threads. Include brass lugged caps, gaskets, and brass chains; brass lugged swivel connection and drop clapper for each hose-connection inlet; 18-inch- high, brass sleeve; and round, floor, brass escutcheon plate with marking "AUTO SPKR & STANDPIPE." Locate FDC per UCR Fire Marshall requirements.

1. Finish Including Sleeve: Polished brass.

2.14 ALARM DEVICES

A. Alarm-device types shall match piping and equipment connections and bear UL/FM label and marking and CSFM listing.

B. Electrically Operated Alarm: UL 464, with 10-inch- diameter, vibrating-type, metal alarm bell with red-enamel factory finish and suitable for outdoor use.

1. Manufacturers:

a. Potter Electric Signal Company.
b. System Sensor.
c. Or equal**.**

C. Water-Flow Indicator: UL 346, electrical-supervision, paddle-operated-type, water-flow detector with 250-psig pressure rating and designed for horizontal or vertical installation. Include two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory-set, field-adjustable retard element to prevent false signals1.Manufacturers:

a. ADT Security Services, Inc.
b. ITT McDonnell & Miller.
c. Potter Electric Signal Company.
d. System Sensor.

e. Viking Corp.
f. Watts Industries, Inc.; Water Products Div.
g. Or equal**.**

D. Valve Supervisory Switch: UL 753, electrical, single-pole, double-throw switch with normally closed contacts. Include design that signals controlled valve is in other than fully open position.

1. Manufacturers:

a. McWane, Inc.; Kennedy Valve Div.
b. Potter Electric Signal Company.
c. System Sensor.
d. Or equal**.**

2.15 PRESSURE GAGES

A. Manufacturers:

1. AMETEK, Inc.; U.S. Gauge.
2. Dresser Equipment Group; Instrument Div.
3. Marsh Bellofram.
4. WIKA Instrument Corporation.
5. Or equal**.**

B. Description: UL 393, 3-1/2- to 4-1/2-inch- diameter, dial pressure gage with range of 0 to 250 psig minimum.

1. Water System Piping: Include caption "WATER" on dial face.

PART 3 - EXECUTION

3.1 PREPARATION

A. Perform fire-hydrant flow test according to NFPA 13, NFPA 14, and NFPA 291. Use results for system design calculations required in Part 1 "Quality Assurance" Article.

B. Report test results promptly and in writing.

3.2 EARTHWORK

A. Refer to Division 31 Section "Earth Moving" for excavating, trenching, and backfilling.

3.3 EXAMINATION

A. Examine roughing-in for hose connections and stations to verify actual locations of piping connections before installation.

B. Examine walls and partitions for suitable thicknesses, fire- and smoke-rated construction, framing for hose-station cabinets, and other conditions where hose connections and stations are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.4 PIPING APPLICATIONS, GENERAL

A. Shop-weld pipe joints where welded piping is to be used.

B. Do not use welded joints for galvanized-steel pipe.

C. Flanges, flanged fittings, unions, nipples, and transition and special fittings with finish and pressure ratings same as or higher than system's pressure rating may be used in aboveground applications only. Flanges shall not be used below ground.

D. Piping between Fire Department Connections and Check Valves: Galvanized, Schedule 40, steel pipe with threaded ends; Galvanized cast- or malleable-iron threaded fittings; and threaded.] joints.

E. Underground Service-Entrance Piping: Ductile-iron, mechanical-joint pipe and fittings and restrained joints. Include corrosion-protective encasement**.**

3.5 Groove-less clamp, cut groove pipe and fittings, reducing couplings, bushings, mechanical tees, street elbows or saddle fittings are not acceptable for use on campus.

3.6 STANDPIPE SYSTEM PIPING APPLICATIONS

A. Standard-Pressure, Wet-Type Standpipe System, 175-psig Maximum Working Pressure:

1. NPS 4 and Smaller: ASTM A53, Threaded-end, black, schedule 40, steel pipe; cast- or malleable-iron threaded fittings; and threaded joints.
2. NPS 4 and Smaller: ASTM A53, Plain-end, black, schedule 40 or 10, steel pipe; steel welding fittings; and welded joints.
3. NPS 4 and Smaller: Roll-Grooved-end, black, schedule 40 or 10, steel pipe with [roll-grooved ends; roll-grooved-end fittings; roll-grooved-end-pipe couplings; and roll-grooved joints.
4. NPS 5 and NPS 6: Roll-grooved-end, black, schedule 40 or 10, steel pipe with roll-grooved ends; roll-grooved-end fittings; roll-grooved-end-pipe couplings; and roll-grooved joints.
5. NPS 2 ½” through 6” roll grooved schedule 10 black steel pipe

3.7 SPRINKLER SYSTEM PIPING APPLICATIONS

A. Standard-Pressure, Wet-Pipe Sprinkler System, 175-psig Maximum Working Pressure:

1. NPS 1-1/2 and Smaller: Threaded-end, black, schedule 40, steel pipe; cast- or malleable iron threaded fittings; and threaded joints.
2. NPS 1-1/2 and Smaller: Plain-end, black, schedule 40, steel pipe; steel welding fittings; and welded joints.
3. NPS 2: Threaded-end, black, schedule 40, steel pipe; cast- or malleable-iron threaded fittings; and threaded joints.

4. NPS 2: Plain-end, black, schedule 40, steel pipe; steel welding fittings; and welded joints.
5. NPS 2: Roll-Grooved-end, black, schedule 40, steel pipe; roll-grooved-end fittings; roll grooved-end-pipe couplings; and roll-grooved joints.
6. NPS 2-1/2 to NPS 3-1/2: Threaded-end, black, schedule 40, steel pipe; cast- or malleable-iron threaded fittings; and threaded joints.
7. NPS 2-1/2 to NPS 3-1/2: Plain-end, black, schedule 40, steel pipe; steel welding fittings; and welded joints.
8. NPS 2-1/2 to NPS 3-1/2: Roll-Grooved-end, black, schedule 40 or 10, steel pipe; roll-grooved end fittings; roll-grooved-end-pipe couplings; and roll-grooved joints.
9. NPS 4 to NPS 6: Threaded-end, black, schedule40, steel pipe; cast- or malleable-iron threaded fittings; and threaded joints.
10. NPS 4 to NPS 6: Plain-end, black, schedule 40 or 10, steel pipe; steel welding fittings; and welded joints.
11. NPS 4 to NPS 6: Roll-grooved-end, black, schedule 40 or 10, steel pipe; roll-grooved-end fittings; roll-grooved-end-pipe couplings; and roll-grooved joints.

12. NPS 2 ½" to 6" roll-grooved sch 10 back steel pipe

3.8 VALVE APPLICATIONS

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

1. Listed Fire-Protection Valves: UL listed and CSFM approved for applications where required by NFPA 13 and NFPA 14

a. Shutoff Duty: Use ball, or straight pattern gate valves. Butterfly valves are not acceptable.

3.9 JOINT CONSTRUCTION

A. Refer to Division 21 Section "Common Work Results for Fire Suppression" for basic piping joint construction.

B. Threaded Joints: Comply with NFPA 13 and Campus Standards for pipe thickness and threads.

Do not thread pipe smaller than NPS 8 with wall thickness less than Schedule 40 to match pipe.

C. Twist-Locked Joints: Shall not be used on Campus.

D. Pressure-Sealed Joints: Use UL-listed tool and procedure. Include use of specific equipment, pressure-sealing tool, and accessories.

E. Mechanically Formed, Copper-Tube-Outlet Joints: Shall not be used.

F. Roll-Grooved Joints: Assemble joints with listed coupling and gasket, lubricant, and bolts.

1. Steel Pipe: Roll-groove piping as indicated. Use roll-grooved-end fittings and rigid, roll grooved-end-pipe couplings.

2. Copper Tube: Roll-groove tubing. Use roll-grooved-end fittings and roll-grooved-end tube couplings.

G. Dissimilar-Metal Piping Joints: Construct joints using dielectric fittings compatible with both piping materials.

1. NPS 2 and Smaller: Use dielectric couplings, or nipples.
2. NPS 2-1/2 to NPS 4: Use dielectric flanges.
3. NPS 5 and Larger: Use dielectric flange insulation kits.

3.10 SERVICE-ENTRANCE PIPING

A. Connect fire-suppression piping to water-service piping of size and in location indicated for service entrance to building. Refer to Division 22 Section "Facility Water Distribution Piping" for exterior piping.

B. Install shutoff valve, backflow preventer, pressure gage, drain, and other accessories indicated at connection to water-service piping. Refer to Division 22 Section "Facility Water Distribution Piping" for backflow preventers.

C. Install 1” relief valve immediately downstream of backflow preventer with an isolation valve and drain to rough grade. Set at 175 PSI.

3.11 PIPING INSTALLATION

A. Refer to Division 21 Section "Common Work Results for Fire Suppression" for basic piping installation.

B. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.

1. Deviations from approved working plans for piping require written approval from Campus Fire Marshal and University Representative. File written approval with University Representative before deviating from approved working plans.

C. Install underground ductile-iron service-entrance piping according to NFPA 24 and with restrained joints. Encase piping in corrosion-protective encasement.

D. Install underground copper service-entrance piping according to NFPA 24. Encase piping in corrosion-protective encasement.

E. Use approved fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.

F. Install sprinkler heads to supply piping via a threaded branch outlet and by a minimum 1-inch by ½-inch threaded, tapered, reducing fitting.

G. Install unions adjacent to each valve in pipes NPS 2 and smaller. Unions are not required on flanged devices or in piping installations using roll-grooved joints.

H. Install flanges or flange adapters on valves, apparatus, and equipment having NPS 2-1/2 and larger connections. Flanges shall be installed on aboveground piping only.

I. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, sized and located according to NFPA 13.

J. Install sprinkler piping with drains for complete system drainage.

K. Install sprinkler zone control valves, test assemblies, and drain risers adjacent to standpipes
L. Install 1" drain valves on standpipes with garden hose outlet.

M. Install ball drip valves to drain piping between fire department connections and check valves. Drain to floor drain or outside building.

N. Hangers and Supports: Comply with NFPA 13 for hanger materials.

1. Install standpipe system piping according to NFPA 14.
2. Install sprinkler system piping according to NFPA 13.
3. Beam clamps shall be fitted with steel retainer straps.
4. Hanger rods of less than 3/8 inch diameter are not permitted.
5. Hanger rods in contact with piping are not permitted.
6. Attach rods to concrete with Type 18 insert or drilled expansion anchor.
7. Powder driven or gas driven studs are not permitted.
8. Retrofit hangers shall not be used for new construction.

O. Earthquake Protection: Install piping according to NFPA 13 and ASCE 7.6 and CBC for seismic zone 4 to protect from earthquake damage.

P. Install pressure gages on riser or feed main, at each sprinkler test connection, and at top of each standpipe. Include pressure gages with connection not less than NPS 1/4 and with soft metal seated globe valve, arranged for draining pipe between gage and valve. Install gages to permit removal.

Q. Fill wet-standpipe system piping with water.

R. Fill wet-pipe sprinkler system piping with water.

3.12 SPRINKLER INSTALLATION

A. Install sprinklers in suspended ceilings in center of narrow dimension of acoustical ceiling panels and tiles. For side wider than two (2) feet, ¼ points will be acceptable.

B. Do not install pendent or sidewall, wet-type sprinklers in areas subject to freezing. Use dry type sprinklers with water supply from heated space.

3.13 LABELING AND IDENTIFICATION

A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13 and NFPA 14 .

3.14 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
3. Energize circuits to electrical equipment and devices.
4. Flush, test, and inspect sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.
5. Flush, test, and inspect standpipe systems according to NFPA 14, "System Acceptance" Chapter.
6. Coordinate with fire alarm tests. Operate as required.
7. Verify that equipment hose threads are same as City of Riverside fire department equipment.

8. Conduct witnessed Standpipe flow test, proving design requirements.

B. Report test results promptly and in writing to University Representative and Campus Fire Marshal.

3.15 CLEANING AND PROTECTION

A. Clean dirt and debris from sprinklers.

B. Remove and replace sprinklers with paint other than factory finish.

C. Protect sprinklers from damage until Substantial Completion.

3.16 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain specialty valves. Refer to Division 01 Sections "Demonstration and Training." and “Closeout Procedures.”

END OF SECTION 21 1000

SECTION 22 0500 - COMMON WORK RESULTS FOR PLUMBING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Piping materials and installation instructions common to most piping systems.
2. Transition fittings.
3. Dielectric fittings.
4. Mechanical sleeve seals.
5. Sleeves.
6. Escutcheons.
7. Grout.
8. Equipment installation requirements common to equipment sections.
9. Painting and finishing. Provided by other section of work.
10. Concrete bases. Provided by other section of work
11. Firestopping

1.2 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe chases, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in chases.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

F. The following are industry abbreviations for plastic materials:

1. CPVC: Chlorinated polyvinyl chloride plastic. Not allowed on lab waste per UCR.
2. PE: Polyethylene plastic.
3. PVC: Polyvinyl chloride plastic.

4. PP: Polypropylene plastic.

G. The following are industry abbreviations for rubber materials:

1. EPDM: Ethylene-propylene-diene terpolymer rubber.
2. NBR: Acrylonitrile-butadiene rubber.

1.3 SUBMITTALS

A. Product Data: For the following:

1. Transition fittings.
2. Dielectric fittings.
3. Mechanical sleeve seals.
4. Escutcheons.

B. Welding certificates.

1.4 QUALITY ASSURANCE

A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

C. Electrical Characteristics for Plumbing Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

D. Piping penetration through fire-rated construction assemblies, including accessory components; sleeves, sealants, packing materials and methods, and installation shall meet the requirements of the CBC, and shall be California State Fire Marshal approved. Firestopping details shall bear the UL label, indicate F-rating, T-rating, and shall meet the requirements of the California Building Code. Recommend all UL systems by one vendor/contractor..

E. Groove-less clamps, cut groove pipe and fittings, reducing couplings, bushings, mechanical tees or saddle fittings are not acceptable for use on campus. Pipe sizes from 2-1/2” and above. 1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.6 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for plumbing installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for plumbing items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Division 08 Section 08 3113 "Access Doors and Frames." Coordinate to avoid access panels at hard lid ceiling if possible. Access panel shall be located in accessible area for maintenance convenience and safety and limit disturbance to the public.

D. Coordinate with other sections of the specifications for the applicability of materials specified in this section. Not every product or material listed may be used.

E. Coordinate requirements of this section with actual work to be performed. This section is general in scope for basic materials and methods, all of which may not actually apply to this project.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer. Review Division 1.

2.2 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 22 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.3 JOINING MATERIALS

A. Refer to individual Division 22 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

2. AWWA C110, rubber, flat face, 1/8-inch-thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: Bolts shall be United States Customary System bolts and nuts (e.g. ¾"). Metric bolts and nuts shall not be used. Bolts and nuts shall be stainless steel with heavy hex nuts at exterior locations, standard carbon steel on interior locations. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

D. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

E. Brazing Filler Metals: AWS A5.8, BCuP Series, BCup3 or BCup4, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping, unless otherwise indicated.

F. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

G. Fiberglass Pipe Adhesive: As furnished or recommended by pipe manufacturer.

2.4 TRANSITION FITTINGS

A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.

1. Manufacturers:

a. Cascade Waterworks Mfg. Co.
b. Dresser Industries, Inc.; DMD Div.
c. Ford Meter Box Company, Incorporated (The); Pipe Products Div.
d. JCM Industries.
e. Smith-Blair, Inc.

f. Viking Johnson.
g. Or equal.

2. Underground Piping NPS 1-1/2 and Smaller: Manufactured fitting or coupling.
3. Underground Piping NPS 2 and Larger: AWWA C219, metal sleeve-type coupling.
4. Aboveground Pressure Piping: Pipe fitting.

B. Plastic-to-Metal Transition Fittings: CPVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.

1. Manufacturers:

a. Eslon Thermoplastics.
b. Or equal.

C. Plastic-to-Metal Transition Adaptors: One-piece fitting with manufacturer's SDR 11 equivalent dimensions; one end with threaded brass insert, and one solvent-cement-joint end.

1. Manufacturers:

a. Thompson Plastics, Inc.
b. Or equal.

D. Plastic-to-Metal Transition Unions: MSS SP-107, CPVC four-part union. Include brass end, solvent-cement-joint end, rubber O-ring, and union nut.

1. Manufacturers:

a. NIBCO INC.
b. NIBCO, Inc.; Chemtrol Div.
c. Or equal.

E. Flexible Transition Couplings for Underground Non-pressure Drainage Piping: ASTM C 1173 with elastomeric sleeve, ends same size as piping to be joined, and corrosion-resistant metal band on each end.

1. Manufacturers:

a. Cascade Waterworks Mfg. Co.
b. Fernco, Inc.
c. Mission Rubber Company.
d. Plastic Oddities, Inc.
e. Or equal.

2.5 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Shall not be used. Provide 6" long brass nipple with brass unions. Or brass union and bronze ball valve on ends of nipple.

D. Dielectric Flanges: Factory-fabricated, companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.

1. Manufacturers:

a. Capitol Manufacturing Co.
b. Central Plastics Company.
c. Epco Sales, Inc.
d. Watts Industries, Inc.; Water Products Div.
e. Or equal.

E. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, full-face or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.

1. Manufacturers:

a. Advance Products & Systems, Inc.
b. Calpico, Inc.
c. Central Plastics Company.
d. Pipeline Seal and Insulator, Inc.
e. Or equal.

2. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.

F. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.

1. Manufacturers:

a. Calpico, Inc.
b. Lochinvar Corp.
c. Or equal.

G. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.

1. Manufacturers:

a. Perfection Corp.
b. Precision Plumbing Products, Inc.
c. Sioux Chief Manufacturing Co., Inc.
d. Victaulic Co. of America.
e. Or equal.

2.6 MECHANICAL SLEEVE SEALS

A. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.

1. Manufacturers:

a. Advance Products & Systems, Inc.
b. Calpico, Inc.
c. Metraflex Co.
d. Pipeline Seal and Insulator, Inc.
e. Thunderline Modular Seals: Link-seal
f. Or equal.

2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
3. Pressure Plates: Stainless steel. Include two for each sealing element.
4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.7 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop on outside walls below grade, unless otherwise indicated.

D. Molded PVC: Permanent, with nailing flange for attaching to wooden forms.

E. PVC Pipe: ASTM D 1785, Schedule 40.

F. Molded PE: Reusable, PE, tapered-cup shaped, and smooth-outer surface with nailing flange for attaching to wooden forms.

2.8 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.

C. One-Piece, Cast-Brass Type: With set screw.

1. Finish: Polished chrome-plated and rough brass.

D. Split-Casting, Cast-Brass Type: With concealed hinge and set screw.

1. Finish: Polished chrome-plated and rough brass.

E. One-Piece, Stamped-Steel Type: With set screw and chrome-plated finish.

F. Split-Plate, Stamped-Steel Type: With concealed hinge, set screw, and chrome-plated finish.

G. One-Piece, Floor-Plate Type: Cast-iron floor plate.

H. Split-Casting, Floor-Plate Type: Cast brass with concealed hinge and set screw.

2.9 GROUT

A. Description: ASTM C 1107, Grade B, non-shrink and nonmetallic, dry hydraulic-cement grout.

1. Characteristics: Post-hardening, volume-adjusting, non-staining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
2. Design Mix: 5000-psi, 28-day compressive strength.
3. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 22 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors according to the following:

1. New Piping:

a. Piping with Fitting or Sleeve Protruding from Wall: Two-piece, deep-pattern type.
b. Chrome-Plated Piping: Two -piece, cast-brass type with polished chrome-plated finish.
c. Insulated Piping: Two-piece, stamped-steel type with spring clips.
d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: Two -piece, cast brass type with polished chrome-plated finish.
e. Bare Piping at Ceiling Penetrations in Finished Spaces: Two-piece, cast-brass type with polished chrome-plated finish.
f. Bare Piping in Unfinished Service Spaces: Two-piece, cast-brass type with polished chrome-plated finish.
g. Bare Piping in Equipment Rooms: Two-piece, cast-brass type.
h. Bare Piping at Floor Penetrations in Equipment Rooms: Two-piece, floor-plate type.

M. Mounting hardware, including nuts, bolts and washers for outdoor applications and below grade applications must be of stainless steel materials.

N. Sleeves are not required for core-drilled holes, except in L Occupancies and other locations, where spill control is required. Refer to architectural documents for details.

O. Permanent sleeves are not required for holes formed by removable PE sleeves.

1. Install sleeves for pipes passing through interior concrete and masonry walls. Install sleeves in new walls and slabs as new walls and slabs are constructed.

2. Install sleeves that provide code compliant annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:

    a. Steel Pipe Sleeves: For pipes smaller than NPS 6, mechanical rooms and wet area applications, where spill containment is required.

3. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint. Refer to Division 07 Section 07 9200 "Joint Sealants" for materials and installation.
4. Sleeve application and installation shall comply with CBC requirements and UL approved Firestopping Details. Refer to Firestopping Sections 07 8413 and 07 8443.
5. Coordinate requirements of sound-proofing caulk, as determined by the Sound and Vibration Consultant's recommendations. Refer to section 22 0548 "Vibration and Seismic Controls for Plumbing.

P. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

1. Install steel pipe for sleeves smaller than 6 inches in diameter.
2. Install cast-iron "wall pipes" for sleeves 6 inches and larger in diameter.
3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

Q. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing galvanized mechanical sleeve seals.

1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

R. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Refer to Division 07 Section 07 8413 "Penetration Firestopping" for materials. T. Verify final equipment locations for roughing-in.

U. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

V. Install valves in readily accessible locations, avoiding hard-lid ceilings where possible. Provide access panels for valve access complying with Division 08, and coordinate access panel locations with other disciplines.

3.2 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 22 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

E. Oxyacetylene torch welding, and cutting of structural steel or bolt holes shall not be permissible.

F. Install main and branch piping using specified fittings, “T-drill”, “welded nozzles”, or “SideTap” or similar fitting substitution style connections are not acceptable. T-drill applications..

G. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

H. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

I. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

J. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

K. Plastic Piping Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:

1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
2. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.

4. PVC Pressure Piping: Join schedule number ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.
5. PVC Nonpressure Piping: Join according to ASTM D 2855.

L. Plastic Pressure Piping Gasketed Joints: Join according to ASTM D 3139.

M. Plastic Nonpressure Piping Gasketed Joints: Join according to ASTM D 3212.

N. PE and PP Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.

1. Plain-End Pipe and Fittings: Use butt fusion.
2. Plain-End Pipe and Socket Fittings: Use socket fusion.

O. Fiberglass Bonded Joints: Prepare pipe ends and fittings, apply adhesive, and join according to pipe manufacturer's written instructions.

3.3 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:

1. Install shut-off valves at final connection to each piece of equipment.
2. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
3. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.
4. Dry Piping Systems: Install dielectric unions and flanges to connect piping materials of dissimilar metals.
5. Wet Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom unless specific mounting heights are not indicated.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install plumbing equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations.

D. Install equipment to allow right of way for piping installed at required slope.

3.5 PAINTING

A. Painting of plumbing systems, equipment, and components is provided by others under Division 09 Sections "Interior Painting" and "High-Performance Coatings."

3.6 CONCRETE BASES Provided by other section of work.

A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to seismic codes at Project.

1. Install anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
2. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
3. Install anchor bolts to elevations required for proper attachment to supported equipment.
4. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.7 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Refer to Division 05 Section "Metal Fabrications" for structural steel.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor plumbing materials and equipment.

C. Field Welding: Comply with AWS D1.1.

D. Outdoor Applications: Outdoor support assemblies and accessories shall be of “stainless steel material”, or “hot-dip galvanized carbon steel with high-performance coatings”, as noted below:

1. Stainless steel: Mounting hardware such as bolts, nuts, washers, straps, brackets, fastening hardware etc., shall be stainless steel.
2. Coated galvanized steel: Carbon steel support assemblies, including all metal fabrications for use outdoors shall comply with each paragraph listed below:

    a. Assemblies must be shop-fabricated and pre-assembled for one-piece hot-dip galvanized coating process
    b. After hot-dip galvanized coating is applied, a high-performance exterior coating system shall be applied. Provide High-Performance Exterior Coating Systems conforming to Division 09 “High Performance Coatings”, meeting all performance requirements, including salt spray test performance.
    c. Touch-up and repair per manufacturer’s recommendations after field installation.

E. Rooftop Applications: Rooftop support assemblies and accessories shall be fabricated for outdoor applications as noted above, and shall be designed per SMACNA design requirements.

1. SMACNA Clearances: Pipes, pipe racks, and equipment shall be installed high enough above roofing surfaces to allow roofing access for maintenance and repair. Install piping and equipment at a minimum height as shown in Table 4-1 of SMACNA Architectural Sheet Metal Manual – 5th Edition.
2. SMACNA Support Systems: Piping systems and equipment supports, unless otherwise shown, use round column supports to tie-in to structure with lead jacks for built-up roofs, and single-ply preformed jacks for single-ply roofs, lead flashing, and lead umbrellas with stainless steel draw band per Figure 4-16A, or Figure 4-16B, of SMACNA Architectural Sheet Metal Manual – 5th Edition.

3.8 GROUTING

A. Grout for plumbing equipment base bearing surfaces, pump and other equipment base plates, and anchors provided by others under Division 03 Section.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout.

END OF SECTION 22 0500

SECTION 22 0513 – MOTORS FOR PLUMBING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes basic requirements for factory or field-installed motors.

B. The standards for the motors listed below exceed those commonly found in the commercial plumbing market. This is intentional and shall not be deviated from. Typical campus applications require much longer life in service than typical commercial applications. Many of the applications are 24 hours per day and on variable frequency drives. The various characteristics of high end industrial motors ensure a very long life in campus service and provide significantly increased energy performance. Their rugged construction helps ensure that initial efficiency is maintained over the life of the motor. Improved characteristics such as reduced shaft runout, and foot flatness allow for better alignment between the motor and the driven equipment. This improves efficiency and reduces noise and vibration. C. Related Sections include the following:

1. Division 22 Section 22 0513 "Vibration and Seismic Controls for Plumbing" for mounting motors and vibration isolation and seismic-control devices.
2. Division 23 Section 23 0510 "Variable Frequency Drives" for speed control devices.
3. Division 22 Sections for application of motors and reference to specific motor requirements for motor-driven equipment.

1.2 QUALITY ASSURANCE

A. Source Limitations: If one of the approved manufacturers cannot be provided and factory installed, then a field-installed motors meeting these specifications shall be field installed.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in California Electrical Code (CEC), Article 100, by a testing agency acceptable to the University, and marked for intended use.

C. Motor Insulation: Insulation shall be inverter-rated Class F, or H, meeting NEMA MG1-2006, Part 31 for inverter duty service with VFD applications. Motor temperature rise shall be kept equal to or below class B standards when operating at full load on sine wave power. The assembled motor insulation system shall resist 2000-volt transients without premature motor failure.

D. Motors shall conform to IEEE Standard 841-2001, IEEE Standard for Petroleum and Chemical Industry - Severe Duty Squirrel Cage Induction Motors.

E. Bearings: Bearing loads and bearing life shall be determined using AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings, and AFBMA 11 - Load Ratings and Fatigue Life for Roller Bearings.

1.3 COORDINATION

A. Coordinate features of motors, installed units, and accessory devices. Provide motors that are:

1. Compatible with the following:
    a. Magnetic controllers.
    b. Reduced-voltage controllers.
    c. Variable frequency drives.
2. Designed and labeled for use with variable frequency controllers (VFD), and suitable for use throughout speed range without overheating.
3. Matched to torque and horsepower requirements of the load.
4. Matched to ratings and characteristics of supply circuit and required control sequence.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified:

1. U.S. Motors, TEFC 841 Plus.
2. General Electric, X$D Ultra 841.
3. Siemens Motors Medallion
4. Baldor Motors
5. Or equal.

B. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 MOTOR REQUIREMENTS

A. Do not include motor specification in other sections as this specification shall apply to every motor on the project. Motor requirements apply to factory-installed or field-installed motors except as follows:

1. Manufacturer for a factory-installed motor requires ratings, performance, or characteristics, other than those specified in this Section, to meet performance specified. This specification shall govern with regards to efficiency, enclosure and ruggedness of design. Factory motors shall match these more stringent standards.

2.3 MOTOR CHARACTERISTICS

A. Motors one horsepower and larger: Three-phase.

B. Motors three-quarter horsepower and smaller: Three-phase or Single-phase.

C. Frequency Rating: 60 Hz.

D. Voltage Rating: NEMA standard voltage selected to operate on nominal circuit voltage to which motor is connected. Polyphase-motor installations on less than 460-Volt nominal circuits shall require written permission from the University.

E. Service Factor: 1.15 or more for all motors on sine wave power; 1.0 for motors on inverter power.

F. Duty: "Severe Duty" and "Continuous Duty" at ambient temperature of 105 deg F (40 deg C) and at altitude of 200 feet above sea level.

G. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

H. Enclosure: Totally Enclosed Fan Cooled (TEFC); or Totally Enclosed Air Over (special applications only), or Totally Enclosed Not Ventilated (special applications only). Open Drip Proof Motors shall not be used.

2.4 POLYPHASE MOTORS ONE-HALF AND THREE-FOURTH HORSEPOWER

A. Efficiency: Meeting or exceeding EPACT 1992 requirements.

B. Bearings: Sealed

C. Service Factor: 1.25

D. Use: Minimize use of motors in this size range by combining loads.

2.5 POLYPHASE MOTORS ONE HORSEPOWER AND LARGER

A. Description: Premium Efficiency Severe Duty, TEFC, Continuous Duty per NEMA Design B.

B. Efficiency: NEMA Premium Efficiency meeting the Standards of IEEE 841 2001. Guaranteed efficiencies shall not be less than the following:

Minimum Guaranteed Motor Efficiencies Percent				
	Nominal Speed (RPM)			
Horsepower	**3600**	**1800**	**1200**	**900**
1	86.5	85.5	82.5	78.5
1½	86.5	86.5	87.5	78.5
2	85.5	86.5	88.5	85.5
3	88.5	89.5	89.5	85.5
5	89.5	89.5	89.5	88.5
7½	90.2	91.7	91.0	88.5
10	90.2	91.7	91.0	89.5
15	91.0	92.4	91.7	89.5
20	91.7	93.0	91.7	90.2
25	92.4	93.6	93.0	91.7

Notes:
1. Premium Efficiency, Severe Duty, Cast Iron frame mounted motors as specified herein are larger and heavier than corresponding lower quality motors. Ensure that the equipment manufacturers make provision for the size and weight of these energy-saving motors.

C. Stator: Copper windings, Windings shall have “inverter grade insulation” and non-hygroscopic.

D. Rotor: Squirrel cage, Precision balanced to less than 0.08 in/sec vibration. Epoxy coated from bearing journal to bearing journal. Total shaft runout shall not exceed 0.001” for shaft sizes 0.875” to 1.625” and 0.0015” for shaft diameters greater than 1.625”.

E. Bearings: Double-shielded, prelubricated ball bearings on motors smaller than 180-frame. Regreasable bearings on 180-T frame and larger. Size 300 series bearings on 250 T frame and

up. Internal bearing caps on 180 T frame and larger. Where motor shafting will be used to support driven equipment (such as a fan), the manufacturer shall make an analysis of the expected bearing life and provide bearings that will have an L_{10} life of 130,000 hours for directdrive and 50,000 hours for belt-drive.

F. Temperature Rise: Class B rise at full load on sine wave power.

G. Insulation: Class F, unless otherwise indicated.

H. Enclosure: Cast Iron Construction (may use steel mounting base on 140-T frame series). Motor casing shall have exterior fins for surface cooling.

I. Finish: Chemical resistant paint (250-hour salt spray test) over corrosion-resistant primer. Color may be standard factory color or finished to match the architectural color palette.

J. Corrosion resistance: Internal components shall be coated with corrosion preventative material

K. Foot Flatness: Motor base mounting-hole to mounting-hole flatness shall be less than 0.005 inches (five thousandths of an inch or 0.127 millimeter).

L. Motor shall have Inpro/Seal on drive end for IP55 protection and shall have provision for converting opposite end to having such a seal. Inpro seal on both ends is also acceptable.

M. Conduit Boxes: Shall be twice NEMA volume standards minimum and shall be field repositionable to allow ease of conduit connection.

N. Grounding: Shall have external grounding provision

O. Nameplate: Shall be embossed stainless steel and shall include efficiency information.

P. Hardware: Corrosion resistant SAE Grade-5.

Q. Breather plug: Shall be fitted with brass breather plug.

R. Compatibility with Inverter Service: Shall be able to operate at 10:1 variable torque and 5:1 constant torque on inverter power.

S. Speed: Motors may be eight-pole, six-pole, or four-pole. Two-pole motors (3600-rpm synchronous speed) may be used only with written permission of the University.

T. Warranty: Warrantee shall be for 60 months from the date of installation or 66 months from the date of shipment from the motor factory.

2.6 POLYPHASE MOTORS WITH ADDITIONAL REQUIREMENTS

A. Motors Used with Reduced-Inrush Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.

1. Designed with critical vibration frequencies outside operating range of controller output.
2. Temperature Rise: Matched to rating for Class B insulation.
3. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

C. Motors connected to variable frequency controllers shall have shaft grounding devices meeting the following requirements:

1. Manufacturer: AEGIS SGR™ Bearing Protection Rings manufactured by Electro Static Technology (EST).
2. Shaft grounding shall be a bearing isolator, or labyrinth seal, that includes a built-in grounding ring and brush. The brush shall contain conductive microfibers that surround the shaft to discharge any current flowing through it.
3. Motors less than 100 HP size shall be provided with a single shaft grounding ring provided on the drive end of the motor.
4. Apply a fast drying silver paint on the shaft surface to prevent corrosion.
5. Shaft grounding ring wear shall be less than 0.001" in 10,000 hours with a fiber wear length designed for expected life 200,000+ hours based on testing. Shaft grounding rings shall be compatible with operating environments ranging from -40° F (-40° C) to 300° F (150° C) and 0-90% RH (non-condensing).

2.7 SINGLE-PHASE MOTORS

A. Type: One of the following, to suit starting torque and requirements of specific motor application:

1. Permanent-split capacitor.
2. Split-phase start, capacitor run.
3. Capacitor start, capacitor run.

B. Shaded-Pole Motors: For motors 1/20 hp and smaller only.

C. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

D. Bearings: Ball type.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive field-installed motors for compliance with requirements, installation tolerances, and other conditions affecting performance.

B. Examine roughing-in of conduit systems to verify actual locations of conduit connections before motor installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 MOTOR INSTALLATION

A. Anchor each motor assembly to base, adjustable rails, or other support, arranged and sized according to manufacturer's written instructions. Attach by bolting. Level and align motor with base.

B. Comply with mounting and anchoring requirements specified in Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing."

C. Connect motor leads to power source using rings and bolts or split bolts as needed. Insulation of connected motor leads shall be of the highest quality and designed to withstand the same temperature as the internal windings. Ordinary electrical tape is not generally suitable for this service and shall not be used as the only means of insulation. Wire nuts shall not be used. D. Motor power leads shall be marked at the source and at the connection box on the motor.

3.3 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Run each motor with its controller. Demonstrate correct rotation, alignment, and speed at motor design load.
2. Test interlocks and control features for proper operation.
3. Verify that current in each phase is within nameplate rating.

B. Testing: University’s Representative may engage a qualified testing agency to perform the following field quality-control testing:

1. Perform each electrical test and visual and mechanical inspection stated in NETA ATS, Section 7.15.1 and certify compliance with test parameters.

C. After the University's testing agency is finished, correct any malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and the University shall retest.

3.4 ADJUSTING

A. Align motors and bases.

3.5 CLEANING

A. After completing equipment installation, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

B. Clean motors, on completion of installation, according to manufacturer's written instructions.

END OF SECTION 22 0513

SECTION 22 0516 - EXPANSION FITTINGS AND LOOPS FOR PLUMBING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following pipe expansion joints and expansion compensation devices for mechanical piping systems:

1. Metal-bellows expansion joints.
2. Expansion compensators.
3. Rubber expansion joints.
4. Flexible-hose expansion joints.
5. Packed slip expansion joints.
6. Seismic flexible hose joints.
7. Pipe bends and loops.

1.2 DEFINITIONS

A. BR: Butyl rubber.

B. Buna-N: Nitrile rubber.

C. CR: Chlorosulfonated polyethylene synthetic rubber.

D. CSM: Chlorosulfonyl-polyethylene rubber.

E. EPDM: Ethylene-propylene-diene terpolymer rubber.

F. NR: Natural rubber.

G. PTFE: Polytetrafluoroethylene plastic.

1.3 PERFORMANCE REQUIREMENTS

A. Compatibility: Products shall be suitable for piping system fluids, materials, working pressures, and temperatures.

B. Capability: Products shall absorb 200 percent of maximum axial movement between anchors.

1.4 SUBMITTALS

A. Product Data: For each type of pipe expansion joint and alignment guide indicated.

B. Shop Drawings: Signed and sealed by a qualified professional engineer.

1. Design Calculations: Calculate requirements for thermal expansion of piping systems and for selecting and designing expansion joints, loops, and bends.

2. Anchor Details: Detail fabrication of each anchor indicated. Show dimensions and methods of assembly and attachment to building structure.
3. Schedule: Indicate type, manufacturer's number, size, material, temperature, pressure rating, end connections, and location for each expansion joint.

C. Product Certificates: For each type of pipe expansion joint, signed by product manufacturer.

D. Welding certificates.

1.5 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to the following:

1. Steel Shapes and Plates: AWS D1.1, "Structural Welding Code - Steel." 2. Welding to Piping: ASME Boiler and Pressure Vessel Code: Section IX.

B. Structural Review: Seismic engineering submittal documents, seismic loads, anchorage support loads, and vertical loads applied to building structures and structural components shall be reviewed, analyzed, and subject to approval by the project structural engineer of record.

Flexible pipe connectors and expansion joints shall be rated for 150% of design maximum working pressure, or as recommended by the product ManufacturerPART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 EXPANSION JOINTS

A. Metal-Bellows Expansion Joints: ASTM F 1120, circular-corrugated-bellows type with external tie rods.

1. Manufacturers:

a. Adsco Manufacturing, LLC.
b. Ebba Iron Sales
c. Flex-Hose Co., Inc.
d. Flexicraft Industries.
e. Hyspan Precision Products, Inc.
f. Metraflex, Inc.
g. Or equal.

2. Metal-Bellows Expansion Joints for Copper Piping: Single- or multiple -ply phosphorbronze bellows, copper pipe end connections, and brass shrouds.
3. Metal-Bellows Expansion Joints for Steel Piping: Single- or multiple -ply stainless-steel bellows, steel pipe end connections, and carbon-steel shroud.
4. Minimum Pressure Rating: 175 psig at 200°F., unless otherwise indicated.
5. Configuration: Single- or double -bellows type, unless otherwise indicated.
6. End Connections: Flanged or weld.

B. Rubber Expansion Joints: ASTM F 1123, fabric-reinforced rubber with external control rods and complying with FSA's "Technical Handbook: Non-Metallic Expansion Joints and Flexible Pipe Connectors."

1. Manufacturers:
    a. Flex-Hose Co., Inc.
    b. Flexicraft Industries.
    c. Ebba Iron Sales
    d. Garlock Sealing Technologies.
    e. Mason Industries, Inc.; Mercer Rubber Co.
    f. Metraflex, Inc.
    g. Or equal.
2. Arch Type: Multiple arches.
3. Spherical Type: Multiple spheres.
    a. Minimum Pressure and Temperature Ratings for NPS 1-1/2 to NPS 4: 150 psig at 220°F.
    b. Minimum Pressure and Temperature Ratings for NPS 5 and larger: 150 psig at 200°F.
4. Material: EPDM, with polyester or nylon reinforcement fabric cord.
5. End Connections: Full-faced, integral, class 150, steel flanges with steel retaining rings.

C. Flexible-Hose Expansion Joints and Assemblies: Flexible hose construction with inner hose and outer sheath, provide hose assemblies in pairs to allow for vertical and horizontal motion.

1. Manufacturers:
    a. Flex-Hose Co., Inc.
    b. Flexicraft Industries.
    c. Metraflex, Inc.
    d. Or equal.
2. Flexible-Hose Expansion Joints for Copper Piping: Copper-alloy fittings with solder joint or threaded end connections.
    a. NPS 2 and Smaller: Bronze hoses and single-braid bronze sheaths with 450 psig at 70 deg F and 340 psig at 450 deg F ratings.

b. NPS 2-1/2 to NPS 4: Stainless-steel hoses and single-braid, stainless-steel sheaths with 300 psig at 70 deg F and 225 psig at 450 deg F ratings.

4. Flexible-Hose Expansion Assembly: Manufactured assembly with two flexible-metalhose legs joined by long-radius, 180-degree return bend or center section of flexible hose; with inlet and outlet elbow fittings, corrugated-metal inner hoses, and braided outer sheaths.

a. Configuration: Pre-assembled unit with flanged connections, stainless steel hoses and double braid stainless steel sheaths.
b. Temperature Rating: 180 psig at 200 degrees F.
c. Design Basis: Flex Hose Company – Tri-flex loop.
d. Angular deflection for NPS 10 and larger: 10 degree minimum

2.4 MATERIALS FOR ANCHORS

A. Steel Shapes and Plates: ASTM A 36/A 36M.

B. Bolts and Nuts: ASME B18.10 or ASTM A 183, steel, hex head.

C. Washers: ASTM F 844, steel, plain, flat washers.

D. Mechanical Fasteners: Insert-wedge-type stud with expansion plug anchor for use in hardened Portland cement concrete, and tension and shear capacities appropriate for application.

1. Stud: Threaded, zinc-coated carbon steel.
2. Expansion Plug: Zinc-coated steel.
3. Washer and Nut: Zinc-coated steel.

E. Chemical Fasteners: Insert-type-stud bonding system anchor for use with hardened Portland cement concrete, and tension and shear capacities appropriate for application.

1. Bonding Material: ASTM C 881, Type IV, Grade 3, 2-component epoxy resin suitable for surface temperature of hardened concrete where fastener is to be installed.
2. Stud: ASTM A 307, zinc-coated carbon steel with continuous thread on stud, unless otherwise indicated.
3. Washer and Nut: Zinc-coated steel.

F. Concrete: Refer to Division 03 Section "Cast-in Place Concrete" for formwork, reinforcement, and concrete.

G. Grout: Refer to Division 03 Section for interior and exterior applications.

1. Properties: Non-staining, noncorrosive, and nongaseous.
2. Design Mix: 5000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.1 EXPANSION-JOINT INSTALLATION

A. Install manufactured, nonmetallic expansion joints according to Fluid Sealing Assoc's "Technical Handbook: Non-Metallic Expansion Joints and Flexible Pipe Connectors" and manufacturers installation instructions.

B. Install expansion joints of sizes matching size of piping in which they are installed.

C. Install alignment guides to allow expansion and to avoid end-loading and torsional stress.

3.2 PIPE BEND AND LOOP INSTALLATION

A. Attach pipe bends and loops to anchors.

1. Steel Anchors: Attach by welding. Comply with ASME B31.9 and ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

2. Concrete Anchors: Attach by fasteners. Follow fastener manufacturer's written instructions.

B. Pipe bends and loops for high pressure steam-temperature water system shall be of one continuous piece of pipe, welded at each end.

3.5 ANCHOR INSTALLATION

A. Install anchors at locations to prevent stresses from exceeding those permitted by ASME B31.9 and to prevent transfer of loading and stresses to connected equipment.

B. Fabricate and install steel anchors by welding steel shapes, plates, and bars to piping and to structure. Comply with ASME B31.9 and AWS D1.1.

C. Construct concrete anchors of poured-in-place concrete of dimensions indicated and include embedded fasteners.

D. Install pipe anchors according to expansion-joint manufacturer's written instructions if expansion joints or compensators are indicated.

E. Use grout to form flat bearing surfaces for expansion fittings, guides, and anchors installed on or in concrete.

3.6 SEISMIC JOINTS

A. Install Seismic Joints according to the requirements of CBC Seismic Zone 4, and Project Geotechnical Reports.

B. Install seismic joints of sizes matching size of pipe in which they are installed.

C. Seismic joints shall be flexible stainless steel hose type, or double ball joint type.

D. Provide shut-off valve on main pipe side of seismic joint installations to isolate failed joints, allowing the system(s) to stay in service.

E. Install seismic joints in all piping including plumbing, HVAC, and fire protection.

F. Ensure maintenance accessibility of seismic joints.

3.7 ROOFTOP AND OUTDOOR APPLICATIONS

A. Outdoor assemblies shall be fully weather-proof design and installation:

1. Stainless steel: Mounting hardware such as bolts, nuts, washers, anchors straps, brackets, fastening hardware etc., shall be stainless steel.
2. Coated galvanized steel: Exposed product and device materials shall be of stainless steel fabrication, or if not available from the manufacturer in stainless steel, shall be hotdipped galvanized steel with the addition of a high-performance coating conforming to Division 09 “High-Performance Coatings.

B. Piping and equipment shall be supported high enough above roofing surfaces to allow roofing access for maintenance and repair. Install pipes, pipeways, and equipment at a minimum height as shown in Table 4-1 of SMACNA Architectural Sheet Metal Manual – 5th Edition.

END OF SECTION 22 0516

SECTION 22 0519 - METERS AND GAGES FOR PLUMBING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following meters and gages for mechanical systems:

1. Thermometers.
2. Gages.
3. Test plugs.
4. Water meters

B. Related Sections include the following:

1. Division 22 Section "Natural Gas Piping" for gas meters inside or outside the building.
2. Division 22 Section "Natural Gas Piping" for gas meters inside the building.

1.2 DEFINITIONS

A. CR: Chlorosulfonated polyethylene synthetic rubber.

B. EPDM: Ethylene-propylene-diene terpolymer rubber.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated; include performance curves.

B. Shop Drawings: Schedule for water meter, thermometers, and gages indicating manufacturer's number, scale range, and location for each.

C. Product Certificates: For each type of water meter, thermometer, and gage signed by product manufacturer.

D. Operation and Maintenance Data: For water meter to include in emergency, operation, and maintenance manuals.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 DIAL THERMOMETERS

A. Manufacturers

1. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
2. Marsh Bellofram/Marshalltown.
3. Trerice, H. O. Co.
4. Weiss Instruments, Inc.
5. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.
6. 3D Instruments
7. Or equal.

B. Bimetallic-Actuated

1. Description: Adjustable angle, Direct-mounting, bi-metallic-actuated dial thermometers complying with ASME B40.3.
2. Case: Liquid-filled type, Stainless steel with 5-inch diameter.
3. Element: Bimetal coil.
4. Dial: Satin-faced, nonreflective aluminum with permanently etched scale markings.
5. Pointer: Black metal.
6. Window: Glass.
7. Ring: Stainless steel.
8. Connector: Adjustable angle.
9. Stem: stainless steel, for thermowells installation and of length to suit installation.
10. Accuracy: Plus or minus 1 percent of range or plus or minus 1 scale division to maximum of 1.5 percent of range. Scale shall be degrees Fahrenheit, unless otherwise indicated, suitable for the media operating temperatures.

2.3 THERMOWELLS

A. Manufacturers:

1. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
2. Marsh Bellofram/Marshalltown.
3. Trerice, H. O. Co.
4. Weiss Instruments, Inc.
5. 3D Instruments
6. Or equal.

B. Description: Pressure-tight, socket-type metal fitting made for insertion into piping and of type, diameter, and length required to hold thermometer.

C. Characteristics:

1. Threaded Stainless Steel
2. Pressure Rating – not less than piping system design pressure.
3. Stem Length – Extend 2" into fluid or to extend to center of pipe
4. Extension for insulated piping –2" nominal but not less than thickness of insulation
5. Threaded cap nut – With chain permanently fastened to well and cap.

2.4 PRESSURE GAGES

A. Manufacturers:

1. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
2. Marsh Bellofram/Marshalltown.
3. Trerice, H. O. Co.
4. Weiss Instruments, Inc.
5. 3D Instruments
6. Or equal.

B. Direct-Mounting, Dial-Type Pressure Gages: Indicating-dial type, complying with ASME B40.100. Provide shutoff valve with pressure gauge. Shall be equal to Trerice 700 Series.

1. Case: Dry and Liquid-filled type (glycerine or other), 4 or 4-1/2-inch diameter, stainless steel case.
2. Pressure-Element Assembly: Phosphor bronze bourdon tube, brass socket.
3. Pressure Connection: Brass, NPS 1/4, bottom-outlet type, unless back-outlet type is indicated.
4. Movement: Mechanical, with link to pressure element and connection to pointer.
5. Dial: Aluminum, white background with black graduations and markings.
6. Pointer: Black metal.
7. Window: Glass.
8. Ring: Stainless steel.
9. Accuracy: Grade 1A, plus or minus 1 percent full scale.
10. Vacuum-Pressure Range: 30-in. Hg of vacuum to 15 psig of pressure.
11. Range for Fluids under Pressure: Two times operating pressure.
12. Scale: Scale shall be psig or inches mercury vacuum depending on the application.

C. Pressure-Gage Fittings:

1. Valves: NPS 1/4 brass, or equal gauge cock type or stainless-steel ball type by Apollo.
2. Siphons: NPS 1/4 coil of brass tubing with threaded ends.
3. Snubbers: ASME B40.5, NPS 1/4 brass bushing with corrosion-resistant, porous-metal disc of material suitable for system fluid and working pressure.

2.5 TEST PLUGS

A. Manufacturers

1. Peterson Equipment Co., Inc.

2. Sisco Manufacturing Co.
3. Trerice, H. O. Co.
4. Or equal.

B. Description: Corrosion-resistant brass or stainless-steel body with core inserts and gasketed and threaded cap, with extended stem beyond insulation for units to be installed in insulated piping.

C. Minimum Pressure and Temperature Rating: 500 psig at 200 deg F.

D. Core Inserts: One or two self-sealing neoprene, valves gasketed orifice, suitable for inserting a 1/8" OD probe assembly.

1. Insert material for air, water, oil, or gas service at 20 to 200 deg F shall be CR.
2. Insert material for air or water service at minus 30 to plus 275 deg F shall be EPDM.

2.6 WATER METERS

A. Manufacturers

1. Master Meter, Inc.
2. ABB Water Meters, Inc.
3. Metron-Farnier
4. Badger Meter, Inc.
5. Schlumberger Limited; Water Div.
6. Sensus Technologies, Inc.
7. Or equal.

B. Provide the following type of water meters based on the capacity required:

Device Size/Type	Low Flow Accuracy >95%	Intermittent Flow per AWWA	Continuous Flow	Head Loss at Intermittent Flow (psi)
2"/PD	8	160	80	12.1
2"/turbo	4	200	160	6.5
3"/turbo	5	450	350	7.1
4"/turbo	15	1250	1000	6.3
6"/ultrasonic	3 at +5%	2000 short term deluge flow	1600	0.69

C. Description: AWWA C701, turbine or ultrasonic type for 1-1/2"and larger meter size. Register flow in cubic feet.

D. Data-Acquisition Units: Comply with University's requirements for connection to Siemens or building data acquisition system. Include meter with signal-transmitting assembly for connection to low-voltage connecting wiring.

E. Intermittent Flow is that flow that can be sustained approximately 1 hour per day seven days a week. Continuous is 24 hours a day seven days a week.

2.7 FLOW INDICATORS

A. Manufacturers

1. Brooks Instrument Div.; Emerson Electric Co.
2. Dwyer Instruments, Inc.
3. Ernst Flow Industries, Inc.
4. Penberthy, Inc.
5. Or equal.

B. Description: Instrument for installation in piping systems for visual verification of flow.

C. Construction: Bronze or stainless-steel body; with sight glass and plastic pelton-wheel indicator, and threaded or flanged ends.

D. Pressure Rating: 125 psig

E. Temperature Rating: 200 deg F

F. End Connections for NPS 2 and Smaller: Threaded.

G. End Connections for NPS 2-1/2 and Larger: Flanged.

PART 3 - EXECUTION

3.1 THERMOMETER APPLICATIONS

A. Install bimetallic-actuated dial thermometers in the following locations:

1. Inlet and outlet of each domestic heat exchanger.
2. Inlet and outlet of domestic and industrial water heaters and in recirculation return pipe.

B. Install bimetallic-actuated dial thermometers at suction or discharge of each pump.

C. Mercury thermometers shall not be used.

D. Provide the following temperature ranges for thermometers:

1. Domestic Hot Water: 30 to 180 deg F, with 2-degree scale divisions.

3.2 GAGE APPLICATIONS

A. Install dry-case-type pressure gages for inlet and discharge of each pressure-reducing valve.

B. Install bi-metal -type pressure gages at suction and discharge of each pump.

3.3 INSTALLATIONS

A. Install direct-mounting thermometers and adjust vertical and tilted positions.

B. Install thermowells with socket extending a minimum of 2 inches into fluid or to the center of pipe and in vertical position in piping tees where thermometers are indicated.

C. Install direct-mounting pressure gages in piping tees with pressure gage located on pipe at most readable position.

D. Install ball valve and snubber fitting in piping for each pressure gage for fluids.

E. Install test plugs in tees in piping.

F. Install flow indicators, in accessible positions for easy viewing, in piping systems.

G. Water meters for domestic water shall be located inside the building in mechanical room in an accessible location and approximately 3’-0” from the floor. Provide a bypass and a lockable shut-off valve around water meter and label “Normally Closed”. Provide a strainer upstream of the meter and shutoff valves on each side of the meter to allow removal while water service is in operation using the bypass.

H. Install permanent indicators on walls or brackets in accessible and readable positions.

I. Install connection fittings for attachment to portable indicators in accessible locations.

J. Mount meters on wall if accessible; if not, provide brackets to support meters.

3.4 CONNECTIONS

A. Install meters and gages adjacent to machines and equipment to allow service and maintenance for meters, gages, machines, and equipment.

B. Ground equipment scope by others. Refer to Division 26 Section "Grounding and Bonding for Electrical Systems."

C. Connect wiring scope by others. Refer to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.5 ADJUSTING

A.

B. Adjust faces of meters and gages to proper angle for best visibility.

3.6 CLEANING

A. Clean windows of meters, and gages, and factory-finished surfaces. Replace cracked and broken windows, and repair scratched and marred surfaces with manufacturer's touch-up paint.

END OF SECTION 22 0519

SECTION 22 0529 - HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following hangers and supports for plumbing system piping and equipment:

1. Steel pipe hangers and supports.
2. Trapeze pipe hangers.
3. Metal framing systems.
4. Thermal-hanger shield inserts.
5. Fastener systems.
6. Pipe stands.
7. Pipe positioning systems.
8. Equipment supports.

B. Related Sections include the following:

1. Division 05 Section 05 5000 "Metal Fabrications" for structural-steel shapes and plates for trapeze hangers for pipe and equipment supports.
2. Division 22 Section 22 0516 "Expansion Fittings and Loops for Plumbing" for pipe guides and anchors.
3. Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing" for vibration isolation devices.
4. Division 22, Section 22 0500 “Common Work Results for Plumbing” for piping, equipment, materials and installation.

1.2 DEFINITIONS

A. MSS: Manufacturers Standardization Society for The Valve and Fittings Industry Inc.

B. Terminology: As defined in MSS SP-90, "Guidelines on Terminology for Pipe Hangers and Supports."

1.3 PERFORMANCE REQUIREMENTS

A. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.

B. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

C. Design seismic-restraint hangers and supports shop drawing for piping and equipment in accordance with CBC for seismic zone 4.

1.4 SUBMITTALS

A. Product Data: For the following:

1. Steel pipe hangers and supports.
2. Thermal-hanger shield inserts.
3. Pipe positioning systems.

B. Shop Drawings: Signed and sealed by a qualified professional engineer. Show fabrication and installation details and include calculations for the following:

1. Trapeze pipe hangers. Include Product Data for components.
2. Metal framing systems. Include Product Data for components.
3. Pipe stands. Include Product Data for components.
4. Equipment supports.

C. Welding certificates.

1.5 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to the following:

1. AWS D1.1, "Structural Welding Code--Steel."
2. AWS D1.2, "Structural Welding Code--Aluminum."
3. AWS D1.4, "Structural Welding Code--Reinforcing Steel."
4. ASME Boiler and Pressure Vessel Code: Section IX.

B. Seismic Engineering: Seismic bracing and support design, mounting hardware and equipment, support systems, restraint systems, anchorage systems, and installation shall conform to the CBC requirements for Seismic Zone 4. Submit calculations, plans, and documents stamped by a qualified California registered engineer.

C. Structural Review: Seismic engineering submittal documents, seismic loads, anchorage and support loads, and vertical loads applied to building structures and structural components shall be reviewed, analyzed, and approved by the project structural engineer of record.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 STEEL PIPE HANGERS AND SUPPORTS

A. Description: MSS SP-58, Types 1 through 58, factory-fabricated components. Refer to Part 3 "Hanger and Support Applications" Article for where to use specific hanger and support types.

B. Manufacturers:

1. B-Line Systems, Inc.; a division of Cooper Industries.
2. Grinnell Corp.
3. ERICO/Michigan Hanger Co.
4. Globe Pipe Hanger Products, Inc.
5. Grinnell Corp.
6. Tolco Inc.
7. Superstrut
8. Or equal.

C. Galvanized, Metallic Coatings: Pregalvanized or hot dipped.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion for support of bearing surface of piping.

2.3 TRAPEZE PIPE HANGERS

A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural-steel shapes with MSS SP-58 hanger rods, nuts, saddles, and U-bolts.

2.4 METAL FRAMING SYSTEMS

A. Description: MFMA-3, shop- or field-fabricated pipe-support assembly made of steel channels and other components.

B. Manufacturers:

1. B-Line Systems, Inc.; a division of Cooper Industries.
2. ERICO/Michigan Hanger Co.; ERISTRUT Div.
3. Power-Strut Div.; Tyco International, Ltd.
4. Tolco Inc.
5. Unistrut Corp.; Tyco International, Ltd.
6. Or equal.

C. Coatings: Manufacturer's standard finish unless bare metal surfaces are indicated.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

2.5 THERMAL-HANGER SHIELD INSERTS

A. Description: 100-psigminimum, compressive-strength insulation insert encased in sheet metal shield.

B. Manufacturers:

1. ERICO/Michigan Hanger Co.
2. PHS Industries, Inc.
3. Pipe Shields, Inc.
4. Or equal.

C.

D. Insulation-Insert Material for Hot Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate or ASTM C 552, Type II cellular glass.

E. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

F. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

G. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.6 FASTENER SYSTEMS

A. Powder-Actuated Fasteners: Shall not be used.

B. Mechanical-Expansion Anchors: Insert-wedge-type zinc-coated, except exterior or corrosive environments shall be stainless steel, for use in hardened portland cement concrete with pullout, tension, and shear capacities appropriate for supported loads and building materials where used.

1. Manufacturers:

a. B-Line Systems, Inc.; a division of Cooper Industries.
b. Hilti, Inc.
c. ITW Ramset/Red Head.
d. Powers Fasteners.
e. Or equal.

C. Concrete Inserts: Carbon steel, electro-galvanized, except exterior or corrosive environments shall be stainless steel, for use in hardened portland cement concrete with pull-out, tension, and

shear capacities appropriate for supported loads and building materials where used. UL listed for use in metal deck formed concrete and formed slabs for pre-positioning and attaching hanger rods in poured concrete decks. Suitable for seismic loads and brace attachments.

1. Manufacturers:

    a. B-Line Systems, Inc.; a division of Cooper Industries.
    b. ISAT (Blue Banger Hanger).
    c. Simpson Strong-Tie Company (Blue Banger Hanger).
    d. NIBCO Inc.; Tolco.
    e. Or equal.

2.7 PIPE STAND FABRICATION

A. Pipe Stands, General: Shop or field-fabricated assemblies made of manufactured corrosionresistant components to support roof-mounted piping.

B. Compact Pipe Stand: One-piece plastic unit with integral-rod-roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.

1. Manufacturers:

    a. ERICO/Michigan Hanger Co.
    b. MIRO Industries.
    c. Or equal.

C. Low-Type, Single-Pipe Stand: One-piece stainless-steel base unit with plastic roller, for roof installation without membrane penetration.

1. Manufacturers:

    a. MIRO Industries.
    b. Or equal.

D. High-Type, Single-Pipe Stand: Assembly of base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.

1. Manufacturers:

    a. ERICO/Michigan Hanger Co.
    b. MIRO Industries.
    c. Portable Pipe Hangers.
    d. Or equal.

2. Base: Stainless steel.
3. Vertical Members: Two or more cadmium-plated-steel or stainless-steel, continuousthread rods.

4. Horizontal Member: Cadmium-plated-steel or stainless-steel rod with plastic or stainlesssteel, roller-type pipe support.

E. High-Type, Multiple-Pipe Stand: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.

1. Manufacturers:

a. Portable Pipe Hangers.
b. Or equal.

2. Bases: One or more plastic.
3. Vertical Members: Two or more protective-coated-steel channels.
4. Horizontal Member: Protective-coated-steel channel.
5. Pipe Supports: Galvanized-steel, clevis-type pipe hangers.

2.8 PIPE POSITIONING SYSTEMS

A. Description: IAPMO PS 42, system of metal brackets, clips, and straps for positioning piping in pipe spaces for plumbing fixtures for commercial applications.

B. Manufacturers:

1. C & S Mfg. Corp.
2. HOLDRITE Corp.; Hubbard Enterprises.
3. Samco Stamping, Inc.
4. Or equal.

2.9 EQUIPMENT SUPPORTS

A. Description: Welded, shop- or field-fabricated equipment support made from structural-steel shapes.

2.10 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.

1. Properties: Nonstaining, noncorrosive, and nongaseous.
2. Design Mix: 5000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT APPLICATIONS

A. Specific hanger and support requirements are specified in Sections specifying piping systems and equipment.

B. Comply with MSS SP-69 for pipe hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized, metallic coatings for piping and equipment that will not have field-applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use padded hangers for piping that is subject to scratching.

F. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated stationary pipes, NPS 1/2 to NPS 12.
2. Yoke-Type Pipe Clamps (MSS Type 2): For suspension of 120 to 450 deg F pipes, NPS 4 to NPS 12, requiring up to 4 inches of insulation.
3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes, NPS 3/4 to NPS 12, requiring clamp flexibility and up to 4 inches of insulation.
4. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes, NPS 1/2 to NPS 12, if little or no insulation is required.
5. Pipe Hangers (MSS Type 5): For suspension of pipes, NPS 1/2 to NPS 4, to allow offcenter closure for hanger installation before pipe erection.
6. Adjustable, Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of noninsulated stationary pipes, NPS 3/4 to NPS 8.
7. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of noninsulated stationary pipes, NPS 1/2 to NPS 8.
8. Adjustable Band Hangers (MSS Type 9): For suspension of noninsulated stationary pipes, NPS 1/2 to NPS 8.
9. Adjustable, Swivel-Ring Band Hangers (MSS Type 10): For suspension of noninsulated stationary pipes, NPS 1/2 to NPS 2.
10. Split Pipe-Ring with or without Turnbuckle-Adjustment Hangers (MSS Type 11): For suspension of noninsulated stationary pipes, NPS 3/8 to NPS 8.
11. Extension Hinged or 2-Bolt Split Pipe Clamps (MSS Type 12): For suspension of noninsulated stationary pipes, NPS 3/8 to NPS 3.
12. U-Bolts (MSS Type 24): For support of heavy pipes, NPS 1/2 to NPS 12.
13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
14. Pipe Saddle Supports (MSS Type 36): For support of pipes, NPS 4 to NPS 12, with steel pipe base stanchion support and cast-iron floor flange.
15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes, NPS 4 to NPS 36, with steel pipe base stanchion support and cast-iron floor flange and with U-bolt to retain pipe.

16. Adjustable, Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes, NPS 2-1/2 to NPS 12, if vertical adjustment is required, with steel pipe base stanchion support and cast-iron floor flange.

G. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers, NPS 3/4 to NPS 12.
2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers, NPS 3/4 to NPS 12, if longer ends are required for riser clamps.

H. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
2. Steel Clevises (MSS Type 14): For 120 to 180 deg F piping installations.
3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 180 deg F piping installations.

I. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction to attach to top flange of structural shape.
3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
6. C-Clamps (MSS Type 23): For structural shapes.
7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel Ibeams for heavy loads.
10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel Ibeams for heavy loads, with link extensions.
11. Malleable Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
12. Welded-Steel Brackets: For support of pipes from below, or for suspending from above by using clip and rod. Use one of the following for indicated loads:

    a. Light (MSS Type 31): 750 lb.

b. Medium (MSS Type 32): 1500 lb.
c. Heavy (MSS Type 33): 3000 lb.

13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

J. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.

K. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
3. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41 roll hanger with springs.
4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
5. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from hanger.
6. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from base support.
7. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from trapeze support.
8. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:

a. Horizontal (MSS Type 54): Mounted horizontally.
b. Vertical (MSS Type 55): Mounted vertically.
c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

L. Comply with MSS SP-69 for trapeze pipe hanger selections and applications that are not specified in piping system Sections.

M. Comply with MFMA-102 for metal framing system selections and applications that are not specified in piping system Sections.

N. Use mechanical-expansion anchors attachments if concrete insert is not available in concrete construction.

O. Use pipe positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

3.2 HANGER AND SUPPORT INSTALLATION

A. Steel Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.

B. Flexible connection located in horizontal piping shall be supported within 2 feet of each connector.

C. Trapeze Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping and support together on field-fabricated trapeze pipe hangers.

1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified above for individual pipe hangers.
2. Field fabricate from ASTM A 36/A 36M, steel shapes selected for loads being supported. Weld steel according to AWS D1.1.

D. Metal Framing System Installation: Arrange for grouping of parallel runs of piping and support together on field-assembled metal framing systems.

E. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

F. Fastener System Installation:

1. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

G. Pipe Stand Installation:

1. Pipe Stand Types except Curb-Mounting Type: Assemble components and mount on smooth roof surface. Do not penetrate roof membrane.

H. Pipe Positioning System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture. Refer to Division 22 Section 22 4000 "Plumbing Fixtures" for plumbing fixtures.

I. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

J. Equipment Support Installation: Fabricate from welded-structural-steel shapes.

K. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

L.

M. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

N. Load Distribution: Install hangers and supports so piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

O. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and so maximum pipe deflections allowed by ASME B31.9 (for building services piping) are not exceeded.

P. Insulated Piping: Comply with the following:

1. Attach clamps and spacers to piping.

2. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.

a.
b. Do not exceed pipe stress limits according to ASME B31.9 for building services piping.

2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.

a. Option: Thermal-hanger shield inserts may be used. Include steel weight distribution plate for pipe NPS 4and larger if pipe is installed on rollers.

3.

4. Shield Dimensions for Pipe: Not less than the following:

a. NPS 1/4 to NPS 4: 12 inches long and 0.048 inch thick.
b. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick.
c. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick.

5. Pipes NPS 8and Larger: Include wood inserts.
6. Insert Material: Length at least as long as protective shield.
7. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

Q. Hangers shall not be in direct contact with the pipe.

3.3 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make smooth bearing surface.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.4 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

3.5 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.6 PAINTING Provided by other section of work.

A. Touch Up: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

B. Touch Up: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Division 09 painting Sections**.**

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

3.7 ROOFTOP AND OUTDOOR APPLICATIONS

A. Outdoor assemblies shall be fully weather-proof design and installation. Mounting hardware such as bolts, nuts, washers, anchors straps, brackets, fastening hardware etc., shall be galvanized steel or stainless steel.

END OF SECTION 22 0529

SECTION 22 0548 - VIBRATION AND SEISMIC CONTROLS FOR PLUMBING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Elastomeric isolation pads and mounts.
2. Restrained elastomeric isolation mounts.
3. Restrained spring isolators.
4. Housed spring mounts.
5. Elastomeric hangers.
6. Spring hangers.
7. Spring hangers with vertical-limit stops.
8. Thrust limits.
9. Pipe riser resilient supports.
10. Resilient pipe guides.
11. Restrained vibration isolation roof-curb rails.
12. Seismic snubbers.
13. Restraining cables.

B. Related Sections include the following:

1. Division 22 Section 22 0516 “Expansion Fittings and Loops for Plumbing” for flexible piping connectors.

1.2 DEFINITIONS

A. Z: seismic zone factor.

1.3 PERFORMANCE REQUIREMENTS

A. Conformance with the California Building Code seismic restraint requirements for seismic zone-4.

B. Z: 0.40

C. Component Seismic Coefficient: shall be per CBC Table 16-Q and the soil profile type for the site.

D. Seismic Importance Factor: 1.25 for anchorage of machinery and equipment required for life-safety systems, 1.0 for other equipment. Life-safety systems would include air-handling units and exhaust fans serving stairwell pressurization fans or laboratories.

E. Component Response Modification Factor: shall be per CBC Table 16-O for the respective nonstructural components and equipment.

F. Component Amplification Factor: Shall be per CBC Table 16-O for the respective nonstructural components and equipment.

G. Sound and Vibration Performance: The Design-Build Team shall retain a licensed professional acoustical engineer for acoustic and vibration analysis and design. All systems shall be reviewed by the acoustical engineer for compliance with acoustics and vibration control contract document requirements. Provide acoustic and vibration design solutions, including system modifications, equipment modifications, additional sound treatment devices, all materials and devices, and all labor per the acoustical engineer's design solution reports, and recommendations.

H. All rotating and reciprocating equipment shall be statically and dynamically balanced to meet the following vibration limits under all design operating conditions and under specified vibration isolation:

Equipment Type	Vibration Limit (inches/sec, RMS)
Pumps	0.1
Reciprocating Equipment	0.4
All Other Equipment	0.1

1. These vibration limits apply either on the bearings or the equipment support structure, whichever applicable.
2. The vibration limits shall include the effects of inertia mass or inertia bases, where applicable.
3. Equipment with variable frequency drives shall meet these limits throughout the entire frequency range that the equipment will operate.

I. Vibration Isolated Equipment with Variable Frequency Drives (VFD) shall not be operated below the following rotational speeds:

Specified Isolation Minimum Static Deflection	Minimum Allowed Equipment Rotational Speed (rpm)
Less than 1 inch	600
1 inch	500
2 inches	400
3 inches	350
4 inches	300
5 or more inches	250

1.4 SUBMITTALS

A. Product Data: Include load deflection curves for each vibration isolation device.

1. Manufacturer's model number for each vibration isolator, the equipment or pipeline to which it is to be attached, and the number of isolators to be furnished for each installed system.
2. For steel spring mounts or hangers - free height, deflected height, solid height, isolator loading, and diameter of spring coil.
3. For neoprene isolators - free height, deflected height, and isolator loading.
4. An itemized list of all isolated equipment with detailed schedules showing isolators proposed for each piece of equipment, referencing materials and drawings.

B. Shop Drawings: Signed and sealed by a qualified California registered professional engineer. Include the following:

1. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
2. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes, and seismic loads. Include certification that riser system has been examined for excessive stress and that none will exist.
3. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, base weights, equipment static loads, power transmission, component misalignment, and cantilever loads.

    a. Show base construction for equipment; include dimensions, structural member sizes and support point locations.
    b. Dimensional and weight data for concrete inertia bases, steel and rail bases, and details of isolator attachment.

4. Seismic-Restraint Details: Detail fabrication and attachment of seismic restraints and snubbers. Show anchorage details and indicate quantity, diameter, and depth of penetration of anchors.

    a. For seismic slack cables - indicated method to achieve vertical restraint.

5. Submittals for Interlocking Snubbers: Include load deflection curves up to 1/2-inch deflection in x, y, and z planes.
6. Layout Drawings showing locations and sizes of braces for suspended piping.

C. Welding certificates.

D. Manufacturer’s Certification: Upon completion of installation, submit written certification from equipment manufacturer that vibration isolation and seismic control devices are installed correctly and properly adjusted.

1.5 QUALITY ASSURANCE

A. Seismic-restraint devices shall have horizontal and vertical load testing and analysis performed according to CBC or shall bear anchorage pre-approval "OPA" number, from OSHPD or another agency acceptable to University's Representative, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If pre-approved ratings are not available, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified California registered professional engineer. Testing and calculations must include both shear and tensile loads and 1 test or analysis at 45 degrees to the weakest mode.

B. Structural Review: Seismic engineering submittal documents, seismic loads, anchorage loads, and all vertical loads applied to the building structure shall be approved by the project structural engineer of record.

C. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel."

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into base. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section 07 7200 "Roof Accessories."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Amber/Booth Company, Inc.
2. California Dynamics Corp.
3. Kinetics Noise Control, Inc.
4. Mason Industries, Inc.
5. Vibration Mountings & Controls/Korfund.
6. Vibration Eliminator Co., Inc.
7. Vibration Isolation Co., Inc.
8. ISAT-Internal Seismic Applications Technology, a Division of Tomarco Contractor Specialties
9. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 VIBRATION ISOLATORS

A. Manufacturers:

1. Amber/Booth Company, Inc.
2. California Dynamics Corp.
3. Kinetics Noise Control, Inc.
4. Mason Industries, Inc.
5. Vibration Mountings & Controls/Korfund.
6. ISAT-Internal Seismic Applications Technology, a Division of Tomarco Contractor Specialties

7. Or equal.

B. Elastomeric Isolator Pads: Oil- and water-resistant elastomer or natural rubber, arranged in single or multiple layers, molded with a nonslip pattern and galvanized steel baseplates of sufficient stiffness for uniform loading over pad area, and factory cut to sizes that match requirements of supported equipment.

1. Material: Bridge-bearing neoprene, complying with AASHTO M 251.
2. Durometer Rating: 50 or 60.
3. Number of Layers: As required. Use multiple layers, separated by steel shims, depending on supported equipment load. See manufacturer's data for load capacities.
4. Based on Mason SWM.

C. Elastomeric Mounts: Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements with factory-drilled, encapsulated top plate for bolting to equipment and with baseplate for bolting to structure. Color-code or otherwise identify to indicate capacity range.

1. Durometer Rating: 50 or 60.
2. Based on Mason ND.

D. Restrained Elastomeric Mounts: All-directional elastomeric mountings with seismic restraint.

1. Materials: Cast-ductile-iron housing containing two separate and opposing, molded, bridge-bearing neoprene elements that prevent central threaded sleeve and attachment bolt from contacting the casting during normal operation.
2. Neoprene: Shock-absorbing materials compounded according to AASHTO M251, the standard for bridge-bearing neoprene.
3. Based on Mason BR.

E. Spring Isolators: Freestanding, laterally stable, open-spring isolators.

1. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
2. Minimum Additional Travel: 50 percent of the required deflection at rated load.
3. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
4. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

5. Baseplates: Factory drilled for bolting to structure and bonded to 1/4-inch- thick, rubber isolator pad attached to baseplate underside. Baseplates shall limit floor load to 100 psig.
6. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.
7. Based on Mason SLF (or) SLFH.

F. Elastomeric Hangers: Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements bonded to steel housings with threaded connections for hanger rods. Color code or otherwise identify to indicate capacity range.

1. Based on Mason HD.

G. Spring Hangers with Vertical-Limit Stop: Combination coil-spring and elastomeric-insert hanger with spring and insert in compression and with a vertical-limit stop.

1. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene, two elements.
7. Adjustable Vertical Stop: Steel washer with neoprene washer "up-stop" on lower threaded rod.
8. Based on Mason PC30N.

H. Thrust Limits: Combination coil spring and elastomeric insert with spring and insert in compression and with a load stop. Include rod and angle-iron brackets for attaching to equipment.

1. Frame: Steel, fabricated for connection to threaded rods and to allow for a maximum of 30 degrees of angular rod misalignment without binding or reducing isolation efficiency.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene.
7. Coil Spring: Factory set and field adjustable for a maximum of 1/4-inch movement at start and stop.
8. Based on Mason WBI (or) WBD.

I. Pipe Riser Resilient Support: All-directional, acoustical pipe anchor consisting of 2 steel tubes separated by a minimum of 1/2-inch- thick, 60-durometer neoprene or rubber. Include steel and

neoprene or rubber vertical-limit stops arranged to prevent vertical travel in both directions. Design support for a maximum load on the isolation material of 500 psig and for equal resistance in all directions.

1. Based on Mason ADA (or) ADAH.
2. Based on Mason VSG (or) VSGH.

2.3 SEISMIC-RESTRAINT DEVICES

A. Manufacturers:

1. Amber/Booth Company, Inc.
2. B-Line Systems, Inc.
3. California Dynamics Corp.
4. Kinetics Noise Control, Inc.
5. Mason Industries, Inc.
6. TOLCO Incorporated.
7. Unistrut Diversified Products Co.; Wayne Manufacturing Division.
8. Vibration Eliminator Co., Inc.
9. Vibration Isolation Co., Inc.
10. Vibration Mountings & Controls/Korfund.
11. ISAT-Internal Seismic Applications Technology, a Division of Tomarco Contractor Specialties
12. Or equal.

B. Resilient Isolation Washers and Bushings: 1-piece, molded, bridge-bearing neoprene complying with AASHTO M 251 and having a durometer of 60, plus or minus 5, with a flat washer face.

1. Based on Mason HG.

C. Seismic Snubbers: All directional and factory fabricated using welded structural-steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.

1. Anchor bolts for attaching to concrete shall be seismic-rated, drill-in, and stud-wedge or female-wedge type.
2. Resilient Isolation Washers and Bushings: 1-piece, molded, bridge-bearing neoprene complying with AASHTO M 251 and having a durometer of 60, plus or minus 5.
3. Snubbers, and snubber quantities, shall be selected based upon calculation of forces/loads.
4. Based on Mason Z-1225, or Z-1011.

D. Restraining Cables: Galvanized steel aircraft cables with end connections made of steel assemblies that swivel to final installation angle and utilize two clamping bolts for cable engagement.

1. Based on Mason SCB/SCBH.

E. Anchor Bolts: Seismic-rated, drill-in, and stud-wedge or female-wedge type. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488/E 488M.

2.5 FACTORY FINISHES

A. Manufacturer's standard prime-coat finish ready for field painting.

B. Finish: Manufacturer's standard paint applied to factory-assembled and -tested equipment before shipping.

1. Powder coating on springs and housings.
2. All hardware shall be electrogalvanized. Exception: Hot-dip galvanized metal components for exterior use or within tunnels, trenches or mechanical rooms containing high temperature water or steam systems.
3. Nuts, bolts, and washers for outdoor use or wet applications shall be stainless steel.
4. Baked enamel for metal components on isolators for interior use.
5. Color-code or otherwise mark vibration isolation and seismic-control devices to indicate capacity range.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements, installation tolerances, and other conditions affecting performance.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install equipment supports, and roof penetrations as specified in Division 07 Section 07 7100 "Roof Accessories."

B. Install thrust limits at centerline of thrust, symmetrical on either side of equipment.

C. Install seismic snubbers on isolated equipment. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure. Seismic snubbers shall be as follows:

1. Equipment weighing less than 2400 pounds – Snubber shall be based on Mason Z-1225.
2. Equipment weighing greater than 2400 pounds – Snubber shall be based on Mason Z1011.
3. Snubbers, and snubber quantities, shall be selected based upon calculation of forces/loads.

D. Install restraining cables at each trapeze and individual pipe hanger. At trapeze anchor locations, shackle piping to trapeze. Install cables so they do not bend across sharp edges of adjacent equipment or building structure.

E. Install steel angles or channel, sized to prevent buckling, clamped with ductile-iron clamps to hanger rods for trapeze and individual pipe hangers. At trapeze anchor locations, shackle piping to trapeze. Requirements apply equally to hanging equipment. Do not weld angles to rods. F. Install resilient bolt isolation washers on equipment anchor bolts.

G. Seismic restraint systems shall be installed in strict accordance with the manufacturer's seismic restraint guidelines manual and all certified submittal data.

H. Branch lines may not be used to restrain main lines.

I. Piping crossing building seismic or expansion joints, passing from building to building, or supported from different portions of the building shall be installed to allow differential support displacements without damaging the pipe, equipment connections, or support connections. Pipe offsets, loops, anchors, and guides shall be installed as required to provide specified motion capability and limit motion of adjacent piping.

J. Do not brace a system to two independent structures such as ceiling and wall.

K. Provide appropriately sized openings in walls, floors, and ceilings for anticipated seismic movement. Provide fire seal systems in fire-rated walls.

L. Installation of seismic restraints shall not cause any change in position of equipment or piping, resulting in stresses or misalignment.

M. No rigid connections between equipment and the building structure shall be made that degrade the noise and vibration-isolation system specified.

N. Additional Seismic devices, mounts, and equipment bases shall be installed, type of device shall be selected by licensed structural engineer, or licensed acoustical engineer as required to meet project requirements.

O. Provide seismic joints in piping crossing building seismic joints.

3.4 PIPING ISOLATION

A. Piping Hangers: Mason PC30N spring isolator type hangers with minimum 1" deflection (see exception in item "D" below) shall be provided for the following, as determined by the Acoustics and Vibration Consultant.

1. All pipes 1 ¼" and 1 ½" in diameter or pipe racks with equivalent pipe diameter 4" through 9".

B. The first three piping hanger supports from the isolated equipment shall have Mason PC30N isolators with deflection distance matching the deflection distance of equipment mounted springs.

C. Piping suspended with vibration isolators, shall only be with braced with cable bracing. Cabling shall be adjustable and shall not be in tension.

D. Provide seismic joints in piping crossing building seismic joints.

3.5 EQUIPMENT ISOLATION

A. Install piping and electrical flexible connections to externally vibration-isolated equipment.

B. Flexible connectors shall be used to connect all piping to isolated equipment, except equipment for which flexible connectors are not permitted by code.

C. Flexible pipe equipment connectors for all externally isolated equipment shall be as follows:

1. Spherical rubber expansion joints.
2. Flexible hose joints.
3. Locate isolation device downstream of shut-off valves.

D. Flexible pipe equipment connectors for all internally isolated equipment shall be as follows:

1. Double-ply stainless steel bellows without braided jackets.
2. Stainless steel corrugated hose, stainless steel sheath, with metal connectors with minimum specified live lengths. Hose type flexible connectors shall have minimum live lengths as specified in the 1999 ASHRAE Handbook, Table 46 (see below).

Nominal Diameter (inches)	Minimum Live Length (inches)
0.75	12
1	12
1.5	12
2	12
2.5	12
3	18
4	18
5	24
6	24
8	24
10	24
12	36

E. Equipment Isolators: For equipment larger than 0.5 horsepower, use spring isolation device. For equipment smaller than 0.5 horsepower, use neoprene isolation device. F. Install flex connections in parallel with motor shaft. Schedule below applies where motors are not provided with isolators by equipment manufacturers.

G. Equipment Isolation Schedule:

Mark	**Motor Hp**	**Equipment RPM**	**VFD**	**Inertia Base Type**	**Isolator Type**	**Hot-Dip Galvanized**	**Static Deflection (inches)**	**Comments**
DI-1AB	7.5	3800	Yes	Mason M	Mason SLF	Yes	1	Booster Pumps skid mounted
RW-2AB	7.5	3300	Yes	Mason M	Mason SLF	Yes	1	Booster Pumps skid mounted

3.7 FIELD QUALITY CONTROL

A. Testing: Perform the following field quality-control testing:

1. Isolator seismic-restraint clearance.
2. Isolator deflection.
3. Snubber minimum clearances.

3.8 ADJUSTING

A. Adjust isolators after piping systems have been filled and equipment is at operating weight.

B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

C. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop.

D. Adjust active height of spring isolators.

E. Adjust snubbers according to manufacturer's written recommendations.

F. Adjust seismic restraints to permit free movement of equipment within normal mode of operation.

G. Torque anchor bolts according to equipment manufacturer's written recommendations to resist seismic forces.

3.9 CLEANING

A. After completing equipment installation, inspect vibration isolation and seismic-control devices. Remove paint splatters and other spots, dirt, and debris.

END OF SECTION 22 0548

SECTION 22 0553 - IDENTIFICATION FOR PLUMBING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following mechanical identification materials and their installation:

1. Equipment nameplates
2. Equipment markers
3. Equipment signs
4. Access panel and door markers
5. Pipe markers
6. Stencils
7. Valve tags
8. Valve schedules/chart
9. Warning tags
10. Control Devices and instruments

1.2 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples: For color, letter style, and graphic representation required for each identification material and device.

C. Valve Numbering Scheme. Provide hard-copy and electronic spreadsheet of valve schedule covering all valve tags. Coordinate numbering scheme prior to submittal.

D. System Drawings: Furnish plans indicating valve numbers and equipment identification numbers/ tags as identified in electronic spreadsheet.

1.3 QUALITY ASSURANCE

A. ASME Compliance: Comply with ASME A13.1, "Scheme for the Identification of Piping Systems," for letter size, length of color field, colors, and viewing angles of identification devices for piping.

B. NFPA Compliance: Comply with requirements of NFPA-99.... for piping and equipment labeling and identification.

1.4 COORDINATION

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied. Painting scope under another division of work.

B. Coordinate installation of identifying devices with location of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 MATERIALS

A. For fixture descriptions in other Part 2 articles where the subparagraph titles "Products," and "Manufacturers" introduce a list of manufacturers and their products or manufacturers only, the following requirements apply for product selection:

1. Products: Subject to compliance with requirements, provide one of the products specified in other Part 2 articles.
2. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified in other Part 2 articles.
3. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 EQUIPMENT IDENTIFICATION DEVICES

A. Equipment Nameplates: Metal or plastic, with data engraved or stamped, for permanent attachment on equipment.

1. Data:

a. Manufacturer, product name, model number, and serial number.
b. Capacity, operating and power characteristics, and essential data.
c. Labels of tested compliances.

2. Location: Accessible and visible.
3. Fasteners: As required to mount on equipment.

B. Equipment Markers: Engraved, color-coded laminated plastic. Include contact-type, permanent epoxy adhesive or rivets.

1. Terminology: Match schedules as closely as possible.
2. Data:
    a. Name and plan number.
    b. Equipment service.
    c. Design capacity.
    d. Other design parameters such as pressure drop, entering and leaving conditions, and speed.
3. Size: 2-1/2 by 4 inches for control devices, dampers, and valves; 4-1/2 by 6 inches for equipment.

C. Equipment Signs: ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, white surface, black phenolic core, with black melamine subcore. Fabricate in sizes required for message. Provide holes for mechanical fastening.

1. Data: Instructions for operation of equipment and for safety procedures.
2. Engraving: Manufacturer's standard letter style, of sizes and with terms to match equipment identification.
3. Thickness: 1/8 inch.
4. Provide signs on equipment that is automatically started to comply with CAL-OSHA requirements.
5. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

D. Access Panel and Door Markers: 1/16-inch- thick, engraved laminated plastic, with abbreviated terms and numbers corresponding to identification. Provide 1/8-inch center hole for attachment.

1. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.3 PIPING IDENTIFICATION DEVICES

A. Manufactured Pipe Markers, General: Preprinted, color-coded, with lettering indicating service, and showing direction of flow.

1. Colors: Comply with ASME A13.1, unless otherwise approved.
2. Lettering: Use piping system terms and abbreviations as approved by the University’s Representative.
3. Pipes with OD, Including Insulation, Less Than 6 Inches: Full-band pipe markers extending 360 degrees around pipe at each location.

4. Pipes with OD, Including Insulation, 6 Inches and Larger: Either full-band or strip-type pipe markers at least three times letter height and of length required for label.
5. Arrows: Integral with piping system service lettering to accommodate both directions; or as separate unit on each pipe marker to indicate direction of flow.

B. Pretensioned Pipe Markers: Precoiled semirigid plastic formed to cover full circumference of pipe and to attach to pipe without adhesive.

C. Shaped Pipe Markers: Preformed semirigid plastic formed to partially cover circumference of pipe and to attach to pipe with mechanical fasteners that do not penetrate insulation vapor barrier.

D. Self-Adhesive Pipe Markers: Plastic with pressure-sensitive, permanent-type, self-adhesive back.

E. Plastic Tape: Continuously printed, vinyl tape at least 3 mils thick with pressure-sensitive, permanent-type, self-adhesive back.

1. Width for Markers on Pipes with OD, Including Insulation, Less Than 6 Inches: 3/4 inch minimum.
2. Width for Markers on Pipes with OD, Including Insulation, 6 Inches or Larger: 1-1/2 inches minimum.

2.4 STENCILS

A. Stencils: Prepared with letter sizes according to ASME A13.1 for piping; minimum letter height of 1-1/4 inches for minimum letter height of 3/4 inch for access panel and door markers, equipment markers, equipment signs, and similar operational instructions.

1. Stencil Material: Aluminum.
2. Stencil Paint: Exterior, gloss, acrylic enamel black. Paint may be in pressurized spraycan form.
3. Identification Paint: Exterior, acrylic enamel in colors according to ASME A13.1.

2.5 VALVE TAGS

A. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2inch numbers, with numbering scheme approved by the University. Provide 5/32-inch hole for fastener.

1. Material: 0.040-inch- thick brass minimum 2” in diameter.
2. Valve-Tag Fasteners: Stainless steel or brass chain, or S-hook.

2.6 VALVE PLANS

A. Valve Plans: For each piping system, provide electronic and hard copy on standard-size or 11”x17” bond paper. Provide a plan per floor showing the location, valve number, control

device number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.

2.7 WARNING TAGS

A. Warning Tags: Preprinted or partially preprinted, accident-prevention tags; of plasticized card stock with matte finish suitable for writing.

1. Size: 3 by 5-1/4 inches minimum.
2. Fasteners: Brass grommet and wire.
3. Nomenclature: Large-size primary caption such as DANGER, CAUTION, or DO NOT OPERATE.
4. Color: Yellow background with black lettering.

2.8 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Brady Corporation.
2. Seton Identification Products.
3. R&R Identification Co.
4. Or equal.

PART 3 - EXECUTION

3.1 APPLICATIONS, GENERAL

A. Products specified are for applications referenced in other Division 22 Sections. If more than single-type material, device, or label is specified for listed applications, selection is Installer's option.

3.2 EQUIPMENT IDENTIFICATION

A. Install and permanently fasten equipment nameplates on each major item of plumbing equipment that does not have nameplate nor has nameplate that is damaged or located where not easily visible. Locate nameplates where accessible and visible.

B. Install equipment markers with screws or permanent adhesive on or near each major item of plumbing equipment. Data required for markers may be included on signs, and markers may be omitted if both are indicated.

1. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering

for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

2. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warning of hazards and improper operations, and identify units.
3. Locate markers where accessible and visible. Include markers for the following general categories of equipment:

    a. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
    b. Meters and similar units.
    c. Fuel-burning units, including water heaters
    d. Pumps, compressors and similar motor-driven units.
    e. Heat exchangers, water heaters and other similar equipment.
    f. Tanks and pressure vessels.
    g. Water-treatment systems, and similar equipment.

C. Install equipment signs with screws or permanent adhesive on or near each major item of mechanical equipment. Locate signs where accessible and visible.

1. Identify mechanical equipment with equipment markers in the following color codes:

    a. Brown: For energy-reclamation equipment and components.

2. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
3. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.
4. Include signs for the following general categories of equipment:

    a. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
    b. Fuel-burning units, including boilers, water heaters.
    c. Pumps, compressors and similar motor-driven units.
    d. Heat exchangers and similar equipment.
    e. Tanks and pressure vessels.
    f. Water-treatment systems, and similar equipment.

D. Install access panel markers with screws or permanent adhesive on equipment access panels.

3.3 PIPING IDENTIFICATION

A. Install manufactured pipe markers indicating service on each piping system. Install with flow indication arrows showing direction of flow.

1. Pipes with OD, Including Insulation, Less Than 6 Inches: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, 1-1/2 inches wide, lapped at least 1-1/2 inches at both ends of pipe marker, and covering full circumference of pipe.
2. Pipes with OD, Including Insulation, 6 Inches and Larger: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, at least 1-1/2 inches wide, lapped at least 3 inches at both ends of pipe marker, and covering full circumference of pipe.
3. Do not use pipe markers and tapes for bare pipes conveying fluids at temperatures of 125 deg F or higher.

B. Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior nonconcealed locations as follows:

1. Near each valve and control device.
2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
3. At access doors, manholes, and similar access points that permit view of concealed piping.
4. Near major equipment items and other points of origination and termination.
5. Spaced at maximum intervals of 25 feet along each run.

3.4 VALVE-TAG INSTALLATION

A. Install tags on all valves (all types) and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; plumbing fixture supply stops; faucets; convenience and lawn-watering hose connections; and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule. Install tags on valves such that they will not interfere with the valve operation and maintenance.

B. Valve-Tag Application Schedule:

1. Information:

a. Service.
b. Floor.
c. Valve number.
d. Area served.
e. Normal position.
f. Duty.
g. Type (if not obvious).

2. Valve-Tag Size and Shape:

a. 2 inches, round.

3.6 WARNING-TAG INSTALLATION

A. Write required message on, and attach warning tags to, equipment and other items where required.

3.7 ADJUSTING

A. Relocate plumbing identification materials and devices that have become visually blocked by other work.

3.8 CLEANING

A. Clean faces of plumbing identification devices.

END OF SECTION 22 0553

SECTION 22 0700 - PLUMBING INSULATION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes preformed, rigid and flexible pipe insulation; insulating cements; field applied jackets; accessories and attachments; and sealing compounds for new and existing affected by work of this project for Plumbing piping systems.

B. This Section includes blanket, board, and block insulation; insulating cements; field-applied jackets; accessories and attachments; and sealing compounds C. Related Sections include the following:

1. Division 07 Section 07 8413 "Penetration Fire stopping" for fire stopping materials and requirements for penetrations through fire and smoke barriers.
2. Division 22 Section 22 0529 "Hangers and Supports for Plumbing Piping and Equipment" for pipe insulation shields and protection saddles.
3. Division 23 Section 23 2110 "Hydronic Distribution" for loose-fill pipe insulation in underground piping outside the building.

1.2 SUBMITTALS

A. Product Data: Identify thermal conductivity, R-value, thickness, and jackets (both factory and field applied, if any), for each type of product indicated.

B. LEED Submittal:

1. Product Data for LEED-NC Credit EQ 4.1: For adhesives and sealants, including printed statement of VOC content.

C. Shop Drawings: Show fabrication and installation details for the following:

1. Application of protective shields, saddles, and inserts at pipe hangers for each type of insulation and hanger.
2. Insulation application at pipe expansion joints for each type of insulation.
3. Insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
4. Removable insulation at piping specialties and equipment connections.
5. Application of field-applied jackets.
6. Field application for each equipment type.
7. Removable insulation sections at access panels.
8. Application of field-applied jackets.
9. Special shapes for cellular-glass insulation.

D. Samples: For each type of insulation and jacket. Identify each Sample, describing product and intended use. Submit Samples in the following sizes:

1. Preformed Pipe Insulation Materials: 12 inches long by NPS 2.
2. Sheet Form Insulation Materials: 12 inches square.
3. Jacket Materials: 12 inches long by NPS 2.
4. Manufacturer's Color Charts: Show the full range of colors available for each type of field-applied finish material indicated.

E. Material Test Reports: From a qualified testing agency acceptable to The University indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets with requirements indicated. Include dates of tests.

F. Installer Certificates: Signed by the Contractor certifying that installers comply with requirements.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the U.S. Department of Labor, Bureau of Apprenticeship and Training.

B. Fire-Test-Response Characteristics: As determined by testing materials identical to those specified in this Section according to ASTM E 84, by a testing and inspecting agency acceptable to The University. Factory label insulation and jacket materials and sealer and cement material containers with appropriate markings of applicable testing and inspecting agency.

1. Insulation Installed Indoors: Flame-spread rating of 25 or less, and smoke-developed rating of 50 or less.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Ship insulation materials in containers marked by manufacturer with appropriate ASTM specification designation, type and grade, and maximum use temperature.

1.5 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Division 22 Section 22 0529 "Hangers and Supports for Plumbing Piping and Equipment."

B. Coordinate clearance requirements with piping Installer for insulation application.

1.6 SCHEDULING

A. Schedule insulation application after testing piping systems. Insulation application may begin on segments of piping that have satisfactory test results.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Mineral-Fiber Insulation:

a. CertainTeed Corp. Crimp Wrap.
b. Johns Manville; Micro-Lok and Micro-Flex.
c. Knauf Insulation; 1000 (Pipe and Tank Insulation).
d. Manson Insulation Inc.; Alley-K and AK Flex.
e. Owens Corning; Fiberglas Pipe and Tank Insulation.
f. Or equal.

2. Calcium Silicate Insulation:

a. Industrial Insulation Group (The); Thermo-12 Gold.
b. Or equal.

2.2 INSULATION MATERIALS

A. Flexible Elastomeric Thermal Insulation: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C 534, Type II for sheet materials, for applications above minus 70 deg F and below 220 deg F.

1. Adhesive: As recommended by insulation material manufacturer.
2. Ultraviolet-Protective Coating: As recommended by insulation manufacturer.

B. Mineral-Fiber Insulation: Glass fibers bonded with a thermosetting resin complying with the following:

1. Preformed Pipe Insulation: Comply with ASTM C 547, Type 1, with factory-applied, all purpose, vapor-retarder jacket.
2. Fire-Resistant Adhesive: Comply with MIL-A-3316C in the following classes and grades:

a. Class 1, Grade A for bonding glass cloth and tape to un-faced glass-fiber insulation, for sealing edges of glass-fiber insulation, and for bonding lagging cloth to un-faced glass-fiber insulation.
b. Class 2, Grade A for bonding glass-fiber insulation to metal surfaces.

4. Vapor-Retarder Mastics: Fire- and water-resistant, vapor-retarder mastic for indoor applications. Comply with MIL-C-19565C, Type II.
5. Mineral-Fiber Insulating Cements: Comply with ASTM C 195.
6. Expanded or Exfoliated Vermiculite Insulating Cements: Comply with ASTM C 196.

7. Mineral-Fiber, Hydraulic-Setting Insulating and Finishing Cement: Comply with ASTM C 449/C 449M.

C. Calcium Silicate Insulation: Preformed pipe sections of noncombustible, inorganic, hydrous calcium silicate with a nonasbestos fibrous reinforcement. Comply with ASTM C 533, Type I.

D. Prefabricated Thermal Insulating Fitting Covers: Comply with ASTM C 450 for dimensions used in preforming insulation to cover valves, elbows, tees, and flanges.

2.4 FIELD-APPLIED JACKETS

A. General: ASTM C 921, Type 1, unless otherwise indicated.

B. Foil and Paper Jacket: Laminated, glass-fiber-reinforced, flame-retardant Kraft paper and aluminum foil.

C. PVC Jacket: High-impact, ultraviolet-resistant PVC; 20 mils thick; roll stock ready for shop or field cutting and forming.

1. Adhesive: As recommended by insulation material manufacturer.
2. PVC Jacket Color: White.

D. Heavy PVC Fitting Covers: Factory-fabricated fitting covers manufactured from 30-mil- thick, high-impact, ultraviolet-resistant PVC.

1. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories for the disabled.
2. Adhesive: As recommended by insulation material manufacturer.

E. Aluminum Piping Jacket: Aluminum roll stock, ready for shop or field cutting and conforming to indicated size. Comply with ASTM B 209, 3003 alloy, H-14 temper.

1. Finish and Thickness: Stucco-embossed finish, 0.024 inch thick.
2. Moisture Barrier: 1-mil- thick, heat-bonded polyethylene and Kraft paper.
3. Elbows: Preformed, 45- and 90-degree, short- and long-radius elbows; same material, and thickness as jacket. Finish shall be smooth.

F. Aluminum Equipment Jacket: Deep corrugated sheets manufactured from aluminum alloy complying with ASTM B 209, and having an integrally bonded moisture barrier over entire surface in contact with insulation. Metal thickness and corrugation dimensions are scheduled at the end of this Section.

1. Jacket thickness: 0.024 inch
2. Corrugation Dimension: 1-1/4” x ¼”
3. Finish: Stucco-embossed or corrugated finish.
4. Moisture Barrier: 3-mil- thick, heat-bonded polyethylene and kraft paper.

2.5 ACCESSORIES AND ATTACHMENTS

A. Glass Cloth and Tape: Comply with MIL-C-20079H, Type I for cloth and Type II for tape. Woven glass-fiber fabrics, plain weave, pre-sized a minimum of 8 oz./sq. yd..

1. Tape Width: 4 inches.

B. Bands: 3/4-inch-wide, in one of the following materials compatible with jacket:

1. Stainless Steel: ASTM A 666, 240Am 240M, Type 304; 0.020 inch thick.
2. Galvanized Steel: 0.005 inch thick.
3. Aluminum: 0.007 inch thick.
4. Brass: 0. ASTM B209, Alloy 3003, Temper H-14, 0.020" thick, ¾" wide.

C. Wire: 0.080-inch, nickel-copper alloy; 0.062-inch, soft-annealed, stainless steel; or 0.062-inch, soft-annealed, galvanized steel

2.6 MASTICS

A. Materials shall be compatible with insulation materials, jackets, and substrates.

B. Vapor-Barrier Mastic: Water based; suitable for indoor and outdoor use on below ambient services.

1. Products:

a. Childers Products, Division of ITW; CP-35.
b. Foster Products Corporation, H. B. Fuller Company; 30-90.
c. ITW TACC, Division of Illinois Tool Works; CB-50.
d. Marathon Industries, Inc.; 590.
e. Mon-Eco Industries, Inc.; 55-40.
f. Vimasco Corporation; 749.
g. Or equal.

2. Water-Vapor Permeance: ASTM E 96, Procedure B, 0.013 perm at 43-mil dry film thickness.
3. Service Temperature Range: Minus 20 to plus 180 deg F.
4. Solids Content: ASTM D 1644, 59 percent by volume and 71 percent by weight.
5. Color: White.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry pipe and fitting surfaces. Remove materials that will adversely affect insulation application.

3.3 GENERAL APPLICATION REQUIREMENTS

A. No insulation shall be applied to piping until all pressure tests and leak tests are complete, leaks repaired, and the system is successfully tested.

B. Insulation shall be installed in accordance with manufacturer's recommendations, except as otherwise specified.

C. Pipe insulation shall be continuous through the pipe hangers with dense inserts and rated walls.

D. Exposed insulation in tunnels, mechanical or machine rooms or other spaces were insulation could be damaged shall be protected with aluminum jacket to level of 10 feet above finished floor or walkway.

E. Cover elbows and fittings with aluminum jacket where a straight length of piping is also required to have aluminum jacket.

F. Insulation inserts for elbows and fittings shall have same thermal resistance (R) value as pipe insulation.

G. "Raw" ends of insulation shall be sealed.

H. Drain Systems: Insulate roof and overflow drain sumps. Insulate first ten feet of horizontal piping, fittings and traps serving roof/overflow drains, and drain receptors receiving cold condensate.

I. Apply insulation materials, accessories, and finishes per the manufacturer's written instructions; with smooth, straight, and even surfaces; free of voids throughout the length of piping, including fittings, valves, and specialties.

J. Refer to schedules at the end of this Section for materials, forms, jackets, and thicknesses required for each piping system.

K. Use accessories compatible with insulation materials and suitable for the service. Use accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

L.

M. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

N. Seal joints and seams with vapor-retarder mastic on insulation indicated to receive a vapor retarder.

O. Keep insulation materials dry during application and finishing.

P. Do not use wire outside of jackets.

Q. Apply insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by the insulation material manufacturer.

R. Apply insulation with the least number of joints practical.

V. Apply insulation over fittings, valves, and specialties, with continuous thermal and vaporretarder integrity, unless otherwise indicated. Refer to special instructions for applying insulation over fittings, valves, and specialties.

W. Hangers and Anchors: Where vapor retarder is indicated, seal penetrations in insulation at hangers, supports, anchors, and other projections with vapor-retarder mastic.

1. Apply insulation continuously through hangers and around anchor attachments.
2. For insulation application where vapor retarders are indicated, extend insulation on anchor legs at least 12 inches from point of attachment to pipe and taper insulation ends. Seal tapered ends with a compound recommended by the insulation material manufacturer to maintain vapor retarder.
3. Install insert materials and apply insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by the insulation material manufacturer.
4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect the jacket from tear or puncture by the hanger, support, and shield.

X. Insulation Terminations: For insulation application where vapor retarders are indicated, taper insulation ends. Seal tapered ends with a compound recommended by the insulation material manufacturer to maintain vapor retarder.

Y. Apply adhesives and mastics at the manufacturer's recommended coverage rate.

Z. Cut insulation according to manufacturer's written instructions to prevent compressing insulation to less than 75 percent of its nominal thickness.

AA. Install vapor-retarder mastic on equipment scheduled to receive vapor retarders. Overlap insulation facing at seams and seal with vapor-retarder mastic and pressure-sensitive tape having same facing as insulation. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-retarder seal.

BB. Provide removable insulation blanket covers on all un-insulated parts of boilers, heaters, heat exchangers, tanks, etc., that could accidentally be touched and cause a burn to maintenance staff.

CC. Insulate the following indoor equipment:

1. Domestic hot-water heaters, heat exchangers and/or storage tanks, not factory insulated.

DD. Equipment Accessibility: Provide removable insulation and jacketing for equipment maintenance access requirements, such as removable heat exchanger head covers and for chilled water equipment testing labels and stamps, etc.

EE. Apply insulation with integral jackets as follows:

1. Pull jacket tight and smooth.
2. Circumferential Joints: Cover with 3-inch- wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip and spaced 4 inches on center.
3. Longitudinal Seams: Overlap jacket seams at least 1-1/2 inches. Apply insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 4 inches on center.

    a. Exception: Do not staple longitudinal laps on insulation having a vapor retarder.

4. Vapor-Retarder Mastics: Where vapor retarders are indicated, apply mastic on seams and joints and at ends adjacent to flanges, unions, valves, and fittings.
5. At penetrations in jackets for thermometers and pressure gages, fill and seal voids with vapor-retarder mastic.

FF. Roof Penetrations: Apply insulation for interior applications to a point even with top of roof flashing.

1. Seal penetrations with vapor-retarder mastic.
2. Apply insulation for exterior applications tightly joined to interior insulation ends.
3. Extend metal jacket of exterior insulation outside roof flashing at least 2 inches below top of roof flashing.
4. Seal metal jacket to roof flashing with vapor-retarder mastic.

GG. Exterior Wall Penetrations: For penetrations of below-grade exterior walls, terminate insulation flush with mechanical sleeve seal. Seal terminations with vapor-retarder mastic.

HH. Interior Wall and Partition Penetrations: Apply insulation continuously through walls and floors.

II. Fire-Rated Wall and Partition Penetrations: Apply insulation continuously through penetrations of fire-rated walls and partitions.

1. Fire stopping and fire-resistive joint sealers are specified in Division 07 Section "Penetration Fire stopping."

JJ. Floor Penetrations: Apply insulation continuously through floor assembly.

1. For insulation with vapor retarders, seal insulation with vapor-retarder mastic where floor supports penetrate vapor retarder.

3.4 INDOOR TANK AND VESSEL INSULATION APPLICATION

A. Blankets, Board, and Block Applications for Tanks and Vessels: Secure insulation with adhesive and anchor pins and speed washers.
   1. Apply adhesives according to manufacturer's recommended coverage rates per square foot, for 100 percent coverage of tank and vessel surfaces.
   2. Groove and score insulation materials to fit as closely as possible to the equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joint. Stagger end joints.
   3. Protect exposed corners with secured corner angles.
   4. Install adhesive-attached or self-adhesive anchor pins and speed washers on sides of tanks and vessels as follows:
      a. Do not weld anchor pins to ASME-labeled pressure vessels.
      b. On tank and vessel, 3 inches' maximum from insulation end joints, and 16 inches on center in both directions.
      c. Do not over compress insulation during installation.
      d. Cut and miter insulation segments to fit curved sides and dome heads of tanks and vessels.
   5. Impale insulation over anchor pins and attach speed washers.
   6. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing
   7. Secure each layer of insulation with stainless-steel bands.
   8. Stagger joints between insulation layers at least 3 inches.
   9. Apply insulation in removable segments on equipment access doors and other elements that require frequent removal for service.
   10. Bevel and seal insulation ends around manholes, hand holes, ASME stamps, and nameplates.
   11. Apply vapor-retarder mastic to open joints, breaks, and punctures for insulation indicated to receive vapor retarder.

B. Flexible Elastomeric Thermal Insulation Applications for Tanks and Vessels: Apply insulation over entire surface of tanks and vessels according to the manufacturer's written instructions.
   1. Apply 100 percent coverage of adhesive to surface with manufacturer's recommended adhesive.
   2. Seal longitudinal seams and end joints.

3.5 MINERAL-FIBER INSULATION APPLICATION

A. Apply insulation to straight pipes and tubes as follows:

1. Secure each layer of preformed pipe insulation to pipe with wire, tape, or bands without deforming insulation materials.
2. Where vapor retarders are indicated, seal longitudinal seams and end joints with vaporretarder mastic. Apply vapor retarder to ends of insulation at intervals of 15 to 20 feet to form a vapor retarder between pipe insulation segments.
3. For insulation with factory-applied jackets, secure laps with outward clinched staples at 6 inches on center.
4. For insulation with factory-applied jackets with vapor retarders, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by the insulation material manufacturer and seal with vapor-retarder mastic.
5. Where pipe expansion is anticipated, detail expansion compensation for insulation on Drawings and indicate intervals for its occurrence. See MICA's "National Commercial & Industrial Insulation Standards," Plate No. 41A.

B. Apply insulation to flanges as follows:

1. Apply preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation segment the same as overall width of the flange and bolts, plus twice the thickness of the pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
4. Apply canvas jacket material with manufacturer's recommended adhesive, overlapping seams at least 1 inch, and seal joints with vapor-retarder mastic.

C. Apply insulation to fittings and elbows as follows:

1. Apply premolded insulation sections of the same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When premolded insulation elbows and fittings are not available, apply mitered sections of pipe insulation, or glass-fiber blanket insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire, tape, or bands.
3. Cover fittings with heavy PVC fitting covers. Overlap PVC covers on pipe insulation jackets at least 1 inch at each end. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.

D. Apply insulation to valves and specialties as follows:

1. Apply premolded insulation sections of the same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When premolded insulation sections are not available, apply glass-fiber blanket insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation. For check valves, arrange insulation for access to strainer basket without disturbing insulation.
3. Apply insulation to flanges as specified for flange insulation application.
4. Use preformed aluminum or heavy PVC fitting covers for valve sizes where available. Secure fitting covers with manufacturer's attachments and accessories. Seal seams with tape and vapor-retarder mastic.

5. For larger sizes where fitting covers are not available, seal insulation with canvas jacket and sealing compound recommended by the insulation material manufacturer.

3.6 CALCIUM SILICATE INSULATION APPLICATION

A. Apply insulation to straight pipes and tubes as follows:

1. Secure each layer of insulation to pipe with stainless-steel bands at 12-inch intervals and tighten without deforming insulation materials.
2. Apply two-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with 0.062-inch, soft-annealed, stainless-steel wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.
3. Apply a skim coat of mineral-fiber, hydraulic-setting cement to surface of installed insulation. When dry, apply flood coat of lagging adhesive and press on one layer of glass cloth or tape. Overlap edges at least 1 inch. Apply finish coat of lagging adhesive over glass cloth or tape. Thin the finish coat to achieve smooth finish.

B. Apply insulation to flanges as follows:

1. Apply preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation segment the same as overall width of the flange and bolts, plus twice the thickness of the pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of block insulation of the same material and thickness as pipe insulation.
4. Finish flange insulation the same as pipe insulation.

C. Apply insulation to fittings and elbows as follows:

1. Apply premolded insulation sections of the same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When premolded sections of insulation are not available, apply mitered sections of calcium silicate insulation. Secure insulation materials with stainless-steel wire.
3. Finish insulation of fittings the same as pipe insulation.

D. Apply insulation to valves and specialties as follows:

1. Apply mitered segments of calcium silicate insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation. For check valves, arrange insulation for access to strainer basket without disturbing insulation.
2. Apply insulation to flanges as specified for flange insulation application.
3. Finish valve and specialty insulation the same as pipe insulation.

3.7 REMOVABLE INSULATION JACKETING COVER APPLICATION

A. Apply removable insulating jacketing system on Domestic Hot-Water (DHW), Heating HotWater (HHW), and High Temperature Hot-Water (HTW) systems, and other heating water systems as follows:

1. Valves.
2. Strainers.
3. Pumps.
4. Regulators.
5. Flow meters.
6. Flow control, balancing, and instrumentation devices.
7. Steam Trap assemblies.
8. Service connection piping to heat exchangers.

B. Blanket Overlap: Blanket will overlap mating flanges as well as existing insulation with a minimum of 2" overlap. Where blanket cannot overlap existing oversized insulation, blanket will butt up to existing insulation with a friction closing seam. Open gaps are not acceptable. Blanket diameters which are 2" larger than existing insulation must be capped to eliminate open air void.

C. Any one piece will not exceed 50 lbs. in weight.

3.8 FIELD-APPLIED JACKET APPLICATION

A. Apply glass-cloth jacket, where indicated, directly over bare insulation or insulation with factory-applied jackets.

1. Apply jacket smooth and tight to surface with 2-inch overlap at seams and joints.
2. Embed glass cloth between two 0.062-inch- thick coats of jacket manufacturer's recommended adhesive.
3. Completely encapsulate insulation with jacket, leaving no exposed raw insulation.

B. Foil and Paper Jackets: Apply foil and paper jackets where indicated.

1. Draw jacket material smooth and tight.
2. Apply lap or joint strips with the same material as jacket.
3. Secure jacket to insulation with manufacturer's recommended adhesive.
4. Apply jackets with 1-1/2-inch laps at longitudinal seams and 3-inch- wide joint strips at end joints.
5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-retarder mastic.

C. Apply PVC jacket where indicated, with 1-inch overlap at longitudinal seams and end joints. Seal with manufacturers recommended adhesive.

D. Apply metal jacket where indicated, with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant

recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches on center and at end joints.

E. Aluminum Jackets: Secure jackets according to jacket manufacturer's written instructions.

3.9 FINISHES

A. Glass-Cloth Jacketed Insulation: Paint insulation finished with glass-cloth jacket as specified in Division 09 Section "Painting."

B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of the insulation manufacturer's recommended protective coating.

3.10 PIPING SYSTEM APPLICATIONS

A. Insulation materials and thicknesses are specified in schedules at the end of this Section.

B. Items Not Insulated: Unless otherwise indicated, do not apply insulation to the following systems, materials, and equipment:

1. Flexible connectors.
2. Vibration-control devices.
3. Cold water piping.
4. Drainage piping located in crawl spaces, unless otherwise indicated.
5. Below-grade cold water piping, unless otherwise indicated.
6. Chrome-plated pipes and fittings, unless potential for personnel injury.
7. Air chambers, unions, strainers, check valves, plug valves, and flow regulators.
8. Vertical storm drain piping except when needed for sound attenuation.
9. Overflow storm drain piping, except for the first 10 feet.

3.11 FIELD QUALITY CONTROL

A. Inspection: University’s Representative may perform the following field quality-control inspections, after installing insulation materials, jackets, and finishes, to determine compliance with requirements:

1. Inspect pumps and tanks randomly.

B. Insulation applications will be considered defective if sample inspection reveals noncompliance with requirements and University’s Representative will then remove sections from each piece of equipment. Remove defective Work and replace with new materials according to these Specifications.

C. Reinstall insulation and covers on pumps and tanks uncovered for inspection according to these Specifications.

D. Inspection: Perform the following field quality-control inspections, after installing insulation materials, jackets, and finishes, to determine compliance with requirements:

1. Inspect fittings and valves randomly selected by The University Representative.
2. Remove fitting covers from 10 elbows or 1 percent of elbows, whichever is less, for various pipe sizes.
3. Remove fitting covers from 10 valves or 1 percent of valves, whichever is less, for various pipe sizes.

E. Insulation applications will be considered defective if sample inspection reveals noncompliance with requirements. Remove defective Work and replace with new materials according to these Specifications.

F. Reinstall insulation and covers on fittings and valves uncovered for inspection according to these Specifications.

3.12 INSULATION APPLICATION SCHEDULE, GENERAL

A. Refer to insulation application schedules for required insulation materials, vapor retarders, and field-applied jackets.

B. Application schedules identify piping system and indicate pipe size ranges and material, thickness, and jacket requirements.

3.13 INTERIOR INSULATION APPLICATION SCHEDULE

A. Service: Domestic hot and recirculated hot water (potable or industrial).

1. Operating Temperature: 80 to 140 **and 180** degrees F.
2. Insulation Material: Preformed Mineral fiber.
3. Insulation Thickness: Apply the following insulation thicknesses for 140 deg F, and below:

a. Copper, Rounouts: 0.5” insulation (up to 12’ long and up to 2”)
b. Copper, Up to 4”: 1.0” insulation
c. Copper, 5” and larger: 1.5” insulation

4. Insulation Thickness: Apply the following insulation thicknesses for applications between 140 deg F and 180 deg F:

a. Copper, Rounouts: 0.5” insulation (up to 12’ long and up to 2”)
b. Copper, 3/4” and larger: 1.5” insulation

5. Field-Applied Jacket: Aluminum shall be provided on piping exposed in mechanical rooms and tunnels. ..
6. Vapor Retarder Required: Yes.
7. Finish: None.

B. Storm drain piping (only first ten feet from drain, sensitive areas, and as directed by Sound Consultant).

1. Operating Temperature: 32 to 100 deg F.
2. Insulation Material: Preformed mineral fiber.
3. Insulation Thickness: Apply the following insulation thickness: 0.5”
4. Field-Applied Jacket: Foil and paper.
5. Vapor Retarder Required: Yes.
6. Finish: None.

C. Service: Roof drain bodies including overflow drain.

1. Operating Temperature: 32 to 100 deg F.
2. Insulation Material: Mineral fiber.
3. Insulation Thickness: 0.5” 4. Field-Applied Jacket: Foil and paper.
5. Vapor Retarder Required: Yes.
6. Finish: None.

D. Service: Sanitary waste piping serving ice machine, refrigerator or freezer condensate drains or air conditioning condensate drains floor sinks or drains. Insulate from drain body and a minimum of 25 linear feet of horizontal piping to prevent drain line from sweating. Coordinate freezer drain pipe insulation with installation of heat tape.

1. Operating Temperature: 35 to 100 deg F.
2. Insulation Material: Flexible elastomeric.
3. Insulation Thickness: Apply the following insulation thickness: 0.75” 4. Field-Applied Jacket: None except use white PVC if exposed in kitchen area.
5. Vapor Retarder Required: Yes.
6. Finish: None.

E. Service: Condensate drains piping.

1. Operating Temperature: 35 to 75 deg F.
2. Insulation Material: Flexible elastomeric.
3. Insulation Thickness: 3/4”.
4. Field-Applied Jacket: Yes.
5. Vapor Retarder Required: Yes.
6. Finish: None.

F. Service: Exposed sanitary drains and domestic hot water supplies and stops for fixtures for the disabled shall be insulated with premanufactured products made for the specific installation.

G. G. Service: Process cooling water.

1. Operating Temperature: 50 to 65°F.
2. Insulation Material: Flexible elastomeric.
3. Insulation Thickness: ¾“.

4. Field-Applied Jacket: None.
5. Vapor Retarder Required: No.
6. Finish: None.

H. Process Water: Install for piping above ceiling, as required by NFPA 13 and Campus Fire Marshal.

1. Operating Temperature: 50 to 65°F.
2. Insulation Material: Flexible elastomeric.
3. Insulation Thickness: ¾“.
4. Field-Applied Jacket: None.
5. Vapor Retarder Required: No.
6. Finish: None.

3.14 EQUIPMENT INSULATION APPLICATION SCHEDULE

Equipment Service	Insulation Thickness	Insulation Type	Jacket Material	Vapor Barrier	Minimum Installed R-Value
<200°F Domestic and industrial water heat exchangers, pumps and equipment)	2”	Mineral fiber	Aluminum	No	5.6

END OF SECTION 22 0700

SECTION 22 1116 - DOMESTIC WATER PIPING AND VALVES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes domestic water piping and valves, including industrial water, reclaim water, ambient temperature water and process cooling water piping and valves, for fixtures and/ or equipment inside the building and approximately to five feet outside of the building to the connection to Civil work.

B. Related Sections include the following:

1. Division 22 Section 22 0519 "Meters and Gages for Plumbing" for water meters, thermometers, pressure gages, and fittings.
2. Division 22 Section 22 1119 "Domestic Water Piping Specialties" for water distribution piping specialties.

1.2 PERFORMANCE REQUIREMENTS

A. Provide components and installation capable of producing domestic water piping systems with the following minimum working-pressure ratings:

1. Domestic Water Service Piping: 160 psig.

1.3 SUBMITTALS

A. Product Data: For pipe, tube, fittings, and couplings.

B. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

C. Water Test Reports: Specified in “Cleaning and Disinfecting” Article in Part 3.

D. Qualifications: Disinfecting company.

1.4 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF 61, "Drinking Water System Components-Health Effects; Sections 1 through 9," for potable domestic water piping and components. Comply with standards of University’s Representative (EH&S) for disinfection of potable water service piping.

C. Piping shall be manufactured in the United States of America, Australia, Canada or Japan only.

PART 2 - PRODUCTS

2.1 MATERIALS

A. For fixture descriptions in other Part 2 articles where the subparagraph titles "Products," and "Manufacturers" introduce a list of manufacturers and their products or manufacturers only, the following requirements apply for product selection:

1. Products: Subject to compliance with requirements, provide one of the products specified in other Part 2 articles.
2. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified in other Part 2 articles.
3. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

B. Transition Couplings for Aboveground Pressure Piping: Coupling or other manufactured fitting the same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

C. Transition Couplings for Underground Pressure Piping: AWWA C219, metal, sleeve-type coupling or other manufactured fitting the same size as, with pressure rating at least equal to and ends compatible with, piping to be joined

2.3 COPPER TUBING.

A. Soft Copper Tube: ASTM B 88, Type K, water tube, annealed temper.

1. Copper Pressure Fittings: ASME B16.22, wrought-copper, solder-joint fittings.
2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end. Furnish Class 300 flanges if required to match piping.
3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and socket, metal-to-metal seating surfaces and solder-joint or threaded ends.

B. Hard Copper Tube: ASTM B 88, Types K and L, water tube, drawn temper.

1. Copper Pressure Fittings: ASME B16.22, wrought- copper, solder-joint fittings.
2. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end. Furnish Class 300 flanges if required to match piping.

3. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body, with ball-and socket, metal-to-metal seating surfaces and solder-joint or threaded ends.
4. Copper, Grooved-End Fittings: ASTM B 75 copper tube or ASTM B 584 bronze castings.
5. Copper, Press-Fit Fittings 4" and smaller: Copper and copper alloy, ASTM B16.18 and B16.22, IAPMO PS 117, EPDM sealing element, leak assurance design, Viega Pro-Press or equal.

2.4 VALVES

A. Ball Valves: Sizes NPS ½" – 2½" (typical)

1. Two-Piece, copper-alloy, MSS SP-110, Bronze body with full-port, 316 stainless steel ball and stem PTFE seats; and 600-psig minimum CWP rating and blowout-proof stem. Stem length shall clear insulation.

    a. Conbraco Industries, Inc.; Apollo Div. 77-140, (threaded only, provide male adapters).
    b. Nibco T-585-66-LF-EL threaded, S-585-66-LF-EL solder, T-585-66-LF-EL press ends, or equal.
    c. No known equal (Campus Standard).

B. AWWA, Cast-Iron Gate Valves 3" and Larger:

1. Manufacturers:

    a. American Cast Iron Pipe Co.; American Flow Control Div.
    b. Crane Co.; Crane Valve Group; Stockham Div.
    c. Grinnell Corporation; Mueller Co.; Water Products Div.
    d. McWane, Inc.; Clow Valve Co. Div. (Oskaloosa).
    e. McWane, Inc.; Kennedy Valve Div.
    f. McWane, Inc.; M&H Valve Company Division
    g. NIBCO INC.
    h. United States Pipe and Foundry Company.
    i. Or equal.

2. Non-rising-Stem, Resilient-Seated Gate Valves: AWWA C509, gray- or ductile-iron body and bonnet; with bronze or gray- or ductile-iron gate, resilient seats, bronze stem, and stem nut.

    a. Minimum Working Pressure: 200 psig.
    b. End Connections: Mechanical joint, or flanged.
    c. Interior and Exterior Coating: Complying with AWWA C550, epoxy.
    d. Or equal.

C. Globe Valves: (NPS Sizes ½" – 3")

1. Type 2, Class 150, MSS-SP-80, bronze body and seat, PTFE disc, union-ring or bolted bonnet, with ferrous-alloy handwheel, threaded or solder ends. Rated for 300 psi WOG, 200 °F maximum, and suited for potable water.

    a. Crane Co.; Crane Valve Group; Crane Valves. 7TF
    b. Crane Co.; Crane Valve Group; Stockham Div. B22/B24
    c. NIBCO INC. T-235-Y
    d. Or equal.

D. Check Valves: (NPS Sizes ½" – 3")

1. Swing Check, Type 3, Class 150, MSS-SP-80, bronze body and seat, Y-pattern, screwed cap, threaded or solder ends. Rated for 300 psi WOG, 200 °F maximum, and suited for potable water.

    a. Crane Co.; Crane Valve Group; Crane Valves. 137
    b. Crane Co.; Crane Valve Group; Stockham Div.
    c. NIBCO INC. T433-Y
    d. Or equal.

E. Drain valves

1. Drain valves shall use ball valve specified above with ¾" hose threads outlet and metal screw on cap.

2.5 PE ENCASEMENT

A. PE Encasement for Underground Metal Piping: ASTM A 674 or AWWA C105 PE film, 0.008inch minimum thickness, tube or sheet.

PART 3 - EXECUTION

3.1 EXCAVATION

A.Refer to Division 31 Section 31 2000 "Earth Moving" for excavating, trenching, and backfilling.

3.2 PIPING APPLICATIONS

A. Underground Domestic Water Service Piping: Use type K soft or hard drawn copper with copper pressure fittings and brazed or silver solder joints. For trap primers only, use soft copper tube, Type K.

B. Aboveground Domestic Cold and Hot Water Piping: Use Type L hard drawn copper with wrought copper fittings and 95-5 solder or ASTM B 813 water flushable, lead-free flux and ASTM B 32 lead-free alloy solder (Bridgit or equal).

1. Press-fit fittings may be used on 4" and smaller pipe sizes.

C. Aboveground Domestic, industrial hot water and process cooling water Recirculating Water Piping: Use Type L hard drawn copper with wrought copper fittings and 95-5 solder or ASTM B 813 water flushable, lead-free flux and ASTM B 32 lead-free alloy solder (Bridgit or equal).

1. Press-fit fittings may be used on 4" and smaller pipe sizes.

D. Aboveground Non-Potable-Water Piping (Soft Water, Industrial Water, Reclaim Water, Ambient Temperature Water, Process Cooling Water): Type L hard drawn copper with wrought copper fittings and 95-5 solder or ASTM B 813 water flushable, lead-free flux and ASTM B 32 lead-free alloy solder (Bridgit or equal).

1. Press-fit fittings may be used on 4" and smaller pipe sizes.

E. Automatic faucets and flush valves shall be piped with copper tube or pipe. Exception: Automatic faucets located in public restrooms serving wall hung lavatories shall have exposed braided stainless steel flexible type connectors with threaded ends. (No plastic tubing is allowed).

F. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below, unless otherwise indicated.

G. Flanges may be used on aboveground piping only.

H. Rolled-Grooved joints may be used on aboveground cold water piping only for sizes up to 6".

I. Groove-less clamp, cut groove pipe and fittings, reducing couplings, bushings, mechanical tees, street elbows or saddle fittings are not acceptable for use on campus.

3.3 VALVE APPLICATIONS

A. Drawings shall indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:

1. Shutoff Duty: Use ball valves for piping NPS 2" and smaller. Use gate valves with flanged ends for piping NPS 2-1/2" and larger.
2. Throttling Duty: Use ball or globe valves for piping NPS 2 and smaller. Use cast-iron globe valves with flanged ends for piping NPS 2-1/2 and larger.
3. Hot-Water-Piping, Balancing Duty: balancing valves shall be automatic flow limiters with fixed calibrated flow rate.
4. Drain Duty: Ball valves with hose-end and cap.
5.

3.4 PIPING INSTALLATION

A. Refer to Division 33 Section 33 1110"Site Water Distribution Piping" for site water distribution and service piping.

B. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for basic piping installation.

C. Extend domestic water service piping to exterior water distribution piping in sizes and locations indicated.

D. Install underground copper tubing according to CDA's "Copper Tube Handbook."

1. Encase piping with polyethylene film according to ASTM A674.

E. Install galvanized steel or HDPE sleeve with water stop and mechanical sleeve seal at each service pipe penetration through basement wall. Select number of interlocking rubber links required to make installation watertight. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for sleeves and mechanical sleeve seals.

F. Install wall penetration system at each service pipe penetration through foundation wall. Make installation watertight. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for wall penetration systems.

G. Install shutoff valve, hose-end drain valve, strainer, water meter, pressure gage, and test tee with valve, inside building at each domestic water service. Refer to Division 22 Section 22 0519 "Meters and Gages for Plumbing" for pressure gages and meters, and to Division 22 Section 22 1119 "Domestic Water Piping Specialties" for strainers.

H. Install water-pressure regulators downstream from main building shutoff valve. Refer to Division 22 Section 22 1119 "Domestic Water Piping Specialties" for water-pressure regulators.

I. Install aboveground domestic water piping level and plumb.

J. Fill water piping. Check components to determine that they are not air bound and that piping is full of water.

K. Perform the following steps before operation:

1. Close drain valves, hydrants, and hose bibbs.
2. Open shutoff valves to fully open position.
3. Open throttling valves to proper setting.
4. Remove plugs used during testing of piping and plugs used for temporary sealing of piping during installation.
5. Remove and clean strainer screens. Close drain valves and replace drain plugs.
6. Remove filter cartridges from housings, and verify that cartridges are as specified for application where used and that cartridges are clean and ready for use.

L. Check plumbing equipment and verify proper settings, adjustments, and operation. Do not operate water heaters before filling with water.

M. Check plumbing specialties and verify proper settings, adjustments, and operation.

1. Water-Pressure Regulators: Set outlet pressure at 80 psig maximum, unless otherwise indicated.

N. Energize pumps and verify proper operation.

O. Domestic water piping beneath concrete slabs shall be avoided. Trap primer piping shall be with no joints below slab.

P. Piping penetrations of floors, walls and roofs shall be carefully detailed and installed. Insulation shall be continuous through penetrations. Coordinate on drawings.

Q. Exterior hose bibs shall be provided at new buildings and plazas to wash down walks, loading docks and drives. Provide at maximum of 100 feet apart along the perimeter of the building. Recessed wall box type with loose key stop and vacuum breaker shall be used on buildings. Locations shall be as approved by the University. Coordinate on plans.

R. Provide service hose bibbs on roof for HVAC Air Handling Units and Major Exhaust Fans.

S. Reclaimed water piping shall be wrapped or painted purple and labelled in accordance with requirements described for chapter 16A Non-Potable Water Reuse Systems of the 2013 California Plumbing Code.

3.5 CROSS CONNECTION

A. Atmospheric vacuum breakers shall be provided on sink outlets in lab areas, or a branch line backflow preventor may be installed in a water line supplying an area of a mechanical room, lab or labs. When a branch line backflow preventor is used, the water piping downstream of the device must be labeled as “non-potable or industrial water” (similar for reclaim water or process cooling water). Lab faucets by others under another division.

B. Cross connection is any connection or arrangement of piping between two otherwise separate piping systems, one of which contains potable water and the other non-potable water or industrial fluids of questionable safety. Cross connection may cause non-potable fluid to enter the potable water system by backflow, back pressure, or back siphonage, and this shall not be allowed.

C. The University obtains water from multiple connections to the Riverside Water District RWD system. These connection points have an RWD meter and cross connection device. Projects will connect downstream of these points to University owned water mains.

D. The University has a responsibility to protect the potable water system on campus. Of the two methods of protection (containment or internal plumbing control), the University uses the internal plumbing control method.

E. The internal plumbing control method involves the installation of the appropriate device at the point of each potential cross connection. This requires the use of air gaps, vacuum breakers, etc., at each plumbing fixture, equipment, tank, sink, etc., to protect the potable water system from backflow. Since many of the buildings on campus are used for both research and academic purposes, the internal control method is the only positive economical method to protect the potable water system.

F. Identify each cross connection and provide adequate protection as described in the CPC. The CPC recognizes six methods for backflow prevention: Air Gap (AG), Atmospheric Vacuum Breaker (AVB), Pressure Vacuum Breaker (PVB), Pressure Vacuum Breaker Spill-Proof Assembly (SVB), Reduced Pressure Backflow Prevention Device (RP), and the Double check Valve Assembly (DC). The design engineer shall consult the Plumbing Code, Manual of Cross Connection Control, 9th edition and future edition published by University of Southern California "Foundation for Cross-Connections, California Administrative Code, Title 17-Public Health, for the proper device to use. The University prefers the use of Reduced Pressure Backflow Preventors. Backflow prevention devices will not be allowed in pits.

3.6 JOINT CONSTRUCTION

A. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for basic piping joint construction.

B. Soldered Joints: Use Tin-Antimony 95-5 solder or ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free-alloy solder; and ASTM B 828 procedure.

C. Rolled-Grooved Joints: Assemble joints with coupling housing, gasket, lubricant, and bolts according to coupling and fitting manufacturer's written instructions.

D. Press-fit Joints: Prepare tubing and fitting for assembly per manufacturer's instructions. Fully insert tubing into the fitting and mark tubing at shoulder of fitting. Extract tubing and verify fitting alignment then re-insert. Press fitting per manufacturer's instructions with tools approved by the fitting manufacturer.

3.7 VALVE INSTALLATION

A. Install sectional valve close to water main on each branch and riser serving plumbing fixtures or equipment.

B. Install shutoff valve on each water supply to equipment and on each water supply to plumbing fixtures without supply stops.

C. Install drain valves for equipment, at base of each water riser.

D. Install flow-limiting valves in each hot-water circulation return branch. Refer to Division 22 Section 22 1119 “Domestic Water Piping Specialties" for flow limiting devices.

3.8 HANGER AND SUPPORT INSTALLATION

A. Refer to Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing" for seismic restraint devices.

B. Refer to Division 22 Section 22 0529 "Hangers and Supports for Plumbing Piping and Equipment" for pipe hanger and support devices. Install the following:

1. Vertical Piping: MSS Type 8 or Type 42 clamps.
2. Individual, Straight, Horizontal Piping Runs: According to the following:

    a. MSS Type 1, adjustable, steel clevis hangers.
3.

C. Install supports according to Division 22 Section 22 0529 "Hangers and Supports for Plumbing Piping and Equipment."

D. Support vertical piping and tubing at base and at each floor.

E. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters in accordance with CPC Tables 313.1 and 313.6.

F. Install supports for vertical copper tubing in accordance with CPC requirements.

3.9 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment and machines to allow service and maintenance.

C. Connect domestic water piping to exterior water service piping. Use transition fitting to join dissimilar piping materials.

D. Connect domestic water piping to service piping with shutoff valve, and extend and connect to the following:

1. Water Heaters: Cold-water supply and hot-water outlet piping in sizes required for the flow, but not smaller than sizes of water heater connections. Valves shall be line size. Any reduction in pipe size for connection to heater shall occur after valves.
2. Plumbing Fixtures: Cold- and hot-water supply piping in sizes required for the flow, but not smaller than required by plumbing code. Refer to Division 22 Section 22 4000 "Plumbing Fixtures."

3. Equipment: Cold- and hot-water supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for NPS 2-1/2 and larger.

3.10 FIELD QUALITY CONTROL

A. Inspect domestic water piping as follows:

1. Do not enclose, cover, or put piping into operation until it is inspected and approved by University's Representative.
2. During installation, notify University's Representative at least 72 hours before inspection must be made. Perform tests specified below in presence of University's Representative:

    a. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
    b. Final Inspection: Arrange for final inspection by University's Representative to observe tests specified below and to ensure compliance with requirements.

3. Re-inspection: If University's Representative finds that piping will not pass test or inspection, make required corrections and arrange for re-inspection.
4. Reports: Prepare inspection reports and have them signed by University's Representative.

B. Test domestic water piping as follows:

1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
2. Leave uncovered and unconcealed new, altered, extended, or replaced domestic water piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
3. Cap and subject piping to static water pressure of 150 psig or 1.5 times the working pressure, whichever is greater, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours with no decrease in pressure. Leaks and loss in test pressure constitute defects that must be repaired.
4. Repair leaks and defects with new materials and retest piping or portion thereof until there are no leaks.
5. Prepare reports for tests and required corrective action.

3.11 CLEANING

A. Clean and disinfect water-distribution piping as follows:

1. Use purging and disinfecting procedure prescribed, use procedure described in AWWA C651 or as described below:

a. Fill system or part of system with water/chlorine solution containing at least 50 ppm of chlorine; isolate and allow to stand for 24 hours.
b. An optional disinfecting procedure that can be used in lieu of paragraph above is to drain system or part of system of previous solution and refill with water/chlorine solution containing at least 200 ppm of chlorine; isolate and allow to stand for 3 hours.

c. Submit water samples in sterile bottles to the University's Representative for review and acceptance by the University's Environmental Health and Safety Representatives. Repeat procedure if biological examination shows evidence of contamination.
d. Underground mains shall be flushed at maximum flow during non-peak campus usage time.

B. Prepare reports of purging and disinfecting activities.

C. After completing drinking fountain installation, inspect unit. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

D. Clean drinking fountains, on completion of installation, according to manufacturer's written instructions.

END OF SECTION

SECTION 22 1119 - DOMESTIC WATER PIPING SPECIALTIES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following domestic, industrial water, reclaim water, ambient temperature water and process cooling water piping specialties:

1. Vacuum breakers.
2. Backflow preventers.
3. Water pressure-reducing valves.
4. Flow limiting devices.
5. Temperature-actuated water mixing valves.
6. Strainers.
7. Outlet boxes.
8. Hose stations.
9. Hose bibbs.
10. Wall hydrants.
11. Water hammer arresters.
12. Air vents.
13. Trap-seal primer valves.
14. Water Filters.
15. Supply Stops.

B. Related Sections include the following:

1. Division 22 Section 22 0519 "Meters and Gages for Plumbing" for thermometers, pressure gages, and flow meters in domestic water piping.
2. Division 22 Section 22 1116 "Domestic Water Piping and Valves" for water meters.
3. Division 22 Section 22 4500 "Emergency Plumbing Fixtures" for water tempering equipment.
4. Division 22 Section 22 4700"Drinking Fountains" for water filters for drinking fountains.

1.2 PERFORMANCE REQUIREMENTS

A. Minimum Working Pressure for Domestic Water Piping Specialties: 160 psig, unless otherwise indicated.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For domestic water piping specialties to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70), Article 100, by a testing agency acceptable to University's Representative, and marked for intended use.

B. NSF Compliance:

1. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified in other Part 2 articles.

B. Products: Subject to compliance with requirements, provide one of the products specified in other Part 2 articles.

C. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 VACUUM BREAKERS

A. Pipe-Applied, Atmospheric-Type Vacuum Breakers

1. Manufacturers:
   a. Cash Acme.
   b. Conbraco Industries, Inc.
   c. FEBCO; SPX Valves & Controls.
   d. Watts Industries, Inc.; Water Products Div.
   e. Zurn Plumbing Products Group; Wilkins Div.
   f. Or equal.
2. Standard: ASSE 1001.
3. Size: NPS 1/4 to NPS 3, as required to match connected piping.
4. Body: Bronze or brass.
5. Inlet and Outlet Connections: Threaded.
6. Finish: Chrome plated.

B. Hose-Connection Vacuum Breakers

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Cash Acme.
   b. Conbraco Industries, Inc.
   c. MIFAB, Inc.
   d. Watts Industries, Inc.; Water Products Div.
   e. Woodford Manufacturing Company.
   f. Zurn Plumbing Products Group; Light Commercial Operation.
   g. Zurn Plumbing Products Group; Wilkins Div.
   h. Or equal.

2. Standard: ASSE 1011.
3. Body: Bronze, non-removable, with manual drain.
4. Outlet Connection: Garden-hose threaded complying with ASME B1.20.7
5. Finish: Chrome or nickel plated.

C. Pressure Vacuum Breakers

1. Manufacturers:
   a. Conbraco Industries, Inc.
   b. FEBCO; SPX Valves & Controls.
   c. Watts Industries, Inc.; Water Products Div.
   d. Zurn Plumbing Products Group; Wilkins Div.
   e. Or equal.

2. Standard: ASSE 1020.
3. Operation: Continuous-pressure applications.
4.
5. Pressure Loss at Design Flow Rate: Maximum 5 psig.
6. Accessories:

   a. Valves: Ball type, on inlet.

D. Laboratory-Faucet Vacuum Breakers: Provided by other section of work.

2.3 BACKFLOW PREVENTERS

A. Intermediate Atmospheric-Vent Backflow Preventers

1. Manufacturers:

   a. Cash Acme.
   b. Conbraco Industries, Inc.
   c. FEBCO; SPX Valves & Controls.
   d. Watts Industries, Inc.; Water Products Div.

e. Zurn Plumbing Products Group; Wilkins Div.
f. Or equal.

2. Standard: ASSE 1012.
3. Operation: Continuous-pressure applications.
4. Size**:** NPS **1/2** and 3/4**.**
5. Body: Bronze.
6. End Connections: Union**,** joint.
7. Finish: Chrome plated.

B. Reduced-Pressure-Principle Backflow Preventers

1. Manufacturers:

a. Conbraco Industries, Inc. # 40-200, 3/4 " – 2" in size, bronze.
b. FEBCO; SPX Valves & Controls. # 825Y or # 825YA, 3/4" – 2" in size, bronze.
c. Watts Industries, Inc.; Water Products Div. #909. 4" & larger to be epoxy coated on interior and exterior.
d. Zurn Plumbing Products Group; Wilkins Div. # 450DA, # 350DA, # 375A, # 475 VBGVIG and # 450DA.
e. Wilkins Model 375A-FSC, 2 1/2" – 6", cast iron with FDA approved epoxy coating on interior and exterior.
f. Or equal.

2. Standard: ASSE 1013.
3. Operation: Continuous-pressure applications.
4. Pressure Loss: 12 psig maximum, through middle 1/3 of flow range.
5. Pressure Loss at Design Flow Rate: Maximum 12psig.
6. Body: Bronze for NPS 2 and smaller; cast iron with interior lining complying with AWWA C550 or that is FDA approved stainless steel for NPS 2-1/2 and larger.
7. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
8. Configuration: Designed for horizontal, straight through.
9. Accessories:

a. Valves: Ball type with threaded, solder or press fit ends on inlet and outlet of NPS 2 and smaller; outside screw and yoke gate-type with flanged ends on inlet and outlet of NPS 2 1/2 and larger.
b. Air-Gap Fitting: ASME A112.1.2, matching backflow-preventer connection.

C. Double-Check Backflow-Prevention Assemblies

1. Manufacturers:

a. Conbraco Industries, Inc. # 40-100, 3/4" – 2", bronze body.
b. FEBCO; SPX Valves & Controls. # 805 Y Series, 3/4" – 2", bronze body.
c. Watts Industries, Inc.; Water Products Div. #709. 3/4" – 3", bronze body, and 4"10" cast iron with fused epoxy coating on interior and exterior.
d. Zurn Plumbing Products Group; Wilkins Div.

e. Or equal.

2. Standard: ASSE 1015.
3. Operation: Continuous-pressure applications, unless otherwise indicated.
4. Pressure Loss: 5 psig maximum, through middle 1/3 of flow range.
5. Body: Bronze for NPS 2 and smaller; cast iron with interior lining complying with AWWA C550 or that is FDA approved stainless steel for NPS 2-1/2 and larger.
6. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
7. Configuration: Designed for horizontal, straight through.
8. Accessories:

a. Valves: Ball type with threaded, solder or press fit ends on inlet and outlet of NPS 2 and smaller; outside screw and yoke gate-type with flanged ends on inlet and outlet of NPS 21/2 and larger.

D. Hose-Connection Backflow Preventers

1. Manufacturers:

a. Conbraco Industries, Inc.
b. Watts Industries, Inc.; Water Products Div.
c. Woodford Manufacturing Company.
d. Or equal.

2. Standard: ASSE 1052.
3. Operation: Up to 10-foot head of water back pressure.
4. Inlet Size: NPS 1/2 or NPS 3/4.
5. Outlet Size: Garden-hose thread complying with ASME B1.20.7.
6. Capacity: At least 3-gpm flow.

2.4 WATER PRESSURE-REDUCING VALVES

A. Water Regulators – Direct Acting Type

1. Manufacturers:

a. Cash Acme.
b. Conbraco Industries, Inc.
c. Watts Industries, Inc.; Water Products Div.
d. Zurn Plumbing Products Group; Wilkins Div.
e. Or equal.

2. Standard: ASSE 1003.
3. Pressure Rating: Initial working pressure of 150 psig.
4. Body: Bronze with chrome-plated finish for NPS 2 and smaller; cast iron with interior lining complying with AWWA C550 or that is FDA approved for NPS 2-1/2 and NPS 3.
5. Valves for Booster Heater Water Supply: Include integral bypass.

6. End Connections: Threaded, solder or press fit for NPS 2 and smaller; flanged for NPS 2-1/2 and NPS 3.

B. Water regulators – Pilot Type

1. Manufacturers:

   a. CLA-VAL Automatic Control Valves.
   b. Watts Industries, Inc.
   c. Watts Industries, Inc.; Watts ACV.
   d. Zurn Plumbing Products Group; Wilkins Div.
   e. Or equal.

2. Description: Pilot-operation, diaphragm-type, single-seated main water control valve.
3. Pressure Rating: Initial working pressure of 150 psig minimum with AWWA C550 or FDA-approved, interior epoxy coating. Include small pilot-control valve, restrictor device, specialty fittings, and sensor piping.
4. Main Valve Body: Cast- or ductile-iron body with AWWA C550 or FDA-approved, interior epoxy coating; or stainless-steel body.

   a. Size: As shown on drawings.
   b. Pattern: Horizontal or Angle Globe valve design.
   c. Trim: Stainless steel.

5. End Connections: Threaded, solder or press fit for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.

2.5 FLOW LIMITING DEVICES

A. Water Balancing Valve: Manual Calibrated Balancing Valves, NPS 2 and Smaller: Bronze body, ball type, 125-psig working pressure, 250 deg F maximum operating temperature, and having threaded ends. Valves shall have calibrated orifice or venturi, connections for portable differential pressure meter with integral seals, and be equipped with a memory stop to retain manually set position. Manual Calibrated Balancing Valves, NPS 2-1/2 and Larger: Cast-iron or steel body, ball type, 125-psig working pressure, 250 deg F maximum operating temperature, and having flanged or grooved connections. Valves shall have calibrated orifice or venturi, connections for portable differential pressure meter with integral seals, and be equipped with a memory stop to retain manually set position.

1. Manufacturers:

   a. B&G Circuit Setter
   b. Taco Circuit Setter
   c. Or equal.

2. Pressure Rating: 230 psi.
3. Temperature Rating: 250°F.
4. Body Material: Brass Lead-free.
5. Body Tapping: 1/4” NPT with brass P/T test valves.

6. PSID Range: 1.0-14.
7. Flow: As indicated on drawings.
8. Provide shut off valves on both sides of flow limiting device.

2.6 TEMPERATURE-ACTUATED WATER MIXING VALVES

A. Individual-Fixture, Water Tempering Valves

1. Manufacturers:

   a. Cash Acme.
   b. Conbraco Industries, Inc.
   c. Lawler Manufacturing Company, Inc.
   d. Leonard Valve Company.
   e. Powers; a Watts Industries Co.
   f. Or equal.

2. Standard: ASSE 1016, thermostatically controlled water tempering valve.
3. Pressure Rating: 125 psig minimum, unless otherwise indicated.
4. Body: Bronze body with corrosion-resistant interior components.
5. Temperature Control: Adjustable.
6. Inlets and Outlet: Threaded.
7. Finish: Chrome-plated bronze.
8. Tempered-Water Setting: 105-110 deg F.

B. Primary Water Tempering Valves

1. Manufacturers:

   a. Heat-Timer Corporation.
   b. Holby Valve Co., Inc.
   c. Or equal.

2. Standard: ASSE 1017, thermostatically controlled tempering valve, listed as tempering valve.
3. Pressure Rating: 125 psig minimum, unless otherwise indicated.
4. Body: Bronze.
5. Temperature Control: Manual or automatic.
6. Inlets and Outlet: Threaded or flanged.
7. Selected Primary Water Tempering Valve Size: Per drawings
8. Tempered-Water Setting: 120 and 140deg F.
9. Tempered-Water Design Flow Rate: Per drawings.
10. Pressure Drop at Design Flow Rate: Maximum 5psig.
11. Tempered-Water Outlet Size: Per Drawings.
12. Cold-Water Inlet Size: Per drawings.
13. Hot-Water Inlet Size: Per drawings.
14. Valve Finish: Rough bronze

2.7 STRAINERS FOR DOMESTIC WATER PIPING

A. Y-Pattern Strainers

1. Pressure Rating: 160 psig minimum, unless otherwise indicated.
2. Body: Bronze for NPS 2 and smaller; cast iron with interior lining complying with AWWA C550 or FDA-approved, epoxy coating and for NPS 2-1/2 and larger.
3. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
4. Screen: Stainless steel with round perforations, unless otherwise indicated.
6. Drain: Factory-installed, hose-end drain valve.

2.8 OUTLET BOXES (See Fixture Schedule)

2.9 HOSE STATIONS (See Fixture Schedule)

A. Manufacturers:

1. Armstrong International, Inc.
2. Leonard Valve Company.
3. Strahman Valves, Inc.
4. T & S Brass and Bronze Works, Inc.
5. Or equal.

B. Hot- and Cold-Water Hose Stations, WS-1

1. Standard: ASME A112.18.1.
2. Type Faucet: Thermostatic mixing valve.
3. Hose-Rack Material: Stainless steel.
4. Body Material: Bronze with stainless-steel wetted parts.
5. Body Finish: Rough bronze.
6. Mounting: Wall, with reinforcement.
7. Supply Fittings: Two NPS 3/4 gate, globe, or ball valves and check valves and NPS 3/4 copper, water tubing. Omit check valves if check stops are included with fitting.
8. Hose: Manufacturer's standard, for service fluid, temperature, and pressure; 25 feet 0 long.
9. Nozzle: With hand squeeze on-off control.
10. Vacuum Breaker: Integral or factory-installed, non-removable, manual-drain-type, hose connection vacuum breaker complying with ASSE 1011 or backflow preventer complying with ASSE 1052; and garden-hose thread complying with ASME B1.20.7 on outlet.2.10 HOSE BIBBS (See Fixture Schedule)

2.11 WALL HYDRANTS (See Fixture Schedule)

2.13 WATER HAMMER ARRESTERS

A. Water Hammer Arresters

1. Manufacturers:

a. AMTROL, Inc.
b. Josam Company.
c. MIFAB, Inc. # MWH.
d. PPP Inc.
e. Sioux Chief Manufacturing Company, Inc.
f. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
g. Tyler Pipe; Wade Div.
h. Watts Drainage Products Inc.
i. Zurn Plumbing Products Group; Specification Drainage Operation.
j. Or equal.

2. Standard: ASSE 1010 or PDI-WH 201.
3. Type: Metal bellows or Copper tube with piston.
4. Size: ASSE 1010, Sizes AA and A through F or PDI-WH 201, Sizes A through F.

2.14 AIR VENTS

A. Bolted-Construction Automatic Air Vents

1. Body: Bronze.
2. Pressure Rating: 125-psig minimum pressure rating at 140 deg F.
3. Float: Replaceable, corrosion-resistant metal.
4. Mechanism and Seat: Stainless steel.
5. Size: NPS 3/8 minimum inlet.
6. Inlet and Vent Outlet End Connections: Threaded.

B. Welded-Construction Automatic Air Vents

1. Body: Stainless steel.
2. Pressure Rating: 150-psig minimum pressure rating.
3. Float: Replaceable, corrosion-resistant metal.
4. Mechanism and Seat: Stainless steel.
5. Size: NPS 3/8 minimum inlet.
6. Inlet and Vent Outlet End Connections: Threaded.

C. Manual Air Vent Bronze body ball valve with stainless steel ball; NPS ½.

2.15 TRAP-SEAL PRIMER VALVES

A. Flush Valve tailpiece type trap primer.

1. This is a primary trap priming system as Campus Standard. Trap priming accessory as part of the flush valve provided, Sloan # VBF-72-A.

2. Trap primer for use with exposed flush valve with one-piece chrome plated flush connection water deflector and flex-bend tube connection to wall with escutcheon.

B. Supply-Type, Trap-Seal Primer Valves

1. This type shall be used only when flush valve is not available in vicinity.
2. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified in other Part 2 articles.

   a. MIFAB, Inc. # MR-500.
   b. Or equal.

3. Standard: ASSE 1018.
4. Pressure Rating: 125 psig minimum.
5. Body: Bronze.
6. Inlet and Outlet Connections: NPS 1/2 threaded, union, or solder joint.
7. Gravity Drain Outlet Connection: NPS 1/2 threaded or solder joint.
8. Provide shut off valve up stream
9. Install in concealed locations. Provide access panel to provide access to trap primer and valve.
10. Removable and serviceable cartridge.

C. Drainage-Type, Trap-Seal Primer Valves: Shall not be used.

2.16 WATER FILTER

A. Manufacturers:

1. CUNO, Inc.
2. Or equal (no known equal that matches filters stocked by the University)

B. General: Cartridge-type assemblies suitable for potable water. Include housing, fittings, filter cartridges, and cartridge and caps.

C. Wall-Mounting Type: Housing head section with threaded inlet and outlet, mounting bracket, and removable lower section for 10-inch long filter cartridge.

1. Housing Material: Stainless steel, 150-psig minimum operating pressure.
2. Cartridge: Activated charcoal filter media, 10 inches, 10-micron-particulate removable rating.

2.17 SUPPLY STOPS

A. Manufacturers:

1. American Standard.
2. Kohler.
3. Delta

4. Brass Craft, Heavy Duty.
5. Or equal.

B. Description: Heavy pattern, 1/2" OD x 12" long chrome plated brass or stainless steel flexible risers with stuffing box cartridge, 1/4 turn ball valve, Stainless steel wall flange, loose key tee handle with Key, lock shield. Outlet end to suit fixture.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for piping joining materials, joint construction, and basic installation requirements.

B. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with University's Representative's instructions.

1. Locate backflow preventers in same room as connected equipment or system.
2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe to floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are not acceptable for this application.
3. Do not install bypass piping around backflow preventers.

C. Install water regulators with inlet and outlet shutoff valves and bypass with throttling valve. Install pressure gages on inlet and outlet.

D. Install water control valves with inlet and outlet shutoff valves and bypass with throttling valve. Install pressure gages on inlet and outlet.

E. Install Flow Limiting Devices on each hot water return branch in locations where they can easily be serviced. Provide shut off valves on each side and check valve.

F. Install temperature-actuated water mixing valves with check stops or shutoff valves on inlets and with shutoff valve on outlet.

1. Install thermometers and water regulators if specified.

G. Install strainers for water on supply side of each control valve, water pressure reducing valve, [solenoid valve**,** water Meter and pump.

H. Install outlet boxes recessed in wall. Install 2-by-4-inch fire-retardant-treated-wood blocking wall reinforcement between studs. Fire-retardant-treated-wood blocking scope by others. Refer to Division 06 Section 06 1053 "Rough Carpentry."

I. Install hose station boxes with check stops or shutoff valves on inlets and with thermometer on outlet.

1. Install shutoff valve on outlet if specified.
2. Install cabinet-type units recessed in or surface mounted on wall as specified. Install 2by-4-inch fire-retardant-treated-wood blocking wall reinforcement between studs. Fire retardant-treated-wood blocking scope by others. Refer to Division 06 06 1053 Section "Rough Carpentry."

J. Install water hammer arresters in water piping according to PDI-WH 201. Provide isolation valve and access panel for each WHA with threaded joints.

K.

L. Install supply-type, trap-seal primer valves with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting. Adjust valve for proper flow.

M. Install water filters with shut off valves and unions or flanges upstream and downstream of filters. Install pressure gage down stream of filters.

N. Reclaimed water piping shall be wrapped or painted purple and labelled in accordance with requirements described for chapter 16A Non-Potable Water Reuse Systems of the 2013 California Plumbing Code.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping and specialties.

B. Ground equipment according to Division 26 Section 26 0256 "Grounding and Bonding for Electrical Systems." Covered by electrical work.

C. Connect wiring according to Division 26 Section 26 05219 "Low Voltage Electrical Power Conductors and Cables." Covered by electrical work.

3.3 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following:

1. Pressure vacuum breakers.
2. Intermediate atmospheric-vent backflow preventers.
3. Reduced-pressure-principle backflow preventers.
4. Double-check backflow-prevention assemblies.
5. Carbonated-beverage-machine backflow preventers.
6. Dual-check-valve backflow preventers.
7. Reduced-pressure-detector, fire-protection backflow-preventer assemblies.
8. Double-check, detector-assembly backflow preventers.
9. Water pressure-reducing valves.
10. Flow limiting devices.

11. Primary, thermostatic, water mixing valves.
12. Manifold, thermostatic, water-mixing-valve assemblies.
13. Primary water tempering valves.
14. Outlet boxes.
15. Hose stations.
16. Supply-type, trap-seal primer valves.
17. Water filters

B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit. Nameplates and signs are specified in Division 22 Section 22 0553 "Identification for Plumbing."

3.4 FIELD QUALITY CONTROL

A. Perform the following tests and prepare test reports:

1. Test each specialty including pressure vacuum breaker, reduced-pressure-principle backflow preventer, and double-check backflow-prevention assembly according to University's Representative and the device's reference standard.

B. Remove and replace malfunctioning domestic water piping specialties and retest as specified above.

3.5 ADJUSTING

A. Set field-adjustable pressure set points of water pressure-reducing valves.

B. Set field-adjustable flow set points of balancing valves.

C. Set field-adjustable temperature set points of temperature-actuated water mixing valves.

END OF SECTION 22 1119

SECTION 22 1123 - DOMESTIC WATER PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following all-bronze and bronze-fitted centrifugal pumps for domestic cold- and hot-water circulation, and process cooling water circulation:

1. Close-coupled, in-line, centrifugal pumps.
2. End Suction Pumps.

1.2 SUBMITTALS

A. Product Data: For each type and size of domestic water pump specified. Include certified performance curves with operating points plotted on curves; and rated capacities of selected models, furnished specialties, and accessories.

B. Shop Drawings: Pumps, diagram power, signal, and control wiring.

C. Operation and Maintenance Data: For domestic water pumps to include in emergency, operation, and maintenance manuals.

1.3 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles of domestic water pumps and are based on the specific system indicated. Refer to Division 01 Section 01 6000 "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70), Article 100, by a testing agency acceptable to University’s Representative, and marked for intended use.

C. UL Compliance: Comply with UL 778 for motor-operated water pumps.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Retain shipping flange protective covers and protective coatings during storage.

B. Protect bearings and couplings against damage.

C. Comply with pump manufacturer's written rigging instructions for handling.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 IN-LINE, SEALLESS CENTRIFUGAL PUMPS

A. Manufacturers:

1. Bell & Gossett
2. Grundfos Pumps Corp. Model UP or UPS.
3. Or equal.

B. Description: Maintenance-free, in-line, wet rotor type with the motor mounted directly to the pump volute for use in an open system. The motor shall be cooled and lubricate by the pumped fluid and shall require no schedule maintenance.

1. Pump and Motor Assembly: The pump volute shall be 304 stainless steel and rated at 145 psi working pressure.
2. Casing: Stainless steel, with flange connections.
3. Impeller, impeller inlet cone, rotor can and rotor cladding: Stainless steel.
4. Motor: Single speed.
5. The pump shall not have a coupling or mechanical seal.
6. Flange to flange: 6 ½”. University Standard.

2.3 HORZONTIAL MOUNTED, IN-LINE, FLEXIBLE COUPLED CENTRIFUGAL PUMP

A. Manufacturers:

1. Bell & Gossett Domestic Pumps
2. Grundfos Pumps Corp.
3. Armstrong Pumps, Inc.
4. Taco, Inc.
5. Or equal.

B. Description: Base-mounted, centrifugal, flexible-coupled, end-suction, single-stage, bronze fitted, back-pull-out, radially split case design; rated for 175-psig minimum working pressure and a continuous water temperature of 225 deg F.

1. Casing: Cast iron, with flanged piping connections, drain plug at low point of volute, threaded gage tappings at inlet and outlet connections, and integral feet or other means on

volute to support weight of casing and attached piping. Casing shall allow removal and replacement of impeller without disconnecting piping.

2. Impeller: ASTM B 584, cast bronze, statically and dynamically balanced, closed, overhung, single suction, keyed to shaft, and secured by locking cap screw.
3. Wear Rings: Replaceable, bronze casing ring.
4. Shaft and Sleeve: Steel shaft with bronze sleeve.
5. Seals: Mechanical, with Hi resist seat, carbon washer, viton elastomer, stainless steel spring and parts.
6. Pump shaft bearings: Grease-lubricated ball bearings in cast-iron housing.
7. Coupling: Flexible-spacer type, capable of absorbing torsional vibration and shaft misalignment; with flange and sleeve section that can be disassembled and removed without removing pump or motor.
8. Coupling Guard: Dual rated; ANSI B15.1, Section 8; OSHA 1910.219 approved; steel; removable; attached to mounting frame.
9. Mounting Frame: Welded-steel frame and cross members, factory fabricated from ASTM A 36/A 36M channels and angles. Fabricate for mounting pump casing, coupling guard, and motor. Field-drill motor-mounting holes for field-installed motors.
10. Motor: Secured to mounting frame, with adjustable alignment.

2.4 CONTROLS

A. In-line circulator pump shall operate continuously unless shutdown by Building Automation System.

B. Aquastats: Electric; adjustable for control of hot-water circulation pump.

1. Manufacturers:
   a. Honeywell International, Inc.
   b. Square D.
   c. White-Rodgers Div.; Emerson Electric Co.
2. Type: Water-immersion sensor, for installation in hot-water circulation piping.
3. Operation of Pump: On or off.

C. Aquastats: Electric; adjustable for control of hot-water circulation pump.

4. Manufacturers:
   a. Honeywell International, Inc.
   b. Square D.
   c. White-Rodgers Div.; Emerson Electric Co.
5. Type: Water-immersion sensor, for installation in hot-water circulation piping.
6. Operation of Pump: On or off.

D. In-line centrifugal pump shall be controlled by variable frequency drive. Refer to Division 23 Section 23 0510 “Variable Frequency Drives” and Division 22 Section 22 0513 “Motors For Plumbing”.

2.5 BUILDING-AUTOMATION-SYSTEM INTERFACE

A. Provide controls for interface to building automation system. Include the following:

1. On-off status of each pump.
2. Alarm status.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in of domestic-water-piping system to verify actual locations of connections before pump installation.

3.2 PUMP INSTALLATION

A. Install pumps with access for periodic maintenance including removal of motors, impellers, couplings, and accessories.

B. Independently support pumps and piping so weight of piping is not supported by pumps and weight of pumps is not supported by piping.

C. Install in-line, horizontal and sealless centrifugal pumps with motor and pump shafts horizontal.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to pumps to allow service and maintenance.

C. Connect domestic water piping to pumps. Install suction and discharge piping equal to or greater than size of pump nozzles. Refer to Division 22 Section 22 1116 "Domestic Water Piping and Valves."

1. Install shutoff valve on suction side of pumps, and check valve and shutoff valve on discharge side of pumps. Install valves same size as connected piping. Refer to Division 22 Section 22 1116 "Domestic Water Piping and Valves" for ball valves.
2. Install pressure gages taps at suction and discharge of pumps. Refer to Division 22 Section 22 0519 "Meters and Gages for Plumbing" for pressure gages and gage connectors.

D. Grounding of equipment under another section of work. Refer to Division 26 Section26 0526 "Grounding and Bonding for Electrical Systems.".

E. Connection of wiring under another section of work. Refer to Division 26 Section 26 0519 "Low-Voltage Electrical Power Conductors and Cables.".

3.4 STARTUP SERVICE

A. Perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Check piping connections for tightness.
3. Perform the following startup checks for each pump before starting:

    a. Verify bearing lubrication. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.
    b. Verify that pump is rotating in the correct direction.

4. Prime pump by opening suction valves and closing drains, and prepare pump for operation.
5. Start motor.
6. Open discharge valve slowly.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's maintenance personnel to adjust, operate, and maintain controls and pumps. Refer to Division 01 Section 01 7900 "Demonstration and Training."

END OF SECTION 22 1123

SECTION 22 1314 - WATER SOFTENING EQUIPMENT

PART 1 - GENERAL

1.1 DESCRIPTION

A. This section lists equipment to be used to condition water. The water conditioning method shall be a "Resin Exchange Water Softener System" whereas the media is to be replaced by a qualified regeneration service provider under contract at regular intervals. The end of a softener service cycle is determined either by a timed service run, total gallon throughput, or a high measure of hardness in the softener effluent.

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions, Special Conditions, Mechanical Supplemental Requirements Divisions 23, and Division-1 Specification sections, apply to work specified in this section.

1.3 RELATED WORK

A. Refer to Section 22 1116 "Domestic Water Piping and Valves".

1.4 QUALITY ASSURANCE

A. Substitution of Materials: Refer to Division 1.

1.5 SUBMITTALS

A. Submit shop drawings on all items specified herein.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. The listing of a manufacturer as "acceptable" does not imply automatic approval. It is the sole responsibility of the Contractor to ensure that any submittals made are for products that meet or exceed the specifications included here.

2.2 MATERIALS

A. All materials specified herein shall be new unless noted otherwise.

2.3 EQUIPMENT

A. Softener

1. Scope:

a. Furnish all equipment and material necessary for complete installation of a water softening system. Provide all work in accordance with these specifications and all applicable local and state plumbing codes, AWWA, ASME, and ASTM standards.

b. The water softener system shall be furnished complete with softener tanks and internals, single point connection of service inlet and outlet, and drain. The water softener shall be rated for a maximum service flow rate of SC gallons per minute with a pressure loss not to exceed 25 psig. The water softener system shall be as manufactured by Culligan, or approved equal and as specified herein.

2. Project Data (each Unit):

PROJECT DATA	SPECIFIED VALUE
Continuous Flow Rate:	170-180 GPM @ 15 PSI loss/Softener
Peak Flow Rate:	250 GPM @ 25 PSI loss/Softener
Minimum Recommended Flow:	25 GPM
Resin Quantity:	Cullex Cation Resin, Na*
Maximum Capacity:	960 kgr@ 450 lbs. Salt*
Minimum Capacity:	600 kgr@ 180 lbs. Salt*
Tank Size, in.:	36" Dia. 60" Side shell
Tank Area, ft^2:	7.07
Freeboard:	8”- Resin Exchange
Tank Rating:	150 PSI @ 130˚F, ASME Code
Softener Tank Quantity:	2
Total Water Hardness:	10-25 GPG
Water Demand:	24 Hours/Day

3. Regeneration Data:

Resin Exchange Service. Capacity Specified above is based on indicated salt dosage. Regeneration Services By: Local Culligan Dealer or equivalent.

4. System Requirements:

Operating Temperature Range	35 - 120 degrees F.
Operating Pressure Range	30-150 PSIG
Pipe Connections, Inches:	
Inlet Size	3” 150# RFSO Flange
Outlet Size	3” 150# RFSO Flange
Fill and Drain Conn.	2” 150# Pad Flange

5. Softener Tanks:

   a. Each softener tank shall be of electric weld construction built in accordance with the ASME Code and so stamped and certified. Exchange tanks 30" diameter and under shall have the following: One (1) 3”x12” site glass port; One (1) 12”x16” Manway with cover (second manway is optional); tank support legs shall be four (4) Angle Legs w/ base plates & support gussets.

6. Internal Distribution System:

   a. The underdrain system shall be PVC 3” Hub & Lateral underdrain distributor & 3” Upper diffuser manifold.

7. Tank Finish:

   The tank interior lining shall be applied over a sandblasted surface and shall be SSPPC-SP10 Devoe 233H 10-16 mil DFT, or equal. The tank exterior shall be cleaned free of any grease, oil, or millscale and exterior lining with Tnemec 161SC06 Safety Blue, 7-8 DFT, or equal.

8. Ion Exchange Resin:

   a. The Ion exchange resin shall be Cullex – 00156001, 00156314 premium grade high capacity synthetic sulfonated styrene divinylbenzene type to be furnished in bead form, ionic form: sodium, or equal.

9. Piping:

   a. The manufacturer is to furnish the softener tanks.

   b. The contractor shall furnish inlet and outlet service lines to the tanks, 1 1/2” Service lines for Resin Inlet and outlet, 1 1/2” pressurized water line at fill site with Male Cam lock, 1 1/2” pressurized water line at fill

site, 1 1/2" Drain line (with shut off valve) off 2", 3" or 4" soft water service line with Wye strainer in line and shut off valve to process exchange fitting and install interconnecting piping, drain shall have an air gap conforming to local codes to permit observation of the discharge backwash water and manufacturer shall provide a valve drain at the lowest point of the softener system. The piping shall be Schedule 40 galvanized with Class 150 standard malleable iron fittings 3" and under, 4" piping and larger shall be black carbon steel.

10. Instructions and Start-Up:

    a. A complete set of operating instructions covering the installation, maintenance, and operation of the softener system shall be furnished, bound in booklet form. The contractor shall provide the service of a competent supervising agent from the water softener manufacturer to inspect the completed installation, start the water softening system in operation, and acquaint the operator with the proper operation and maintenance of this equipment.

11. Equipment Description for Approval:

    a. Upon request, manufacturer selected shall furnish a complete and detailed equipment list for approval including a drawing showing pertinent dimensions of this system.

12. Guarantees:

    a. Attrition loss of the ion exchange resin is guaranteed not exceed 3% per year for a period of three years. All mechanical equipment is guaranteed for one year against defects in workmanship or material. Any part proving defective will be replaced or repaired within this period. The manufacturer guarantees that under actual operating conditions, the resin shall not be washed out of the system during the service run or backwashing period; that the turbidity and color of the effluent by reason of passing through the softener system shall not be greater than the incoming water and that the underdrain system, gravel, and resin shall not become fouled either with turbidity or by dirt, rust, or scale from the softening system, or present in the hard water while operating as noted on manufacturer's instructions.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Water softener shall be installed level in location as shown and detailed on the drawings. All water piping to and from the softener shall be supported from the building structure; piping shall not be supported from the softener.

B. The manufacturer shall provide start up service for the unit.

3.2 TEST

A. After satisfactory performance of the sequence of operation, water samples of raw and conditioned water shall be taken and sent to a lab to verify performance of conditioning the water.

B. After each exchange, the Driver cleans up, checks for leaks and places dated tag on tank that it has been exchanged.

END OF SECTION 22 1314

SECTION 22 1316 - SANITARY WASTE AND VENT PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following for soil, waste, and vent piping inside the building and to 5 feet outside of building.

1. Pipe, tube, and fittings.
2. Special pipe fittings.
3. Encasement for underground metal piping.

B. Related Sections include the following:

1. 22 Section 22 6000 "Chemical-Waste Piping" for chemical-waste and vent piping systems.
2. Division 22 Section 22 1329 "Sanitary Sewage and Lab Waste Pumps."

1.2 DEFINITIONS

B. PVC: Polyvinyl chloride plastic.

1.3 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressure, unless otherwise indicated:

1. Soil, Waste, and Vent Piping: 10-foot head of water
2. Sanitary Sewer, Force-Main Piping: 70 psig

B. Seismic Performance: Soil, waste, and vent piping and support and installation shall be capable of withstanding the effects of seismic events determined according to CBC Requirements for Seismic Zone 4.

1.4 SUBMITTALS

A. Submit sanitary waste and vent systems as a complete package, including hangers and supports. Clean-outs, floor drains and floor sinks and plumbing specialties.

B. Product Data: For pipe, tube, fittings, and couplings.

C. Shop Drawings:

1. Design Calculations: Signed and sealed by a qualified California registered professional engineer for selecting seismic restraints.

D. Field quality-control inspection and test reports.

1.5 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Piping and fittings shall be manufactured in the United States of America, Australia, Canada or Japan only.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

2.4 HUBLESS CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings: ASTM A 74, ASTM A 888 or CISPI 301. The piping shall bear collective trademark of the CISPI.

B. Shielded Couplings: ASTM C 1277 & ASTM C1540, minimum 24 gauge, type 304 Stainless steel assembly of metal shield or housing, corrosion-resistant fasteners, and rubber sleeve with integral, center pipe stop. Heavy Duty.

1. Heavy-Duty, Shielded, Stainless-Steel Couplings: With stainless-steel shield, minimum of four stainless-steel bands and tightening devices, and ASTM C 564, rubber sleeve.

a. Manufacturers:

1) Husky Series SD-4000.
2) ANACO.
3) Clamp All 125.

4) Ideal Div.; Stant Corp.
5) Or equal.

2.6 COPPER TUBE AND FITTINGS

A. Copper DWV Tube: ASTM B 306, drainage tube, drawn temper.

1. Copper Drainage Fittings: ASME B16.23, cast copper or ASME B16.29, wrought copper, solder-joint fittings.

B. Hard Copper Tube: ASTM B 88, Types L, water tube, drawn temper.

1. Copper Pressure Fittings: ASME B16.22, wrought-copper, solder-joint fittings.
2. Copper Flanges: ASME B16.24, Class 150, cast copper with solder-joint end.
3. Copper Unions: MSS SP-123, copper-alloy, hexagonal-stock body with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

2.7 SPECIAL PIPE FITTINGS

A. Flexible, Non-pressure Pipe Couplings: Comply with ASTM C 1173, elastomeric, sleeve-type, reducing or transition pattern. Include shear ring, ends of same sizes as piping to be joined, and corrosion-resistant-metal tension band and tightening mechanism on each end.

1. Manufacturers:

a. Dallas Specialty & Mfg. Co.
b. Fernco, Inc.
c. Logan Clay Products Company (The).
d. Mission Rubber Co.
e. NDS, Inc.
f. Plastic Oddities, Inc.
g. Or equal.

2. Sleeve Materials:

a. For Cast-Iron Soil Pipes: ASTM C 564, rubber.
b. For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.

B. Pressure Pipe Couplings Where Applicable: AWWA C219 metal, sleeve-type same size as, with pressure rating at least equal to, and ends compatible with, pipes to be joined.

1. Manufacturers:

a. Cascade Waterworks Mfg. Co.
b. Dresser, Inc.; DMD Div.
c. EBAA Iron Sales, Inc.

d. Ford Meter Box Company, Inc. (The); Pipe Products Div.
e. JCM Industries, Inc.
f. Smith-Blair, Inc.
g. Viking Johnson.
h. Or equal.

2. Center-Sleeve Material: Stainless steel.
3. Gasket Material: Natural or synthetic rubber.
4. Metal Component Finish: Corrosion-resistant coating or material.

2.8 ENCASEMENT FOR UNDERGROUND METAL PIPING

A. Description: ASTM A 674 or AWWA C105, LLDPE film of 0.008-inch minimum thickness.

B. Form: Tube

C. Color: Black

PART 3 - EXECUTION

3.1 EXCAVATION

A.Refer to Division 31 Section 31 2000 "Earth Moving" for excavating, trenching, and backfilling.

3.2 PIPING APPLICATIONS

A. Flanges and unions may be used on aboveground pressure piping, unless otherwise indicated.

B. Aboveground, soil and waste piping 1-1/2” shall be any of the following:

1. Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings.
2. Copper DWV tube, copper drainage fittings, and soldered joints.

C. Aboveground, soil and waste and vent piping NPS 2 and larger shall be any of the following:

1. Service class, cast-iron soil pipe and fittings; gaskets; and compression joints (except for vent).
2. Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings; and hubless-coupling joints.
3. Copper DWV tube, copper drainage fittings, and soldered joints.

D. Underground, soil, waste, and vent piping shall be any of the following:

1. Service class, cast-iron soil piping; gaskets; and gasketed joints.
2. Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings; and hubless-coupling joints.

E. Sanitary-sewage force mains shall be any of the following:

1. Hard copper tube, Type K for below grade, Type L for above ground; wrought copper pressure fittings; brazed joints below grade, solder joint or mechanical joint above ground.

F. Indirect and condensate Drains: Type L hard drawn copper piping with wrought copper fittings.

G. NPS 2 1/2 piping shall not be used, provide NPS 3.

H. CPC does not permit discharge of more than 140-degree F waste water into sewer. Provide cooling-blending water systems for drain discharges from Lab Equipment that discharge exceeds 140-degree F.

3.3 PIPING INSTALLATION

A. Sanitary sewer piping outside the building is specified in Division 33 Section 33 3100 "Facility Sanitary Sewers."

B. Basic piping installation requirements are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

C. Install seismic restraints on piping. Seismic-restraint devices are specified in Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing."

D. Install cleanouts at grade and extend to 5’-0” outside of the building where building sanitary drains connect to building sanitary sewers and provide a two-way cleanout. Install underground, copper, force-main tubing according to CDA's "Copper Tube Handbook."

1. Install encasement on piping according to ASTM A 674 or AWWA C105.

E. Install galvanized steel or HDPE sleeve with water stop and mechanical sleeve seal at each service pipe penetration through a basement wall. Select number of interlocking rubber links required to make installation watertight. Sleeves and mechanical sleeve seals are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

F. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

1. Install encasement on underground piping according to ASTM A 674 or AWWA C105.

G. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if 2 fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and

reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

H. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements.

I. Install soil and waste drainage and vent piping at the following minimum slopes, unless otherwise approved by the University's Representative:

1. Building Sanitary Drain: 2 percent downward in direction of flow for piping sizes up to 3", 1 percent downward in direction of flow for piping sizes 4" and above.
2. Horizontal Sanitary Drainage Piping: 2 percent downward in direction of flow for piping sizes up to 3", 1 percent downward in direction of flow for piping sizes 4" and above.
3. Vent Piping: Sloping is not required. Lay horizontal vent piping level with no sections rapped, otherwise provide 1 percent down toward vertical fixture vent or toward vent stack.

M. Install engineered soil and waste drainage and vent piping systems as follows:

1. Combination Waste and Vent: Comply with standards of CPC.

N. Do not enclose, cover, or put piping into operation until it is inspected and approved by University's Representative.

O. Do not use copper piping on urinals.

3.4 JOINT CONSTRUCTION

A. Basic piping joint construction requirements are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

B. Join hubless cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-coupling joints.

C. Mechanical Joint for copper tube pump discharge piping: Compression joint grooved end, copper coating using elastomeric gasket. ASTM A 536 housing, for rigid installation, ASTM A536 flanges adapter.

D. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free alloy solder; and ASTM B 828 procedure.

E. The use of adhesives, lubricants, sealants, etc. or the addition of any substance between no-hub cast iron pipe and coupling shall be prohibited.

3.5 VALVE INSTALLATION

A. General valve installation requirements are specified in Division 22 Section 22 1116 "Domestic Water Piping and Valves."

B. Shutoff Valves: Install shutoff valve on each sewage pump discharge.

1. Install full-port ball valve for piping NPS 2" and smaller.
2. Install gate valve for piping NPS 2-1/2" and larger.

C. Check Valves: Install swing check valve, between pump and shutoff valve, on each sewage pump discharge.

D. Backwater Valves: Install backwater valves in piping subject to sewage backflow or if required by code.

1. Horizontal Piping: Horizontal backwater valves. Use normally closed type.
2. Floor Drains: Drain outlet backwater valves, unless drain has integral backwater valve.
3. Install backwater valves in accessible locations.
4. Backwater valve are specified in Division 22 Section 22 1319 "Sanitary Waste Piping Specialties."

A. Seismic-restraint devices are specified in Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing."

B. Pipe hangers and supports are specified in Division 22 Section 22 0529 "Hangers and Supports for Plumbing Piping and Equipment." Install supports according to Division 22 Section 22 0529 "Hangers and Supports for Plumbing Piping and Equipment."

C. Support vertical piping and tubing at base and at each floor not to exceed 10 vertical spacing.

D. Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch minimum rods.

E. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:

1. Comply with CPC Section 313, Table 313.1 and 313.6.
2. Support adjacent to a joint, not exceeding 18 inches from joint.
3. Hangers shall not be placed on couplings.
4. Provide 3/8" rod size up to NPS 2, 1/2" rod for NPS 3, 5/8" rod for NPS 4 and NPS5, 3/4" rod for NPS 6 and 7/8" rod for NPS 8 through NPS 12.

F. Install supports for vertical cast-iron soil piping maximum at every floor to floor.

G. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters in accordance with CPC Tables 313.1 and 313.6.

H. Install supports for vertical copper tubing in accordance with CPC requirements.

I. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.7 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

C. Connect drainage and vent piping to the following:

1. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by CPC.
2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by CPC.
3. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by CPC.
4. Equipment: Connect drainage piping as indicated. Provide shutoff valve and union for each connection. Use flanges instead of unions for connections NPS 2-1/2 and larger.

D. Connect force-main piping to the following:

1. Sanitary Sewer: To exterior force main or sanitary manhole.
2. Sewage Pumps: To sewage pump discharge.

3.8 FIELD QUALITY CONTROL

A. During installation, notify University’s Representative at least 24 hours before inspection must be made. Perform tests specified below in presence of University’s Representative.

1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
2. Final Inspection: Arrange for final inspection by University’s Representative to observe tests specified below and to ensure compliance with requirements.

B. Re-inspection: If University’s Representative finds that piping will not pass test or inspection, make required corrections and arrange for re-inspection.

C. Reports: Prepare inspection reports and have them signed by University’s Representative.

D. Test sanitary drainage and vent piping according to procedures of California Plumbing Code or, in absence of published procedures, as follows:

1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.

2. Leave uncovered and unconcealed new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
3. Roughing-in Plumbing Test Procedure: Test drainage and vent piping, except outside leaders, on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 15 minutes before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
4. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
5. Prepare reports for tests and required corrective action.

E. Test force-main piping according to procedures of University's Representative or, in absence of published procedures, as follows:

1. Leave uncovered and unconcealed new, altered, extended, or replaced force-main piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
2. Cap and subject piping to static-water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
3. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
4. Prepare reports for tests and required corrective action.

F. The University shall run a camera through storm piping upon substantial completion of the project. Any broken or damaged new or affected pipe found shall be repaired as part of the basic contract.

3.9 CLEANING

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

END OF SECTION 22 1316

SECTION 22 1319 - SANITARY WASTE PIPING SPECIALTIES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following drainage piping specialties:

1. Backwater valves.
2. Cleanouts.
3. Floor drains and Floor Sinks.
4. Trench drains.
5. Roof flashing assemblies.
6. Through-penetration firestop assemblies.
7. Miscellaneous drainage piping specialties.
8. Flashing materials.

B. Related Sections include the following:

1.Division 22 Section 22 4000 "Plumbing Fixtures" for hair interceptors.

1.2 DEFINITIONS

A. ABS: Acrylonitrile-butadiene-styrene plastic.

B. FRP: Fiberglass-reinforced plastic.

C. HDPE: High-density polyethylene plastic.

D. PE: Polyethylene plastic.

E. PP: Polypropylene plastic.

F. PUR: Polyurethane plastic.

G. PVC: Polyvinyl chloride plastic.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and accessories for the following:

1. Backwater valve
2. Cleanouts
3. Floor drains and floor sinks
4. Trench drains
5. Roof flashing assemblies By Roofer.

6. Through penetration fires top assemblies by other vendor.
7. Miscellaneous drainage piping specialties
8. Flashing materials
9. Wiring Diagrams: Power, signal, and control wiring.

B. Manufacturer Seismic Qualification Certification: Submit certification that accessories, and components will withstand seismic forces defined in Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing." Include the following:

1. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
2. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For drainage piping specialties to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in California Electrical Code (NFPA 70), Article 100, by a testing agency acceptable to University's Representative, and marked for intended use.

1.5 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate size and location of roof penetrations.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Products: Subject to compliance with requirements, provide one of the products specified in other Part 2 articles.

B. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified in other Part 2 articles.

C. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 BACKWATER VALVES

A. Horizontal, Cast-Iron Backwater Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Josam Company; Josam Div.
    b. MIFAB, Inc.
    c. Smith, Jay R. Mfr. Co.; Division of Smith Industries, Inc.
    d. Tyler Pipe; Wade Div.
    e. Watts Drainage Products Inc.
    f. Zurn Plumbing Products Group; Specification Drainage Operation.
    g. Or equal.

2. Standard: ASME A112.14.1.
3. Size: Same as connected piping.
4. Body: Cast iron.
5. Cover: Cast iron with boltedor threaded access check valve.
6. End Connections: Hubless.
7. Type Check Valve: Removable, bronze, swing check, factory assembled to hang closed or field modified to hang open for airflow unless subject to backflow condition.
8. Extension: ASTM A 74, or A888, Service class; full-size, cast-iron, soil-pipe extension to field-installed cleanout at floor or grade; replaces backwater valve cover.

B. Drain-Outlet Backwater Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Josam Company; Josam Div.
    b. Smith, Jay R. Mfr. Co.; Division of Smith Industries, Inc.
    c. Watts Drainage Products Inc.
    d. Zurn Plumbing Products Group; Specification Drainage Operation.
    e. Or equal.

2. Size: Same as floor drain or floor sink outlet.
3. Body: Cast iron or bronze made for vertical installation in bottom outlet of floor drain or floor sink.
4. Check Valve: Removable ball float.
5. Inlet: Threaded as applicable.
6. Outlet: Threaded or no-hub.

2.3 CLEANOUTS

A. Exposed Exterior Metal Cleanouts:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Josam Company; Josam Div.
   b. MIFAB, Inc.
   c. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
   d. Tyler Pipe; Wade Div.
   e. Watts Drainage Products Inc.
   f. Zurn Plumbing Products Group; Specification Drainage Operation.
   g. Or equal.

2. Standard: ASME A112.36.2M for cast iron for cleanout test tee.
3. Size: Same as connected drainage piping up to 6".
4. Body Material: Hubless, cast-iron soil pipe test tee as required to match connected piping.
5. Housing: Heavy duty round cast iron with heavy duty cast iron coves.
6. Closure: Countersunk, Taper thread bronze plug.
7. Closure Plug Size: Same as or not more than one size smaller than cleanout size.
8. J.R. Smith # 4253S or equal.
9. Set cleanout flush with sidewalk grade or set in a 24" x 24" x 4" concrete pad 1 inch above finished grade. Concrete work by another section of work. Refer to Division 3.

B. Metal Floor Cleanouts:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Josam Company; Josam Div.
   b. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
   c. Tyler Pipe; Wade Div.
   d. Watts Drainage Products Inc.
   e. Zurn Plumbing Products Group; Light Commercial Operation.
   f. Zurn Plumbing Products Group; Specification Drainage Operation.
   g. Or equal.

2. Standard: ASME A112.36.2M for adjustable housing cleanout.
3. Size: Same as connected branch.
4. Type: Heavy-duty, adjustable housing.
5. Body or Ferrule: Cast iron.
6. Clamping Device: As required.
7. Outlet Connection: As required.
8. Closure: Brass plug with tapered threads.
9. Adjustable Housing Material: Cast iron with set-screws or other device.
10. Frame and Cover Material and Finish: Cast iron secured.

11. Frame and Cover Shape: Round.
12. Top Loading Classification: Heavy Duty.
13. Riser: ASTM A 74, Service class, cast-iron drainage pipe fitting and riser to cleanout.
14. Finish shall match floor finish.
15. J.R. Smith # 4103SDC, #4253Sor equal.

C. Cast-Iron Wall Cleanouts :

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Josam Company; Josam Div.
   b. MIFAB, Inc.
   c. Smith, Jay R. Mfg. Co.; Division of Smith Industries, Inc.
   d. Tyler Pipe; Wade Div.
   e. Watts Drainage Products Inc.
   f. Zurn Plumbing Products Group; Specification Drainage Operation.
   g. Or equal.

2. Standard: ASME A112.36.2M. Include wall access.
3. Size: Same as connected drainage piping.
4. Body: Hubless, cast-iron soil pipe test tee as required to match connected piping.
5. Closure: Countersunk, drilled-and-threaded brass plug.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.
7. Wall Access: Round, flat, chrome-plated brass or stainless-steel cover plate with screw.
8. Wall Access: Round, nickel-bronze wall-installation frame and cover.
9. J.R. Smith #4532S or #4553S or equal.

2.4 FLOOR DRAINS AND FLOOR SINKS (See Fixture Schedule)

2.5 TRENCH DRAINS (See Fixture Schedule)

2.6 ROOF FLASHING ASSEMBLIES

A. Roof Flashing Assemblies:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Acorn Engineering Company; Elmdor/Stoneman Div.
   b. Thaler Metal Industries Ltd.
   c. Or equal.

B. Description: Manufactured assembly made of 4.0-lb/sq. ft., 0.0625-inch- thick, flashing collar and skirt extending at least 8 inches from pipe, with galvanized-steel boot reinforcement and counterflashing fitting.

2.7 THROUGH-PENETRATION FIRESTOP ASSEMBLIES

A. Through-Penetration Firestop Assemblies

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. ProSet Systems Inc.
   b. 3M
   c. Or equal.

2. Standard: UL 1479 assembly of sleeve and stack fitting with firestopping plug.
3. Size: Same as connected soil, waste, or vent stack.
4. Sleeve: Molded PVC plastic, of length to match slab thickness and with integral nailing flange on one end for installation in cast-in-place concrete slabs.

2.8 MISCELLANEOUS DRAINAGE PIPING SPECIALTIES

A. Open Drains:

1. Description: Shop or field fabricate from ASTM A 74, Service class, hub-and-spigot, cast-iron, soil-pipe fittings. Include P-trap, hub-and-spigot riser section; and where required, increaser fitting joined with ASTM C 564, rubber gaskets.

B. Floor Drain, Floor Sink, Trap-Seal Primer Fittings:

1. Description: Cast iron, with threaded inlet and threaded or no-hub outlet, and trap-seal primer valve connection.
2. Size: Same as floor drain or floor sink outlet with NPS 1/2 side inlet.

C. Air-Gap Fittings

1. Standard: ASME A112.1.2, for fitting designed to ensure fixed, positive air gap between installed inlet and outlet piping.
2. Body: Bronze or cast iron.
3. Inlet: Opening in top of body.
4. Outlet: Larger than inlet.
5. Size: Same as connected waste piping and with inlet large enough for associated indirect waste piping.

1. 2.9 FLASHING MATERIALS

A. Copper Sheet: ASTM B 152/B 152M, of the following minimum weights and thicknesses, unless otherwise indicated:

1. General Applications: 12 oz./sq. ft..
2. Vent Pipe Flashing: 8 oz./sq. ft..

B. Zinc-Coated Steel Sheet: ASTM A 653, with 0.20 percent copper content and 0.04-inch minimum thickness, unless otherwise indicated. Include G90 hot-dip galvanized, millphosphatized finish for painting if indicated.

C. Elastic Membrane Sheet: ASTM D 4068, flexible, chlorinated polyethylene, 40-mil minimum thickness.

D. Fasteners: Metal compatible with material and substrate being fastened.

E. Metal Accessories: Sheet metal strips, clamps, anchoring devices, and similar accessory units required for installation; matching or compatible with material being installed.

F. Solder: ASTM B 32, lead-free alloy.

H. Bituminous Coating: SSPC-Paint 12, solvent-type, bituminous mastic.

2.11 MOTORS

A. General requirements for motors are specified in Division 22 Section 22 0513 "Motors for Plumbing."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for piping joining materials, joint construction, and basic installation requirements.

B. Install backwater valves in building drain piping. For interior installation, provide cleanout deck plate flush with floor and centered over backwater valve cover, and of adequate size to remove valve cover for servicing.

C. The University's requirements for cleanouts exceed minimum code requirements to allow for ease of maintenance and maintainability and to allow cleaning of the piping with a 50-foot snake. Cleanouts shall be provided on all floors.

D. Install cleanouts in aboveground piping and building drain piping according to the following, unless otherwise approved by the University's Representative:

1. Size same as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
2. Locate at minimum intervals of 50 feet for horizontal piping.
3. Locate at base of each vertical soil and waste stack.
4. Locate at end of sanitary waste drains more than five feet in length.
5. Locate above sanitary tees.
6. Locate in vent piping above urinals or an end of a battery of urinals.
7. Install cleanouts flush with finished floor.

F. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor.

G. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

H. Install floor drains at low points of surface areas to be drained as indicated on drawings. Set grates of drains flush with finished floor, unless otherwise indicated.

1. Position floor drains for easy access and maintenance.
2. Set floor drains at low point of the finished floor to allow floor drainage. Set with grates depressed according to the following drainage area radii:

    a. Radius, 30 Inches or Less: Equivalent to 1 percent slope, but not less than 1/4-inch total depression.
    b. Radius, 30 to 60 Inches: Equivalent to 1 percent slope.
    c. Radius, 60 Inches or Larger: Equivalent to 1 percent slope, but not greater than 1inch total depression.

3. Install floor-drain flashing collar or flange so no leakage occurs between drain and adjoining flooring. Maintain integrity of waterproof membranes where penetrated.
4. Install individual traps for floor drains connected to sanitary building drain, unless otherwise indicated.

I. Install trench drains at low points of surface areas to be drained as indicated on drawings. Set grates of drains flush with finished surface, unless otherwise indicated. Care must be taken to provide adequate length to prevent drainage from escaping to lower floor.

J. Assemble and install ASME A112.3.1, stainless-steel channel drainage systems according to ASME A112.3.1. Install on support devices so that top will be flush with surface.

K. Assemble FRP channel drainage system components according to manufacturer's written instructions. Install on support devices so that top will be flush with adjacent surface.

L. Install flashing fittings on sanitary stack vents and vent stacks that extend through roof.

M. Install through-penetration firestop assemblies in stacks at floor penetrations.

N. Install roof drains at low points of roof areas according to roof membrane manufacturer's written installation instructions. Roofing materials are specified in Division 07.

1. Position roof drains for easy access and maintenance. Are sump receivers being provided. Coordinator with architectural details for installation.

O. Assemble overflow drain fittings and install with top of water collar 2 inches above roof surface.

P. Install trap-seal primer fittings on outlet of floor drains or floor sinks that require trap-seal primer connection.

1. Exception: Fitting may be omitted if P-trap has trap-seal primer connection.
2. Size: Same as floor drain or floor sink outlet.

Q. Install air-gap fittings on draining-type backflow preventers and on indirect-waste piping discharge into sanitary drainage system.

R. Install reinforcement in wall for wall-mounting-type specialties.

S. Install traps on plumbing specialty drain outlets. Omit traps on indirect wastes unless trap is indicated.

T. Install escutcheons at wall, floor, and ceiling penetrations in exposed finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding pipe fittings.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

3.3 FLASHING INSTALLATION

A. Fabricate flashing from single piece unless large pans, sumps, or other drainage shapes are required. Join flashing according to the following if required:

1. Copper Sheets: Solder joints of copper sheets.

3.4 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near all the equipment on the project.

B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit. Nameplates and signs are specified in Division 22 Section 22 0553 "Identification for Plumbing."

3.6 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION 22 1319

SECTION 22 1323 - WASTE INTERCEPTORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes the following types of interceptors typically installed outside of the building:
   1. Grease interceptors.
   2. Fiberglass holding tanks.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of interceptor indicated. Include materials of fabrication, dimensions, rated capacities, retention capacities, operating characteristics, size and location of each pipe connection, furnished specialties, sealant, and accessories.

B. Shop Drawings: For each type and size of precast-concrete interceptor or holding tank indicated.

   1. Include materials of construction, dimensions, rated capacities, retention capacities, location and size of each pipe connection, furnished specialties, and accessories.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Interceptors, drawn to scale, on which the following items are shown and coordinated with each other, based on input from Installers of the items involved:

   1. Interceptors or holding tank.
   2. Piping connections. Include size, location, and elevation of each.
   3. Interface with underground structures and utility services.

B. Warranty: Special warranty

C. Seismic Qualification: Manufacturer’s certification of seismic qualification according to ASCE 7-05. Submit ASCE 7-05 special seismic certification as required. Include method used to determine compliance with requirements.

   1. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

2. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

PART 2 - PRODUCTS

2.1 GREASE INTERCEPTORS

A. Concrete Grease Interceptors: Precast concrete complying with ASTM C 1613.

1. Basis of Design: Jensen Precast, or equal.
2. Class 1 concrete with design strength of 4500 PSI at 28 days. Unit shall be of monolithic construction at floor and wall. Unit shall be rated for H-20 loading.
3. Interceptor shall be designed for H-20-44 traffic loading as defined by AASHTO. Structural reinforcement placement shall be in accordance to ACI. All reinforcement steel shall comply with ASTM A615 grade 60 or ASTM A706 grade 60. Bar bending shall comply with latest ACI standards.
4. Lifting inserts to be installed for handling and be installed per manufacturer's requirements.
5. Include rubber-gasketed joints, vent connections, manholes, compartments or baffles, and piping or openings to retain grease and to permit wastewater flow.
6. Resilient Pipe Connectors: ASTM C 923, cast or fitted into interceptor walls, for each pipe connection.
7. Sealant: A water based acrylic concrete sealant equal to ConSeal CS-55 shall be applied to all surfaces on both the interior and the exterior of the interceptor. The coating shall be factory applied, and 10-12 mils thick.
8. Grade Rings: Reinforced-concrete rings, 6- to 9-inch total thickness, to match diameter of manhole frame and cover. Manhole shall be installed flush with finished grade.
9. Manhole Frames and Covers: Ferrous; 24-inch ID by 7- to 9-inch riser with 4-inch-minimum width flange and 26-inch-diameter cover.

2.2 UNDERGROUND FIBERGLASS HOLDING TANKS.

A. Basis of design manufacturer: Xerxes Corporation Fiberglass reinforced plastic (FRP) tanks, or equal.

1. Capacities and characteristics shall be as stated on the drawings.
2. Tank shall be manufactured with structural ribs which are fabricated as in integral part of the tank wall.
3. Tank shall be manufactured with a laminate consisting of resin and glass fiber reinforcement only. No sand/silica fillers or resin extenders shall be used.
4. Tank shall be vented to atmospheric pressure.
5. Tank shall be capable of handling liquids with specific gravity up to 1.1.
6. Tank shall be compatible with liquids identified in the manufacturer's standard limited warranty.

B. Loading Conditions - Tank shall meet the following design criteria.

1. Internal Load - Tank shall be designed to withstand a 5-psig (35 kPa) air-pressure test with a 5:1 safety factor.
2. Surface Loads - Tank shall be designed to withstand surface H-20 and HS-20 axle loads when properly installed according to manufacturer's current Installation Manual and Operating Guidelines.
3. External Hydrostatic Pressure - Tank shall be designed for 7 feet (2.1 m) of overburden over the top of the tank, the hole fully flooded, and a safety factor of 5:1 against general buckling.

C. Fire Water Detention Applications:
1. Governing Standards, as applicable:
   a. ANSI/AWWA D120 - Thermosetting Fiberglass-Reinforced Plastic Tanks.
   b. American Concrete Institute (ACI) standard ACI 318, Building Code Requirements for Structural Concrete.
   c. Tank manufacturer shall be recognized by Underwriters Laboratories (UL) as a manufacturer of tanks listed to the UL-1316 standard.
2. Tank Design: Single-Wall as stated on the drawings.
3. Tank Accessories - Fire Water Detention Applications:
   a. Tank Anchoring:
      1) Anchor straps shall be as supplied by tank manufacturer and designed for a maximum load of 25,000 lbs.
      2) Galvanized turnbuckles shall be supplied by the tank manufacturer.
      3) Prefabricated concrete anchors shall be supplied by the tank manufacturer, designed to the ACI 318 standard, manufactured with 4,000 psi concrete and shall have adjustable anchor points.
   b. Piping and fittings:
      1) Tank shall be equipped with factory-installed threaded fittings, or pipe stubs.
      2) PVC piping shall at a minimum meet the requirements of ANSI Schedule 40.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Excavating, trenching, and backfilling are specified in Division 31 Section 31 2000 "Earth Moving."

3.2 INSTALLATION

A. Fiberglass tank shall be installed according to the tank manufacturer's Installation Manual and Operating Guidelines in effect at time of installation

B. Install precast-concrete interceptors according to ASTM C 891.

C. Comply with mounting and anchoring requirements for seismic installations.

D. Set all interceptors level and plumb.

E. Install interceptor inlets and outlets at elevations indicated on the drawings.

F. Install manhole risers from top of underground interceptors to frames and covers at finished grade.

G. Set tops of manhole frames and covers flush with finished surface in pavements. Set tops 3 inches above finish surface elsewhere, unless otherwise indicated.

H. Repair and restore protective coatings to original condition.

I. Install all interceptors per the manufacturer’s recommendations.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Make piping connections between interceptors and piping systems.

3.4 IDENTIFICATION

A. Identification materials and installation are specified in Division 31 Section 31 2000 "Earth Moving." Arrange for installation of green warning tapes directly over piping and at outside edges of underground interceptors.

1. Use warning tapes or detectable warning tape over ferrous piping.
2. Use detectable warning tape over nonferrous piping and over edges of underground structures.

3.5 TESTING

A. Tank shall be tested according to the tank manufacturer's Installation Manual and Operating Guidelines in effect at time of installation.

END OF SECTION 22 1323

SECTION 22 1329 – SANITARY SEWERAGE AND LAB WASTE PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following sewage pumps and accessories for sanitary drainage piping systems in buildings:

1. Sanitary Sewer pumps: Submersible
2. Lab Waste pumps: Vertical frame mounted.
3. Sewage/waste and lab waste pumps basins.

1.2 SUBMITTALS

A. Product Data: For each type and size of sewage pump specified. Include certified performance curves with operating points plotted on curves; and rated capacities of selected models, furnished specialties, and accessories.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Operation and Maintenance Data: For each sewage and lab waste pump to include in emergency, operation, and maintenance manuals.

1.3 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of sewage/lab waste pumps and are based on the specific system indicated. Refer to Division 01 Section 01 6000 "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70), Article 100, by a testing agency acceptable to University’s Representative, and marked for intended use.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Retain shipping flange protective covers and protective coatings during storage.

B. Protect bearings and couplings against damage.

C. Comply with pump manufacturer's written rigging instructions for handling.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 SE-1 SUBMERSIBLE SEWAGE/WASTE PUMPS

A. Manufacturers:
1. Weil Pump Company, Inc.
2. Goulds Pumps; ITT Industries.
3. Flygt; ITT Industries.
4. HOMA Pump Technology.
5. Or equal.

B. Submersible, Factory-assembled and tested, sewage pump unit. Each pump shall be a submersible, end-suction, single-stage, close-coupled, overhung-impeller, centrifugal pump as defined in ANSI HI 1.1-1.2 and HI 1.3. Capacities and characteristics shall be as scheduled on the drawings.

1. Pump Casing: Cast iron, with open inlet, legs that elevate pump to permit flow into impeller, and discharge fittings for connection to guide rail support.
2. Impeller: Statically and dynamically balanced, ASTM A 48/A 48M, Class No. 25 A cast iron, non-clog, open or semi-open design for solids handling, and keyed and secured to shaft.
3. Guide-Rail Supports: Include the following for each sewage pump:
    a. Guide Rails: Vertical pipes or structural members, made of galvanized or stainless steel attached to baseplate and basin sidewall or cover.
    b. Baseplate: Corrosion-resistant metal plate, attached to basin floor, supporting guide rails and stationary elbow.
    c. Pump Yoke: Motor-mounted or casing-mounted yokes or other attachments for aligning pump during connection of flanges.
    d. Sliding Pump Bracket: Constructed of heavy duty ASTM A48-53 Class 30 cast iron. The sliding bracket shall act as a wedge type coupling between the pump and stationary elbow.
    e. Stationary Elbow: ASTMA48-53 Class 30 cast iron shall be fixed and shall permit the removal of pump without disturbing the discharge piping. ANSI flange connection shall be used for connection of discharge pipe.
    f. Lifting Cable: Stainless steel; attached to pump and cover at manhole.

C. Controls: NEMA 250, Type 12 wall mounted enclosure, pedestal-mounted float switches; with floats, float rods, and rod buttons. Include automatic alternator to alternate operation of pump units on successive cycles and to operate multiple units if one pump cannot handle load.

1. Float Guide: Pipe or other restraint for floats and rods in basins of depth greater than 60 inches.

    a. High-Water Alarm: Cover-mounted, compression-probe alarm, with electric bell; 120-V ac, with transformer and contacts for remote alarm bell.

2.3 SE-2 VERTICAL LAB WASTE PUMPS

A. Manufacturers:

1. Weil Pump Company, Inc.
2. Gorman-Rupp
3. Zoeller Pump Company
4. Or equal.

D. Description: Factory-assembled and -tested, single-stage, centrifugal, self-priming, end-suction sewage pumps complying with UL 778. Horizontal, separately coupled, or belt-driven.

1. Pump Arrangement: Duplex.
2. Casing: Stainless, with flanged outlet connections for NPS 2-1/2 and larger discharge piping.
3. Impeller: Stainless steel statically and dynamically balanced, , and keyed and secured to shaft.
4. Pump Shaft and Sleeve Bearings: Stainless-steel shaft and ball bearings. Mechanically oil lubricated. Oil sight glasses.
5. Pump and Motor Shaft Coupling (Direct drive): Flexible, capable of absorbing torsional vibration and shaft misalignment.

E. Pump Discharge Piping: Refer to Section 22 6000 for appropriate lab waste system piping material.

F. Motor: Totally enclosed, single-speed; Comply with requirements in Division 22 Section 22 0513 "Motors for Plumbing."

1. Mounting: Vertical on base pit-mount.

G. Controls: NEMA 250, Type 12 wall mounted enclosure, pedestal-mounted float switches; with floats, float rods, and rod buttons. Include automatic alternator to alternate operation of pump units on successive cycles and to operate multiple units if one pump cannot handle load.

1. Float Guide: Pipe or other restraint for floats and rods in basins of depth greater than 60 inches.

2. High-Water Alarm: Cover-mounted, compression-probe alarm, with electric bell; 120-V ac, with transformer and contacts for remote alarm bell.

2.4 SEWAGE PUMP BASINS

A. Description: Factory fabricated reinforced fiberglass basin, pipe connections, and separate cover.

B. Basin: Fabricate watertight, with sidewall openings for pipe connections.

1. Material: Fiberglass.
2. Reinforcement: Mounting plates for pumps, fittings, guide-rail supports, and/or accessories.

3. Anchor Flange: Same material as or compatible with basin, cast into the bottom of the basin.

C. Cover: Fabricate with openings having gaskets, seals, and bushings for inspection and access to, control rods and wiring, suction piping and vent connections.

1. Material: Stainless steel capable of supporting foot traffic.

2.5 FLEXIBLE CONNECTORS

A. Manufacturers:

1. Flex-Hose Co., Inc.
2. Hyspan Precision Products, Inc.
3. Mercer Rubber.
4. Metraflex, Inc.
5. Or equal.

B. Description: 125-psig minimum working-pressure rating and ends matching pump connections:

1. Bronze Flexible Connectors: Corrugated, bronze inner tubing covered with bronze wire braid. Include copper-tube ends or bronze flanged ends, braze-welded to tubing.
2. Stainless-Steel Flexible Connectors: Corrugated, stainless-steel inner tubing covered with stainless-steel wire braid. Include stainless-steel nipples or flanges, welded to tubing.

2.6 BUILDING AUTOMATION SYSTEM INTERFACE

A. Provide auxiliary contacts in pump controllers for BACNET interface to building automation system. Include the following:

1. On-off status of each pump.
2. Alarm status.
3. Sequence each pump on and off.
4. High level alarm.
5. Malfunction alarm.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for plumbing piping to verify actual locations of sanitary drainage and vent piping connections before sewage pump installation.

3.2 INSTALLATION

A. Excavating, trenching, and backfilling are specified in Division 31 Section 31 2000 "Earth Moving."

B. Install sewage and lab waste pumps according to applicable requirements in ANSI HI 1.4.

C. Install pumps and arrange to provide access for maintenance including removal of motors, impellers, couplings, and accessories.

D. Set submersible pumps on basin floors. Make direct connections to the drainage piping

E. Mount vertical lab waste pumps from basin covers. Make direct connections to drainage piping.

F. Install fiberglass basins in accordance with manufacturer’s installation instructions and connect to drainage and vent piping. Brace interior of basins according to manufacturer's written instructions to prevent distortion or collapse. Set basin cover and fasten to basin top flange. Install cover so top surface is flush with finished floor or grade. Support piping so weight of piping is not supported by pumps. Backfill in accordance with manufacturer’s instructions.

3.3 CONNECTIONS

A. Piping installation requirements are specified in Division 22 Section 22 1316 "Sanitary Waste and Vent Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to sewage pumps to allow service and maintenance.

C. Connect sanitary sewage/lab waste and vent piping to pumps and basins. Install discharge piping equal to or greater than size of pump discharge piping. Install vent piping equal to or greater than size of pump basin vent connection. Refer to Division 22 Sections 22 1316 and 22 60000.

1. Install flexible connectors adjacent to pumps in discharge piping.
2. Install check and shutoff valves on discharge piping from each pump. Install unions on pumps having threaded pipe connections. Install valves same size as connected piping. Refer to Division 22 Sections 22 1116 and 22 6700 " for general-duty valves for sanitary/lab waste piping.

D. Ground equipment according to Division 26 Section 26 0526 "Grounding and Bonding for Electrical Systems."

E. Connect wiring according to Division 26 Section 26 0519 "Low Voltage Electrical Power Conductors and Cables."

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Verify bearing lubrication.
3. Disconnect couplings and check motors for proper direction of rotation.
4. Verify that each pump is free to rotate by hand. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.
5. Verify that pump controls are correct for required application.

B. Start pumps without exceeding safe motor power:

1. Start motors.
2. Open discharge valves slowly.
3. Check general mechanical operation of pumps and motors.

C. Test and adjust controls and safeties.

D. Remove and replace damaged and malfunctioning components.

1. Pump Controls: Set pump controls for automatic start, stop, and alarm operation as required for system application.
2. Set field-adjustable switches and circuit-breaker trip ranges as indicated, or if not indicated, for normal operation.

E. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project outside normal occupancy hours for this purpose.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's maintenance personnel to adjust, operate, and maintain controls and pumps. Refer to Division 01 Section 01 7900 "Demonstration and Training."

END OF SECTION 22 1329

SECTION 22 1413 - STORM DRAINAGE PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following storm drainage piping inside the building and to 5 feet outside the building:

1. Pipe, tube, and fittings.
2. Special pipe fittings.
3. Encasement for underground metal piping.

B. Related Sections include the following:

1. Division 22 Section 22 1423 "Storm Drainage Piping Specialties".

1.2 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressure, unless otherwise indicated:

1. Storm Drainage Piping: 10-foot head of water
2. Storm Drainage, Force-Main Piping: 75 psig

B. Seismic Performance: Storm drain piping and support and installation shall be capable of withstanding the effects of seismic events determined according to CBC, Edition 2001, Seismic Zone 4 requirements.

1.3 SUBMITTALS

A. Product Data: For pipe, tube, fittings, and couplings.

B. Shop Drawings:

1. Design Calculations: Signed and sealed by a qualified registered California professional engineer for selecting seismic restraints.

C. Field quality-control inspection and test reports.

1.4 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Piping and fittings shall be manufactured in the United States, Australia, Canada or Japan.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

2.3 HUBLESS CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings: ASTM A 888 or CISPI 301.

B. Shielded Couplings: ASTM C 1277 assembly of metal shield or housing, corrosion-resistant fasteners, and rubber sleeve with integral, center pipe stop.

1. Heavy-Duty, Shielded, Stainless-Steel Couplings: With stainless-steel shield, minimum four stainless-steel bands and tightening devices, and ASTM C 564, rubber sleeve.

a. Manufacturers:

1) ANACO., Husky Series SD-4000
2) Or equal.

2.4 STEEL PIPE AND FITTINGS.

A. Steel Pipe: ASTM A 53/A 53M, Type E or S, Grade B, Schedule 40, galvanized. Include ends matching joining method.

B. Drainage Fittings: ASME B16.12, galvanized, threaded, cast-iron drainage pattern.

C. Pressure Fittings:

1. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M or ASTM A 106, Schedule 40, galvanized, seamless steel pipe. Include ends matching joining method.

2. Malleable-Iron Unions: ASME B16.39; Class 150; hexagonal-stock body with ball-and socket, metal-to-metal, bronze seating surface; and female threaded ends.
3. Gray-Iron, Threaded Fittings: ASME B16.4, Class 125, galvanized, standard pattern.
4. Cast-Iron, Flanged Fittings: ASME B16.1, Class 125, galvanized.

2.6 COPPER TUBE AND FITTINGS

A. Copper DWV Tube: ASTM B 306, drainage tube, drawn temper.

1. Copper Drainage Fittings: ASME B16.23, cast-copper or ASME B16.29, wrought copper, solder-joint fittings.

B. Hard Copper Tube: ASTM B 88, Types L and M, water tube, drawn temper.

1. Copper Pressure Fittings: ASME B16.22, wrought-copper, solder-joint fittings.
2. Copper Flanges: ASME B16.24, Class 150, cast copper with solder-joint end.
3. Copper Unions: MSS SP-123, copper-alloy, hexagonal-stock body with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

2.7 SPECIAL PIPE FITTINGS

A. Flexible, Nonpressure Pipe Couplings: Comply with ASTM C 1173, elastomeric, sleeve-type, reducing or transition pattern. Include shear ring, ends of same sizes as piping to be joined, and corrosion-resistant-metal tension band and tightening mechanism on each end.

1. Manufacturers:

a. Dallas Specialty & Mfg. Co.
b. Fernco, Inc.
c. Logan Clay Products Company (The).
d. Mission Rubber Co.
e. NDS, Inc.
f. Plastic Oddities, Inc.
g. Or equal.

2. Sleeve Materials:

a. For Cast-Iron Soil Pipes: ASTM C 564, rubber.
b. For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.

B. Shielded Non-pressure Pipe Couplings: ASTM C 1460, elastomeric or rubber sleeve with full length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.

1. Manufacturers:

    a. Cascade Waterworks Mfg. Co.
    b. Mission Rubber Co.
    c. Or equal.

2.8 ENCASEMENT FOR UNDERGROUND METAL PIPING

A. Description: ASTM A 674 or AWWA C105, LLDPE film of 0.008-inch minimum thickness.

B. Form: tube.

C. Color: Black.

PART 3 - EXECUTION

3.2 PIPING APPLICATIONS

A. Flanges and unions may be used on aboveground pressure piping, unless otherwise indicated.

B. Aboveground storm drainage piping NPS 2 and larger shall be any of the following:

1. Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings; and coupled joints.
2. Steel pipe, drainage fittings, and threaded joints..
3. Copper DWV tube, copper drainage fittings, and soldered joints.
4. Dissimilar Pipe-Material Couplings: Flexible, non-pressure pipe couplings for joining dissimilar pipe materials with small difference in OD.

C. Underground storm drainage piping NPS 6 and smaller shall be any of the following:

1. Hubless cast-iron soil pipe and fittings; heavy-duty shielded, stainless-steel couplings; and coupled joints.
2. Dissimilar Pipe-Material Couplings: Flexible, non-pressure pipe couplings for joining dissimilar pipe materials with small difference in OD.

D. Underground, storm drainage piping NPS 8 and larger shall be the following:

1. Hubless cast-iron soil pipe and fittings; shielded, stainless-steel couplings; and coupled joints.
2. Dissimilar Pipe-Material Couplings: Flexible, non-pressure pipe couplings for joining dissimilar pipe materials with small difference in OD.

3.3 PIPING INSTALLATION

A. Storm sewer and drainage piping outside the building are specified in Division 33 Section 33 4100 "Storm Utility Drainage Piping"

B. Basic piping installation requirements are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

C. Install seismic restraints on piping. Seismic-restraint devices are specified in Division 22 Section 22 0548 "Vibration and Seismic Controls. For Plumbing"

D. Install cleanouts at grade and extend to where building storm drains connect to building storm sewers. Cleanouts are specified in Division 22 Section 22 1319 "Sanitary Waste Piping Specialties."

E. Install cast-iron sleeve with water stop and mechanical sleeve seal at each service pipe penetration through foundation wall. Select number of interlocking rubber links required to make installation watertight. Sleeves and mechanical sleeve seals are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

F. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

1. Install encasement on underground piping according to ASTM A 674 or AWWA C105.

G. Make changes in direction for storm drainage piping using appropriate branches, bends, and long-sweep bends. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.

H. Lay buried building storm drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements.

I. Install storm drainage piping at the following minimum slopes, unless otherwise approved by University’s Representative:

1. Building Storm Drain: Slope pipe at percent downward in direction of flow in accordance with CPC .requirments.

J. Do not enclose, cover, or put piping into operation until it is inspected and approved by University’s Representative.

3.4 JOINT CONSTRUCTION

A. Basic piping joint construction requirements are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

B. Hubless Cast-Iron Soil Piping Coupled Joints: Join according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-coupling joints.

C. Soldered Joints: Use ASTM B 813, water-flushable, lead-free flux; ASTM B 32, lead-free alloy solder; and ASTM B 828 procedure, unless otherwise indicated.

3.6 HANGER AND SUPPORT INSTALLATION

A. Seismic-restraint devices are specified in Division 22 Section 22 0548 "Vibrations and Seismic Controls for Plumbing."

B. Pipe hangers and supports are specified in Division 22 Section 22 0529 "Hangers and Supports for Plumbing."

C. Install supports according to Division 22 Section 22 0529 "Hangers and Supports for Plumbing."

D. Support vertical piping and tubing at base and at each floor in accordance with CPC requirements.

E. Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch minimum rods.

F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:.

1. Comply with CPC Section 313, Table 313.1 and 313.6.
2. Support adjacent to a joint, not exceeding 18 inches from joint.
3. Hangers shall not be placed on couplings. Provide 3/8” rod size up to NPS 2, 1/2” rod for NPS 3, 5/8” rod for NPS 4 and NPS5, 3/4” rod for NPS 6 and 7/8” rod for NPS 8 through NPS 12.

G. Install supports for vertical cast-iron soil piping every floor to floor.

H. Install supports for vertical steel piping every floor to floor.

I. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters in accordance with CPC Tables 313.1 and 313.6..

J. Install supports for vertical copper tubing in accordance with CPC requirements.

K. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.7 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect interior storm drainage piping to exterior storm drainage piping. Use transition fitting to join dissimilar piping materials.

C. Connect storm drainage piping to roof drains and storm drainage specialties.

3.8 FIELD QUALITY CONTROL

A. During installation, notify University's Representative at least 72 hours before inspection must be made. Perform tests specified below in presence of the University's Representative.

1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in.
2. Final Inspection: Arrange for final inspection by University's Representative to observe tests specified below and to ensure compliance with requirements.

B. Re-inspection: If University's Representative find that piping will not pass test or inspection, make required corrections and arrange for re-inspection.

C. Reports: Prepare inspection reports and have them signed by University's Representative.

D. Test storm drainage piping according to procedures of California Plumbing Code or, in absence of published procedures, as follows:

1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
2. Leave uncovered and unconcealed new, altered, extended, or replaced storm drainage piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.

3. Test Procedure: Test storm drainage piping on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 15 minutes before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
4. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
5. Prepare reports for tests and required corrective action.

E. The University shall run a camera through storm piping upon substantial completion of the project. Any broken or damaged new or existing affected pipe found shall be repaired as part of the basic contract..

3.9 CLEANING

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

END OF SECTION 22 1413

SECTION 22 1423 - STORM DRAINAGE PIPING SPECIALTIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Roof and overflow drains.
2. Miscellaneous storm drainage piping specialties.
3. Cleanouts.
4. Backwater valves through-penetration firestop assemblies. Recommend single vendor/contractor provide all.
5. Flashing materials. Provided by roofing contractor.

1.2 SUBMITTALS

A. Product Data: For each type of product indicated.

1.3 QUALITY ASSURANCE

A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

PART 2 - PRODUCTS

2.1 METAL ROOF DRAINS

A. Cast-Iron, Large-Sump, General-Purpose Roof Drains:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Josam Company.
b. Marathon Roofing Products.
c. MIFAB, Inc.
d. Smith, Jay R. Mfg. Co.
e. Tyler Pipe.
f. Watts Water Technologies, Inc.
g. Zurn Plumbing Products Group; Specification Drainage Operation.
h. Or Equal.

2. Standard: ASME A112.6.4, for general-purpose roof drains.

3. Body Material: Cast iron.
4. Dimension of Body: Nominal 14-inch diameter.
5. Combination Flashing Ring and Gravel Stop: Required.
6. Flow-Control Weirs: Not required.
7. Outlet: Bottom.
8. Extension Collars: Required.
9. Underdeck Clamp: Required.
10. Expansion Joint: Not Required.
11. Sump Receiver Plate: Required.
12. Dome Material: Rough cast-iron.
13. Perforated Gravel Guard: Not required
14. Vandal-Proof Dome: Not required.
15. Water Dam: 2 inches high for Overflow Drains.

B. Cast-Iron, Medium-Sump, General-Purpose Roof Drains: Only for smaller areas, and approved by the University Representative in writing.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Josam Company.
    b. MIFAB, Inc.
    c. Smith, Jay R. Mfg. Co.
    d. Tyler Pipe.
    e. Watts Water Technologies, Inc.
    f. Zurn Plumbing Products Group; Light Commercial Products Operation.
    g. Zurn Plumbing Products Group; Specification Drainage Operation.
    h. Or Equal.

2. Standard: ASME A112.6.4, for general-purpose roof drains.
3. Body Material: Cast iron.
4. Dimension of Body: 8- to 12-inch diameter.
5. Combination Flashing Ring and Gravel Stop: Required.
6. Flow-Control Weirs: Not required.
7. Outlet: Bottom.
8. Extension Collars: Required.
9. Underdeck Clamp: Required.
10. Expansion Joint: Not required.
11. Sump Receiver Plate: Required.
12. Dome Material: Roughcast-iron.
13. Wire Mesh: Not requried.
14. Perforated Gravel Guard: Not required.
15. Vandal-Proof Dome: Required.
16. Water Dam: 2 inches high for overflow drains.

C. Metal, Medium-Sump, Promenade Roof Drains:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Josam Company.
    b. MIFAB, Inc.
    c. Smith, Jay R. Mfg. Co.
    d. Tyler Pipe.
    e. Zurn Plumbing Products Group; Specification Drainage Operation.
    f. Or Equal.

2. Standard: ASME A112.6.4, for promenade roof drains.
3. Body Material: Cast iron.
4. Dimension of Body: minimum **12-inch** diameter.
5. Dimension of Frame and Grate: Nominal **12 inches** square.
6. Outlet: Bottom.
7. Grate Material: Nickel-bronze alloy.
8. Vandal-Proof Grate: Required.
9. Extension Collars: Required.
10. Expansion Joint: Not required.

2.2 MISCELLANEOUS STORM DRAINAGE PIPING SPECIALTIES

A. Downspout Adaptors:

1. Description: Manufactured, gray-iron casting, for attaching to horizontal-outlet, parapet roof drain and to exterior, sheet metal downspout.
2. Size: Inlet size to match parapet drain outlet.

B. Downspout nozzle:

1. Description: Manufactured, ASTM A 48/A 48M, bronze casting, with strap or ears for attaching to building; NPS 4 outlet; and shop-applied bituminous coating.
2. Size: Inlet size to match downspout and NPS 4 outlet.

C. 2.3 CLEANOUTS

A. Floor Cleanouts:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Josam Company.
    b. Oatey.
    c. Sioux Chief Manufacturing Company, Inc.
    d. Smith, Jay R. Mfg. Co.
    e. Tyler Pipe.
    f. Watts Water Technologies, Inc.
    g. Zurn Plumbing Products Group; Light Commercial Products Operation.
    h. Zurn Plumbing Products Group; Specification Drainage Operation.

i. Or Equal.

2. Standard: ASME A112.36.2M, for heavy-duty, adjustable housing] cleanouts.
3. Size: Same as connected branch.
4. Type: Heavy-duty, adjustable housing.
5. Body or Ferrule Material: Cast iron.
6. Clamping Device: Required.
7. Outlet Connection: Inside calk or gasket.
8. Closure: Brass plug with tapered threads.
9. Adjustable Housing Material: Cast iron with threads, set-screws or other device.
10. Frame and Cover Material and Finish: Nickel-bronze, copper alloy.
11. Frame and Cover Shape: Round or Square.
12. Top-Loading Classification: Heavy Duty.
13. Riser: ASTM A 74, Service class, cast-iron drainage pipe fitting and riser to cleanout.

B. Test Tees:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Josam Company.
b. MIFAB, Inc.
c. Smith, Jay R. Mfg. Co.
d. Tyler Pipe.
e. Watts Water Technologies, Inc.
f. Zurn Plumbing Products Group; Specification Drainage Operation.
g. Or Equal.

2. Standard: ASME A112.36.2M and ASTM A 74, ASTM A 888, or CISPI 301, for cleanout test tees.
3. Size: Same as connected drainage piping.
4. Body Material: Hub-and-spigot, cast-iron soil-pipe T-branch or hubless, cast-iron soilpipe test tee as required to match connected piping.
5. Closure Plug: Countersunk brass.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.

C. Wall Cleanouts:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Josam Company.
b. MIFAB, Inc.
c. Smith, Jay R. Mfg. Co.
d. Tyler Pipe.
e. Watts Water Technologies, Inc.
f. Zurn Plumbing Products Group; Specification Drainage Operation.
g. Or Equal.

2. Standard: ASME A112.36.2M, for cleanouts. Include wall access.
3. Size: Same as connected drainage piping.
4. Body Material: Hubless, cast-iron soil-pipe test tee as required to match connected piping.
5. Closure: Countersunk brass plug.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.
7. Wall Access: Round, flat, chrome-plated brass or stainless-steel cover plate with screw.
8. Wall Access: Round, or stainless-steel wall-installation frame and cover.

2.4 BACKWATER VALVES

A. Cast-Iron, Horizontal Backwater Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Josam Company.
    b. MIFAB, Inc.
    c. Smith, Jay R. Mfg. Co.
    d. Tyler Pipe.
    e. Watts Water Technologies, Inc.
    f. Zurn Plumbing Products Group; Specification Drainage Operation.
    g. Or Equal.

2. Standard: ASME A112.14.1, for backwater valves.
3. Size: Same as connected piping.
4. Body Material: Cast iron.
5. Cover: Cast iron with bolted or threaded access check valve.
6. End Connections: hubless.
7. Check Valve: Removable, bronze, swing check, factory assembled or field modified to hang open for airflow unless subject to backflow condition.
8. Extension: ASTM A 74, Service class; full-size, cast-iron soil-pipe extension to field installed cleanout at floor; replaces backwater valve cover.

B. Cast-Iron, Drain-Outlet Backwater Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Josam Company.
    b. Smith, Jay R. Mfg. Co.
    c. Watts Water Technologies, Inc.
    d. Zurn Plumbing Products Group; Specification Drainage Operation.
    e. Or Equal.

2. Size: Same as floor drain outlet.

3. Body Material: Cast iron or bronze made for vertical installation in bottom outlet of floor drain.
4. Check Valve: Removable ball float.
5. Inlet: Threaded as applicable.
6. Outlet: Threaded or spigot.

2.6 THROUGH-PENETRATION FIRESTOP ASSEMBLIES Recommend these be provided by one vendor/contractor.

A. Through-Penetration Firestop Assemblies:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. ProSet Systems Inc.
   b. Or Equal.

2. Standard: ASTM E 814, for through-penetration firestop assemblies.
3. Certification and Listing: Insert testing agency acceptable to University Representative for through-penetration firestop assemblies.
4. Size: Same as connected pipe.
5. Sleeve: Molded PVC plastic, of length to match slab thickness and with integral nailing flange on one end for installation in cast-in-place concrete slabs.
6. Stack Fitting: ASTM A 48/A 48M, gray-iron, hubless-pattern, wye branch with neoprene O-ring at base and gray-iron plug in thermal-release harness. Include PVC protective cap for plug.
7. Special Coating: Corrosion resistant on interior of fittings.

2.7 FLASHING MATERIALS (PROVIDED BY OTHERS) .

A. Copper Sheet: ASTM B 152/B 152M, 12 oz./sq. ft.

B. Zinc-Coated Steel Sheet: ASTM A 653/A 653M, with 0.20 percent copper content and 0.04inch minimum thickness unless otherwise indicated. Include G90 hot-dip galvanized, mill phosphatized finish for painting if indicated.

C. Elastic Membrane Sheet: ASTM D 4068, flexible, chlorinated polyethylene, 40-mil minimum thickness.

D. Fasteners: Metal compatible with material and substrate being fastened.

E. Metal Accessories: Sheet metal strips, clamps, anchoring devices, and similar accessory units required for installation; matching or compatible with material being installed. F. Solder: ASTM B 32, lead-free alloy.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install roof drains at low points of roof areas according to roof membrane manufacturer's written installation instructions. Roofing materials are specified in Division 07 Sections.

1. Install flashing collar or flange on roof drain with sump receiver to prevent leakage between drain and adjoining roofing. Maintain integrity of waterproof membranes where penetrated.
2. Position roof drains for easy access and maintenance.

B. Install downspout adapters on outlet of back-outlet parapet roof drains and connect to sheet metal downspouts.

C. Install downspout nozzle at grade with top 6 inches above grade. Secure to building wall.

D. Install cleanouts in aboveground piping on each floor and building drain piping according to the following instructions unless otherwise indicated. Provide cleanouts where required per CPC Section 707:

1. Use cleanouts the same size as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
2. Locate cleanouts at each change in direction of piping greater than 45 degrees.
3. Locate cleanouts at maximum intervals of 100 feet.
4. Locate cleanouts at base of each vertical stack.
5. For floor cleanouts serving piping below floors, install cleanout deck plates with top flush with finished floor.

E. For cleanouts located on concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

F. ..Install test tees in vertical conductors' cleanouts and near floor.

G. Install wall cleanouts in vertical conductors. Install access door in wall if indicated.

H. Install through-penetration firestop assemblies in plastic conductors at concrete floor penetrations.

I. .

3.2 CONNECTIONS

A. Comply with requirements for piping specified in Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

.3.3 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION 22 1423

SECTION 221454 – RECLAIMED WATER SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes a packaged domestic water treatment system. The "package" system shall be provided, installed and tested by a qualified reclaimed water system contractor/ Vendor. The package system shall consist of turnkey system for disinfection and re-pressurization as indicated on the drawings. System shall ensure disinfection with controlled injection of chemicals (user defined) via side-stream re-circulation loop, so as to maintain a residual disinfection. Disinfection equipment shall include onboard pump, two (2) bag filters with 10 and 2 micron bags respectively, and suction strainer assembly with check (foot) valve. System shall be skid-mounted and include an on-board control panel with system status indicators and alarms, with dry contacts for alarm connection to building control systems. Re-pressurization equipment shall include a duplex alternating vertical multi-stage booster pump system with integral VFD drives. System shall be complete with suction and discharge manifolds and storage tank. The collected water is then used for toilet flushing.

1.3 SUBMITTALS

A. Product Data: Include rated operating characteristics, furnished specialties, and accessories for each type of product indicated.

B. Shop Drawings: Include plans, sections, details (including dimensions and connection sizes), and attachments to other work:

1. Wiring Diagrams: Power, signal, and external control wiring.

C. Operation and maintenance data.

D. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Systems shall be ETL approved for both US and Canada. All applicable electrical components shall be UL listed.

1.5 WARRANTY

A. Special Warranty: Vendor's standard form in which Vendor agrees to repair or replace equipment that fails in materials or workmanship within specified warranty period.
   1. Limited Warranty Period: 1 year from date of system startup. Consult operations manual for full warranty details.

PART 2 - PRODUCTS

2.1 PACKAGED DOMESTIC WATER TREATMENT SYSTEM

A. Vendor's: Subject to compliance with requirements, provide products by one of the following:

B. Experience: The Vendor shall have more than five years' experience with water filtration, chemical injection, and pumping systems.
Basis-of-Design Product: Subject to compliance with requirements, provide product by one of the following:
   1. Water Control Corporation (Ramsey, MN).
   2. Approved Equal.

D. The same Vendor shall be used for the complete system including chemical injector, filtration equipment, pumps, and skid.

2.2 SYSTEM CONSTRUCTION:

A. The domestic water treatment system shall consist of enclosed (2) chemical injection pumps/injection equipment, 2 HP side-stream circulation loop pump, 10 and 2 micron basket filters in 150 psi rated stainless steel housing, control panel with LED system status indicators in NEMA 3R enclosure, and sampling cocks, all mounted on powder-coated aluminum skid.

2.3 MECHANICAL FEATURES:

A. The domestic water treatment system shall disinfect stored water via side stream circulation and chemical injection. Water shall be circulated from tank, into skid system. Chemicals (user defined) shall be injected into circulated water, which shall then be returned to tank. ORP (Oxygen Reduction Potential) meter located on pump suction inlet shall take constant tank oxidation measurements and cycle chemical injection equipment/pump on and off as necessary in order to maintain a residual disinfection in storage tank. Recirculation pump shall filter water through on-board 10 and 2 micron bag filters.

2.4 CONNECTIONS:

A. All piping to and from cistern tanks and domestic water treatment system shall be Schedule 80 PVC. See drawings for connection sizes and locations.

2.5 CONTROLS AND FAIL-SAFE MECHANISMS

A. System shall include on-board electronic controller in NEMA 3R enclosure, with LED system and tank status displays. Controller shall monitor at all times tank water level, tank ORP levels, pump temperatures, and pressure differential through bag filters. Should tank water level drop to suction inlet level, controller shall initiate potable water make-up. Chemical disinfection system shall come online at a programmable interval to disinfect tank water. Should ORP levels in tank drop such that chemical concentrations have fallen, controller shall cycle chemical system on to rebuild concentrations. Should pressure differential through bag filters exceed 9 psi, controller shall indicate that bag filters require changing. Controller shall also monitor pump temperatures to indicate when pumps require re-priming, or strainers require cleaning. Status of all fail-safe functions shall be clearly displayed on LED control panel. System shall include fail-safe alarm light with dry contacts for connection to building monitoring system.

2.6 PERFORMANCE

A. Disinfection levels: The system shall maintain and monitor tank water disinfection levels via ORP (oxygen reduction potential) meter. ORP levels shall be displayed on system control panel.

B. Tank water levels: The system shall monitor tank water levels via tethered mechanical float switch. Tank levels shall not be allowed to drop to lower than suction inlets. If tank water level approaches suction inlet level, potable water make-up shall be initiated in order to maintain suction pump prime

C. Pump temperatures: The system shall monitor pump operating temperatures. If pumps should overheat, system shall revert to standby mode with alarm and indicator light activated.

D. Pressure loss through filters: The system shall monitor pressure differential across any on-board filter housings. If at any time, pressure differential should exceed 9 psid, alarm shall be activated until filters have been serviced.

E. Temperature requirements: Ideal system operating temperatures shall be 50°- 75°F. Minimum operating temperature shall be 35°F. Maximum operating temperature shall be 100°F. System shall not be subjected to freezing temperatures.

2.7 ACCESSORIES

A. Storage tank: Molded polyethylene horizontal or vertical liquid storage tank, by Norwesco, or equal.

B. Booster pump system: Shall be a duplex alternating vertical multi-stage pump package. Pumps shall include an integral VFD drive and communication cable. System shall be skid mounted and include stainless steel suction and discharge manifolds.

C. Fresh water by-pass: Shall be installed on the downstream side of the booster pump system and shall consist of reduced pressure zone assembly, pressure reducing valve, two check valves. PRV to be set 5 to 10 PSI below the booster pump set pressure.

D. Vendor's: Subject to compliance with requirements, provide products by one of the following

E. Experience: The Vendor shall have more than five years' experience with water filtration, chemical injection, and pumping systems. Basis-of-Design Product: Subject to compliance with requirements, provide product by one of the following:

1. Water Control Corporation (Ramsey, MN).

2. Approved equal.

3. The same Vendor shall be used for the complete system including chemical injector, filtration equipment, pumps, and skid.

PART 3 - EXECUTION

3.1 APPLICATIONS

A. Install domestic water treatment system: Packaged treatment system with side-stream circulation/chemical injection system, on-board filtration, pressure pump, pressure tank with pressure switch, controls, fail-safe systems, storage tanks, pre-filters, and accessories.

3.2 INSTALLATION

A. Install domestic water treatment system according to the drawings and the Vendor's instructions. The installer shall be responsible for providing a functional system, installed in accordance with applicable national and local requirements.

B. Install and secure storage tanks per Vendor's instructions. Consult Vendor's to determine optimal inlet/outlet connection locations. Above ground tanks shall be mounted on poured concrete base. Tank overflow(s) shall run to storm sewer/grade per civil engineer instructions.

C. Install sanitation and re-pressurization system for domestic water.
1. Install skid system on concrete pad in mechanical room or other location providing protection from freezing and other harmful elements.
2. Connect suction strainers to tank outlets on inside of tank, with check (foot) valves located on exterior side of tank outlets. Suction strainers should be minimum 6" from tank bottom, where possible. Where necessary, consult Vendor to determine optimal configuration.

3. Connect system suction inlets to suction strainer outlets -- and chemical circulation return outlet to cistern tank using Schedule 80 PVC. Chemical circulation return line should be minimum 25' in length to ensure adequate oxidation (snake pipe if necessary to achieve distance).
4. Tether tank float to tank top per Vendor instructions.

D. Electrical Connections and Grounding: System requires separate sources of power;
1. 460/230-208 Volts 3 Phase power for the disinfection system pump.
2. 120 Volts single phase for the System Control and Disinfection apparatus.
3. 460/230-208 Volt 3 Phase power for the booster pump system.
4. Power lines shall be supplied from a building service box, which includes proper connections and circuit breakers with quick disconnection mechanism, and sized according to system requirements (see drawings). Wiring shall conform to local electrical codes and requirements and must be performed by a licensed electrical contractor. Electrical inspection shall be performed, and inspection notice approved, by an authorized approval agency.

E. Authorized factory representative shall perform final (on-site) system activation, calibration, and training.

3.3 FIELD QUALITY CONTROL

A. Verification: Authorized Vendor representative shall provide final inspection and verification of system installation and operation.

3.4 PIPING SCHEDULE

A. Above ground reclaimed water piping system shall be as specified in Division 22 Section 22 1116 "Domestic Water Piping and Valves"

3.5 PIPING INSTALLATION

A. Copper pipe and tube shall be installed as described in Division 22 Section 22 1116 "Domestic Water Piping and Valves".

B. Reclaimed water piping shall be wrapped or painted purple and labelled in accordance with requirements described for chapter 16A Non-Potable Water Reuse Systems of the 2013 California Plumbing Code.

END OF SECTION 221454

22 1513 - GENERAL-SERVICE COMPRESSED-AIR PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes piping and related specialties for general-service compressed-air systems operating at 125 psig and less.

B. Related Sections include the following:

1. Division 22 Section 22 0516 "Meters and Gages for Plumbing" for thermometers and pressure gages.
2. Division 22 Section 22 1519 "General-Service Packaged Compressed-Air Equipment" for compressed-air equipment and accessories.
3. Division 22 Section 22 0529 "Hangers and Supports for Plumbing Piping and Equipment" for piping support requirements.

1.2 DEFINITIONS

A. Retain abbreviations and definitions that remain after this Section has been edited. Compressed Air Piping: System of compressed-air piping and specialties operating at pressures of 125 psig and less.

B. NBR: Acrylonitrile-butadiene rubber.

C. PE: Polyethylene plastic.

1.3 SUBMITTALS

A. Product Data: For the following:

1. Pipes, tubes, and fittings.
2. Flexible pipe connectors.
3. Safety valves.
4. Pressure regulators.

B. Coordination Drawings: For compressed-air systems. Include relationship to other services that serve same work area.

C. Brazing Certificates: As required by ASME Boiler and Pressure Vessel Code, Section IX, or AWS B2.2.

D. Welding Certificates: As required by ASME Boiler and Pressure Vessel Code, Section IX.

E. Field quality-control test reports.

1.4 QUALITY ASSURANCE

A. Brazing: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications," or AWS B2.2, "Standard for Brazing Procedure and Performance Qualification."

B. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

C. Comply with ASME B31.9, "Building Services Piping," for low-pressure compressed-air piping.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

2.3 PIPES, TUBES, AND FITTINGS

A. Copper Tube: ASTM B 88, Type L, seamless, drawn-temper, water tube. All piping and fittings shall be cleaned for oxygen service prior delivery on site and installation. Bag fittings and cap pipe ends.

1. Wrought-Copper Fittings: ASME B16.22, wrought solder-joint pressure fittings or ASME B16.50 wrought copper braze joint fittings; braze joints in accordance with MSS SP-73, silver brazing joints for wrought copper with dimensions for brazed joints.

2. Cast-Copper-Alloy Flanges: ASME B16.24, Class 150 or 300. Provide Class 300 if indicated.
3. Copper Unions: ASME B16.22 or MSS SP-123.

2.4 JOINING MATERIALS

A. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for joining materials not in this Section.

1. Brazing Filler Metals: AWS A5.8, BCuP-3 or BCuP-4

2.5 VALVES

A. Ball Valves: (NPS 1/2– NPS 2-1/2)

1. Three-Piece, copper-alloy, NFPA-99, Bronze body with full-port, chrome plated brass ball and stem PTFE seats, cleaned for medical gas service with end capped and bagged; and 600-psig minimum CWP rating and blowout-proof stem.

a. Amico Corporation
b. Conbraco Industries, Inc.; Apollo Div., brazed only.
c. Or equal.

B. Check Valves: (NPS 1/4 - NPS 1-1/2)

1. Bronze, threaded, and rated at 150 psi at 200°F.

a. Lift check valves for use in compressed air piping shall be based on Spirax-Sarco Model No. LCV1 or equal.

2.6 SPECIALTIES

A. Safety Valves: ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," construction; National Board certified, labeled, and factory sealed; constructed of bronze body with poppet safety valve for compressed-air service.

B. Air Line Pressure Regulators: Brass and bronze construction, with gauge or gauge ports, spring-loaded manual pressure-setting adjustment, factory cleaned for oxygen, minimum rated for 250 psig inlet pressure.

1. Type: Pilot operated or direct acting.

Manufacturers:

a. BeaconMedaes
b. Norgren.

c. Ingersol Rand.
d. Or equal.

2.7 IDENTIFICATION

A. Refer to Division 22 Section 22 0553 "Identification for Plumbing" for identification of piping, valves, gages, and specialties.

PART 3 - EXECUTION

3.2 PIPING APPLICATIONS

A. Install nipples, flanges, unions, transition and special fittings, and valves with pressure ratings same as or higher than system pressure rating used in applications below, unless otherwise indicated.

B. Joining of Dissimilar Metal Piping: Use dielectric isolation fittings. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for dielectric fitting types and requirements. Dielectric unions shall not be used on Campus.

C. Specialty and Equipment Flanged Connections: Use cast-copper-alloy companion flange with gasket and brazed joint for connection to copper tube.

D. Compressed-Air Distribution Piping: Use the following piping materials:

1. ASTM B 88, Copper tube, wrought-copper fittings, and brazed joints.

a. Aboveground: Type L.

3.3 VALVE APPLICATIONS

A. General-Duty Valves:

1. Shut-off: Three-piece ball valve on main and branch piping.
2. Check Valve: Lift Check.

3.4 PIPING INSTALLATION

A. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for basic piping installation.

B. Install a ball valve and a flexible pipe connector on each connection to air compressors, or equipment.

C. Install pipe expansion joints and anchors according to Division 22 Section 22 0516 "Expansion Fittings and Loops for Plumbing."

D. Pressure test entire piping system at 150 psig, or 150-percent of system pressure, whichever is greater for four hours. Check each joint for leaks with soap – repair detected leaks. For system to be acceptable, the piping system shall retain pressure for test period duration.

3.5 VALVE AND SPECIALTIES INSTALLATION

A. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for basic piping and valve installation.

B. Install valves according to manufacturer's written instructions.

C. Install shutoff valve at each connection to and from general-service compressed-air specialties, equipment, and accessories. Install strainer if indicated.

D. Install shutoff valves at inlet of pressure regulators. Install pressure gages at inlet and outlet of pressure regulators located in lower level interstitial. Provide gage ports at inlet and outlet of pressure regulators at all other locations.

E. Install check valves to maintain correct direction of fluid flow to and from compressed-air piping specialties and equipment.

F. Install safety valves where recommended by specialty manufacturers.

G. Install sectional shutoff valves in branch piping systems at mains to allow portions of the distribution piping to be shut down without requiring a major shutdown.

3.6 JOINT CONSTRUCTION

A. Refer to Division 22 Common Work Results for Plumbing" for basic piping joint construction.

B. Join copper tubing by brazed joints under continuous nitrogen purge. Use silver-composition or copper-phosphorus composition filler metal as indicated in Section 22 0500 "Common Work Results for Plumbing".

C. Dissimilar Metal Piping Material Joints: Use dielectric fittings. Dielectric Unions shall not be used. Refer to Section 22 0500 "Common Work Results for Plumbing".

3.7 HANGER AND SUPPORT INSTALLATION

A. Refer to Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

B. Refer to Division 22 Section 22 0529 "Hangers and Supports for Plumbing" for pipe hanger and support devices.

C. Install supports according to Division 22 Section 22 0529 "Hangers and Supports for Plumbing."

D. Support horizontal piping within 12 inches of each fitting and coupling.

E. Support vertical piping and tubing at base and at each floor.

F. Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch minimum rods.

G. Install hangers for copper tubing in accordance with CPC requirements.

H. Install supports for vertical copper tubing in accordance with CPC requirements.

3.8 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to specialties and equipment to allow service and maintenance.

C. Connect piping to air compressors, accessories, and specialties with shutoff valve and union or flanged connection.

3.9 LABELING AND IDENTIFICATION

A. Install identifying labels and devices for general-service compressed-air piping systems. Refer to Division 22 Section 22 0553 "Identification for Plumbing" for labeling and identification materials.

3.10 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:

1. Test and adjust piping safety controls. Replace damaged and malfunctioning safety controls.
2. Piping Leak Tests: Test new and modified parts of existing piping. Cap and fill general service compressed-air piping with oil-free dry air or gaseous nitrogen to pressure of 50 psig above system operating pressure, but not less than 150 psig. Isolate test source and let stand for four hours to equalize temperature. Refill system, if required, to test pressure; hold for two hours without drop in pressure.

    a. Repair leaks and retest until no leaks exist.

3. Report results in writing.

END OF SECTION 22 1513

SECTION 22 1519 - GENERAL SERVICE PACKAGED AIR EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following general-service compressed-air equipment and related accessories:

1. Air compressors with integral intercoolers, aftercoolers, intake filters and controls.
2. Receivers.
3. Compressed-air dryers.

B. Related Sections include the following:

1. Division 22 Section 22 1513 "General-Service Compressed-Air Piping" for compressed-air piping, valves and related specialties.

1.2 DEFINITIONS

A. Actual Air: Air delivered from air compressors. Flow rate is delivered compressed air measured in acfm.

B. Standard Air: Free air at 68 deg F and 1 atmosphere (29.92 in. Hg) before compression or expansion and measured in scfm.

1.3 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for the following compressed-air equipment:

1. Air compressors with integral intercoolers, after coolers, intake filters and controls.
2. Receivers.
3. Compressed-air dryers.

B. Shop Drawings: Signed and sealed by a qualified professional engineer.

1. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.
3. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
4. Wiring Diagrams: Power, signal, and control wiring.

C. Product Certificates: Certificates of shop inspection and data report for receiver tanks as required by ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

D. Qualification Data: For Installer.

E. Startup service reports.

F. Operation and Maintenance Data: For the following compressed-air equipment and accessories to include in emergency, operation, and maintenance manuals:

1. Air compressors.
2. Compressed-air dryers.

G. Certified test data, performance curves, and spare parts lists are to be included in the Operation and Maintenance Manuals (O&M).

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative of compressed-air equipment manufacturer for both installation and maintenance of units required for this Project.

B. Product Options: Drawings indicate size, profiles, and dimensional requirements of compressed-air equipment and are based on the specific system indicated. Refer to Division 01 Section 01 6000 "Product Requirements."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70, Article 100), by a testing agency acceptable to University's Representative, and marked for intended use.

D. ASME Compliance: Fabricate and label receiver tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

E. Comply with CEC (NFPA 70), "National Electrical Code."

1.5 COORDINATION

A. Coordinate size and location of concrete bases. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing" for concrete bases. Refer to Division 03 Section 03 3000 "Cast-in-Place Concrete" for formwork, reinforcement, and concrete requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000"Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 AIR COMPRESSOR SYSTEM

A. General Description: Duplexed compressor and dryer system. Base frame mounted compressors, sound insulated painted steel enclosure with removable hinged access doors for ease of maintenance. Each compressor factory-assembled, -wired, -piped, and -tested; electric-motor-driven; air-cooled; continuous-duty type that delivers 100% oil-free air. Refer to equipment schedule for capacities and model.

1. Manufacturers:
   a. Allied Healthcare Products, Inc., Gardner Denver EnviroAire
   b. Ingersol Rand, Air Compressor Div.
   c. Quincy Compressor.
   d. Or equal.

D. Compressor: Positive displacement, single-stage, oil-free, rotary screw type, housing, one-piece bronze main rotor, carbon fiber composite gate rotors, and shafts, precision timing gears, anti-friction bearings, speed increaser with thrust cancelling bull gear, self-adjusting ring seals, sealed oil-free bearings, integral air-cooled intercooler and aftercooler, cooling fan, auto-drain. Flexible coupled TEFC motors for compressor, oil pump and fan. Integral oil lubrication sump with gear drive oil pump, pressure regulating system, load-unload capacity control valve with muffler, safety pressure relief valve.

E. Controls: Integral with compressor enclosure. Allen Bradley PLC automatic controls with load control and protection functions. Comply with NEMA ICS 2 and UL 508.

1. Mounting and Wiring: Factory installed and connected as an integral part of equipment package.
2. Enclosure: NEMA ICS 6, Type 12 control panel minimum.
3. Motor Controllers: Variable frequency drive, Full-voltage, combination-magnetic type with under voltage release feature and motor-circuit-protector-type disconnecting means and short-circuit protective device.

   a. Control Voltage: 120-V ac or less, using integral control power transformer.
   b. Motor Overload Protection: Overload relay in each phase.
   c. Starting Devices: Hand-off-automatic selector switch in cover of control panel, plus pilot device for automatic control.

      1) Automatic controls for alternating lead-lag compressors for duplex operation.

4. Instrumentation: Operator interface touch screen to include intake air and oil filter conditions, routine maintenance indicators, first and second stage temperatures and

pressures, oil level, temperature and pressure, run time, power and run indicators, cooling fan indicator, alarm indicator and buzzer with cancel switch, motor overloads, etc.

5. BACNET capable for connection to building management system to remotely monitor compressor system.

F. Motors: General requirements for motors are specified in Division 22 Section 22 0513 "Motors for Plumbing."

1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

G. Receivers: Vertical steel tank constructed according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1; rated for working pressure at least as high as highest discharge pressure of connected compressors; and bearing appropriate code symbols. Include safety valve, pressure gage, automatic drain, and pressure-reducing valve.

H. Fabricate base and attachment to pressure vessel with reinforcement strong enough to resist packaged equipment movement during a seismic event when base is anchored to building structure.

2.6 COMPRESSED-AIR DRYERS

A. Desiccant-Type Dryers: Twin-tower unit with purge system, mufflers, and capability to deliver plus 10 deg F, 100-psig air at dew point. Include dew point controlled purge, step-down transformers, disconnect switches, inlet and outlet pressure gages, thermometers, automatic controls, and filters.

1. Manufacturers:

a. Allied Healthcare Products, Inc.
b. Rotary Atlas Copco
c. Ingersoll-Rand Company; Air Compressor Group.
d. Wilkerson Corp.
e. Zeks Air Drier Corporation.
f. Or equal.

2. Capacity: Match maximum capacity of connected air compressor.
3. Inlet Filter: 5 microns.
4. Outlet Filter: 1 micron(s).

2.7 ACCESSORIES AND OPTIONS

A. General: Include accessories with working-pressure rating not less than system pressure at location where used, and compatible with equipment and piping system used.

2.8 SPECIALTIES

A. Safety Valves: ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, construction; National Board certified, labeled, and factory sealed; constructed of bronze body with poppet safety valve for compressed-air service.

1. Pressure Settings: Higher than discharge pressure and same or lower than receiver pressure rating.

B. Automatic Drain Valves: Electrical operation type with corrosion-resistant metal body and internal parts, rated for 200-psig minimum working pressure, capable of automatic discharge of collected condensate.

C. Pressure Regulators: Stainless Steel or Bronze body, direct acting, spring loaded, manual pressure-setting adjustment, and rated for 250-psig inlet pressure, unless otherwise indicated.

1. Type: Diaphragm or pilot operated.

D. Pressure Regulators: Aluminum alloy or Stainless steel body, diaphragm operated, direct acting, spring loaded, manual pressure-setting adjustment, and rated for 250-psig inlet pressure, unless otherwise indicated. E. Compressed-Air Filters:

1. Manufacturers:

a. Allied Healthcare Inc.
b. Arrow Pneumatics, Inc.
c. Ingersoll-Rand Company; Air Compressor Group.
d. Wilkerson Corp.
e. Zeks Air Drier Corporation.
f. Or equal.

2. Mechanical-Separation Filters: Two-stage air-line filters of capacity not less than that of connected equipment. Equip with deflector plates; resin-impregnated-ribbon-type filters with edge filtration, 10 micrometers thick; and drain chock.
3. Coalescing Filters: Capacity not less than that of connected equipment; with color change dye to indicate when carbon is saturated and warning light to indicate when selected maximum pressure drop has been exceeded. Equip with activated carbon capable of removing water and oil aerosols.

PART 3 - EXECUTION

3.1 CONCRETE BASES

A. Install concrete bases for compressed-air equipment. Concrete base is specified in Division 22 Section 22 0500 "Common Work Results for Plumbing," and concrete materials and installation requirements are specified in Division 03.

3.2 EQUIPMENT INSTALLATION

A. Install air compressors on concrete bases. Install units level, plumb, and anchored to substrate in locations indicated. Maintain manufacturers' recommended clearances. Orient equipment so controls and devices are accessible for servicing.

1. Anchor packaged equipment to concrete base.

a. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around full perimeter of base.
b. Install epoxy-coated anchor bolts for supported equipment; extend through concrete base and anchor into structural concrete floor.
c. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
d. Install anchor bolts to elevations required for proper attachment to supported equipment.

B. Vibration Isolation: Install restrained spring isolators with a minimum deflection of Vibration isolation devices and installation requirements are specified in Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing."

C. Vibration Isolation: Mount equipment with motors larger than 5 hp on vibration isolation equipment base as specified in Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing."

D. Maintain manufacturer's recommended clearances for service and maintenance.

E. Install the following devices on compressed-air equipment:

1. Thermometer, Pressure Gage, and Safety Valve: Install on each compressed-air receiver.
2. Pressure Regulators: Install downstream from air compressors, dryers, purification units, and filter assemblies.
3. Automatic Drain Valves: Install on intercoolers, aftercoolers, receivers, and dryers. Discharge condensate over nearest floor drain.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 and 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Connect piping to air compressors and receivers, except safety relief valve connections, with flexible pipe connectors of materials suitable for service. Flexible pipe connectors and their installation are specified in Division 22 Section 22 1513 "General-Service Compressed-Air Piping."

D. Ground equipment according to Division 26 Section 26 0526 "Grounding and Bonding for Electrical Systems."

E. Connecting of wiring under another scope of work. Refer to Division 26 Section 26 0519 "Low Voltage Electrical Power Conductors and Cables."

F. Tighten electrical connectors and terminals according to manufacturer's published torque tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

3.4 LABELING AND IDENTIFICATION

A. Install identifying labels and devices for compressed-air equipment. Refer to Division 22 Section 22 0553 "Identification for Plumbing" for labeling and identification materials.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to test, inspect, and adjust components and equipment installation and to perform startup service.

B. Perform the following final checks:

1. Verify that specified tests of piping systems are complete.
2. Verify that potable-water supply connections to equipment have correct backflow preventer.
3. Check for piping connection leaks.
4. Check for lubricating oil in lubricated-type equipment.
5. Check belt drives for proper tension.
6. Verify that air-compressor inlet filters and piping are clear.
7. Check for equipment vibration-control supports and flexible pipe connectors and verify that equipment is properly attached to substrate.
8. Check safety valves for correct settings. Ensure that settings are greater than air compressor discharge pressure but not greater than rating of system components.
9. Check for proper seismic restraints.
10. Test operation of equipment safety controls and devices.
11. Drain receiver tanks.

C. Verify that compressed-air equipment is installed and connected according to the Contract Documents.

D. Verify that electrical wiring installation complies with manufacturer's submittal and written installation requirements in Division 26 Sections.

E. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.

F. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

G. Complete installation and startup checks according to manufacturer's written instructions.

H. Prepare written report documenting testing procedures and results.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's maintenance personnel to adjust, operate, and maintain general-service compressed-air equipment. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 22 1519

SECTION 22 1613 – FACILITY NATURAL GAS DISTRIBUTION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following for natural gas distribution outside the building:

1. Piping.
2. Valves.
3. Regulators.
4. Concrete bases.

B. Related Sections include the following:

1. Division 22 Section 22 1616 "Fuel Gas Piping" for natural gas piping inside the building.
2. Division 23 Section "Instrumentation and Controls" for natural gas meters control connection.

1.2 DEFINITIONS

A. Gas Distribution: Piping branch off from UCIR site main to individual UCR re-charge meter at or in building and gas shut-off valves.

B. Gas Meter Assembly: Piping, valves, regulator, meter and earthquake valve and specialties.

C. Point of Delivery: Piping outlet from service-meter assembly or connection to existing University gas piping.

D. Natural Gas Piping: Piping that conveys natural gas from point of delivery to natural gas utilization devices inside the building. G. PE: Polyethylene plastic.

1.3 PERFORMANCE REQUIREMENTS

A. Minimum Working-Pressure Ratings:

1. Piping and Valves: 80 psig minimum, unless otherwise indicated.
2. Regulators: 100 psig minimum, unless otherwise indicated.
3. Meters: 20 psig minimum, unless otherwise indicated.

1.4 SUBMITTALS

A. Product Data: For the following:

1. Pipe and fittings.
2. Valves.

B. Shop Drawings: For natural gas service piping including earthquake valves. Include plans, elevations, sections, details, and attachments to other work.

C. Welding certificates.

D. Field quality-control test reports.

1.5 QUALITY ASSURANCE

A. HDPE Fusion Welding: Follow pipe manufacturers guidelines for butt fusion welding and fusion coupling install.

B. Comply with requirements of utility supplying natural gas (The Gas Company) and with University's Representative for natural gas systems.

C. Comply with ANSI Z223.1, ASME B31.8 and AGA IFGC for materials, installation, testing, inspection, and purging.

D. Design shall be based on pressure at regulator and CPC sizing parameters.

E. Preinstallation Conference: Conduct Conference at the Project Site to comply with requirements of Division 01 Section "Project Management and Coordination."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Handling Flammable Liquids: Remove and legally dispose of liquids from drips in existing gas piping. Handle liquids to avoid spillage and ignition. Do not leave flammable liquids on premises overnight.

B. Store PE pipes and valves protected from direct sunlight.

1.7 PROJECT CONDITIONS

A. Perform site survey, research public utility records, and verify existing utility locations. Contact utility-locating service for area where Project is located.

B. Interruption of Existing Natural Gas Service: Do not interrupt natural gas service to facilities occupied by University or others unless permitted under the following conditions and then only after arranging to provide purging and startup of gas supply according to requirements indicated:

1. Notify University's Representative no fewer than two weeks in advance of proposed interruption of natural gas service.

2. Do not proceed with interruption of natural gas service without University's written permission.

1.8 COORDINATION

A. Coordinate connection to gas main with utility (The Gas Company), if applicable or with University's Representative if University piping system.

B. Coordinate natural gas distribution with other utility Work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 PIPES AND FITTINGS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, fitting, and joining materials.

B. Steel Pipe: ASTM A 53/A 53M, Type E or S, Grade B; Schedule 40, black.

1. Malleable-Iron Fittings: ASME B16.3, Class 150, standard pattern, with threads complying with ASME B1.20.1.
2. Steel Fittings: ASME B16.9, wrought-steel butt-welding type; and ASME B16.11, forged steel.
3. Steel Flanges and Flanged Fittings: ASME B16.5.
4. Unions: ASME B16.39, Class 150, black malleable iron; female pattern; brass-to-iron seat; ground joint.

C. PE Pipe: ASTM D 2513, SDR 11, SDR 11.5. HDPE coil or individual straight pipe are permitted.

1. PE Fittings: ASTM D 2683, socket type or ASTM D 3261, butt type with dimensions matching ASTM D 2513, SDR 11, SDR 11.5 PE piping.

D. Transition Fittings: Manufactured pipe fitting with one PE pipe end for heat-fusion connection to PE pipe and with one ASTM A 53/A 53M, Schedule 40, steel pipe end for threaded connection to steel pipe.

E. Service-Line Risers: Manufactured PE pipe fitting with PE pipe inlet for heat-fusion connection to underground PE pipe; PE pipe riser section with protective-coated, anodeless, steel casing and threaded outlet for threaded connection to aboveground steel piping.

2.3 JOINING MATERIALS

A. Components, Tapes, Gaskets, and Bolts and Nuts: Suitable for natural gas and as recommended by piping manufacturer.

2.4 SHUTOFF VALVES

A. Shutoff Valves, General: Manual operation, suitable for natural gas service, and with 100psig minimum working-pressure rating.

B. Threaded Valves, NPS 1 and Smaller: Include listing by American Gas Association.

C. Ball Valves: Bronze body, with stainless steel ball and stem; lever handle; and complying with ASME B16.33, MSS SP-110, UL 842.

1. Manufacturers:

a. Apollo/Conbraco Industries, Inc.# 77-140. (Campus Standard)
b. Or equal (no known equal).

D. Non-lubricated Plug Valves: Cast-iron body, with resilient-coated eccentric plug; lever operation; and complying with ASME B16.38, MSS SP-108, and UL 842. Include locking device.

1. Manufacturers:

a. Milliken Valve Co., Inc.
b. Olson Technologies, Inc.; Homestead Valve Div.
c. Pratt, Henry Co.
d. SPX Corporation; DeZURIK Unit.
e. Or equal.

E. PE Valves: Made for gas distribution, with nut or flat head for key operation; and complying with ASME B16.40, UL 842.

1. Manufacturers:

a. Kerotest Manufacturing Corp.

b. Nordstrom Valves, Inc.
c. Perfection Corporation; Gas Products Div.
d. Or equal.

F. Valve Boxes: Cast-iron, two-section box. Include top section with cover with "GAS" lettering, bottom section with base to fit over valve and barrel 5 inches in diameter, and adjustable cast-iron extension of length required for depth of bury. Include tee-handle, steel operating wrench with socket end fitting valve nut or flat head and with stem of length required to operate valve.

2.5 MISCELLATNEOUS MATERIALS

A. Warning Tapes: See Division 31 Section “Earth Moving”. Tapes shall state “Caution” Gas Line Buried Below”.

B. Tracer Wire: See Division 31 Section “Earth Moving”.

C. Corrosion Protection: ASTM A 674 or AWWA 6105, PE film, 8 mil minimum, tube or sheet. "Not required on plastic pipe or plastic coated steel pipe."

2.6 CONCRETE BASES

A. Description: Concrete made of 3000-psi- minimum, 28-day compressive strength reinforced concrete; at least 4 inches thick and 4 inches larger in each dimension than supported item.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Refer to Division 31 Section "Earth Moving" for excavating, trenching, and backfilling.

3.2 PREPARATION

A. For existing buildings, close equipment shutoff valves before turning off gas to premises or piping section.

B. Inspect natural gas piping according to fuel gas code to determine that natural gas utilization devices are turned off in piping section affected.

C. Comply with NFPA 54, fuel gas code requirements for prevention of accidental ignition.

D. Pipe and fittings shall be free from burrs and fins.

3.3 PIPING APPLICATIONS

A. Flanges, unions, and transition and special fittings with pressure ratings same as or higher than system pressure rating may be used.

B. Aboveground Piping:

1. NPS 2 and Smaller: Steel pipe, malleable-iron fittings, and threaded joints.
2. NPS 2-1/2 and Larger: Steel pipe, butt-welding-type fittings, and welded joints. Joints for connection to service regulators, meters, and valves with flanged connections may be flanged. Joints for connection to regulators, meters, and valves with threaded connections NPS 2-1/2 to NPS 4 may be threaded.

C. Underground Piping: PE pipe, PE fittings, and heat-fusion joints.

D. Provide shut off valve at the point of connection to existing piping.

E. Underground-to-Aboveground Piping Connections: Service-line riser.

F. PE-to-Steel Piping Connections: Transition fitting.

3.4 VALVE APPLICATIONS

A. Types of shutoff valves to be used shall comply with the following requirements:

1. Connections to Existing Gas Piping: Use valve and fitting assemblies made for tapping gas mains.
2. Underground: Use PE valves.
3. Aboveground, NPS 2 and Smaller: Ball valves.
4. Aboveground, NPS 2-1/2 and Larger: Non-lubricated plug valves.

3.5 PIPING INSTALLATION

A. Install underground, natural gas distribution piping buried at least 30 inches below finished grade.

B. Install underground, PE, natural gas distribution piping according to ASTM D 2774.

C. Natural gas piping shall not be installed under any part of building.

D. Install double wrap of PE corrosion protection on all buried metallic pipe and fitting.

E. Drips and Sediment Traps: Install drips at points where condensate may collect, including meter outlets and drops at each appliance or equipment. Locate where readily accessible to permit cleaning and emptying.

1. Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use nipple a minimum length of 3 pipe diameters, but not less than 3 inches long and

same size as connected pipe. Install with space below bottom of drip to remove plug or cap.

F. Terminate regulator horizontal vents or horizontal vent piping with reducing-elbow fittings with large end as outlet at the exterior of building. Install fitting outlet turned down with corrosion-resistant insect screen in outlet.

3.6 VALVE INSTALLATION

A. Install PE shutoff valves on branch connections to existing underground, natural gas distribution piping. Install valves with valve boxes.

B. Install metal shutoff valves on aboveground, natural gas distribution piping.

C. Install earthquake valves aboveground, outside building, and according to listing applications.

3.7 JOINT CONSTRUCTION

A. Refer to Division 22 Section "Common Work Results for Plumbing." for basic piping joint construction.

3.8 CONNECTIONS

A. Coordinate piping installations and specialty arrangements with requirements specified. Connect gas distribution piping to natural gas source and extend to meter assemblies and points indicated. Connect to building's natural gas piping if it is installed; otherwise, terminate piping with caps, plugs, or flanges, as required for piping material. Refer to Division 22 Section "Fuel Gas Piping" for natural gas piping inside the building.

B. Install unions, in above ground piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment having threaded pipe connection.

C. Install flanges, in above ground piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment having flanged pipe connection.

D. Do not use natural gas distribution piping as grounding electrode.

3.9 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplates and signs on or near each regulator, meter, and earthquake valve.

1. Text: In addition to identifying unit, distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.

B. Refer to Division 22 Section "Common Work Results for Plumbing" for equipment nameplates, signs, and tracer wire.

C. Warning Tapes: Arrange for installation of continuous, underground, warning tape over natural gas distribution piping during backfilling of trenches for piping.

D. Tracer Wire: Install strapped to underground piping at 10'-0" on centers and terminating above ground at entrance to building.

E. Refer to Division 31 Section "Earth Moving" for warning tapes.

3.10 PAINTING

A. All painting, with exception of touch up, provided under another division scope of work.

3.11 IDENTIFICATION

A. Materials and their installation are specified in Division 31 Section "Earth Moving". Arrange for installation of yellow warning tape directly over piping and installation of tracer wire.

1. Use warning tape over all piping.
2. Use tracer wire over nonferrous piping.

3.12 FIELD QUALITY CONTROL

A. Test, inspect, and purge natural gas distribution according to requirements of fuel gas code and University's Representative.

B. Repair leaks and defective valves and specialties and retest system until no leaks exist.

C. Report results in writing.

D. Verify correct pressure settings for service regulators.

3.13 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's maintenance personnel to adjust, operate, and maintain earthquake valves. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 22 1613

SECTION 22 1616 - FUEL GAS PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes fuel gas piping outside and within the building. Products include the following:

B. Adjust list below to suit Project.

1. Pipe, tube, fittings, and joining materials.
2. Protective pipe and fitting coating.
3. Piping specialties.
4. Specialty valves.
5. Recharge meters.
6. Pressure regulators.
7. Earthquake valves.
8. Laboratory Safety Device System (Emergency Gas Shutoff)

1.2 DEFINITIONS

A. CBC: California Building Code.

B. CPC: California Plumbing Code.

C. NFPA: National Fire Protection Agency.

D. PE: Polyethylene plastic.

1.3 PROJECT CONDITIONS

A. Gas System Pressures: Two pressure ranges. Primary pressure is more than 2.0 psig but not more than 5.0 psig, and is reduced to secondary pressure of more than 0.25 psig but not more than 2.0 psig.

B. Design values of fuel gas supplied for these systems are as follows:

1. Nominal Heating Value: 1000 Btu/cu. ft.
2. Nominal Specific Gravity: 0.6.

1.4 SUBMITTALS

A. Product Data: For the following:

1. Specialty valves. Include pressure rating, capacity, settings, and electrical connection data of selected models.
2. Recharge-meter bars. Include Recharge-meter size of selected models.
3. Recharge meters. Include pressure rating and capacity of selected models.
4. Recharge-meter bypass fittings.
5. Pressure regulators. Include pressure rating, capacity, and settings of selected models.
6. Earthquake valves.
7. Wiring Diagrams: Power, signal, and control wiring
8. Laboratory Safety Device System.

B. Welding certificates.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For natural gas specialties and accessories to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Welding: Qualify processes and operators per ASME Boiler and Pressure Vessel Code: Section IX.

B. Electrical Components and Devices: Listed and labeled as defined in CEC (NFPA 70), Article 100, by a testing agency acceptable to University's Representative, and marked for intended use; alarm devices in accordance with NFPA 72 National Fire Alarm Code.

C. Code: Comply with California Building Codes (CBC and CPC), NFPA 54.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Handling Flammable Liquids: For modification of existing systems, remove and legally dispose of liquids from drips in existing gas piping. Handle cautiously to avoid spillage and ignition. Notify fuel gas supplier. Handle flammable liquids used by Installer with proper precautions and do not leave on premises from end of one day to beginning of next day. B. Store PE pipes and valves protected from direct sunlight.

B. Products and Devices shall be kept clean, dry and protected from all damage, including that due to weather, humidity and construction traffic.

C. All handling and storage procedures shall comply to the manufacturer's recommendations.

1.7 COORDINATION

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by the University or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

B. Notify University's Representative not less than two weeks in advance of proposed utility interruptions.

1. Do not proceed with utility interruptions without University's Representative written permission.

C. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified, or equal.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section 01 6000 "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, tube, fitting, and joining materials.

2.3 PIPES, TUBES, FITTINGS, AND JOINING MATERIALS

A. Steel Pipe: ASTM A 53/A 53M; Type E or S; Grade B; Schedule 40 black. Wall thickness of wrought-steel pipe shall comply with ASME B36.10M.

1. Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern, with threaded ends according to ASME B1.20.1.
2. Steel Threaded Fittings: ASME B16.11, forged steel with threaded ends according to ASME B1.20.1.
3. Steel Welding Fittings: ASME B16.9, wrought steel or ASME B16.11, forged steel.
4. Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends according to ASME B1.20.1.
5. Cast-Iron Flanges and Flanged Fittings: ASME B16.1, Class 125.

6. Joint Compound and Tape: Suitable for natural gas.
7. Steel Flanges and Flanged Fittings: ASME B16.5.
8. Gasket Material: Thickness, material, and type suitable for natural gas.

B. Transition Fittings: Manufactured pipe fitting with one PE pipe end for heat-fusion connection to PE pipe and with one ASTM A 53/A 53M, Schedule 40, steel pipe end for threaded connection to steel pipe.

C. Service-Line Risers: Manufactured PE pipe fitting with PE pipe inlet for heat-fusion connection to underground PE pipe; PE pipe riser section with protective-coated, anode less, steel casing and threaded outlet for threaded connection to aboveground steel piping.

2.4 PROTECTIVE COATING

A. Furnish for underground steel pipe and fittings with factory-applied, corrosion-resistant polyethylene coating for use in contact with materials that may corrode the pipe.

2.5 PIPING SPECIALTIES

A. Flexible Connectors: ANSI Z21.24, stainless steel metal connectors for gas appliances.

B. Quick-Disconnect Devices: ANSI Z21.41, convenience outlets and matching plug connectors.

2.6 SPECIALTY VALVES

A. Valves, NPS 2 and Smaller: Threaded ends according to ASME B1.20.1 for pipe threads.

B. Valves, NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel flanges.

C. Valves in category below are limited to 0.5 psig (3.45 kPa), are used for shutoff service to appliances, and are NPS 3/4 (DN 20) and smaller.

D. Appliance Connector Valves: ANSI Z21.15 and CSA International listed.

1. Manufacturers:

a. American Valve Inc.
b. B&K Industries, Inc.
c. Conbraco Industries, Inc.; Apollo Div.
d. JMF Company
e. Fisher Controls International, Inc.
f. Jomar International Ltd.
g. Key Gas Components, Inc.
h. Legend Valve and Fitting, Inc.
i. McDonald, A. Y. Mfg. Co.
j. Mueller Co.; Mueller Gas Products Div.
k. Robert Manufacturing Co.

l. State Metals, Inc.
m. Watts Industries, Inc.; Water Products Div.
n. Or equal.

E. Gas Stops: Size, 2" and below, bronze body with AGA stamp, plug type with bronze plug and flat or square head, ball type with chrome-plated brass ball and lever handle; 2-psig minimum pressure rating.

F. Ball valves, NPS 2 and Smaller: ASME B16.33 and CSA International-listed bronze body and 125-psig pressure rating.

1. Manufacturers:

a. Conbraco Industries, Inc., Apollo Div.
b. Crane Valves.
c. Flow Control Equipment, Inc.
d. Honeywell International Inc.
e. Jomar International Ltd.
f. Lyall, R. W. & Co., Inc.
g. McDonald, A. Y. Mfg. Co.
h. Milwaukee Valve Company.
i. Mueller Co.; Mueller Gas Products Div.
j. NIBCO INC.
k. Velan Inc.
l. Watts Industries, Inc.; Water Products Div.
m. Or equal.

2. Tamperproof Feature: Include design for locking.

G. Gas Solenoid Valves, NPS 2 and Smaller: UL listed and CSA International-certified brass, bronze or stainless body suitable for natural gas and 125-psig pressure rating.

1. Manufacturers:

a. Emerson ASCO Redhat.
b. Magnatrol Valve Corp.
c. Jefferson Solenoid Valves USA, Inc.
d. Or equal.

H. Plug Valves, NPS 2-1/2 and Larger: ASME B16.38 and MSS SP-78 cast-iron, lubricated plug valves, with 125-psig pressure rating.

1. Manufacturers:

e. Flow Control Equipment, Inc.

f. Milliken Valve Co., Inc.
g. Nordstrom Valves, Inc.
h. Olson Technologies, Inc.; Homestead Valve Div.
i. Walworth Co.
j. Or equal.

2. Tamperproof Feature: Include design for locking.

I. Earthquake Valves: Listed in CSA International's "Certified Product Listing Directory: Components for Gas and Electrical Equipment" as complying with ASCE 25 and UL listed. The valves shall be certified by California, Division of the State Architect.

1. Earthquake-Valve: Working-pressure rating is 25 psig. Cast-aluminum body with stainless-steel internal parts. Buna-N, reset-stem, O-ring seal. Threaded end connections.
2. Manufacturers:

a. Safe T Quake Corp.
b. California Koso.
c. Or equal.

2.7 GAS METERS

A. University Recharge Meters: For gas service extended from University Mains on Site to the project site. Coordinate with Facilities. Provide site main, gas pressure regulator, recharge meter and earthquake safety valve.

1. Recharge Gas Meters.
2. Gas meter assemblies shall conform to the requirements of ANSI B109 Metering Standards.
3. Recharge Gas Meters, General: Positive-displacement gas meter.

a. Construction: Metal case with temperature compensation, and corrosion-resistant internal components.
b. Pipe Connections:

1) NPS2 and Smaller: Threaded or flanged.
2) NPS 2-1/2 and Larger: Flanged.

4. Manufacturers:

a. Invensys Energy Metering.
b. American Meter Co.
c. Or equal.

5. Small-Capacity Gas Meters: ANSI B109.1, diaphragm type, with registration in cubic feet for meters with capacities of 500 cfh and less.

6. Large-Capacity Gas Meters: ANSI B109.2, diaphragm type, with registration in cubic feet for meters with capacities of more than 500 cfh, but less than or equal to 1,000 cfh.
7. Rotary Gas Meters: ANSI B109.3, rotating-lobe type, with registration in cubic feet for meters with capacities of more than 1,000 cfh.
8. Gas Meter Bars: (For meters 1" and larger) Malleable-or cast-iron frame for supporting Recharge meter. Include offset swivel pipes, nuts with O-ring seal, field-installed dielectric device, and threaded ends.
9. Exception: Omit offset swivel pipes if dimensions match meter connections.
10. Manufacturers:

    a. Fisher Controls International
    b. McDonald, A.Y. Mfg. Co.
    c. Mueller Company.
    d. National Meter.
    e. Schlumberger Limited.
    f. Or equal.

11. Volume Correctors: Pulse output flow computer for temperature and pressure volumetric correction of natural gas.

    a. Power Requirements: 24 volts DC power, provided by building management system controls contractor.
    b. Instrument Enclosure: Rugged cast aluminum casing.
    c. Mounting: Directly on gas meter.
    d. Transducers: Integral pressure and temperature transducers.
    e. Corrected Volume Totalizer: Local indexing in cubic feet.
    f. Hazardous Rating: Class 1, Div. 1, Group D per NEC
    g. Outputs:

        1) Corrected indexing, non-re-settable.
        2) Pulse transmitter for remote billing purposes.
        3) 4-20 ma output, for flow recording and analysis.

    h. Accuracy: 1% accuracy.
    i. Approvals: UL Listed.

12. Manufacturers:

    a. Equimeter.
    b. Mercury.
    c. American Meter Co.
    d. Invensys.
    e. National Meter Ind. Inc.
    f. Or equal.

2.8 PRESSURE REGULATORS

A. Description: Single stage and suitable for fuel gas service. Include steel jacket and corrosion resistant components, elevation compensator, and atmospheric vent.

1. Manufacturers:

a. Service Pressure Regulators:

1) American Meter Company.
2) Fisher Controls International, Inc.; Division of Emerson.
3) Invensys.
4) National Meter Industries, Inc.
5) Schlumberger Limited; Gas Div. 6) Or equal.

b. Line Pressure Regulators:

1) American Meter Company.
2) Donkin, Bryan RMG Canada, Ltd.
3) Fisher Controls International, Inc.; Division of Emerson.
4) Invensys.
5) Maxitrol Company.
6) National Meter Industries, Inc.
7) Schlumberger Limited; Gas Div.
8) Or equal.

2. NPS 2 and Smaller: Threaded ends according to ASME B1.20.1 for pipe threads.
3. NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel flanges and according to ASME B16.24 for copper and copper-alloy flanges.
4. Service Pressure Regulators: ANSI Z21.80. Include 100-psig- minimum inlet pressure rating.

5. Line Pressure Regulators: ANSI Z21.80 with 10-psig inlet pressure rating, unless otherwise indicated.

B. Pressure Regulator Vents: Factory- or field-installed, corrosion-resistant screen in opening if not connected to vent piping. Normally vented outside with insect screen and U-turn end.

2.9 LABORATORY SAFETY DEVICE SYSTEM

A. Products in this section: All Products and Devices for a complete Laboratory Safety Device System shall be provided as shown on the Drawings and as listed in the Equipment Schedule of the Section.

1. Utility Controller: At each science classroom and elsewhere as shown on Drawings, provide a Utility Controller with fascia panel mounted switches to activate remote solenoid to control natural gas. Utility Controller shall comply and be certified to Underwriter's

Laboratory UL61010-1 3rd Edition Standards. Utility Controller shall have integrated printed circuit board and microprocessor with adaptable programming features. Utility Controller shall provide line voltage signal for output circuit, to be transformed down to 24 VDC, and shall provide inputs for remote emergency operator and BMS. The Utility Controller shall be equipped with an Authority Key Lock that restricts activation of output signal to the instructor or educator. Utility Controller shall be provided with a fascia mounted Emergency Shut Off Button. Output signal will require Key Lock Authority for reset.

2. Solenoid Valve: At each science classroom as shown on Drawings, provide UL-approved solenoid for gas service. Solenoids shall be normally closed and fail closed on loss of power. Number of solenoids, intended use and pipe sizes are as noted in Equipment Schedule or Drawings.
3. Remote Shut Off Button: Where shown on Drawings and where classroom size and configuration restricts clear path from work areas to Utility Controller, provide a wall mounted Shut Off Button. Assembly shall be located as shown on Drawings and as stipulated in Equipment Schedule. Integrate assembly with low voltage input on Utility Controller.
4. Provide a manufacturer's parts warranty covering 36 months from date of product shipment
5. Manufacturers:

    a. American Gas Safety LLC, Merlin 1000Si
    b. Or equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for fuel oil piping system to verify actual locations of piping connections before equipment installation.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Close equipment shutoff valves before turning off fuel gas to premises or section of piping. Perform leakage test as specified in "Field Quality Control" Article to determine that all equipment is turned off in affected piping section.

3.3 RE-CHARGE METER ASSEMBLY INSTALLATION

A. Install re-charge meter assemblies inside in a mechanical room or if approved by University's Representative aboveground, outside building

1. Set outside meter assembly on, or supported over, precast concrete bases. Excavate earth and make level beds to support bases. Set bases level with top surface projecting 3 inches

above finished grade. Concrete bases are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

B. Include gas valve or plug valve, strainer, earthquake valve pressure regulator, and meter for each assembly.

C. Install gas valve or plug valve and strainer upstream from each pressure regulator.

D. Install outside pressure regulators with vent outlet turned down and with corrosion-resistant metal insect screen.

E. Inside pressure regulator shall have vent outlet extended to outside and turned down and protected with insect screen.

F. Select locations of gages from options in first paragraph below or delete if not required.

G. Install pressure gage tap upstream and downstream from each pressure regulator.

H. Install meters downstream from pressure regulators, unless noted otherwise.

1. Meters with connections NPS 1 and smaller on meter bars.
2. Meters with connections larger than NPS 1 supported from piping or set on concrete bases.

I. Provide adequate points of connections to install a temporary by pass around the meter, so that the meter can be removed and replaced without interrupting gas service to the facility.

3.4 LABORATORY SAFETY DEVICE SYSTEM

A. Integration and Configuration:

1. Building Automation/ Management System (BMS): Where shown on Drawings, provide low voltage integration wiring from each Utility Controller to connection point on BMS. Configure Utility Controller to comply with BMS requirements. Utility Controller can accept low voltage signal from Fire Alarm to shutdown utilities in case of fire alarm. Final connection by others.
2. System Configuration: Utility Controllers shall be factory configured to the standard configurations and shall be capable of field adjustments to meet specific project modification requirements. Configurations are limited to DIP switch adjustments on rear of fascia panel without the requirement of additional equipment.
3. Panel Details:

a. Classroom Gas: Gas at student work-stations shall be controlled by independent output circuit at the Utility Controller. Gas shall be activated by Utility Controller fascia panel switches and the engaging of the authority control key. Activation of gas shall be restricted to the instructor by means of the authority key lock switch.

b. Time Out Function: Each Utility Controller be pre-set to shut down after either 2 hours, 4 hours, 8 hours, or have this function disabled. This configuration shall be adjusted via DIP switches in the Utility Controller.
c. Building Automation or Management System: Where indicated by the Drawings, configure each Utility Controller to integrate with the BMS. The BMS shall monitor the Utility Controller for Gas "ON" or Emergency Shut Off activation. Utility Controller shall accept fire alarm signal from BMS for automatic shutdown. The output signal from the Utility Controller shall be in the form of a NO or NC low voltage relay output signal.
d. Emergency Shut Off Re-Set: Unless stated elsewhere on Drawings, The Utility Controller shall only re-set from Emergency Shut Off after engagement of the authority key on fascia panel and after local Emergency Shut Off has been reset.
e. Fire Alarm Re-Set: Unless stated elsewhere on Drawings, the Utility Controller shall be configured so that continued fire alarm signal to Utility Controller shall prevent reset.
f. Emergency Gas Shut Off: Each Utility Controller shall be configured so that pressing Emergency Shut Off will disable gas.

B. System Execution:

1. Installation:

a. Install in accordance with manufacturer's recommendations and instructions. Verify manufacturer's mounting heights to comply with ADA or other standards.
b. Finish and install all devices as shown in Drawings and as specified herein. Where device is to be installed by other trades, furnish and then turn over to appropriate trade for installation.
c. Furnish, install and make final connections to monitoring and remote Emergency Shut Off Buttons as indicated on Drawings and specified herein. Furnish and install low voltage and volt-free control wiring from Utility Controller to connection point on BMS.

2. Plumbing: Make final connections to gas piping system where indicated by Drawings and specifications. Install in accordance with Division 22 specification sections and as described here within this section.
3. Electrical: Electrical Contractor shall furnish all conduit and wiring, making final wiring connections to all equipment as indicated by Drawings and specifications. Contractor shall be responsible for all system configurations, integration, test and start-up.

C. System Test and Start-up:

1. Prior to placing the Utility Controller System into service, perform all Start-Up procedures and checklists as stated in Manufacturer's Operations and Maintenance Procedure.
2. Verify that all components and devices comply with manufacturer's requirements and recommendations and that all devices and installations conform to Drawings and specification requirements.

3. Upon completion of all Start-Up tests, place the system into service. Complete all warranty registration documents. Submit originals with other project related closeout and O & M documentation. Review all operating procedures with a representative of the owner. Provide all System Authority Keys to the owner's representative.

3.5 SERVICE ENTRANCE PIPING

A. Extend fuel gas piping and connect to Campus fuel gas distribution for service entrance to building.

B. Provide exterior fuel gas distribution system piping, earthquake valve, pressure regulator, and meter.

C. Install dielectric fitting downstream from and adjacent to each meter unless meter is supported from meter bar with integral dielectric fitting. Install shutoff valve downstream from and adjacent to dielectric fitting. Dielectric fittings are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

D. Install strainer upstream from each earthquake valve. Strainers are specified in Division 22 Section 22 1119 "Domestic Water Piping Specialties."

3.6 PIPING APPLICATIONS

A. Flanges, unions, transition, and special fittings with pressure ratings same as or higher than system pressure rating may be used in applications below, unless otherwise indicated.

B. Fuel Gas Piping, 5 psig or Less:

1. NPS 1/2 to NPS 2: Steel pipe, malleable-iron threaded fittings, and threaded joints.
2. NPS 2-1/2 and Larger: Steel pipe, steel welding fittings, and welded joints.

C. Underground Fuel Gas Piping: Do not install pipe under building floor slabs. Steel pipe, steel welding fittings, and welded joints. Encase in containment conduit.

D. Underground-to-Aboveground Piping Connections: Service-line riser.

E. PE-to-Steel Piping Connections: Transition fitting.

3.7 VALVE APPLICATIONS

A. Appliance Shutoff Valves for Pressure 0.5 psig or Less: Appliance connector valve or gas stop.

B. Appliance Shutoff Valves for Pressure 0.5 to 5 psig: Gas valve.

C. Piping Line Solenoid Valves for Pressure 0.5 to 5 psig: Gas valve.

D. Piping Line Valves, NPS 2 and Smaller: Gas valve.

E. Piping Line Valves, NPS 2-1/2 and Larger: Plug valve or general-duty valve.

F. Valves at Meter, NPS 2 and Smaller: Gas valve.

G. Valves at Meter, NPS 2-1/2 and Larger: Plug valve.

3.8 PIPING INSTALLATION

A. Basic piping installation requirements are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

B. Concealed Locations:

C. Above-Ceiling Locations: Gas piping may be installed in accessible spaces, subject to approval of University's Representative, whether or not such spaces are used as plenums.

1. In Floor Channels: Gas piping may be installed in floor channels, subject to approval of University's Representative. Channels must have cover and be open to space above cover for ventilation.
2. In Partitions: Do not install concealed piping in solid partitions. Protect tubing from physical damage when installed inside stud partitions or hollow walls.

a. Exception: Pipe passing through partitions or walls.

3. Prohibited Locations: Do not install gas piping in or through circulating air ducts, clothes or trash chutes, chimneys or gas vents (flues), ventilating ducts, or dumbwaiter or elevator shafts. Do not install gas piping in floors, under building floor slabs on grade or solid walls.

a. Exception: Accessible above-ceiling space specified above.

D. Drips and Sediment Traps: Install drips at points where condensate may collect. Include outlets of meters. Locate where readily accessible for cleaning and emptying.

1. Construct drips and sediment traps using tee fitting with bottom outlet and stop valve. Use minimum-length nipple of 3 pipe diameters, but not less than 3 inches long, and same size as connected pipe. Install with space between bottom of drip and floor for removal of plug or cap and opening of the valve.

E. Conceal pipe installations in hollow walls, pipe spaces, utility spaces, above ceilings, below exterior grade floors, and in floor channels, unless indicated to be exposed to view.

G. Install pressure test ports, upstream and downstream of gas meter.

H. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.

I. Connect branch piping from top or side of horizontal piping.

J. Install unions in pipes NPS 2 and smaller, adjacent to each valve, at final connection to each piece of equipment, and elsewhere as indicated. Unions are not required on flanged devices.

K. Install pipe bollards or other suitable barriers in front of outside gas meter assemblies for protection.

L. Install strainer on inlet of each line pressure regulator.

M. Install pressure gage taps upstream and downstream from each line pressure regulator.

N. Install flanges on valves, specialties, and equipment having NPS 2-1/2 and larger connections. Install unions similarly on NPS 2" and smaller.

O. Install vent piping for gas pressure regulators and gas trains, extend up through roof, and vent to atmosphere. Terminate vents with turned-down, reducing-elbow fittings with corrosion resistant insect screens in large end.

3.9 JOINT CONSTRUCTION

A. Basic piping joint construction is specified in Division 22 Section 22 0500 "Common Work Results for Plumbing" and 22 1613 "Facility Natural Gas Piping."

B. Use materials suitable for fuel gas.

C. Patch factory-applied protective coating as recommended by manufacturer at field welds and where damage to coating occurs during construction.

3.10 HANGER AND SUPPORT INSTALLATION

A. Pipe hanger and support and equipment support materials and installation requirements are specified in Division 22 Section 22 0529 "Hangers and Supports for Plumbing."

B. Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes: CPC is more stringent for smaller sizes.

C. NPS 1/2: Maximum span, 72 inches; minimum rod size, 3/8 inch.

D. NPS 3/4 and 1: Maximum span, 96 inches; minimum rod size, 3/8 inch.

E. NPS 1-1/4: Maximum span, 108 inches; minimum rod size, 3/8 inch.

F. NPS 1-1/2 and NPS 2: Maximum span, 108 inches; minimum rod size, 3/8 inch.

G. NPS 2-1/2 to NPS 3-1/2: Maximum span, 10 feet; minimum rod size, 1/2 inch.

H. NPS 4 and Larger: Maximum span, 10 feet; minimum rod size, 5/8 inch.

3.11 CONNECTIONS

A. Drawings indicate general arrangement of fuel gas piping, fittings, and specialties.

B. Install piping adjacent to appliances to allow service and maintenance.

C. Connect piping to appliances using gas with shutoff valves and unions. Install valve upstream from and within 72 inches of each appliance. Install union downstream from valve.

D. Sediment Traps: Install tee fitting with capped nipple in bottom to form drip, as close as practical to inlet of each appliance using gas.

E. Retain two paragraphs and associated subparagraph below for electrically operated devices.

F. Ground equipment according to Division 26 Section 26 0526 "Grounding and Bonding for Electrical Systems."

G. Do not use gas pipe as grounding electrode.

H. Connect wiring according to Division 26 Section 26 0519 "Low Voltage Electrical Power Conductors and Cables."

3.12 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each meter, pressure regulator, and specialty valve.

1. Text: In addition to name of identified unit, distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.
2. Nameplates, pipe identification, and signs are specified in Division 22 Section 22 0553 "Identification for Plumbing."

3.13 PAINTING

A. Use materials and procedures in Division 09 painting Sections.

B. Paint exterior meters, pressure regulators, and specialty valves.

1. Color: Gray or as directed by University's Representative.

3.14 FIELD QUALITY CONTROL

A. Test, inspect, and purge piping according to CPC and requirements of University's Representative.

B. Repair leaks and defects with new materials and retest system until satisfactory results are obtained.

C. Verify capacities and pressure ratings of re-charge meters, pressure regulators, valves, and specialties.

D. Verify correct pressure settings for pressure regulators.

E. Verify that specified piping tests are complete.

3.15 COORDINATION

A. Coordinate gas -meter power and control wiring connections, and interface with Controls Contractor. Prior to procurement, ensure metering assembly shall have output compatible with the Building Management System for both volumetric indexing (pulse signal), and instantaneous flow rate (4-20ma signal).

B. Coordinate gas -meter and transmitter body space requirements with other trades.

C. Coordinate location and installation of gas -meter protective barriers with other trades.

D. Coordinate gas -meter label numbering with Controls Contractor for proper graphical interface and tenant billing information.

END OF SECTION 22 1616

SECTION 22 3300 - ELECTRIC DOMESTIC WATER HEATERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following electric water heaters:
   1. Instantaneous electric water heaters.

1.3 ACTION SUBMITTALS

A. Product Data: For each type and size of water heater indicated. Include rated capacities, operating characteristics, electrical characteristics, furnished specialties, and accessories.

B. LEED Submittal:

   1. Product Data for Prerequisite EA 2: Documentation indicating that units comply with applicable requirements in ASHRAE/IESNA 90.1, Section 7, "Service Water Heating."

C. Warranty: Special warranty specified in this Section.

1.4 INFORMATIONAL SUBMITTALS

A. Domestic-Water Heater Labeling: Certified and labeled by testing agency acceptable to authorities having jurisdiction.

B. Source quality-control reports.

C. Field quality-control reports.

D. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For electric, domestic-water heaters to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain same type of electric water heaters through one source from a single manufacturer.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of electric water heaters that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Faulty operation of controls.
   b. Deterioration of metals, metal finishes, and other materials beyond normal use.

2. Warranty Period(s): From date of Substantial Completion:

   a. Instantaneous Electric Water Heaters: Minimum one year parts and labor.

PART 2 - PRODUCTS

2.1 GENERAL

A. Refer to Water Heater Schedule on the drawings for additional information on the capacity and characteristics of each heater.

2.2 INSTANTANEOUS ELECTRIC WATER HEATERS

A. Instantaneous Electric Water Heaters: UL listed for tankless electric (water heater) heating appliance.

1. Available Manufacturers:

   a. Eemax, Inc.
   b. Chronomite Laboratories, Inc.
   c. Stiebel Eltron
   d. Or equal.

2. Construction: Element shall be iron free, Nickel Chrome material, or copper piping or tubing complying with materials for potable water, without storage capacity.

   a. Pressure Rating: 150 psig.
   b. Heating Element: Resistance heating system.
   c. Temperature Control: microprocessor temperature control, integrated mixing valve.
   d. Safety Control: High-temperature-limit cutoff device or system.

e. Jacket: Aluminum or steel with enameled finish or plastic.
f. Heater shall be fitted with 1/2" pipe compression nuts (5/8" OD) or 3/8" sleeves, to eliminate need for soldering

PART 3 - EXECUTION

3.1 WATER HEATER INSTALLATION

A. Install water heaters level and plumb, according to construction documents, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.

B. Assemble and install inlet and outlet piping manifold kits for multiple water heaters. Fabricate, modify, or arrange manifolds for balanced water flow through each water heater.

C. Include a shutoff valve and thermometer in each water heater's inlet and outlet piping.

D. Ground equipment according to Division 26 Section 26 0256 "Grounding and Bonding for Electrical Systems."

3.2 IDENTIFICATION

A. Identify system components. Comply with requirements for identification specified in Division 22 Section 22 0553 "Identification for Plumbing Piping and Equipment."

3.3 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:

1. Leak Test: After installation, test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, confirm proper operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Remove and replace water heaters that do not pass tests and inspections and retest as specified above.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain electric water heaters. Refer to Division 01 Section 01 7900"Demonstration and Training."

END OF SECTION 223300

SECTION 22 3500 - DOMESTIC WATER HEAT EXCHANGERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following heat exchangers:
   1. Instantaneous heat exchangers.
   2. Expansion tanks.
   3. Heat-exchanger accessories.

1.3 SUBMITTALS

A. Product Data: For each type and size of heat exchanger indicated. Include rated capacities, operating characteristics, furnished specialties, and accessories.

B. Seismic Qualification: Manufacturer's certification of seismic qualification according to ASCE 7-05. Submit ASCE 7-05 special seismic certification as required. Include method used to determine compliance with requirements.

   1. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   2. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Source quality-control test reports.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For heat exchangers to include in emergency, operation, and maintenance manuals.

F. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain same type of heat exchangers through one source from a single manufacturer.

B. Product Options: Drawings indicate size, profiles, and dimensional requirements of heat exchangers and are based on the specific system indicated. Refer to Division 01 Section 01 6000 "Product Requirements."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. Comply with NSF 61, "Drinking Water System Components - Health Effects; Sections 1 through 9" for all components that will be in contact with water.

1. All plumbing components, including but not limited to piping, valves, backflow preventers, fixtures, etc. that are connected to the domestic water system which convey water to be used for human consumption shall meet the NSF-372, 'Lead-Free' requirements. Items not intended to dispense water for human consumption such as flush valves, tub fills, shower valves, or piping accessories connected to non-potable water systems, are not required to meet the 'Lead Free' requirements.

1.5 COORDINATION

A. Coordinate size and location of concrete bases with Architectural and Structural Drawings.

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of heat exchangers that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including heat exchanger, and supports.
b. Faulty operation of controls.
c. Deterioration of metals, metal finishes, and other materials beyond normal use.

2. Warranty Period(s): From date of Substantial Completion:

a. Instantaneous Heat Exchangers:

1) Tube Coil and Shell: One year.
2) Controls and Other Components: One year.

PART 2 - PRODUCTS

2.1 INSTANTANEOUS HEAT EXCHANGERS

A. Manufacturers:
1. AERCO International, Inc.
2. Cemline Corporation.
3. Patterson-Kelley.
4. PVI Industries, LLC.

B. Description: Tube coil and shell, packaged assembly of heat-exchanger coil, controls, and specialties for heating domestic water.

C. Construction: ASME-code, negligible-capacity, copper-lined, carbon-steel or copper-alloy shell.
1. Configuration: Horizontal or Vertical.
2. Shell Tappings: Factory fabricated of materials compatible with water heater shell. Attach tapping's to shell before testing and labeling.
a. NPS 2 and Smaller: Threaded ends according to ASME B1.20.1.
b. NPS 2-1/2 and Larger: Flanged ends according to ASME B16.5 for steel and stainless-steel flanges, and according to ASME B16.24 for copper and copper-alloy flanges.
3. Insulation: Complying with ASHRAE/IESNA 90.1, unless otherwise indicated, and suitable for operating temperature. Surround entire shell and nozzle except connections and controls.
4. Heat-Exchanger Coil: Copper, double-wall.

D. Temperature Control: Adjustable thermostat that operates [team control valve and that is capable of maintaining outlet-water temperature within 5 deg F of setting.

E. Safety Control: Automatic, high-temperature-limit cutoff device or system.

F. Relief Valves: ASME rated and stamped and complying with ASME PTC 25.3, for combination temperature and pressure relief valves. Include one or more relief valves with total relieving capacity at least as great as heat input, and include pressure setting less than working-pressure rating of heat exchanger. Select one relief valve with sensing element that extends into shell.

G. Miscellaneous Components for Heating Hot-Water Unit: Control valve, valves, and piping. Include components fitted for electronic control.

H. Miscellaneous Components for Steam Unit: Strainers, steam-control valve, steam trap, valves, pressure gage, thermometer, and piping. Include components fitted for electronic control.

I. Stand: Factory fabricated for floor mounting.

2.2 EXPANSION TANKS

A. Description: Steel pressure-rated tank constructed with welded joints and factory-installed butyl-rubber diaphragm. Include air pre-charge to minimum system-operating pressure at tank.

1. Manufacturers:

a. AMTROL Inc.
b. Smith, A. O.; Aqua-Air Div.
c. State Industries, Inc.
d. Watts Regulator Co.

2. Construction:

a. Tappings: Factory-fabricated steel, welded to tank before testing and labeling. Include ASME B1.20.1, pipe thread.
b. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.
c. Air-Charging Valve: Factory installed.

3. Refer to the drawings for capacities and characteristics.

2.3 HEAT-EXCHANGER ACCESSORIES

A. Combination Temperature and Pressure Relief Valves: ASME rated and stamped and complying with ASME PTC 25.3. Include relieving capacity at least as great as heat input, and include pressure setting less than working-pressure rating of heat exchanger

B. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE/IESNA 90.1 or ASHRAE 90.2.

2.4 SOURCE QUALITY CONTROL

A. Test and inspect heat-exchanger storage tanks, specified to be ASME-code construction, according to ASME Boiler and Pressure Vessel Code.

B. Hydrostatically test heat-exchanger storage tanks before shipment to minimum of one and one-half times pressure rating.

PART 3 - EXECUTION

3.1 HEAT-EXCHANGER INSTALLATION

A. Install heat exchangers on concrete bases. Concrete bases are specified in Division 22 section 22 0500 ”Common Work Results for Plumbing.”

B. Install heat exchangers level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.

C. Anchor heat exchangers to substrate.

D. Comply with mounting and anchoring requirements for seismic installations.

E. Install combination temperature and pressure relief valves in water piping for heat exchangers without storage. Extend relief-valve outlet, with drain piping same as water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.

F. Install heat-exchanger drain piping as indirect waste to spill by positive air gap into open drains or over floor drains. Install hose-end drain valves at low points in water piping for heat exchangers that do not have tank drains. Refer to Division 22 Section 22 1119 "Domestic Water Piping Specialties" for hose-end drain valves.

G. Install thermometer on each heat-exchanger domestic-water inlet and outlet piping, and install thermometer on each heat-exchanger heating-fluid inlet and outlet piping. Refer to Division 22 Section 22 0519 "Meters and Gages for Plumbing Piping" for thermometers.

H. Install pressure gages on heat-exchanger heating-fluid piping. Refer to Division 22 Section 22 0519 "Meters and Gages for Plumbing Piping" for pressure gages.

I. Fill heat exchangers with water.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to heat exchangers to allow service and maintenance. Arrange piping for easy removal of heat exchangers.

C. Ground equipment according to Division 26 Section 26 0526 "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Division 26 Section 26 0519 "Low-Voltage Electrical Power Conductors and Cables."

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:

1. Leak Test: After installation, test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, confirm proper operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace heat exchangers that do not pass tests and inspections and retest as specified above.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain heat exchangers. Refer to Division 01 Section 01 7900 "Demonstration and Training."

END OF SECTION 223500

SECTION 22 4000 - PLUMBING FIXTURES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes plumbing fixtures and related components.

B. Related Sections include the following:

1. Division 22 Section "Emergency Plumbing Fixtures."
2. Division 22 Section "Drinking Fountains."
3. Division 22 Section “Domestic Water Piping Specialties" for backflow preventers and specialty fixtures not in this Section.

1.2 DEFINITIONS

A. Accessible Fixture: Plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Fitting: Device that controls flow of water into or out of plumbing fixture. Fittings specified in this Section include supplies and stops, faucets and spouts, shower heads and tub spouts, drains and tailpieces, and traps and waste pipes. Piping and general-duty valves are included where indicated.

1.3 SUBMITTALS

A. Product Data: Include selected fixture and trim, fittings, accessories, appliances, appurtenances, equipment, and supports and indicate materials and finishes, dimensions, construction details, and flow-control rates for each type of fixture indicated.

B. Shop Drawings: Diagram power, signal, and control wiring and differentiate between manufacturer-installed and field-installed wiring.

C. Maintenance Data: For plumbing fixtures to include in maintenance manuals specified in Division 01.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain plumbing fixtures, faucets, and other components of each category through one source from a single manufacturer.

1. Exception: If fixtures, faucets, or other components are not available from a single manufacturer, obtain similar products from other manufacturers specified for that category.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70) Article 100, by a testing agency acceptable to University’s Representative, and marked for intended use.

C. Regulatory Requirements: Comply with requirements of California Building Code about accessible plumbing fixtures for people with disabilities. See architectural floor plans for accessible fixture requirements.

D. Regulatory Requirements: Comply with requirements in Public Law 102-486, "Energy Policy Act," about water flow and consumption rates for plumbing fixtures.

E. Regulatory Requirements: Comply with California Energy Commission Title-24 water conservation and consumption rates for plumbing fixtures.

F. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water.

G. Select combinations of fixtures and trim, faucets, fittings, and other components that are compatible.

H. Comply with the following applicable standards and other requirements specified for plumbing fixtures:

1. Enameled, Cast-Iron Fixtures: ASME A112.19.1M.
2. Hand Sinks: NSF 2 construction.
3. Slip-Resistant Bathing Surfaces: ASTM F 462. Applicable, Shower pans.
4. Stainless-Steel Fixtures Other Than Service Sinks: ASME A112.19.3M.
5. Vitreous-China Fixtures: ASME A112.19.2M.

I. Comply with the following applicable standards and other requirements specified for lavatory and sink faucets:

1. Faucets: ASME A112.18.1M.
2. Hose-Connection Vacuum Breakers: ASSE 1011.
3. Hose-Coupling Threads: ASME B1.20.7.
4. Integral, Atmospheric Vacuum Breakers: ASSE 1001.
5. NSF Materials: NSF 61.
6. Pipe Threads: ASME B1.20.1.
7. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
8. Supply and Drain Fittings: ASME A112.18.1M.

J. Comply with the following applicable standards and other requirements specified for shower faucets:

1. Backflow Protection Devices for Hand-Held Showers: ASME A112.18.3M.
2. Combination, Pressure-Equalizing and Thermostatic-Control Antiscald Faucets: ASSE 1016.
3. Faucets: ASME A112.18.1M.
4. Hand-Held Showers: ASSE 1014.
5. High-Temperature-Limit Controls for Thermal-Shock-Preventing Devices: ASTM F 445.
6. Hose-Coupling Threads: ASME B1.20.7.
7. Pipe Threads: ASME B1.20.1.

8. Pressure-Equalizing-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.
9. Sensor-Actuated Faucets and Electrical Devices: UL 1951.
10. Thermostatic-Control Antiscald Faucets: ASTM F 444 and ASSE 1016.

K. Comply with the following applicable standards and other requirements specified for miscellaneous fittings:

1. Atmospheric Vacuum Breakers: ASSE 1001.
2. Brass and Copper Supplies: ASME A112.18.1M.
3. Sensor-Operation Flushometers: ASSE 1037 and UL 1951.
4. Tubular Brass Drainage Fittings and Piping: ASME A112.18.2M.

L. Comply with the following applicable standards and other requirements specified for miscellaneous components:

1. Disposers: ASSE 1008 and UL 430. Applicable.
2. Floor Drains: ASME A112.6.3.
3. Hose-Coupling Threads: ASME B1.20.7.
4. Off-Floor Fixture Supports: ASME A112.6.1M.
5. Pipe Threads: ASME B1.20.1.
6. Plastic Toilet Seats: ANSI Z124.5.
7. Supply and Drain Protective Shielding Guards: ICC A117.1.

1.5 COORDINATION

A. Coordinate roughing-in and final plumbing fixture locations, and verify that fixtures can be installed to comply with original design and referenced standards.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. For fixture descriptions in other Part 2 articles where the subparagraph titles "Products," and "Manufacturers" introduce a list of manufacturers and their products or manufacturers only, the following requirements apply for product selection:

1. Products: Subject to compliance with requirements, provide one of the products specified in other Part 2 articles.
2. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified in other Part 2 articles.
3. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 LAVATORY FAUCETS (See Fixture Schedule)

2.3 SHOWER FAUCETS (See Fixture Schedule)

2.4 SINK FAUCETS (See Fixture Schedule)

2.5 PROTECTIVE SHIELDING GUARDS

A. Protective Shielding Guard: Manufactured, plastic covering for hot-water supplies and trap and drain piping and complying with ADA requirements.

1. Manufacturers:

a. Plumberex Specialty Products, "Pro-Extreme."
b. True Bro "Lav Guard 2."
c. Or equal.

2.6 FIXTURE SUPPORTS

A. Water-Closet Support: Water-closet combination carrier designed for accessible or standard mounting height. Include left-hand or right-hand, single or double, vertical or horizontal, hub and-spigot or hub-less waste fitting as required for piping arrangement; faceplates; couplings with gaskets; feet; and fixture bolts and hardware matching fixture. Include additional extension coupling, faceplate, and feet for installation in wide pipe space.

B. Urinal Support: Type II, urinal carrier with hanger and bearing plates. Include coated rectangular steel uprights with feet.

C. Lavatory Support: Type II, lavatory carrier with concealed arms and tie rod. Include steel uprights with feet.

D. Sink Support: Type II, sink carrier with hanger plate, bearing studs, and tie rod. Include steel uprights with feet.

E. Manufacturers:

1. Watts Drainage Products USA.
2. Jay R. Smith.
3. Josam.
4. Zurn.
5. Or equal.

2.8 SHOWER RECEPTORS (See Fixture Schedule)

2.9 DISPOSERS

A. Disposer: Batch-feed, household, food-waste disposer. Include 115-V ac, 1725-rpm, 1/2 -hp motor with overload protection and reset button; wall switch; corrosion-resistant chamber with jam-resistant, cutlery- or stainless-steel grinder or shredder; NPS 1-1/2 outlet; quick-mounting, stainless-steel sink flange; antisplash guard; and combination cover/stopper.

1. Manufacturers:

a. Insinkerator, Badger 5.

b. Waste King
c. Or equal.

2. Model: Sound-insulated chamber and stainless-steel outer shell.

2.10 WATER CLOSETS (See Fixture Schedule)

A. Toilet Seat: Solid plastic, Self-Sustaining Check Hinge, open front.

1. Manufacturers:

a. Olsonite: 10SSC.
b. Or equal.

B. Fixture Support: Water-closet support combination carrier. Manufactured waste fitting with seal and chrome plated fixture bolts.

2.11URINALS (See Fixture Schedule)

2.12 LAVATORIES (See Fixture Schedule)

2.13 KITCHEN SINKS (See Fixture Schedule)

2.14 SERVICE SINKS (See Fixture Schedule)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water soil and for waste piping systems and supports to verify actual locations and sizes of piping connections and that locations and types of supports match those indicated, before plumbing fixture installation. Use manufacturer's roughing-in data if roughing-in data are not indicated.

B. Examine walls, floors, and cabinets for suitable conditions where fixtures are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FIXTURE INSTALLATION

A. Assemble fixtures, trim, fittings, and other components per manufacturers' written instructions.

B. For wall-hanging fixtures, install off-floor supports affixed to building substrate.

1. Use carrier supports with waste fitting and seal for back-outlet fixtures.
2. Use carrier supports without waste fitting for fixtures with tubular waste piping.
3. Use chair-type carrier supports with rectangular steel uprights for accessible fixtures.

C. Install back-outlet, wall-hanging fixtures onto waste fitting seals and attach to supports.

D. Install floor-mounting fixtures on closet flanges or other attachments to piping or building substrate.

E. Install wall-hanging fixtures with tubular waste piping attached to supports.

G. Install counter-mounting fixtures in and attached to casework.

H. Install fixtures level and plumb according to manufacturers' written instructions and roughing-in drawings.

I. Install water-supply piping with stop on each supply to each fixture to be connected to water distribution piping. Attach supplies to supports or substrate within pipe spaces behind fixtures. Install stops in locations where they can be easily reached for operation.
   1. Exception: Use ball valve if stops are not specified with fixture.

J. Install trap and tubular waste piping on drain outlet of each fixture to be directly connected to sanitary drainage system.

K. Install tubular waste piping on drain outlet of each fixture to be indirectly connected to drainage system.

L. Install toilet seats on water closets.

M. Install faucet-spout fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

N. Install water-supply, flow-control fittings with specified flow rates in fixture supplies at stop valves.

O. Install faucet, flow-control fittings with specified flow rates and patterns in faucet spouts if faucets are not available with required rates and patterns. Include adapters if required.

P. Install shower, flow-control fittings with specified maximum flow rates in shower arms.

Q. Install traps on fixture outlets.

   1. Exception: Omit trap on fixtures with integral traps.
   2. Exception: Omit trap on indirect wastes, unless otherwise indicated.

R. Install disposer in outlet of sinks indicated to have disposer. Install switch where indicated or in wall adjacent to sink if location is not indicated.

S. Install escutcheons at piping wall ceiling penetrations in exposed, finished locations and within cabinets and millwork. Use deep-pattern escutcheons if required to conceal protruding fittings. Refer to Division 22 Section "Common Work Results for Plumbing" for escutcheons.

T. Set service basins in leveling bed of cement grout. Refer to Division 22 Section "Common Work Results for Plumbing" for grout.

U. Seal joints between fixtures and walls, floors, and counters using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Refer to Division 07 Section "Joint Sealants" for sealant and installation requirements.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect water supplies from water distribution piping to fixtures.

C. Connect drain piping from fixtures to drainage piping.

D. Supply and Waste Connections to Plumbing Fixtures: Connect fixtures with water supplies, stops, risers, traps, and waste piping. Use size fittings required to match fixtures. Connect to plumbing piping.

E. Supply and Waste Connections to Fixtures and Equipment Specified in Other Sections: Connect fixtures and equipment with water supplies, stops, risers, traps, and waste piping specified. Use size fittings required to match fixtures and equipment. Connect to plumbing piping.

F. Ground Equipment: Scope of work provided under another division. Tighten electrical connectors and terminals per manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

3.4 FIELD QUALITY CONTROL

A. Verify that installed fixtures are categories and types specified for locations where installed.

B. Check that fixtures are complete with trim, faucets, fittings, and other specified components.

C. Inspect installed fixtures for damage. Replace damaged fixtures and components.

D. Test installed fixtures after water systems are pressurized for proper operation. Replace malfunctioning fixtures and components, then retest. Repeat procedure until units operate properly.

3.5 ADJUSTING

A. Operate and adjust faucets and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.

B. Operate and adjust disposers, and controls. Replace damaged and malfunctioning units and controls. .

C. Adjust water pressure at faucets, shower valves, and flushometer valves to produce proper flow and stream.

D. Replace washers and seals of leaking and dripping faucets and stops.

3.6 CLEANING

A. Clean fixtures, faucets, and other fittings with manufacturers' recommended cleaning methods and materials. Do the following:
   1. Remove faucet spouts and strainers, remove sediment and debris, and reinstall strainers and spouts.
   2. Remove sediment and debris from drains.

3.7 PROTECTION

A. Provide protective covering for installed fixtures and fittings.

B. Do not allow use of fixtures for temporary facilities unless approved in writing by University's Representative.

END OF SECTION 22 4000

SECTION 22 4500 - EMERGENCY PLUMBING FIXTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following emergency plumbing fixtures:

1. Combination units.

B. Related Sections include the following:

1. Division 22 Section "Plumbing Fixtures".
2. Division 22 Section "Sanitary Waste Piping Specialties" for floor drains.

1.3 DEFINITIONS

A. Accessible Fixture: Emergency plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Plumbed Emergency Plumbing Fixture: Fixture with fixed, potable-water supply.

C. Self-Contained Emergency Plumbing Fixture: Fixture with flushing-fluid-solution supply.

D. Tepid: Moderately warm, ambient temperature water.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated. Include flow rates and capacities, furnished specialties, and accessories.

B. Shop Drawings: Submit for the fixture.

C. Product Certificates: Submit certificates of performance testing specified in "Source Quality Control" Article.

D. Field quality-control test reports.

E. Operation and Maintenance Data: For emergency plumbing fixtures to include in maintenance manuals.

1.5 QUALITY ASSURANCE

A. ANSI Standard: Comply with ANSI Z358.1, "Emergency Eyewash and Shower Equipment."

B. Regulatory Requirements: Comply with requirements in ICC A117.1, "Accessible and Usable Buildings and Facilities"; Public Law 90-480, "Architectural Barriers Act"; and Public Law 101-336, "Americans with Disabilities Act"; for plumbing fixtures for people with disabilities.

C. NSF Standard: Comply with NSF 61, "Drinking Water System Components--Health Effects," for fixture materials that will be in contact with potable water. Equivalent certification of compliance to NSF by an ANSI accredited third-party certification body such as Intertek ETL is acceptable.

PART 2 - PRODUCTS

2.3 COMBINATION UNITS (See Fixture Schedule)

A.:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Bradley Corporation.
    b. Guardian Equipment Co.
    c. Haws Corporation.
    d. Lab Safety Supply Inc.
    e. WaterSaver Faucet Co.
    f. Western Emergency Equipment.
    g. Or Equal**.**

2.4 SOURCE QUALITY CONTROL

A. Certify performance of plumbed emergency plumbing fixtures by independent testing agency acceptable to authorities having jurisdiction.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before plumbed emergency plumbing fixture installation.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 EMERGENCY PLUMBING FIXTURE INSTALLATION

A. Assemble emergency plumbing fixture piping, fittings, control valves, and other components.

B. Install fixtures level and plumb.

C. Fasten fixtures to substrate.

D. Install shutoff valves in water-supply piping to fixtures. Use ball valve if specific type valve is not indicated. Install valves chained or locked in open position if permitted. Install valves in locations where they can easily be reached for operation. Valves are specified in Division 22 Section "General-Duty Valves for Plumbing Piping."

E. Install dielectric fitting in supply piping to fixture if piping and fixture connections are made of different metals. Dielectric fittings are specified in Division 22 Section "Common Work Results for Plumbing."

F. Install trap and waste to wall on drain outlet of fixture receptors that are indicated to be directly connected to drainage system.

G. Install escutcheons on piping wall and ceiling penetrations in exposed, finished locations. Escutcheons are specified in Division 22 Section "Common Work Results for Plumbing."

H. Install equipment nameplates or equipment markers on fixtures and equipment signs on water tempering equipment. Identification materials are specified in Division 22 Section "Identification for Plumbing Piping and Equipment."

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect cold-water-supply piping to plumbed emergency plumbing fixtures not having water tempering equipment.

C. Directly connect emergency plumbing fixture receptors with trapped drain outlet to sanitary drainage and vent piping.

3.4 FIELD QUALITY CONTROL

A. Mechanical-Component Testing: After plumbing connections have been made, test for compliance with requirements. Verify ability to achieve indicated capacities and temperatures.

B. Repair or replace malfunctioning units. Retest as specified above after repairs or replacements are made.

C. Report test results in writing.

3.5 ADJUSTING

A. Adjust or replace fixture flow regulators for proper flow.

B. Adjust equipment temperature settings.

END OF SECTION 22 4500

SECTION 22 4700 - DRINKING FOUNTAINS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Drinking fountains with bottle filler.
2. Fixture supports.

1.2 DEFINITIONS

A. Accessible Drinking Fountains: Fixture that can be approached and used by people with disabilities.

B. Cast Polymer: Dense, cast-filled-polymer plastic.

C. Drinking Fountain: Fixture with nozzle for delivering stream of water for drinking.

D. Fitting: Device that controls flow of water into or out of fixture.

E. Fixture: Drinking fountain unless one is specifically indicated.

1.3 SUBMITTALS

A. Product Data: For each fixture indicated. Include rated capacities, furnished specialties, and accessories.

B. Shop Drawings: Equipment cuts.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For fixtures to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with requirements of CBC, Chapter 11B.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 DRINKING FOUNTAINS

A. Drinking Fountains: Refer to Plumbing Fixture Schedule.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Elkay Manufacturing Co.
b. Haws Corporation.
c. Oasis Corporation.
d. Sunroc Corp.
e. Or equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before fixture installation. Verify that sizes and locations of piping and types of supports match those indicated.

B. Examine walls and floors for suitable conditions where fixtures are to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Use mounting frames for recessed drinking fountains, unless otherwise indicated.

B. Use chrome-plated brass or copper tube, fittings, and valves in locations exposed to view. Plain copper tube, fittings, and valves may be used in concealed locations.

3.3 INSTALLATION

A. Install off-floor supports affixed to building substrate and attach wall-mounting fixtures, unless otherwise indicated.

B. Install mounting frames affixed to building construction and attach recessed drinking fountains to mounting frames, unless otherwise indicated.

C. Install fixtures level and plumb. For fixtures indicated for children, install at height required by University's Representative.

D. Install water-supply piping with shutoff valve on supply to each fixture to be connected to water distribution piping. Use ball, gate, or globe valve. Install valves in locations where they can be easily reached for operation. Valves are specified in Division 22 Section 22 1116 "Domestic Water Piping and Valves."

E. Install trap and waste piping on drain outlet of each fixture to be connected to sanitary drainage system.

F. Install pipe escutcheons at wall penetrations in exposed, finished locations. Use deep-pattern escutcheons where required to conceal protruding pipe fittings. Escutcheons are specified in Division 22 Section 22 0500 "Common Work Results for Plumbing."

G. Seal joints between fixtures and walls and floors using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Sealants are specified in Division 07 Section 07 9200 "Joint Sealants."

3.4 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.

3.5 FIELD QUALITY CONTROL

A. Drinking Fountain and Bottle Filler Testing: After fixture has been installed, test for compliance with requirements. Test and adjust controls and safeties.

1. Remove and replace malfunctioning units and retest as specified above.
2. Report test results in writing.

3.6 ADJUSTING

A. Adjust fixture flow regulators for proper flow and stream height.

3.7 CLEANING

A. Removal of paint splatters and other spots, dirt, and debris, cleaning of fixtures provided by another division scope of work.

END OF SECTION 22 4700

SECTION 22 6000 - CHEMICAL-WASTE PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following components for chemical-waste piping:

1. Single-wall piping.
2. Special-duty valves.
3. Piping specialties.

1.2 DEFINITIONS

A. EPDM: Ethylene-propylene-diene terpolymer rubber.

B. PE: Polyethylene plastic.

C. PP: Polypropylene plastic.

D. PTFE: Polytetrafluoroethylene plastic.

E. PVC: Polyvinyl chloride plastic.

F. PVDF: Polyvinylidene fluoride plastic.

G. TFE: Tetrafluoroethylene plastic.

1.3 PERFORMANCE REQUIREMENTS

A. Gravity-Flow Drainage Piping:

1. Single-Wall Piping Pressure Rating: 10 feet head of water.

B. Force-Main Piping:

1. Single-Wall Piping Pressure Rating: At least equal to system operating pressure but not less than 100 psig.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, furnished specialties, and accessories.

B. Shop Drawings: Signed and sealed by a qualified professional engineer.

1. Design Calculations: Calculate requirements for selecting seismic restraints for above ground piping.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For chemical-waste specialties to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Source Limitations: Obtain pipe, fittings, and joining materials for each piping system through one source from a single manufacturer.

1. Exception: Piping from different manufacturers may be used in same system if indicated and suitable transition fittings matching both piping materials are used. University's Representative approval shall be received prior to use.

B. Piping materials shall bear label, stamp, or other markings of specified testing laboratory.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to University's Representative, and marked for intended use.

D. NFPA Compliance: Comply with NFPA 70, "National Electrical Code."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver and store piping and specialties with sealing plugs in ends or with end protection.

B. Do not store plastic pipe or fittings in direct sunlight.

C. Protect pipe, fittings, and seals from dirt and damage.

1.7 PROJECT CONDITIONS

A. Interruption of Existing Chemical-Waste Service: Do not interrupt chemical-waste service to facilities occupied by University or others unless permitted under the following conditions and then only after arranging to provide temporary chemical-waste service according to requirements indicated:

1. Notify University's Representative no fewer than fourteen days in advance of proposed interruption of service.
2. Do not proceed with interruption of service without University's Representative's written permission.

1.8 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term “or equal”, comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before the use of an unnamed manufacturer or product.

2.2 SINGLE-WALL PIPE AND FITTINGS

A. PP Drainage Pipe and Fittings: ASTM F 1412, pipe extruded and drainage-pattern fittings molded, with Schedule 40 dimensions, from PP resin with fire-retardant additive complying with ASTM D 4101; with fusion -joint ends. 180°F resistance to continuous heat.

1. Exception: Pipe and fittings made from PP resin without fire-retardant additive may be used for underground installation.
2. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. IPEX Inc.
    b. Orion Fittings, Inc.
    c. Town & Country Plastics, Inc.
    d. Watts Industries (Canada) Inc.
    e. Zurn Plumbing Products Group; Chemical Drainage Systems.
    f. Or equal.

B. PP Pressure Pipe and Fittings: Pipe extruded and fittings molded from PP resin complying with ASTM D 4101; with SDR 11 or Schedule 80 dimensions and socket or butt-fusion fittings.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Asahi/America.
    b. Fischer, George, Inc.
    c. Flo Safe, Inc.
    d. NIBCO INC.; Chemtrol Div.
    e. Town & Country Plastics, Inc.
    f. Orion.
    g. Or equal.

C. PVDF Drainage Pipe and Fittings: Pipe extruded and drainage-pattern fittings molded, with Schedule 40 dimensions, from PVDF resin complying with ASTM D 3222; with drainage pattern fittings complying with ASTM D 3311 except with fusion -joint ends. 285°F resistance to continuous heat.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Orion Fittings, Inc.
b. Watts Industries (Canada) Inc.
c. Zurn Plumbing Products Group; Chemical Drainage Systems.
d. Town & Country Plastics
e. Ipex, Inc.
f. Or equal.

D. PVDF Pressure Pipe and Fittings: Pipe extruded and fittings molded, with Schedule 80 dimensions, from PVDF resin complying with ASTM D 3222; with fusion-joint ends.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Fischer, George, Inc.
b. Flo Safe, Inc.
c. NIBCO INC.; Chemtrol Div.
d. Orion Fittings, Inc.Or equal.

E. High-Silicon-Iron, Mechanical-Joint Pipe and Fittings: ASTM A 861, pipe and drainagepattern fittings; and stainless-steel clamps with TFE inner sleeve and CR outer sleeve.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Flowserve Corporation; Foundry Operations.
b. Duriron, Inc.
c. Or equal.

2.3 JOINING MATERIALS

A. Refer to Division 22 Section "Common Work Results for Plumbing" for commonly used joining materials.

B. Couplings: Assemblies with combination of clamps, gaskets, sleeves, and threaded or flanged parts; compatible with piping and system liquid; and made by piping manufacturer for joining system piping.

C. Adapters and Transition Fittings: Assemblies with combination of clamps, couplings, adapters, gaskets, and threaded or flanged parts; compatible with piping and system liquid; and made for joining different piping materials.

D. Flanges: Assemblies of companion flanges and gasket complying with ASME B16.21 and compatible with system liquid, and bolts and nuts.

2.4 SPECIAL-DUTY VALVES

A. PP and PVDF Ball Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. American Valve, Inc.
b. Asahi/America.
c. Fischer, George, Inc.
d. IPEX Inc.
e. NIBCO INC.; Chemtrol Div.
f. Plast-O-Matic Valves, Inc.
g. Sloane, George Fischer, Inc.
h. Spears Manufacturing Co.
i. Town & Country Plastics, Inc.
j. Or equal.

2. Standard: MSS SP-122; same material as piping.
3. Pressure Rating: minimum 150 psig at 73 deg F.
4. End Connections: Threaded, union ends.

B. Plastic Valves Other Than Ball Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. American Valve, Inc.
b. Asahi/America.
c. Colonial Engineering, Inc.
d. Fischer, George, Inc.
e. Hayward Industrial Products, Inc.
f. ITT Industries; Engineered Valves.
g. NIBCO INC.; Chemtrol Div.
h. Plast-O-Matic Valves, Inc.
i. Spears Manufacturing Co.
j. Thermoplastic Valves, Inc.
k. Town & Country Plastics, Inc.
l. Or equal.

2. Type: check, gate, or globe types; same material as or compatible with piping.
3. Pressure Rating: minimum 150 psig at 73 deg F.

2.5 PIPING SPECIALTIES

A. Plastic Dilution Traps:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. IPEX Inc.
    b. Orion Fittings, Inc.
    c. Sloane, George Fischer, Inc.
    d. Town & Country Plastics, Inc.
    e. Or equal.

2. Material: Corrosion-resistant PP, with removable base.
3. End Connections: Mechanical joint.
4. Dilution Tanks: 1-gal. capacity, with clear base unless colored base is indicated; with two NPS 1-1/2 top inlets and one NPS 1-1/2 side outlet.

E. High-Silicon-Iron Floor Drains: Refer to Plumbing Fixture Schedule

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Flowserve Corporation; Foundry Operations.
    b. Durion, Inc.
    c. Or equal.

G. PP Floor Drains: Refer to Plumbing Fixture Schedule

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. IPEX Inc.
    b. Orion Fittings, Inc.
    c. Schier Products Company.
    d. Sloane, George Fischer, Inc.
    e. Town & Country Plastics, Inc.
    f. Watts Industries (Canada) Inc.
    g. Or equal.

H. PP and PVDF Cleanouts:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Orion
    b. Enfield
    c. GF Fuseal
    d. Or equal.

K. Plastic Backwater Valves:

1. Description: Full-port NPS 3 check valve, PP or PVDF, matching or compatible with system piping and compatible with system liquid, with EPDM seals and flanged ends.
2. Standard: ASTM A 861, high-silicon iron, NPS 1-1/2, with clamping device and 4-, 6-, or 8-inch- high overflow fitting, as indicated.

M. PP Sink Outlets:

1. Description: NPS 1-1/2, with clamping device, stopper, and 7-inch- high overflow fitting.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Excavating, trenching, and backfilling are specified in Division 31 Section "Earth Moving."

3.2 CONCRETE BASES

A. Anchor Equipment to concrete bases. Concrete scope of work by others. Refer to Division 3.

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 19-inch centers around full perimeter of base.
2. For installed equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be imbedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.
5. Concrete base construction requirements are specified in Division 22 Section "Common Work Results for Plumbing."
6. Cast-in-place concrete materials and placement requirements are specified in Division 03.

3.3 PIPING APPLICATIONS

A. Transition and special fittings with pressure ratings at least equal to piping pressure rating may be used in applications below, unless otherwise indicated.

B. Flanges may be used on aboveground pressure piping, unless otherwise indicated.

C. Aboveground Chemical-Waste Piping: Use any of the following piping materials for each size range:

1. NPS 1-1/2 to NPS 6: PP drainage piping and electrofusion joints.
2. NPS 1-1/2 to NPS 6: PVDF drainage piping and electrofusion joints.

D. Under Slab-on-Grade, Chemical-Waste Piping: Use any of the following piping materials for each size range:

1. NPS 1-1/2 to NPS 6: PP drainage piping and electrofusion joints.
2. NPS 1-1/2 to NPS 6: PVDF drainage piping and electrofusion joints.
3. NPS 1-1/2 to NPS 6: NPS 2 to NPS 4 high-silicon-iron piping with bell-and-spigot ends and calked joints.

E. Above ground, Chemical-Waste, Force-Main Piping: Use any of the following piping materials for each size range:

1. NPS 2 to NPS 4: PP pressure pipe, SDR 11, with butt-fusion fittings and heat-fusion joints.
2. NPS 2 to NPS 4: PP pressure pipe, flame-retardant, Schedule 80, and fusion fittings and heat-fusion joints.
3. NPS 2 to NPS 4: PVDF pressure piping, and socket fittings, flame-retardant and heat fusion joints.

3.4 VALVE APPLICATIONS

A. Drawings indicate valve types to be used. If specific valve types are not indicated, the following requirements apply:

1. Shutoff Duty: Ball, or gate valves.
2. Throttling Duty: Ball, or globe valves.
3. Butterfly valve shall not be used.

B. Plastic valves; with wetted surfaces same material as or compatible with piping and system liquid. PVC or CPVC valves shall not be used.

3.5 PIPING INSTALLATION

A. Refer to Division 22 Section "Basic Work Results for Plumbing" for basic piping installation.

B. Install piping next to equipment, accessories, and specialties to allow service and maintenance.

C. Transition and special fittings with pressure ratings at least equal to piping pressure rating may be used, unless otherwise indicated.

D. Flanges may be used on aboveground piping, unless otherwise indicated.

E. Install drain valves at low points in chemical-waste force mains.

F. Provide insulation with 1-hour fire rating to all polypropylene (PP & PVDF) piping installed above floor in fire resistive construction as required by NFPA, CBC and Campus Fire Marshal.

3.7 PIPING SPECIALTY INSTALLATION

A. Install piping specialties as components of connected chemical-waste piping system.

3.8 JOINT CONSTRUCTION

A. Refer to Division 22 Section "Basic Work Results for Plumbing" for basic piping joint construction. Where specific joint construction is not indicated, follow piping manufacturer's written instructions.

B. Plastic-Piping Electrofusion Joints: Make polyolefin drainage-piping joints according to ASTM F 1290.

C. Plastic-Piping, Heat-Fusion Joints: Make polyolefin pressure-piping joints according to ASTM D 2657.

D. Dissimilar-Material Piping Joints: Make joints using adapters compatible with both system materials.

3.9 HANGER AND SUPPORT INSTALLATION

A. Pipe sizes in this Article refer to aboveground, single-wall piping and carrier piping of containment piping.

B. Refer to Division 22 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

C. Refer to Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment" for pipe hanger and support devices. Install the following:

1. Vertical Piping: MSS Type 8 or MSS Type 42, riser clamps.
2. Individual, Straight, Horizontal Piping Runs:

    a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.

D. Install supports according to Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment."

E. Support horizontal piping and tubing within 12 inches of each fitting and coupling.

F. Support vertical piping and tubing at base and at each floor.

G. Rod diameter may be reduced 1 size for double-rod hangers, to minimum of 3/8 inch.

H. Install vinyl-coated hangers for PP piping .in accordance with CPC requirements.

I. Install supports for vertical PP piping in accordance with CPC requirements.

J. Install vinyl-coated hangers for PVDF piping in accordance with CPC requirements.

K. Install supports for vertical PVDF piping.

L Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.10 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Grounding of equipment under another section of work. Refer to Division 26 Section "Grounding and Bonding for Electrical Systems."

D. Connecting of wiring under another section of work. Refer to Division 26 Section "Low Voltage Electrical Power Conductors and Cables."

3.11 LABELING AND IDENTIFICATION

A. Install labeling and pipe markers on equipment and piping according to requirements in Division 22 Section "Identification for Plumbing Piping and Equipment."

B. Label pressure piping with system operating pressure.

3.12 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.13 CLEANING

A. Use procedures described below:

1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
2. Clean piping by flushing with potable water.

END OF SECTION 22 6000

SECTION 22 6213 - VACUUM PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes laboratory vacuum piping and related specialties.

B. Related Sections include the following:

1. Division 11 Section "Laboratory Fume Hoods" for laboratory fume hood outlets requiring laboratory vacuum service.
2. Division 12 Section "Laboratory Casework" for wood casework and outlets requiring laboratory vacuum service.
3. Division 22 Section "Meters and Gages for Plumbing" for pressure gages.
4. Division 22 Section "Vacuum Equipment for Laboratory Facilities" for laboratory vacuum equipment and related accessories.

1.2 DEFINITIONS

A. PTFE: Polytetrafluoroethylene plastic.

B. TFE: Tetrafluoroethylene plastic.

1.3 PERFORMANCE REQUIREMENTS

A. General: Provide laboratory vacuum piping systems that comply with NFPA 99, Category 4 requirements for materials and installation.

1.4 SUBMITTALS

A. Product Data: For the following:

1. Laboratory vacuum tubes and fittings.
2. Flexible pipe connectors.

B. Coordination Drawings: For laboratory vacuum systems. Include relationship to other services that serve same work area.

C. Brazing Certificates: As required by ASME Boiler and Pressure Vessel Code, Section IX, or AWS B2.2.

D. Piping Material Certification: Signed by Installer certifying that laboratory vacuum piping materials comply with NFPA 99 requirements.

E. Qualification Data: For testing agency.

F. Field quality-control test reports.

1.5 QUALITY ASSURANCE

A. Brazing: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications," or AWS B2.2, "Standard for Brazing Procedure and Performance Qualification."

B. Comply with NFPA 99, "Health Care Facilities," for materials and installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 TUBES AND FITTINGS

A. Copper Tube: ASTM B 88, Type L, seamless, hard drawn-temper, tube.

1. Fittings:

a. Copper Pressure Fittings: ASME B16.22, wrought-copper solder joint pressure type or MSS SP-73, wrought copper with dimensions for brazed joints.
b. Cast-Copper-Alloy Flanges: ASME B16.24, Class 150.
c. Copper Unions: ASME B16.22 or MSS SP-123.
d. Mechanical Tees, nipples, reducing coupling. Street Elbows and bushings shall not be used on Campus.

B. Flexible Pipe Connectors: Corrugated-bronze inner tubing with bronze wire-braid covering and ends brazed to inner tubing.

1. Working-Pressure Rating: 200 psig minimum.
2. End Connections NPS 2 and Smaller: Threaded copper pipe or plain-end copper tube.
3. End Connections NPS 2-1/2 and Larger: Flanged copper alloy.
4. Manufacturers:

a. ANAMET Inc.
b. Flex-Hose Co., Inc.

c. Flexicraft Industries.
d. Hyspan Precision Products, Inc.
e. Mercer Rubber Co.
f. Metraflex, Inc.
g. Proco Products, Inc.
h. Unaflex Inc.
i. Or equal.

2.3 JOINING MATERIALS

A. Refer to Division 22 Section "Common Work results for Plumbing" for joining materials not in this Section.

B. Brazing Filler Metals: AWS A5.8, BCuP3 & BCuP4 series alloys. Flux is prohibited unless used with bronze fittings.

C. Threaded-Joint Tape: PTFE.

D. Gasket Material: ASME B16.21, nonmetallic, flat, asbestos free, and suitable for oxygen service.

2.4 VALVES

A. Copper-Alloy Ball Valves: MSS SP-110, 3-piece-body, full-port ball valve rated for 400-psig minimum working pressure; with stainless steel ball, PTFE or TFE seats, blowout-proof stem, threaded or solder-joint ends, and locking-type handle designed for quarter turn between opened and closed positions.

1. Manufacturers:

a. Conbraco Industries, Inc.; Apollo Div. # 77-140, 77-240.
b. Or equal. (no known equal).

B. AWWA, Cast-Iron Gate Valves 3” and Larger:

1. Manufacturers:

    a. American Cast Iron Pipe Co.; American Flow Control Div.
    b. Crane Co.; Crane Valve Group; Stockham Div.
    c. Grinnell Corporation; Mueller Co.; Water Products Div.
    d. McWane, Inc.; Clow Valve Co. Div. (Oskaloosa).
    e. McWane, Inc.; Kennedy Valve Div.
    f. McWane, Inc.; M&H Valve Company Division
    g. NIBCO INC.
    h. United States Pipe and Foundry Company.
    i. Or equal.

1. Nonrising-Stem, Resilient-Seated Gate Valves: AWWA C509, gray- or ductile-iron body and bonnet; with bronze or gray- or ductile-iron gate, resilient seats, bronze stem, and stem nut.

    a. Minimum Working Pressure: 200 psig.
    b. End Connections: Mechanical joint, or flanged.
    c. Interior and Exterior Coating: Complying with AWWA C550, epoxy.
    d. Or equal.

C. Check Valves: Straight-through-pattern, spring-loaded ball check valve; designed for 300-psig minimum working pressure.

D. Safety Valves: Bronze body with settings to match system requirements.

1. Vacuum Relief Valves: Specialty manufacturer's option.

2.5 TEST GAS

A. Description: Oil-free dry nitrogen complying with CGA P-9, for purging and testing of piping.

2.6 IDENTIFICATION

A. Refer to Division 22 Section "Identification for Plumbing" for identification of piping, valves, gages, alarms, and specialties.

PART 3 - EXECUTION

3.1 PREPARATION

A. Cleaning of Piping: When using hard drawn copper tubing in accordance with ASTM B819 (medical gas tubing) the following cleaning procedures shall apply. When using hard drawn copper

tubing in accordance with ASTM B88 (water tubing) cleaning procedures noted below shall not apply. Perform the following procedures:

1. Clean laboratory vacuum tubes and fittings, valves, gages, and other components of oil, grease, and other readily oxidizable materials as required for oxygen service according to CGA G-4.1, "Cleaning Equipment for Oxygen Service."
2. Wash laboratory vacuum piping and components in hot, alkaline-cleaner-water solution of sodium carbonate or trisodium phosphate in proportion of 1 lb of chemical to 3 gal. of water.

    a. Scrub to ensure complete cleaning.
    b. Rinse with clean, hot water to remove cleaning solution.

3.2 PIPING APPLICATIONS

A. General: Use tube, fittings, and joining methods for laboratory vacuum piping systems according to the following applications:

B. Joining of Dissimilar Metal Piping: Use dielectric fittings. Refer to Division 22Section “Common Work Results for Plumbing" for dielectric fitting types.

1. NPS 2 and Smaller: Use dielectric fittings.
2. NPS 2-1/2 to NPS 4: Use dielectric flanges.
3. Dielectric unions shall not be used.

C. Specialty and Equipment Flanged Connections: Use cast-copper-alloy companion flange with gasket and brazed joint for connection to copper tube.

D. Laboratory Vacuum Piping: Use copper tube, long sweep copper pressure fittings, and brazed joints.

3.3 VALVE APPLICATIONS

A. Drawings indicate valve types to be used for laboratory vacuum piping. If specific valve types are not indicated, the following requirements apply:

1. Shutoff Valves NPS 3 and Smaller: Copper-alloy ball valve, full-port type.
2. Check Valves NPS 3 and Smaller: Bronze.

3.4 PIPING INSTALLATION

A. Refer to Division 22 Section "Common Work Results for Plumbing" for basic piping installation.

B. Install vacuum gages according to Division 22 Section "Meters and Gages for Plumbing."

C. Install flexible pipe connector and isolation valve at each connection to laboratory vacuum equipment.

D. Purge laboratory vacuum piping, using oil-free dry nitrogen, after installing piping but before connecting to alarms and gages.

E. Install isolation valve as indicated on drawings.

3.5 VALVE INSTALLATION

A. Refer to Division 22 Section “Common Work Results for Plumbing "for basic piping and valve installation.

B. Install shutoff valve as indicated on drawings.

C. Install check valves to maintain correct direction of fluid flow to and from laboratory vacuum specialties and equipment.

D. Install vacuum relief valves where recommended by specialty manufacturers.

E. Provide double shutoff drain valves to allow blowdown without losing vacuum Where indicated on drawings .

3.6 JOINT CONSTRUCTION

A. Refer to Division 22 Section "Common Work Results for Plumbing" for basic piping joint construction.

B. Brazed Joints: Use silver- or copper-phosphorus-composition filler metal and comply with CDA's "Copper Tube Handbook," Section VII, "Brazed Joints**."**

3.7 HANGER AND SUPPORT INSTALLATION

A. Refer to Division 22 Section "Mechanical Vibration and Seismic Controls for Plumbing" for seismic-restraint devices.

B. Refer to Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment" for pipe hanger and support devices. Install the following:

1. Vertical Piping: MSS Type 8 or 42 clamps.
2. Individual, Straight, Horizontal Piping Runs: According to the following:

    a. 100 Feet and Less: MSS Type 1, adjustable, steel, clevis hangers.

C. ...Install supports according to Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment."

D. Support vertical piping and tubing at base and at each floor.

E. Rod diameter may be reduced 1 size for double-rod hangers, with 3/8-inch minimum rods.

F. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters in accordance with CPC and NFPA..

G. Install supports for vertical copper tubing in accordance with CPC and NFPA..

3.8 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to specialties and equipment to allow service and maintenance.

3.9 LABELING AND IDENTIFICATION

A. Install identifying labels and devices for laboratory vacuum piping systems according to NFPA 99. Refer to Division 22 Section "Identification for Plumbing" for labeling and identification materials.

B. Captions and Color-Coding: Use the following or similar captions and color-coding for laboratory vacuum piping products as required by NFPA 99.

1. Laboratory Vacuum Piping: Black boxed letters on white-and-black checkerboard background.

3.10 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:

1. Laboratory Vacuum Piping Testing: Use oil-free dry nitrogen, unless otherwise indicated, and perform procedures and tests as indicated in NFPA 99 performance and testing paragraphs for piped vacuum systems. Include the following:

   a. Blow Down: Clear piping before connecting service connections or inlets.
   b. Pressure Tests: Subject each piping section to test pressure of 15 psig for 24 hours. Verify that pressure drop does not exceed 5 psig. Repair leaks with new materials and retest systems.
   c. Cross-Connection Tests: Perform as part of laboratory air piping testing.
   d. Alarm Tests: Operate systems and verify proper warning indication of each laboratory vacuum system function
   e. Labeling: Verify correct labeling.

2. Test and adjust controls and safeties.

B. Testing Certification: Certify that specified tests, inspections, and procedures have been performed and certify report results. Include the following:

1. Inspections performed.
2. Procedures, materials, and gases used.
3. Test methods used.
4. Results of tests.

3.11 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's maintenance personnel to adjust, operate, and maintain laboratory vacuum alarm system. Refer to Division 01 Section "Closeout Procedures."

END OF SECTION 22 6213

SECTION 22 6219 - VACUUM EQUIPMENT FOR LABORATORY FACILITIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Packaged, oil-lubricated, rotary vane vacuum pumps.
2. Vacuum equipment alarm systems.
3. Computer interface cabinets.

B. Related Sections include the following:

1. Division 22 Section "Vacuum Piping" for vacuum piping, valves, and related specialties:

1.2 DEFINITIONS

A. Actual Air: Air delivered at vacuum producer inlet. Flow rate is air measured in expanded cfm.

B. Laboratory Vacuum Equipment: Equipment and accessories for laboratory facilities.

C. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

D. Standard Air: Free air at 68 deg F and 1 atmosphere before compression or expansion and measured in scfm.

1.3 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design vacuum equipment mounting, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. Seismic Performance: Vacuum equipment shall withstand the effects of earthquake motions determined according to SEI/ASCE 7, NFPA 99 and CBC for seismic zone 4.

C. Laboratory vacuum equipment shall comply with NFPA 99. Level 1 requirement for installation and testing.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

1. Wiring Diagrams: For power, signal, and control wiring.

B. Delegated-Design Submittal: For vacuum-producing equipment mounting indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Detail fabrication and assembly of supports.
2. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.

C. Qualification Data: For qualified Installer and testing agency.

D. Field quality-control reports.

E. Operation and Maintenance Data: For vacuum equipment to include in operation and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Installer Qualifications:

1. Laboratory Vacuum System Equipment for Laboratory Facilities: An employer of workers trained and approved by manufacturer.

B. Testing Agency Qualifications: An independent testing agency, with the experience and capability to conduct the vacuum equipment testing indicated, that is an NRTL, and that is acceptable to University Representative.

1. Qualify testing personnel according to ASSE 6020 for inspectors and ASSE 6030 for verifiers.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. ASME Compliance: Fabricate and label receivers to comply with ASME Boiler and Pressure Vessel Code.

E. Comply with NFPA 99, "Health Care Facilities," for vacuum equipment and accessories for vacuum systems.

1.7 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term “or equal”, comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before the use of an unnamed manufacturer or product.

2.2 GENERAL REQUIREMENTS FOR PACKAGED VACUUM PUMPS

A. Description: Factory-assembled, -wired, -piped, and -tested; electric-motor-driven; air-cooled; continuous-duty vacuum pumps and receivers.

B. Control Panels: Automatic control station with load control and protection functions. Comply with NEMA ICS 2 and UL 508.

1. Enclosure: NEMA ICS 6, Type 12 control panel unless otherwise indicated.
2. Motor Controllers: Full-voltage, combination-magnetic type with under-voltage release feature and motor-circuit-protector-type disconnecting means and short-circuit protective device.
3. Control Voltage: 120-V ac or less, using integral control power transformer.
4. Motor Overload Protection: Overload relay in each phase.
5. Starting Devices: Hand-off-automatic selector switch in cover of control panel, plus pilot device for automatic control.
6. Automatic control switches to alternate lead-lag vacuum pumps for multiplex vacuum pumps.
7. Instrumentation: Include vacuum pump inlet and receiver vacuum gages, hour meter, vacuum pump discharge-air and coolant temperature gages, and control transformer.
8. Alarm Signal Device: For connection to alarm system to indicate when backup vacuum pump is operating.

C. Receivers: Steel tank constructed according to ASME Boiler and Pressure Vessel Code, Section VIII, Division 1; bearing appropriate code symbols.

1. Interior Finish: Corrosion-resistant coating.
2. Accessories: Include vacuum relief valve, vacuum gage, and drain valve.

D. Mounting Frame: Fabricate base and attachment to pressure vessel with reinforcement strong enough to resist packaged equipment movement during a seismic event when base is anchored to building structure.

2.3 LUBRICATED ROTARY VANE VACUUM PUMPS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Allied Healthcare Products, Inc., Garner Denver
2. Ingersoll-Rand; Air Solutions Group.
3. Quincy Inc.
4. Busch Inc.
5. Or equal.

B. Description: Packaged unit.

C. Vacuum Pumps: Oil lubricated, rotary vane, air cooled type.

1. Inlet filters.
2. Outlet silencers and oil-mist separators on discharge piping.
3. Oil filter and initial fill of synthetic oil.
4. Oil and smoke exhaust eliminators.
5. Anti-suck-back valves
6. Vibration isolators on each pump

D. Receiver: ASME, vertical type.

1. Manual drain valve
2. Sight and vacuum gages
3. Corrosion resistant interior lining
4. Prepiped with valves and by-pass

E. Capacities and Characteristics: Refer to equipment schedule on drawings.

F. Controls:

1. The control system provides automatic lead/lag sequencing and automatic alternation of all pumps in order to equalize the amount of usage among the available vacuum pumps. The control system shall include:

    a. PLC controller and a 6” color touch screen HMI (Human Machine Interface) panel which displays the operating status of the unit.
    b. UL508A listed control panel in a NEMA 12 enclosure. The panel door will include: the HMI touch screen, audible and visual alarms with an acknowledge button, and an HOA switch for each pump.
    c. Magnetic starters
    d. Vacuum transducer for process control
    e. Single point power connection
    f. Redundant 120Vac control transformers with fused primary and secondary protection.

g. System overload trip, high temperature conditions, low vacuum or maintenance intervals for the pump will result in visual and audible alarms.
h. The control system provides automatic lead/lag sequencing and automatic alternation of all pumps.
i. Building automation communication gateway with BacNet® protocol and Web server features. Web server features include email notifications in case the system is in alarm or has achieved one its maintenance intervals and requires service.
j. Ethernet port for connection to BacNet ® server or direct connection to facility Ethernet for viewing of system operations and status via device IP-address.
    a Auto purge feature will include:
    b Control and operation of air actuated and/or
    c electric isolation and purge valves
    d 3-position mode switch (Auto-Off-Manual)
    e Pump Status (PUMP ON, PUMP READY, PUMP OFF, PUMP PURGING)
    f Pumps will run through an automatic purge cycle every 24 hours (after alternation phase), to purge any gases from the pump to atmosphere. A 3-positionswitch is provided to select automatic purge, manual purge, or purge off modes. (NOTE: Pneumatic purge isolation valves require 80 psi compressed air to be field supplied.)

2.6 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Division 22 Section "Common Motor Requirements for Plumbing Equipment."

1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
2. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in Division 26 Sections.

PART 3 - EXECUTION

3.1 PREPARATION

A. Clean vacuum equipment, accessories, and components that have not been cleaned for oxygen service and sealed or that are furnished unsuitable for vacuum applications, according to CGA G4.1, "Cleaning Equipment for Oxygen Service."

3.2 VACUUM EQUIPMENT INSTALLATION

A. Install vacuum equipment according to ASSE 6010 and NFPA 99.

B. Equipment Mounting: Install vacuum producers on concrete bases using elastomeric pads. Comply with requirements in Division 03 Section "Cast-in-Place Concrete." Comply with

requirements for vibration isolation devices specified in Division 22 Section "Vibration and Seismic Controls for Plumbing Piping and Equipment."

1. Minimum Deflection: 1/4 inch.
2. Install dowel rods to connect concrete base to concrete floor, concrete work provided by others under Division 3. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
5. Install anchor bolts to elevations required for proper attachment to supported equipment.

3.4 CONNECTIONS

A. Comply with requirements for drain piping specified in Division 22 Section "Sanitary Waste and Vent Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Comply with requirements for vacuum piping specified in Division 22 Section "Vacuum Piping for Laboratory Facilities." Drawings indicate general arrangement of piping, fittings, and specialties.

C. Install piping adjacent to equipment to allow service and maintenance.

D. Connect vacuum piping to vacuum equipment, accessories, and specialties with shutoff valve and union or flanged connection.

3.5 IDENTIFICATION

A. Identify laboratory vacuum equipment system components. Comply with requirements for identification specified in Division 22 Section "Identification for Plumbing Piping and Equipment."

B. Identify vacuum equipment system components. Comply with requirements for identification specified in Division 22 Section "Identification for Plumbing Piping and Equipment." and with NFPA 99.

3.6 FIELD QUALITY CONTROL FOR VACUUM EQUIPMENT

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Tests and Inspections:

1. Preparation: Perform vacuum equipment tests according to requirements in NFPA 99 for the following:

    a. System operation test.

2. Equipment Verification: Comply with requirements in ASSE 6020, ASSE 6030, and NFPA 99 for verification of vacuum equipment.
3. Replace damaged and malfunctioning controls and equipment.
4. Testing Certification: Certify that specified tests, inspections, and procedures have been performed and certify report results. Include the following:

    a. Inspections performed.
    b. Procedures and materials used.
    c. Test methods used.
    d. Results of tests.

D. Components will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.7 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Check for lubricating oil in lubricated-type equipment.
3. Verify that vacuum producer outlet piping is clear.
4. Check for equipment vibration-control supports and flexible pipe connectors and verify that equipment is properly attached to substrate.
5. Check safety valves for correct settings.

6. Check for proper seismic restraints.
7. Drain receiver tank(s).
8. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
9. Test and adjust controls and safeties.

B. Verify that vacuum equipment is installed and connected according to the Contract Documents.

C. Verify that electrical wiring installation complies with manufacturer's submittal and written installation requirements in Division 26 Sections.

D. Prepare written report documenting testing procedures and results.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train. University's maintenance personnel to adjust, operate, and maintain vacuum producers.

END OF SECTION 22 6219

SECTION 22 6700 - PROCESSED-WATER PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes Reagent, Deionized and reverse-osmosis-water piping.

1.2 DEFINITIONS

A. PP: Polypropylene plastic.

B. PTFE: Polytetrafluoroethylene plastic.

C. PVDF: Polyvinylidene fluoride plastic.

1.3 PERFORMANCE REQUIREMENTS

A. Provide components and installation capable of producing piping with the following minimum working-pressure ratings, unless otherwise indicated:

1. Reagent-Water Piping: 100 psig, unless otherwise indicated.
2. Deionized and Reverse-Osmosis-Water Piping: 100 psig, unless otherwise indicated.

1.4 SUBMITTALS

A. Product Data: For each type of pipe and fitting indicated.

B. Welding certificates.

C. Field quality-control test reports.

1.5 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing laboratory.

B. Welding: Qualify procedures and personnel according to ASME Boiler and Pressure Vessel Code: Section IX.

C. ASME Compliance: Comply with ASME B31.3, "Process Piping."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Do not store plastic pipe and fittings in direct sunlight.

B. Protect pipe and fittings from dirt and damage.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, fitting, and joining materials.

B. Transition Fittings: Couplings, flanges, or other manufactured fittings, same size as, with pressure rating at least equal to and ends compatible with piping to be joined.

2.3 PLASTIC PIPE AND FITTINGS

A. PP Pipe and Fittings: Made from ASTM D 4101, PP resin.

1. Manufacturers:

a. Asahi/America.
b. Fischer, George Inc.
c. IPEX Inc.
d. NIBCO INC.
e. Orion.
f. Town & Country Plastics, Inc.
g. Or equal.

2. Standard Dimensional Ratio (SDR) or Schedule 40, Pipe and Fittings: SDR pipe and fittings conforming to ASTM Standards, dimensions and socket fusion joints; Schedule

40 pipe conforming to ASTM D 2447 dimensions and socket- or butt-fusion fittings matching pipe Schedule 40 dimensions.

B. PVDF Pipe and Fittings: Made from ASTM D 3222, PVDF resin.

a. Asahi/America.
b. Fischer, George Inc.
c. NIBCO INC.
d. Orion.
e. Or equal.

2. Standard Dimensional Ratio (SDR) or Schedule 40, Pipe and Fittings: SDR pipe and fittings conforming to ASTM Standards, dimensions and socket fusion joints; Schedule 40 pipe conforming to ASTM D 2447 dimensions and socket- or butt-fusion fittings matching pipe Schedule 40 dimensions.

2.6 PLASTIC VALVES

A. PP Valves: Made from ASTM D 4101, PP resin.

1. Ball Valves: MSS SP-122, union type with socket ends and pressure rating not less than 150 psig at 73 deg F.
2. Butterfly Valves: Shall not be used on Campus.
3. Check Valves: Swing or ball type with pressure rating not less than 150 psig at 73 deg F.

B. PVDF Valves: Made from ASTM D 3222, PVDF resin.

1. Ball Valves: MSS SP-122, union type with socket ends and pressure rating not less than 150 psig at 73 deg F.
2. Butterfly Valves: Shall not be used on Campus.
3. Check Valves: Swing or ball type with pressure rating not less than 150 psig at 73 deg F.

2.7 DIAPHRAGM VALVES

Prohibited on Campus.

2.8 FLOW RESTRICTOR VALVES

A. PP Flow Restrictor Valve

B. 3/8-inch Female NPT polypropylene body and flow restrictor. Delrin retainer, acetal flow restrictor, and ethylene propylene o-rings. 125 psi maximum inlet pressure. NSF approved.

2.10 STAINLESS-STEEL VALVES

1. Conbraco.
2. Foster Valve Co.
3. Jamesbury, Inc.
4. Marvin Ball Valves; a division of Richards Industries.
5. NIBCO INC.
6. Or equal.

B. Ball Valves, NPS 2 and Smaller: MSS SP-110, 600-psig minimum CWP, **3** or **2** piece, with stainless-steel body, full-port stainless-steel ball, PTFE seals, and threaded ends.

C. Ball Valves, NPS 3 and Larger: MSS SP-72, Class 150, 2- piece, with stainless-steel body, stainless-steel ball, PTFE seals, and flanged ends.

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS

A. Transition and special fittings with pressure ratings at least equal to and of material same as, or compatible with, piping may be used in applications in this article, unless otherwise indicated.

B. Deionized and Reverse-Osmosis- Water Piping: Use any of the following piping materials for each size range:

1. Standard Dimensional Ratio (SDR) or Schedule 40 PP pipe and fittings and heat-fusion joints.
2. Standard Dimensional Ratio (SDR) or Schedule 40 PVDF pipe and fittings and heat-fusion joints.

3.2 VALVE APPLICATIONS

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirement apply:

1. Shutoff Duty: Use ball valves.
2. Throttling Duty: Use ball valves.

B. Valves for Deionized and Reverse-Osmosis-Water Piping: Use any of the following valves for each piping material:

1. PP Pipe and Fittings: PP plastic or Stainless-steel valves.
2. PVDF Pipe and Fittings: PVDF plastic or Stainless-steel valves.

3.3 PIPING INSTALLATION

General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of reagent, and Deionized and reverse-osmosis-water piping. Location and arrangement of piping layout take design considerations into account. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.

B. Refer to Division 22 Section "Common Work Results for Plumbing" for general piping installation requirements.

C. Provide insulation with 1-hour fire rating to all polypropylene (PP) piping install above floor in fire resistive construction as required by NFPA, CBC and Campus Fire Marshal. Provide rated penetrations for all piping penetrating rated wall, floor or ceiling.

3.4 JOINT CONSTRUCTION

A. Refer to Division 22 Section "Common Work Results for Plumbing" for basic piping joint construction. Where specific joint construction is not indicated, follow piping manufacturer's written instructions.

B. PP & PDVF Piping Joints: Make heat-fusion joints similar to procedure in ASTM D 2657 for polyolefin piping joints.

C. Stainless-Steel Pressure Tubing Joints: Make butt-welding joints without use of filler metal. Polish exterior to match tubing.

D. Joint dissimilar pipe materials with transition fittings compatible with pipe materials being joined.

3.5 VALVE INSTALLATION

A. Refer to Division 22 Section "Domestic water piping and Valves".

B. Install sectional valves close to mains on each branch and riser serving equipment.

C. Install shutoff valve on each supply to each equipment.

3.6 HANGER AND SUPPORT INSTALLATION

A. Seismic-restraint devices are specified in Division 22 Section "Vibration and Seismic Controls for Plumbing."

B. Pipe hanger and support devices and installation requirements are specified in Division 22 Section "Hangers and Supports for Plumbing Piping and Equipment." Install the following:

1. Clamps for Vertical Piping: MSS Type 8 or Type 42.

2. Individual, Straight, Horizontal Piping Runs:

a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.

C. Support horizontal piping and tubing in accordance with CPC requirments.

D. Support vertical piping and tubing at base and at each floor.

E. Rod diameter may be reduced 1 size for double-rod hangers, to minimum of 3/8 inch.

F. Install padded hangers for PP piping with the following maximum horizontal spacing and minimum rod diameters in accordance with CPC requirements.

G. Install padded supports for vertical PP piping in accordance with CPC requirments.

H. Install padded hangers for PVDF piping with the following maximum horizontal spacing and minimum rod diameters in accordance with CPC requirements.

I. Install padded supports for vertical PVDF piping in accordance with CPC requirements .

J. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.7 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment and machines to allow service and maintenance.

C. Connect deionized and reverse-osmosis-water piping to equipment and service outlets with unions or flanges.

3.8 LABELING AND IDENTIFICATION

A. Install pipe markers and valve tags on piping. Distinguish between different systems and include direction of flow indication on each pipe. Labeling and identification devices are specified in Division 22 Section "Identification for Plumbing."

3.9 FIELD QUALITY CONTROL

A. Test new piping and parts of existing piping that have been altered, extended, or repaired, for leaks and defects.

1. Schedule tests and their inspections by University’s Representative, with at least 72 hours' advance notice.
2. Do not cover or put into service before inspection and approval.

3. Test completed piping according to CPC. If CPC does not have published procedures, perform tests as follows:

    a. Hydrostatic Tests: Test piping at pressure not less than 1-1/2 times the maximum system operating pressure, but not less than 100 psig.
    b. Exception: Do not subject glass piping to pressure above manufacturer's pressure rating for size.

4. Replace leaking joints with new materials and retest until no leaks exist.
5. Submit separate reports for each test.

3.10 CLEANING

A. Use procedures prescribed by University's Representative or, if not prescribed, use procedures described below:

1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
2. Clean piping by flushing with system reagent or Deionized and reverse-osmosis water.

END OF SECTION 22 6700

SECTION 22 6701 – PROCESSED-WATER EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes a complete processed-water system consisting of the following.

1. Activated carbon filter.
2. Pre-filter
3. Reverse Osmosis unit.
4. Ultra-violet sterilizer
5. Deionizers
6. DI Cartridge filter
7. Storage tank
8. RO/DI system
9. Chemicals.
10. Water testing kits.

B. Related Sections include the following:

1. Division 22 Section 22 6700 "Processed-Water Piping" for piping, valves, hangers and supports.

1.2 DEFINITIONS

A. ABS: Acrylonitrile-butadiene-styrene plastic.

B. FRP: Fiberglass-reinforced plastic.

C. NBR: Acrylonitrile-butadiene rubber.

D. PE: Polyethylene plastic.

E. ppm: Parts per million.

F. PVC: Polyvinyl chloride plastic.

G. PP: High purity Virgin un-pigmented polypropylene piping.

H. PVDF: Polyvinylidene fluoride plastic.

1.3 SYSTEM DESCRIPTION

A. Equipment Supplier/Manufacturer's Scope of Work:

1. Equipment Manufacturer shall provide all new equipment as detailed in this specification; transport to the job site; completely install and pipe: and provide efficiently operating automatic system.
2. The equipment manufacturer shall start up the system, completely sanitize and provide training for University personnel.
3. Provide (4) four copies of operations and maintenance manuals.
4. Provide rental and exchange units, based on separate service contract with University.

1.4 DESIGN REQUIREMENTS

A. System Parameters:

1. Feed water quality: Riverside city water
2. Required product water quality: ASTM Type II
3. Resistivity, min: 7 megohms-cm
4. Bacteria, subset B max count: 10/100 mL
5. Silica, max: 3 ug/L
6. Total Organic Carbon, max: 50 ug/L
7. Chlorides, max: 5 ug/L
8. Sodium, max: 5 ug/L
9. Usage period: 24 hours per day, 7 days per week
10. Maximum Instantaneous use rate: Estimated to be 40 gpm at the sinks.
11. Estimated to be 15 gpm each of the autoclaves
12. Daily water usage: Estimated to be 2,000 gallons per day plus future total maximum capacity to be 4,000 gallons per day.
13. Piping between equipment: Schedule 80 PVC. PVC not allowed beyond equipment room.
14. Distribution loop: GF PRO Polypropylene pipe RO/DI loop size per plans.
15. Flow rate requirements for distribution loops: Estimated 70 gpm for RO/DI loop
16. Pressure requirements for distribution loop: Estimated to be minimum 25 psi required at sinks and equipment.
17. Application: Makeup and rinse water for laboratory bench applications, washer equipment, and equipment use including cage wash rinse and humidifiers.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated and include the following:

1. All purified water equipment include rated capacities, operating characteristics, furnished specialties, and accessories.
2. Water testing kits.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection. Include plans, elevations, sections, details, and connections to piping systems.

1. Wiring Diagrams: Power, signal, and control wiring.

C. Manufacturer Seismic Qualification Certification: Submit certification that indicated steel mineral tanks, accessories, and components will withstand seismic forces defined in Division 22 Section 22 0548 "Vibration and Seismic Controls for Plumbing." Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

D. Manufacturer Certificates: Signed by manufacturers certifying that purified water systems comply with requirements.

E. Source quality-control test reports.

F. Field quality-control test reports.

G. Startup service test reports.

H. Operation and Maintenance Data: For Purified Water system to include in emergency, operation, and maintenance manuals.

I. Warranty: Special warranty specified in this Section.

J. Maintenance service agreement.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain each type of water filtration equipment through one source from a single manufacturer.

B. Product Options: Drawings indicate size, profiles, and dimensional requirements of purified water systems and are based on the specific system indicated. Refer to Division 1 Section 01 6000 “Product Requirements."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70), Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.7 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

1.8 WARRANTY

A. Warranty: University's standard form in which contractor agrees to repair or replace components of purified water system that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures of mineral, storage and brine tanks.
b. Faulty operation of controls.
c. Deterioration of metals, metal finishes, and other materials beyond normal use.
d. Attrition loss of resin exceeding 3 percent per year.
e. Mineral washed out of system during service run or backwashing period.
f. Effluent turbidity greater and color darker than incoming water.
g. Fouling of under-drain system, gravel, and resin, with turbidity or by dirt, rust, or scale from softener equipment or soft water, while operating according to manufacturer's written operating instructions.

1.9 MAINTENANCE SERVICE

A. Maintenance: Submit four copies of manufacturer's "Agreement for Continued Service and Maintenance," before Substantial Completion, for University's acceptance. Offer terms and conditions for furnishing chemicals and providing continued testing and servicing to include replacing materials and equipment. Include one-year term of agreement with option for one year renewal.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with the provisions in Division 1, Section 01 6000 "Product Requirements", Part 2 "Product Substitutions", article. Specific procedures must be followed before use of an unnamed product or manufacturer.
3. Manufacturers:

    a. SOUTH COAST WATER, a Division of Hannah Industries (www.sch2o.com)
    b. Evoqua Water Technologies.
    c. Columbia Water Conditioned System Inc.
    d. Rain Soft Division
    e. Or equal.

2.2 EQUIPMENT

A. Based on the system parameters as defined in Section 1.4, recommends the following equipment is recommended:

B. One (1) SCW Reverse Osmosis, Deionization Upright Skid # SCWRODIPOST4K70, or equal.
1. 4000 gallon per day reverse osmosis.
    a. One (1) I Control ROC 2 Reverse Osmosis controller; Readings: TDS product and reject, percent rejection, low feed pressure, run time, pretreatment lockout, high level on/ off.
    b. Three (3) Axeon H5 4X40 thin film membranes staged 2-1 housed in Axeon PVC housings.
    c. One (1) Fluid O Tech high pressure pump coupled to a 1 HP Baldor motor, 110 volt single phase TEFC.
    d. Two (2) Blue and White flow meters, product and reject F-4550LE8 and F-45500LA-8.
    e. Two (2) 0-160 LF Stainless pressure gauges.
    f. Two (2) Pre filters, 1-5 micron carbon and 1 20" carbon.
    g. One (1) TOC Reducing unit Viqua Pro10
2. Distribution Pumps
    a. Two (2) GOULD's 15SV4FH4C60 7.5HP 3Phase 304 SS Vertical pumps.
    b. Two (2) HOA starters.
    c. Two (2) 0-160 LF Stainless pressure gauges
3. Post Treatment
    a. Sixteen (16) 1447 3.5 cubic foot Mixed Bed DI running 8 into 8 as series
    b. Four (4) 40" 5 micron filters, Housed in SHELCO multi housing 304 stainless steel 4FOS4
    c. Five (5) 40" 0.2 micron filters, housed in SHELCO multi housing 304 stainless steel 5FOS4
    d. Five (5) 40" Endotoxin filters, housed in SHELCO multi housing 304 stainless steel 5FOS4
    e. Two (2) Ultraviolet Sterilizers Atlantic model S2400 40 GPM each
    f. One (1) Myron L Quality Monitor 0-18 MEG/OHM digital readout with 4-20 ma output.

C. Equipment off Upright Skid.

1. One (1) PE Carbon exchange tank pretreat to RO, 1 cubic foot 10X40.
2. One (1) Four bed PE DI installed after RO before Storage.
3. Sixteen (16) 1447 3. cubic foot Mixed Bed DI running 8 online 8 standby.
4. Three (3) SHELCO filter housings.
5. Two (2) S2400 UV Sterilizers.

D. Return Loop

1. One (1) 2" PLASTOMATIC Pressure reducing valve PVC, RVT 200PV.

2.4 COMMERCIAL WATER SOFTENERS

A. RO/DI feed water source from building soft water exchange system.

2.6 WATER TESTING SETS.

A. Description: Manufacturer's standard water-hardness testing apparatus and chemicals with testing procedure instructions. Include metal container suitable for wall mounting.

2.7 SOURCE QUALITY CONTROL

A. Hydrostatically test mineral tanks before shipment to minimum of one and one-half times pressure rating.

B. Prepare test reports.

PART 3 - EXECUTION

3.1 INTERFACE WITH OTHER WORK

A. Design Builders' Scope of work:

1. Provide a 6" high, approximately 20' x 30' equipment concrete pad with 4' clearance all around, capable of supporting equipment operating weight of 70,000 lbs. With mainly about 50,000 lbs. Weight of the RO water Storage Tank. The location must be accessible for transportation; temporary storage of equipment and transportation to the pad. Provide a forklift to offload the equipment and set in place.
2. Provide a minimum 3" ball valved city water stub out at the location required by the system installer, providing at least 130 gpm at 60 psi, continuous flow. Provide reduced pressure backflow preventer and a 3" pressure regulating valve upstream of the stub out.
3. Provide drains, vented to the atmosphere and located at and around equipment pad, capable of draining 3 gpm from RO reject, 50 gpm from softener, rinse of the DI units and draining of the storage tank.
4. Electric power: Provide 480V/3PH/60HZ/15 AMPS to RO electrical panel, 480V/3PHG/60HZ/20 AMPS to the distribution pumps electric panel,

110V/1PH/60HZ/20 AMPS to Softener and 110V/1PH/60HZ/20 AMPS to equipment pad. All electrical shall dedicated circuits with beakers or fuse protection.

5. Provide 2" ball valved PP stub outs for pure water supply and return distribution loop at the required locations at the equipment pad. The PW distribution loop shall be High purity virgin non-pigmented polypropylene piping.
6. Provide adequate access for the installer for installation and service.
7. Provide all required work by the other trades.
8. Provide a 1" ball valved stub out for extending the pure water to humidifiers.
9. Provide a PRV immediately at start of the distribution loop to control the excessive pressure build up.

3.2 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of water softeners and other filtered water equipment.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before equipment installation.

C. Examine walls and floors for suitable conditions where water softeners and other filtered water equipment will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 CONCRETE BASES

A. Install concrete bases of dimensions required for commercial purified water systems. Refer to Division 22 Section 22 0500 "Common Work Results for Plumbing."

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around full perimeter of base.
2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevation required for proper attachment to supported equipment.

B. Cast-in-place concrete materials and placement requirements are specified in Division 03.

3.4 PURIFIED WATER SYSTEM INSTALLATION

A. Install commercial purified water system equipment on concrete bases, level and plumb. Maintain manufacturer's and UCR recommended clearances. Arrange units so controls and devices that require servicing are accessible. Anchor mineral and brine tanks and floor mounting accessories to substrate.

B. Submit equipment list and flow and piping diagrams to University Representative for review and approval. All recommended changes shall be incorporated.

C. Install seismic restraints for freestanding cartridge filters, tanks and floor-mounting accessories and anchor to building structure.

D. Install filter elements in cartridges.

E. Install water testing sets mounted on wall, unless otherwise indicated, and near purified water systems.

3.5 CONNECTIONS

A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to equipment to allow service and maintenance.

C. Make piping connections between dissimilar-metal water piping with dielectric fittings. Dielectric fittings are specified in Division 22 Section 22 0500 "common Work Results for Plumbing."

D. Install shutoff valves on feedwater-inlet and filtrate-outlet piping of each water filtering equipment**,** and on inlet and outlet headers and on inlet and outlet headers.

1. Plastic valves are specified in Division 22 Section 22 6700 "Processed Water Piping."
2. Exception: Water processing equipment with factory-installed shutoff valves at locations indicated.

E. Install pressure gages on soft feedwater-inlet and processed piping of each water processing equipment. Pressure gages are specified in Division 22 Section 22 0519 "Meters and Gages for Plumbing."

1. Exception: Water processing equipment with factory-installed pressure gages at locations indicated.
2. Exception: Cartridge water filter.

F. Install valved bypass water piping around each water processing equipment process.

1. Plastic valves are specified in Division 22 Section 22 6700 "Processed Water Piping."
2. Water piping is specified in Division 22 Section 22 6700 "Processed Water Piping."
3. Exception: Cartridge water filtration equipment.

G. Install drains as indirect wastes to spill into open drains or over floor sinks. Piping shall be routed around floor so as not to cause a tripping hazard.

H. Ground equipment per Division 26 Section 26 0526 "Grounding and Bonding for Electrical Systems."

I. Connect wiring per Division 26 Section 26 2200 "Low Voltage Power Conductors and Cables."

3.6 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace malfunctioning processing water systems that do not pass tests and inspections and retest as specified above.

3.7 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

B. Sample pure water from the most remote location on the highest floor distribution loop, after the start up and three consecutive seven day intervals (Total of four samples taken from the same location) and provide certified test report prepared by an independent testing lab to show that the water meets performance characteristics specified in Section 1.4-A, lines 1 through 8. Design Requirements, System Parameters. Comply with the following:

1. ASTM D 859, "Test Method for Silica in Water."
2. ASTM D 1067, "Test Methods for Acidity or Alkalinity of Water."
3. ASTM D 1129, "Terminology Relating to Water."
4. ASTM D 3370, "Practices for Sampling Water from Closed Conduits."

C. Sample soft water similarly and provide similar certificates. Comply with the following:

1. ASTM D 1068, "Test Methods for Iron in Water."
2. ASTM D 1126, "Test Method for Hardness in Water."

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's maintenance personnel to adjust, operate, and maintain processing water systems. Refer to Division 1 Section Project Closeout.

END OF SECTION 22 6701

SECTION 23 0500 - COMMON WORK RESULTS FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Piping materials and installation instructions common to most piping systems.
2. Transition fittings.
3. Dielectric fittings.
4. Mechanical sleeve seals.
5. Sleeves.
6. Escutcheons.
7. Grout.
8. Mechanical demolition.
9. Equipment installation requirements common to equipment sections.
10. Painting and finishing.
11. Concrete bases.
12. Supports and anchorages.

1.2 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspaces, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

D. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in duct shafts.

E. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within concrete pipe trench and unheated shelters.

F. The following are industry abbreviations for plastic materials:

1. ABS: Acrylonitrile-butadiene-styrene plastic.
2. CPVC: Chlorinated polyvinyl chloride plastic.
3. PE: Polyethylene plastic.

4. PVC: Polyvinyl chloride plastic.

G. The following are industry abbreviations for rubber materials:

1. EPDM: Ethylene-propylene-diene terpolymer rubber.
2. NBR: Acrylonitrile-butadiene rubber.

1.3 SUBMITTALS

A. Product Data: For the following if proposed to be used on this project:

1. Transition fittings.
2. Dielectric fittings.
3. Mechanical sleeve seals.
4. Escutcheons.

B. Welding certificates.

1. Certificates shall be applicable for materials to be joined at the job-site.

1.4 QUALITY ASSURANCE

A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel." ASME Section VIII.

B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
2. Certify that each welder has passed NCPW or AWS qualification tests for welding processes involved and that certification is current.

C. Electrical Characteristics for Mechanical Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

D. Piping penetration through fire-rated construction assemblies, including accessory components; sleeves, sealants, packing materials and methods, and installation shall meet the requirements of the CBC, and shall be California State Fire Marshal approved. Firestopping details shall bear the UL label, indicate F-rating, T-rating, and shall meet the requirements of the California Building Code.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.6 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for mechanical installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for mechanical items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Division 08 Section "Access Doors and Frames." Coordinate to avoid access panels at hard lid ceiling if possible. Access panel shall be located in accessible area for maintenance convenience and safety and limit disturbance to the public.

D. Coordinate with other sections of the specifications for the applicability of materials specified in this section. Not every product or material listed may be used.

E. Coordinate requirements of this section with actual work to be performed. This section is general in scope for basic materials and methods, all of which may not actually apply to this project.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 23 piping Sections for pipe, tube, and fitting materials and joining methods.

B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

2.3 JOINING MATERIALS

A. Refer to individual Division 23 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

    a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
    b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: Bolts shall be United States Customary System bolts and nuts (e.g. ¾"). Metric bolts and nuts shall not be used for CHW and HHW. Bolts and nuts shall be 2' electro-galvanized for indoor applications and SAE Grade hot-dip galvanized steel or stainless steel with heavy hex nuts for outdoor application . For steam and steam condensate return applications, bolts shall meet ASTM A193 Grade B7 and nuts shall meet ASTM A194 Grade 2H. Except for manufacture supplied.

D. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813 Alloy E.

E. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping, unless otherwise indicated.

F. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.4 TRANSITION FITTINGS

A. AWWA Transition Couplings: Same size as, and with pressure rating at least equal to and with ends compatible with, piping to be joined.

1. Manufacturers:

    a. Cascade Waterworks Mfg. Co.
    b. Dresser Industries, Inc.; DMD Div.
    c. Ford Meter Box Company, Incorporated (The); Pipe Products Div.
    d. JCM Industries.
    e. Smith-Blair, Inc.
    f. Viking Johnson.
    g. Or equal.

2. Underground Piping NPS 1-1/2 and Smaller: Manufactured fitting or coupling.
3. Underground Piping NPS 2 and Larger: AWWA C219, metal sleeve-type coupling.
4. Aboveground Pressure Piping: Pipe fitting.

2.5 DIELECTRIC FITTINGS

A. Description: Combination fitting of copper alloy and ferrous materials with threaded, solderjoint, plain, or weld-neck end connections that match piping system materials.

B. Insulating Material: Suitable for system fluid, pressure, and temperature.

C. Dielectric Unions: Shall not be used. Provide 6" long brass nipple with brass unions or brass couplings. Or brass union and bronze ball valve on ends of nipple.

D. Dielectric-Flange Kits: Companion-flange assembly for field assembly. Include flanges, fullface- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.

1. Manufacturers:

a. Advance Products & Systems, Inc.
b. Calpico, Inc.
c. Central Plastics Company.
d. Pipeline Seal and Insulator, Inc.
e. Or equal.

2. Separate companion flanges and steel bolts and nuts shall have 150- or 300-psig minimum working pressure where required to suit system pressures.

E. Dielectric Couplings: Galvanized-steel coupling with inert and noncorrosive, thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.

1. Manufacturers:

a. Calpico, Inc.
b. Lochinvar Corp.
c. Or equal.

F. Dielectric Nipples: Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.

1. Manufacturers:

a. Precision Plumbing Products, Inc.
b. Sioux Chief Manufacturing Co., Inc.
c. Victaulic Co. of America.
d. Or equal.

2.1 MECHANICAL SLEEVE SEALS

G. Description: Modular sealing element unit, designed for field assembly, to fill annular space between pipe and sleeve.

1. Manufacturers:

a. Calpico, Inc.
b. Metraflex Co.
c. Pipeline Seal and Insulator, Inc.
d. Thunderline Modular Seals; Link-Seal
e. Or equal.

2. Sealing Elements: EPDM interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
3. Pressure Plates: Stainless steel. Include two for each sealing element.
4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.
5. Link-Seal shall be basis of design.

2.6 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends on exterior walls only.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.

1. Underdeck Clamp: Clamping ring with set screws.

E. Molded PVC: Permanent, with nailing flange for attaching to wooden forms. Acceptable only for concrete foundation walls below grade.

F. Molded PE: Reusable, PE, tapered-cup shaped, and smooth-outer surface with nailing flange for attaching to wooden forms.

2.7 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished chrome-plated finish.

C. One-Piece, Cast-Brass Type: With set screw.

1. Finish: Polished chrome-plated and rough brass.

D. Split-Casting, Cast-Brass Type: With concealed hinge and set screw.

1. Finish: Polished chrome-plated and rough brass

E. One-Piece, Floor-Plate Type: Cast-iron floor plate.

F. Split-Casting, Floor-Plate Type: Cast brass with concealed hinge and set screw.

2.8 GROUT

A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.

1. Characteristics: Post-hardening, volume-adjusting, nonstaining, noncorrosive, nongaseous, and recommended for interior and exterior applications.
2. Design Mix: 5000-psi, 28-day compressive strength.
3. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 23 Sections specifying piping systems.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

F. Install piping to permit valve servicing.

G. Install piping at indicated slopes.

H. Install piping free of sags and bends.

I. Install fittings or custom bends for changes in direction and branch connections.

J. Install piping to allow application of insulation.

K. Select system components with pressure rating equal to or greater than system operating pressure.

L. Install escutcheons for penetrations of walls, ceilings, and floors in exposed areas in public spaces according to the following:

1. New Piping:

a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
b. Chrome-Plated Piping: One-piece, cast-brass type with polished chrome-plated finish.
c. Insulated Piping: One-piece, stamped-steel type with spring clips.
d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, castbrass type with polished chrome-plated finish.
e. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass type with polished chrome-plated finish.
f. Bare Piping in Equipment Rooms: One-piece, cast-brass type.
g. Bare Piping at Floor Penetrations in Equipment Rooms: One-piece, floor-plate type.

M. Mounting hardware, including nuts, bolts and washers for outdoor applications and below grade applications must be of stainless steel materials.

N. Sleeves are not required for core-drilled holes, except in Group L type occupancy, and other locations where spill control is needed.

O. Permanent sleeves are not required for holes formed by removable PE sleeves.

P. Install sleeves for pipes passing through interior concrete and masonry walls, and concrete floor and roof slabs.

1. Cut sleeves to length for mounting flush with both surfaces.

a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.

2. Install sleeves in new walls and slabs as new walls and slabs are constructed.
3. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation. Use the following sleeve materials:

a. Steel Pipe Sleeves: For Group L occupancies, mechanical rooms, and wet area applications where spill containment is required.
b. Steel Sheet Sleeves: For applications not requiring spill containment.
c. Stack Sleeve Fittings: For pipes penetrating floors with membrane waterproofing.

Secure flashing between clamping flanges. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level. Refer to Division 07 Section "Sheet Metal Flashing and Trim" for flashing.

d. Seal space outside of sleeve fittings with grout.

4. Except for underground wall penetrations, seal annular space between sleeve and pipe or pipe insulation, using joint sealants appropriate for size, depth, and location of joint. Refer to Division 07 Section "Joint Sealants" for materials and installation.

5. Where required, sleeve application and installation shall comply with UL approved Firestopping Detail.

6. Coordinate requirements of sound-proofing caulk, as determined by the Sound and Vibration Consultant's recommendations.

Q. Aboveground, Exterior-Wall Pipe Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

1. Install steel pipe for sleeves smaller than 6 inches in diameter.
2. Install steel "wall pipes" for sleeves 6 inches and larger in diameter.
3. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

R. Underground, Exterior-Wall Pipe Penetrations: Install cast-iron "wall pipes" for sleeves. Seal pipe penetrations using mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

1. Mechanical Sleeve Seal Installation: Select type and number of sealing elements required for pipe material and size. Position pipe in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pipe and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

S. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials per UBC requirements. Refer to Division 07 Section "Penetration Firestopping" for material and installation requirements. Piping penetration through fire-rated construction assemblies, including accessory components; sleeves, sealants, packing materials and methods, and installation shall conform to Underwriters Laboratories Listed firestop systems. T. Verify final equipment locations for roughing-in.

U. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

V. Install valves in readily accessible locations, avoiding hard-lid ceilings where possible. Provide access panels for valve access complying with Division 08, and coordinate access panel locations with other disciplines.

3.2 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 23 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Oxyacetylene torch welding, and cutting of structural steel or bolt holes shall not be permissible.

E. Install main and branch piping using tee fittings, “T-drill”, “welded nozzles”, or “SideTap” or Pro Press.

F. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.

G. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter, using copper-phosphorus brazing filler metal complying with AWS A5.8.

H. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

I. Welded Joints: See Section 23 0511 “Welding Pressure Piping.”

J. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.3 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:

1. Install shut-off valves at final connection to each piece of equipment.
2. Install unions, in piping NPS 2″ and smaller, at final connection to each piece of equipment or flanges.
3. Install flanges, in piping NPS 2-1/2″ and larger, at final connection to each piece of equipment.
4. Dry Piping Systems: Install dielectric flanges to connect piping materials of dissimilar metals.
5. Wet Piping Systems: Install brass union, or brass coupling ball valve and brass nipple

fitting to connect piping materials of dissimilar metals.

3.4 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment to allow maximum possible headroom.

B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces.

C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Grease fittings shall be installed in accessible locations. Extended lube lines are not acceptable.

D. Install equipment to allow right of way for piping installed at required slope.

3.5 PAINTING

A. Painting of mechanical systems, equipment, and components is specified in Division 09 Section "High Performance Coatings" by painting contractor.

B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.

3.6 CONCRETE BASES

A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to CBC seismic zone 4 requirements by General Contractor.

1. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit, vibration isolator, or seismic restraint. Provide 1inch chamfer at all corners and round over edge.
2. Install dowel rods to connect concrete base to concrete floor. Install dowel rods on 18inch centers around the full perimeter of the base.
3. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor when required by structural engineer.
4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded. Minimum embedment shall comply with seismic engineer’s calculations.
5. Install anchor bolts to elevations required for proper attachment to supported equipment.
6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
7. General Contractor to provide 3000-psi, 28-day compressive-strength concrete and reinforcement as specified in Division 03 Section "Cast-in-Place Concrete."

3.7 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Refer to Division 05 Section "Metal Fabrications" for structural steel.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.

C. Field Welding: Comply with AWS D1.1.

D. Outdoor Applications: Outdoor support assemblies and accessories shall be of "stainless steel material", or "hot-dip galvanized carbon steel with high-performance coatings", as noted below:

1. Stainless steel: Mounting hardware such as bolts, nuts, washers, straps, brackets, fastening hardware etc., shall be stainless steel.

2. Coated galvanized steel: Carbon steel support assemblies, including all metal fabrications for use outdoors shall comply with each paragraph listed below:

a. Assemblies must be shop-fabricated and pre-assembled for one-piece hot-dip galvanized coating process

b. Touch-up and repair per manufacturer's recommendations after field installation.

E. Rooftop Applications: Rooftop support assemblies and accessories shall be fabricated for outdoor applications as noted above, and shall be designed per SMACNA design requirements.

1. SMACNA Clearances: Pipes, pipe racks, and equipment shall be installed high enough above roofing surfaces to allow roofing access for maintenance and repair. Install piping and equipment at a minimum height as shown in Table 4-1 of SMACNA Architectural Sheet Metal Manual – 5th Edition.
2. SMACNA Support Systems: Piping systems and equipment supports, unless otherwise shown, use round column supports to tie-in to structure with lead jacks for built-up roofs, and single-ply preformed jacks for single-ply roofs, lead flashing, and lead umbrellas with stainless steel draw band per Figure 4-16A, or Figure 4-16B, of SMACNA Architectural Sheet Metal Manual – 5th Edition.

3.8 GROUTING

A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout.

END OF SECTION 23 0500

SECTION 23 0510 - VARIABLE FREQUENCY DRIVES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes solid-state, Pulse Width Modulated (PWM) and Vector Control, VFDs for speed control of three-phase, squirrel-cage induction motors for plumbing and HVAC equipment.

B. Related Sections include the following:

1. Division 23 Section “Instrumentation and Controls” for BMS interface for monitoring and control.
2. Division 26 Section "Electrical Power Monitoring and Control" for monitoring and control of motor circuits.
3. Division 26 Section "Fuses" for fuses in fusible switches.

1.2 DEFINITIONS

A. PWM: Pulse-width modulated.

B. VFD: Variable frequency drive (may be referred to as “VSD” or “variable speed drive”, in other sections of the proposal documents).

1.3 SUBMITTALS

A. Product Data: For each type of VFD, provide dimensions; mounting arrangements; location for conduit entries; shipping and operating weights; and manufacturer's technical data on features, performance, electrical ratings, characteristics, installation instructions and finishes.

B. Shop Drawings: For each VFD.

1. Include VFD dimensions, required clearances, and service space around equipment. Show location of installed devices, and equipment features. In submittal information Include the following:

    a. Each installed unit's type and details.
    b. Nameplate legends.
    c. Short-circuit current ratings of integrated unit.
    d. VFD UL listing for series rating of over-current protective devices in combination controllers.

2. Wiring Diagrams: Power, signal, and control wiring for VFD. Provide schematic wiring diagram for each type of VFD.

C. Coordination Drawings: Floor plans showing dimensioned layout, required working clearances, and required area above and around VFDs where pipe and ducts are prohibited. Show VFD layout and relationships between electrical components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate field measurements.

D. Qualification Data: For testing agency and manufacturer.

E. Manufacturer's field service report.

F. Operation and Maintenance Data: For VFDs, all installed devices, and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section " Operation and Maintenance Data," include the following:

1. Routine maintenance requirements for VFDs and all installed components.
2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.

1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications: Maintain, within 100 miles of Project site, a service center capable of providing training, parts, and emergency maintenance and repairs.

B. Source Limitations: Obtain VFDs of a single type through one source from a single manufacturer for every VFD required for the project.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70), Article 100, by a testing agency acceptable to University’s Representative, and marked for intended use.

D. Design: VFDs shall meet requirements of IEC 801-2, IEC 801-4, IEC 255-4.

E. Product Selection for Restricted Space: Coordinate maximum dimensions for VFDs, minimum clearances between VFDs, and adjacent surfaces and other items. Comply with manufacturer’s recommended clearances.

F. Comply with CEC (NFPA 70).

G. VFDs and by-pass, if applicable, shall be manufactured and tested in the United States of America.

H. VFD Manufacturer shall perform the following:

1. Control power test.
2. No Load test.
3. Partial Load test, at 10 Hz.
4. Full Load test (full amperage).
5. Voltage detection testing.

6. Calibration test.

I. VFDs shall be UL listed.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver VFDs in shipping splits of lengths that can be moved past obstructions in delivery path.

B. Store VFDs indoors in clean, dry space with uniform temperature to prevent condensation. Protect VFDs from exposure to dirt, fumes, water, corrosive substances, and physical damage.

C. If stored in areas subject to weather, cover VFDs to protect them from weather, dirt, dust, corrosive substances, and physical damage. Remove loose packing and flammable materials from inside controllers; install electric heating of sufficient wattage to prevent condensation.

1.6 COORDINATION

A. Coordinate layout and installation of VFDs with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

C. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."

D. Coordinate features of VFDs, installed units, and accessory devices with pilot devices and control circuits to which they connect.

E. Coordinate features, accessories, and functions of each VFD and each installed unit with ratings and characteristics of supply circuit, motor, required control sequence, and duty cycle of motor and load.

F. Coordinate with Division 26 on location of VFDs and disconnect switch. Coordinate flexible electrical connections, and travel requirements, on spring/rubber isolated equipment such as fans, pumps, and other equipment. Avoid unnecessary duplication of disconnect switch if provided integral with VFDs and fuse protection is provided.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 VARIABLE FREQUENCY CONTROLLERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Allen Bradley
2. Danfoss
3. Toshiba International Corporation.
4. Or equal.

B. Description: NEMA ICS 2, FWR, IGBT, PWM, PW rating of 1600 volts, VFD; listed and labeled as a complete unit and arranged to provide variable frequency of a NEMA MG 1, Design B, 3-phase, premium -efficiency induction motor by adjusting output voltage and frequency. Drives 60 HP and larger shall use direct torque control technology.

C. Configuration

1. For parts interchangeability purposes, VFDs shall have the same customer interface and control logic board, including digital display, keypad and control connections; regardless of horsepower rating. VFDs from 2 HP to 400 HP shall have the same operator interface and keypad. The keypad is to be used for local control (start/stop, hand, off, auto, forward/reverse, and speed adjust), for setting parameters, and for stepping through the displays and menus.
2. The VFD shall give the user the option of either (1) displaying a fault, or (2) running at a programmable preset speed if the input reference (4-20mA or 2-10V) is lost; as selected by the user.
3. The VFD's shall utilize digital display in English. The digital display shall be a 30character (2 line x 16 characters/line,) LCD display. The screen shall be backlit to provide easy viewing in any light condition. The contrast should be adjustable to optimize viewing at any angle.
4. The Drive shall have local-remote for speed control and manual-auto for start-up. When in "Local", the VFD will be started, and the speed will be controlled from the speed up or speed down keypads. When in "Off", the VFD will be stopped. When in "Auto", the VFD will start via an external contact closure, and its speed will be controlled via an external speed reference.
5. The VFD shall be capable of starting into a rotating load (forward or reverse) and accelerate or decelerate to set point without safety tripping or component damage (flying start). Coast to stop before restart shall not be required.
6. VFD's to have the following adjustments:

    a. Three (3) programmable critical frequency lockout ranges to prevent the VFD from continuously operating at an unstable speed.
    b. PID Set point controller shall be standard in the drive, allowing a pressure or flow signal to be connected to the VFD, using the microprocessor in the VFD for the closed loop control; thus eliminating the need for external controllers. Drives not utilizing a PID controller shall provide a field installed controller provided by the

drive manufacturer for field mounting or shall incorporate a floating point controller utilizing a Dwyer Photohelic factory mounted in the drive panel.

c. Two (2) programmable analog inputs shall accept a current or voltage signal for speed reference, or for reference and actual signals for PID controller. Analog inputs shall include a filter, programmable from 0.01 to 10 seconds to remove any oscillation in the input signal. The minimum and maximum values (gain and offset) shall be adjustable within the range of 0-20 mA and 0-10 volts.

d. Two independently adjustable accel and decel ramps. These ramp times shall be adjustable from 1 to 1800 seconds.

D. Design and Rating: Match load type such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.

E. Output Rating: 3-phase; 6 to 60 Hz, with voltage proportional to frequency throughout voltage range.

F. Unit Operating Requirements:

1. Input ac tolerance of 200V +/-10% at 48-63 Hz for nominal 208V systems, and 460V +/10% at 48-63 Hz for nominal 480 V systems.
2. Capable of driving full load, under the following conditions, without derating:

a. Ambient Temperature: 0 to 40 deg C.
b. Humidity: Less than 95 percent (non-condensing).
c. Altitude: 3300 feet.

3. Minimum Efficiency: 98 percent at 60 Hz, full load.
4. Minimum Displacement Primary-Side Power Factor: 98 percent.
5. Overload Capability: 1.1 times the base load current for 60 seconds; 2.0 times the base load current for 3 seconds.
6. Starting Torque: 150 percent of rated torque.
7. Speed Regulation: Plus or minus 1 percent.
8. Isolated control interface to allow controller to follow control signal over an 11:1 speed range.

G. Internal Adjustability Capabilities:

1. Minimum Speed: 5 to 25 percent of maximum rpm.
2. Maximum Speed: 80 to 100 percent of maximum rpm.
3. Acceleration: 2 to a minimum of 22 seconds.
4. Deceleration: 2 to a minimum of 22 seconds.
5. Current Limit: 50 to a minimum of 110 percent of maximum rating.

H. Self-Protection and Reliability Features:

1. The drive shall employ two current limit circuits to provide trip free operation:

a. The Rapid Current Regulation limit shall be adjustable from 50% to 180% of the VFDs variable torque current rating. If the motor current exceeds the current limit setting, the drive shall stop, and decrease the output frequency until the motor current is reduced below the current limit level, at which time the output frequency shall accelerate (at the rate set by the acceleration time) to the set frequency. The rapid current regulation shall allow up to 200% current to be drawn for a short period of time before the current is reduced to the slow current regulation limit.
b. The Slow Current Regulation limit circuit shall be adjustable from 50% to 350% of the VFDs variable torque current rating. This current regulation operates similarly to the rapid current regulation, except at a slower rate. This adjustment shall be made via the keypad, and shall be displayed in actual amps, and not as percent of full load.

2. The overload rating of the drive shall be 110% of its variable torque current rating for 1 minute every 10 minutes, and 115% of its variable torque current rating for 2 seconds every 10 seconds.
   a. The VFD shall have a 65,000 Amp short circuit rating protection without the need of semi-conductor fuses.
   b. The Customer terminal strip shall be isolated from the line and ground.

3. Motor thermal protection shall be accomplished with connection to the klixon thermisters provided by motor manufacturer.

4. The VFD shall have the following protection circuits. In the case of a protective trip, the drive shall stop, and announce the fault condition in complete words.
   a. Over current trip limit: 3.5 x In instantaneous of the VFD's variable torque rating
   b. Over voltage trip limit: 1.35 x Vr (rated voltage)
   c. Under voltage trip limit: .65 x Vn
   d. Over temperature (heat sink): + 203 degrees F
   e. Auxiliary voltage: ground fault protected
   f. Ground Fault: Protected
   g. Short circuit: Protected
   h. Microprocessor fault: Protected
   i. Motor stall protection: Protected
   j. Motor over-temperature protection (I2t): Protected
   k. Loss of reference: Protected
   l. Input power loss of phase: Protected

5. Input transient protection by means of surge suppressors.
6. Snubber networks to protect against malfunction due to system voltage transients.
7. Under- and overvoltage trips; inverter overtemperature, overload, and overcurrent trips.
8. Motor Overload Relay: Adjustable and capable of NEMA 250, Class 20 performance.
9. Notch filter to prevent operation of the controller-motor-load combination at a natural frequency of the combination.
10. Instantaneous line-to-line and line-to-ground overcurrent trips.

11. Loss-of-phase protection.
12. Reverse-phase protection.
13. Short-circuit protection.
14. Motor overtemperature fault.

I. Multiple-Motor Capability: Controller suitable for service to multiple motors and having a separate overload relay and protection for each controlled motor. Overload relay shall shut off controller and motors served by it when overload relay is tripped.

J. Automatic Reset and Restart: To attempt restarts after controller fault or on return of power after an interruption and before shutting down for manual reset or fault correction. Bidirectional autospeed search shall be capable of starting into rotating loads spinning in either direction and returning motor to set speed in proper direction, without damage to controller, motor, or load. (The number of restart attempts and trail duration period shall be programmable.)

K. Torque Boost: Automatically vary starting and continuous torque to at least 1.5 times the minimum torque to insure high-starting torque and increased torque at slow speeds.

L. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled fan-ventilated motors at slow speeds.

M. VFD Compliance to IEEE 519 will be determined after the drive manufacturer completes a full harmonic analysis. Electrical drawings must be made available to manufacturer for review. If additional filters or reactors are required manufacturer shall comply. VFD Output Filtering: VFD Output filtering shall be considered for long VFD to motor line lengths (over 100 feet). Consideration for filtering shall be given during IEEE 519 analysis. If required, manufacturer shall comply.

N. Panel-Mounted Operator Station: Start-stop and speed control are functions of system key pad.

O. Indicating Devices: VFD keypad and display shall indicate the following controller parameters:

1. Output frequency (Hz).
2. Motor speed (rpm).
3. Motor status (running, stop, fault).
4. Motor current (amperes).
5. Motor torque (percent).
6. Fault or alarming status (code).
7. PID feedback signal (percent).
8. DC-link voltage (VDC).
9. Set-point frequency (Hz).
10. Motor output voltage (V).

P. Control Signal Interface: Provide VFD with the following:

1. Electric Input Signal Interface: A minimum of 2 analog inputs (0 to 10 V or 0/4-20 mA) and 6 programmable digital inputs.

2. Pneumatic Input Signal Interface: 3 to 15 psig.
3. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the BMS or other control systems:

    a. 0 to 10-V dc.
    b. 0-20 or 4-20 mA.
    c. Potentiometer using up/down digital inputs.
    d. Fixed frequencies using digital inputs.
    e. RS485.
    f. Keypad display for local hand operation.

4. Output Signal Interface:

    a. A minimum of 1 analog output signal (0/4-20 mA), which can be programmed to any of the following:

        1) Output frequency (Hz).
        2) Output current (load).
        3) DC-link voltage (VDC).
        4) Motor torque (percent).
        5) Motor speed (rpm).
        6) Set-point frequency (Hz).

5. Remote Indication Interface: A minimum of 2 dry circuit relay outputs (120-V ac, 1 A) for remote indication of the following:

    a. Motor running.
    b. Set-point speed reached.
    c. Fault and warning indication (overtemperature or overcurrent).
    d. PID high or low speed limits reached.

Q. VFD Serial Communications with Siemens or Johnson Controls systems:

1. The VFD shall have an RS-485 port as standard.
2. To communicate with Siemens FLN control systems, the variable frequency drive must, as a minimum, be able to accomplish functions of: runstop control, speed set adjustment, proportional/integral gain adjustments, RPM feedback, kilowatt-hour feedback, drive and motor temperature feedback, and warning/fault diagnostics across the serial port. Serial communication shall be accomplished through a EE-Prom integral to the VFD. Communication gateways or hard wiring for each individual point shall not be required. The VFD manufacturer's serial communication protocol, software and product must be officially approved and endorsed by the DDC control company, and a letter from the DDC control manufacturer shall be furnished upon request.

R. Manual Bypass: Arrange magnetic contactor to safely transfer motor between controller output and bypass controller circuit when motor is at zero speed. Controller-off-bypass selector switch sets mode, and indicator lights give indication of mode selected. Unit shall be capable of stable

operation (starting, stopping, and running), with motor completely disconnected from controller (no load).

S. Isolating Switch: Non-load-break switch arranged to isolate VFD and permit safe troubleshooting and testing, both energized and de-energized, while motor is operating in bypass mode.

T. Bypass Controller: NEMA ICS 2, full-voltage, non-reversing enclosed controller with across-the-line starting capability in manual-bypass mode. Provide motor overload protection under both modes of operation with control logic that allows common start-stop capability in either mode.

U. Integral Disconnecting Means: NEMA KS 1, fusible switch with lockable handle.

2.3 ENCLOSURES

A. The VFD enclosure shall be rated NEMA 4 for outdoor units, NEMA 12 (with NEMA 12 Keypad) for indoor units.

2.4 ACCESSORIES

A. If IEEE 519 analysis indicates requirement Manufacturer shall comply: Provide a 3% impedance input Line Reactor for lower harmonic distortion on the power line and improved displacement power factor. The line reactor shall be integral to the drive and the drive performance shall be based on the drive including the integral line reactor as a standard feature. The line reactor shall be 1-1/2% on each of the positive and negative legs on the input side of the DC Bus Link.

B. Devices shall be factory installed in controller enclosure, unless otherwise indicated.

C. Historical Logging Information and Displays:

1. Total run time.
2. Fault log, maintaining last four faults.

D. Current-Sensing, Phase-Failure Relays for Bypass Controller: Solid-state sensing circuit with isolated output contacts for hard-wired connection; arranged to operate on phase failure, phase reversal, current unbalance of from 30 to 40 percent, or loss of supply voltage; with adjustable response delay.

2.5 UNACCEPTABLE FEATURES

A. The following design and/or construction features will not be acceptable for use on this particular project:

1. Drive efficiencies of less than 97% at full rating are not acceptable.
2. Phase Control Rectifiers (Thyristors) or other such devices causing line notching are not acceptable.

3. VV1, six-step, and current source drives are not acceptable.
4. Drives requiring external fusing are not acceptable.
5. Function and/or fault indications that are in code or require reference to an operating manual or any methods not using direct reading English words are not acceptable.
6. SCR'S GTO'S and Darlington transistors are not acceptable.

2.6 FACTORY FINISHES

A. Manufacturer's standard finish suitable for area of installation. Units are not to be field painted.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, surfaces, and substrates to receive VFDs for compliance with requirements, installation tolerances, and other conditions affecting performance.

B. Examine roughing-in for conduit systems to verify actual locations of conduit connections before VFD installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Select features of each VFD to coordinate with ratings and characteristics of supply circuit and motor; required control sequence; and duty cycle of motor, drive, and load.

B. Select rating of controllers to suit motor controlled.

3.3 INSTALLATION

A. Install VFD mounting to walls in accordance with manufacturer’s installation instructions.

B. Large drives may be floor mounted. Install VFDs on concrete bases complying with Division 03 Section "Cast-in-Place Concrete."

C. Comply with mounting and anchoring requirements specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."

D. Controller Fuses: Install fuses in each fusible switch. Comply with requirements in Division 26 Section "Fuses."

3.4 IDENTIFICATION

A. Identify VFDs, components, and control wiring according to Division 23 Section "Common Work Results for HVAC."

B. Operating Instructions: Frame printed operating instructions for VFDs, including control sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of VFD units.

3.5 CONTROL WIRING INSTALLATION

A. Install wiring between VFDs and remote devices according to Division 26 Section "LowVoltage Power Conductors and Cables."

B. Bundle, train, and support wiring in enclosures.

C. Connect hand-off-automatic switch and other automatic-control devices where available.

1. Connect selector switches with control circuit in both hand and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

3.6 CONNECTIONS

A. Conduit installation requirements are specified in other Division 26 Sections. Drawings indicate general arrangement of conduit, fittings, and specialties.

B. Ground equipment.

C. Tighten electrical connectors and terminals according to manufacturer's published torque tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

3.7 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Test insulation resistance for each VFD element, bus, component connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

B. Testing: Perform the following field quality-control testing:

1. Perform each electrical test and visual and mechanical inspection stated in NETA ATS, Sections 7.5, 7.6, and 7.16. Certify compliance with test parameters.
2. VFD Failure analysis: VFD manufacturer shall have an analysis laboratory to evaluate the failure of any component. The failure analysis lab shall allow the manufacturer to perform complete electrical testing, x-ray of components, and de-cap or de-laminate of components and analyze failures within the components.
3. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

C. VFD Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, and perform testing and adjusting of VFDs.

D. Test Reports: Prepare a written report to record the following:

1. Test procedures used.
2. Test results that comply with requirements.

3. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

3.8 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Verify that electrical wiring installation complies with manufacturer's submittal and installation requirements in Division 26 Sections.

C. Complete installation and startup checks according to manufacturer's written instructions.

3.9 ADJUSTING

A. Set field-adjustable switches and circuit-breaker trip ranges.

3.10 CLEANING

A. Clean VFDs internally, on completion of installation, according to manufacturer's written instructions. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

3.11 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's maintenance personnel to adjust, operate, and maintain VFDs. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 23 0510

SECTION 23 0511 - WELDING PRESSURE PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section applies to welding of steel piping provided under Division 23.

B. Related Sections include the following:

1. Division 23 Section "Common Work Results for HVAC" for general piping materials and installation requirements.
2. Division 23 Section "Vibration and Seismic Controls for HVAC."
3. Division 23 Section "Hangers and Supports for HVAC" for pipe supports, product descriptions, and installation requirements.

1.2 REFERENCES

A. The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

B. ANSI Z49.1 - Safety in Welding and Cutting.

C. ASME-01 - Boiler and Pressure Vessel Code; Section I, Power Boilers.

D. ASME-04 - Boiler and Pressure Vessel Code; Section II, Material Specifications, Part C Specifications for Welding Rods, Electrodes and Filler Metals.

N. AWS A2.4 – Symbols for Welding, Brazing and Nondestructive Examination

O. AWS A3.0 – Welding Terms and Definitions Including Terms for Brazing, Soldering Thermal Spraying and Thermal Cutting.

1.3 SUBMITTALS

A. Certificates: Welding Certificates applicable to the material being joined.

B. Pressure Piping: Detail drawings showing location, length, and type of welds; and indicating postweld heat treatment and NDE as required.

C. Qualifications: Welder and welding operator performance qualification certificates. Welding inspectors and NDE personnel certificates. Qualifications of testing laboratory or the Contractor's quality assurance organization.

D. Welding Operations: Detailed procedures that define methods of compliance to contract drawings and specifications. Inspection and material procurement records. System and material testing and certification records. Written records and drawings indicating location of welds made by each welder or welding operator.

1.4 DEFINITIONS

A. Definitions shall be in accordance with AWS A3.0.

1.5 GENERAL REQUIREMENTS

A. This Section covers the welding of pressure piping systems. Procedures shall be developed for welding all metals included in the work. Welding shall not be started until welding procedures, welders, and welding operators have been qualified. An approved testing laboratory shall perform qualification testing. Maintain current records of the test results obtained in the welding procedure, welding operator, welder performance qualifications, and nondestructive examination (NDE) procedures readily available at the site for examination. The procedures for making transition welds between different materials or between plates or pipes of different wall thicknesses shall be qualified. ASME B31.1 or ASME B31.9, as applicable, requirements for branch connections may be used in lieu of detailed designs. Unless otherwise specified, the choice of welding process shall be the responsibility of the Contractor.

1.6 PERFORMANCE

A. Provide quality joint preparation, welding, and examination. All materials used in the welding operations shall be clearly identified and recorded. The inspection and testing defined in this

specification are minimum requirements. Additional inspection and testing shall be the responsibility of the Contractor when he deems it necessary to achieve the quality required.

1.7 QUALIFICATIONS

A. Certification

1. Each welder shall have passed a qualification test. The test shall be in accordance with the ASME Boiler and Pressure Vessel Code, Section IX, "Welding Qualifications," ASME Section VIII.
2. The certifications shall certify that the welder is qualified to weld the material to be used at the job site.
3. Submit copies of each welder's certifications for approval prior to commencing the work. No welder shall be used on the project until so certified.

B. Welding Procedures Qualification: Record in detail and qualify the Welding Procedure Specifications for every welding procedure proposed. Qualification for each welding procedure shall conform to the requirements of ASME B31.1 or ASME B31.9, as applicable, and to this specification. The welding procedures shall specify end preparation for butt welds including cleaning, alignment, and root openings. Preheat, interpass temperature control, and postheat treatment of welds shall be as required or specified. The type of backing rings or consumable inserts, if used, shall be described and if they are to be removed. Welding procedures shall be identified individually and shall be referenced on the detail drawings.

C. Welder and Welding Operator Performance: Each welder and welding operator assigned to work shall be qualified in accordance with ASME B31.1 or ASME B31.9, as applicable,

D. Inspector Certification: Welding inspectors shall be qualified in accordance with AWS QC1.

E. NDE Personnel: NDE personnel shall be certified, and a written procedure for the control and administration of NDE personnel training, examination and certification shall be established. The procedures shall be based on appropriate specific and general guidelines of training and experience recommended by ASNT-01.

1.8 DELIVERY, STORAGE AND HANDLING

A. All filler metals, electrodes, fluxes, and other welding materials shall be delivered to the site in manufacturers' original packages and stored in a dry space until used.

B. Material Control: Materials shall be stored in a controlled access and clean, dry area that is weathertight and is maintained at a temperature recommended by the manufacturer. The materials shall not be in contact with the floor and shall be stored on wooden pallets or cribbing.

1.9 SYMBOLS

A. Symbols shall be in accordance with AWS A2.4.

1.10 SAFETY

A. Safety precautions shall conform to ANSI Z49.1.

PART 2 - PRODUCTS

2.1 WELDING MATERIALS

A. Welding materials shall comply with ASME-04. Welding equipment, electrodes, welding wire, and fluxes shall be capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

PART 3 - EXECUTION

3.1 WELDING

A. Do not deviate from applicable codes, approved procedures and approved shop drawings without prior written approval from the University's Representative. Materials or components with welds made off the site will not be accepted if the welding does not conform to the requirements of this specification unless otherwise specified. Assign each welder or welding operator an identifying number, letter, or symbol that shall be used to identify his welds. Each welder or welding operator shall apply his mark adjacent to his weld using an approved rubber stamp or felt-tipped marker with permanent, weatherproof ink or other approved methods that do not deform the metal. For seam welds, place identification marks adjacent to the welds at 3 foot intervals. Confine identification by die stamps or electric etchers to the weld reinforcing crown, preferably in the finished crater.

3.2 WELDING OPERATORS

A. Perform welding in accordance with qualified procedures using qualified welders and welding operators.

3.3 WELDING PROCEDURES

A. Welding procedure (except for HTW piping):

1. Electric metallic arc process shall be used on all welding. End preparations shall conform to ANSI and ASTM Standards. Welding shall be per ASME standards. Cutting by oxyacetylene torch shall be in accordance with ASME B31.1 or ASME B31.9, as applicable.

2. Use only one welder for each joint.
3. Branch pipe shall be welded to mains with thread-o-let, weld-o-let, sock-o-let other manufactured fittings or fabricated fittings per B31.9 criteria.
4. Weld slip-on flanges on both front and backsides.
5. Thermometer and test wells shall be threaded and installed with thread-o-let fittings.

3.4 SUPPORTS

A. Welding of hangers, supports, and plates to structural members shall conform to AWS D1.1.

3.5 EXAMINATIONS, INSPECTIONS AND TESTS

A. Visual and nondestructive examinations shall be included in the contract to detect surface and internal discontinuities in completed welds. Employ the services of a qualified commercial inspection or testing laboratory or technical consultant approved by the University. Visually examine welds. Radiographic, Liquid penetrant, Magnetic particle, or Ultrasonic examination shall be required as indicated or in accordance with other sections where detailed requirements are specified. When examination and testing indicates defects in a weld joint, a qualified welder shall repair the weld in accordance with the paragraph entitled "Corrections and Repairs" of this section.

B. Visually examine welds as follows:

1. Before welding -- for compliance with requirements for joint preparation, placement of backing rings or consumable inserts, alinement and fit-up, and cleanliness.
2. During welding -- for conformance to the qualified welding procedure.
3. After welding -- for cracks, contour and finish, bead reinforcement, undercutting, overlap, and size of fillet welds.

C. NDE shall be in accordance with written procedures. Procedures for radiographic tests and methods shall conform to ASME BPVC SEC V. The approved procedure shall be demonstrated to the satisfaction of the University’s Representative. In addition to the information required in ASME BPVC SEC V, the written procedures shall include:

1. Timing of the nondestructive examination in relation to the welding operations.
2. Safety precautions.

D. Examinations and Tests by the University

1. Examinations and tests will conform to paragraphs "Visual Examination" and "Nondestructive Examination" of this section, except that destructive tests may be required also. When destructive tests are made, qualified welders or welding operators shall make repairs using welding procedures which will develop the full strength of the members cut. Welding shall be subject to examination and tests in the mill, shop, and field.

3.6 ACCEPTANCE STANDARDS

A. Visual: The following indications are unacceptable:

1. Surface of welds shall be sufficiently free from coarse ripples, grooves, overlaps, abrupt ridges, and valleys.
2. Cracks
3. Undercut on surface that is greater than 1/32-inch deep.
4. Weld reinforcement greater than 5/32 inch.
5. Lack of fusion on surface.
6. Incomplete penetration (applies only when inside surface is readily accessible).
7. Convexity of fillet weld surface greater than 10 percent of longest leg plus 0.03 inch.
8. Concavity in groove welds.
9. Concavity in fillet welds greater than 1/16 inch.
10. Fillet weld size less than indicated or greater than 1-1/4 times the minimum indicated fillet leg length.

B. Magnetic Particle Examination: The following relevant indications are unacceptable:

1. Any cracks and linear indications.
2. Rounded indications with dimensions greater than 3/16 inch.
3. Four or more rounded indications in a line separated by 1/16 inch or less edge-to-edge.
4. Ten or more rounded indications in any 6 square inches of surface with the major dimension of this area not to exceed 6y inches with the area taken in the most unfavorable location relative to the indications being evaluated.

C. Liquid Penetrant Examination: Indications whose major dimensions are greater than 1/16 inch shall be considered relevant. The following relevant indications are unacceptable:

1. Any cracks or linear indications.
2. Rounded indications with dimensions greater than 3/16 inch.
3. Four or more rounded indications in a line separated by 1/16 inch or less edge-to-edge.
4. Ten or more rounded indications in any 6 square inches of surface with the major dimension of this area not to exceed 6 inches with the area taken in the most unfavorable location relative to the indications being evaluated.

D. Radiography: Welds that are shown by radiography to have any of the following discontinuities are unacceptable:

1. Porosity in excess of that shown as acceptable in the ASME-01, Appendix A-250.
2. Any type of crack or zone of incomplete fusion or penetration.

3. Any other elongated indication which has a length greater than:
   a. 1/4 inch for t up to 3/4 inch inclusive, where t is the thickness of the thinner portion of the weld.

b. 1/3 t for t from 3/4 inch to 2-1/4 inch, inclusive.
c. 3/4 inch for t over 2-1/4 inch.

4. Any group of indications in line that have an aggregate length greater than t in a length of 12t, except where the distance between the successive indications exceeds 6L where L is the longest indication in the group.

5. Where t pertains to the thickness of the weld being examined; if a weld joins two members having different thickness at the weld, t is the thinner of these two thicknesses.

E. Ultrasonic Examination: Linear-type discontinuities are unacceptable if the amplitude exceeds the reference level and discontinuities have lengths which exceed the following:

1. 1/4 inch for t up to 3/4 inch.
2. 1/3 inch for t from 3/4 to 2-1/4 inch.
3. 3/4 inch for t over 2-1/4 inch.
4. Where t is the thickness of the weld being examined; if the weld joints two members having different thicknesses at the weld, t is the thinner of these two thicknesses. Where discontinuities are interpreted to be cracks, lack of fusion, and incomplete penetration, they are unacceptable regardless of length.

F. The University reserves the right to perform any in-process inspection to ensure that the welds meet the requirements of ASME B31.1 or ASME B31.9, as applicable.

3.7 CORRECTIONS AND REPAIRS

A. Defects shall be removed and repaired as specified in ASME B31.1 or ASME B31.9, as applicable, unless otherwise specified. Disqualifying defects discovered between weld passes shall be repaired before additional weld material is deposited. Wherever a defect is removed, and repair by welding is not required, the affected area shall be blended into the surrounding surface, eliminating sharp notches, crevices or corners. After defect removal is complete and before rewelding, the area shall be examined by the same test method which first revealed the defect to ensure that the defect has been eliminated. After rewelding, the repaired area shall be reexamined by the same test method originally used for that area. Any indication of a defect shall be regarded as a defect unless reevaluation by NDE or by surface conditioning shows that no disqualifying defects are present. The use of any foreign material to mask, fill in, seal, or disguise welding defects will not be permitted.

END OF SECTION 23 0511

SECTION 23 0513 –MOTORS FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes basic requirements for factory or field-installed motors.

B. The standards for the motors listed below exceed those commonly found in the commercial HVAC market. This is intentional and shall not be deviated from. Typical campus applications require much longer life in service than typical commercial applications. Many of the applications are 24 hour per day and on variable frequency drives. The various characteristics of high end industrial motors ensure a very long life in campus service and provide significantly increased energy performance. Their rugged construction helps ensure that initial efficiency is maintained over the life of the motor. Improved characteristics such as reduced shaft runout, and foot flatness allow for better alignment between the motor and the driven equipment. This improves efficiency and reduces noise and vibration. C. Related Sections include the following:

1. Division 23 Section "Vibration and Seismic Controls for HVAC" for mounting motors and vibration isolation and seismic-control devices.
2. Division 23 Sections for application of motors and reference to specific motor requirements for motor-driven equipment.

1.2 QUALITY ASSURANCE

A. Source Limitations: If one of the approved manufacturers cannot be provided and factory installed, then a field-installed motors meeting these specifications shall be field installed.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in California Electrical Code (CEC), Article 100, by a testing agency acceptable to the University, and marked for intended use.

C. Motor Insulation: Insulation shall be inverter-rated Class F, or H, meeting NEMA Table 12-12, Part 31 for inverter duty service with VFD applications. Motor temperature rise shall be kept equal to or below class B standards when operating at full load on sine wave power. The assembled motor insulation system shall resist 2000-volt transients without premature motor failure.

D. Motors shall comply with NEMA MG 1 unless otherwise indicated.

E. Bearings: Bearing loads and bearing life shall be determined using AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings, and AFBMA 11 - Load Ratings and Fatigue Life for Roller Bearings.

1.3 COORDINATION

A. Coordinate features of motors, installed units, and accessory devices. Provide motors that are:

1. Compatible with the following:
   a. Magnetic controllers.
   b. Reduced-voltage controllers.
   c. Variable frequency drives.
2. Designed and labeled for use with variable frequency controllers (VFD), and suitable for use throughout speed range without overheating.
3. Matched to torque and horsepower requirements of the load.
4. Matched to ratings and characteristics of supply circuit and required control sequence.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified:

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 MOTOR REQUIREMENTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers listed in this section:

2.3 MOTOR CHARACTERISTICS

A. Motors One Horsepower and Larger: Three-phase.

B. Motors Three-Quarter Horsepower and Smaller: Three-phase or Single-phase.

C. Frequency Rating: 60 Hz.

D. Voltage Rating: NEMA standard voltage selected to operate on nominal circuit voltage to which motor is connected. Polyphase-motor installations on less than 460-Volt nominal circuits shall require written permission from University’s Representative.

E. Service Factor: 1.15 or more for all motors on sine wave power; 1.0 for motors on inverter power.

F. Duty: "Severe Duty" and "Continuous Duty" at ambient temperature of 105 deg F (40 deg C) and at altitude of 200 feet above sea level.

G. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

H. Enclosure: Totally Enclosed Fan Cooled (TEFC); or Totally Enclosed Air Over (special applications only), or Totally Enclosed Not Ventilated (special applications only). Open Drip Proof Motors shall not be used.

2.4 POLYPHASE MOTORS ONE-HALF AND THREE-FOURTH HORSEPOWER

A. Efficiency: Meeting or exceeding EPACT 1992 requirements.

B. Bearings: Sealed

C. Service Factor: 1.25

D. Use: Minimize use of motors in this size range by combining loads.

2.5 POLYPHASE MOTORS ONE HORSEPOWER AND LARGER

A. Basis-of-Design Product: Subject to compliance with requirements, provide comparable product by one of the following:

a Baldor Super E
b Marathon Blue Chip XRI
c Reliance XEX
d Siemens GP100A
e Toshiba EQPIII

B. Description: NEMA MG 1, Design B, medium induction motor.

a Efficiency: Meet or exceed the most stringent of the applicable Energy Code, NEMA Premium efficiency standards, as defined in NEMA MG 1 or the efficiencies listed below when tested in accordance with IEEE Standard 112, Method B procedures as stated in NEMA MG 1-12.53a.

	Open Drip-Proof			Totally Enclosed Fan-Cooled		
HP	6-pole	4-pole	2-pole	6-pole	4-pole	2-pole
1	82.5	85.5	77.0	82.5	85.5	77.0

1.5	86.5	86.5	84.0	87.5	86.5	84.0
2	87.5	86.5	85.5	88.5	86.5	85.5
3	88.5	89.5	85.5	89.5	89.5	86.5
5	89.5	89.5	86.5	89.5	89.5	88.5
7.5	90.2	91.0	88.5	91.0	91.7	89.5
10	91.7	91.7	89.5	91.0	91.7	90.2
15	91.7	93.0	90.2	91.7	92.4	91.0
20	92.4	93.0	91.0	91.7	93.0	91.0
25	93.0	93.6	91.7	93.0	93.6	91.7
30	93.6	94.1	91.7	93.0	93.6	91.7

C. Retain first paragraph below for service factors exceeding NEMA standard for other than open-dripproof motors. If retaining, coordinate with Drawings or other Sections. See "Product Characteristics" Article in the Evaluations for discussion of service factor. A service factor of at least 1.15 is available for most motors, including explosion proof; however, there are exceptions.

D. Service Factor: 1.15.

E. Retain one of first two paragraphs below. Retain first paragraph for lower first cost. Retain second to require all multispeed motors to be two-winding type. See "Multispeed and Variable-Speed Considerations" Article in the Evaluations.

F. Rotor: Random-wound, squirrel cage.

G. Bearings: Regreasable, shielded, antifriction ball bearings suitable for radial and thrust loading.

H. Temperature Rise: Class B.

I. Insulation: Class F.

J. Code Letter Designation:

a Motors 15 HP and Larger: NEMA starting Code F or Code G.
b Motors Smaller than 15 HP: Manufacturer's standard starting characteristic.

K. Enclosure Material: Cast iron for motor frame sizes 324T and larger; rolled steel for motor frame sizes smaller than 324T.

L. Warranty: 36 months

M. All motors 40 HP and greater shall be provided with motor mounted power factor correction capacitors to improve power factor to .90 minimum. Motors less than 40 HP shall be provided with .85 power factor. Where motors less than 40 HP are not available with minimum .85 power factor, provide motor mounted power factor correction capacitor to improve power factor to at least .90 under rated load condition.

2.6 POLYPHASE MOTORS WITH ADDITIONAL REQUIREMENTS

A. Motors Used with Reduced-Inrush Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.

1. Designed with critical vibration frequencies outside operating range of controller output.
2. Temperature Rise: Matched to rating for Class B insulation.
3. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

C. Motors connected to variable frequency controllers shall have shaft grounding devices meeting the following requirements:

1. Manufacturer: AEGIS SGR™ Bearing Protection Rings manufactured by Electro Static Technology (EST).
2. Shaft grounding shall be a bearing isolator, or labyrinth seal, that includes a built-in grounding ring and brush. The brush shall contain conductive microfibers that completely surround the shaft to discharge any current flowing through it.
3. Motors less than 100 HP size shall be provided with a single shaft grounding ring provided on the drive end of the motor.
4. Motors 100 HP size and larger shall be provided with a shaft grounding ring on both ends of the motor shaft or shall have an insulated ceramic bearing installed on the non-drive end of the motor and a shaft grounding ring installed on the drive end of the motor.
5. Apply a fast drying silver paint on the shaft surface to prevent corrosion.
6. Shaft grounding ring wear shall be less than 0.001” in 10,000 hours with a fiber wear length designed for expected life 200,000+ hours based on testing. Shaft grounding rings shall be compatible with operating environments ranging from -40° F (-40° C) to 300° F (150° C) and 0-90% RH (non-condensing).

D. Cooling Tower Motors: provide with tropicalization (protective coating) treatment performed.

2.7 SINGLE-PHASE MOTORS

A. Type: One of the following, to suit starting torque and requirements of specific motor application:

1. Permanent-split capacitor.
2. Split-phase start, capacitor run.
3. Capacitor start, capacitor run.

B. Shaded-Pole Motors: For motors 1/20 hp and smaller only.

C. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

D. Bearings: Ball type.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive field-installed motors for compliance with requirements, installation tolerances, and other conditions affecting performance.

B. Examine roughing-in of conduit systems to verify actual locations of conduit connections before motor installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 MOTOR INSTALLATION

A. Anchor each motor assembly to base, adjustable rails, or other support, arranged and sized according to manufacturer's written instructions. Attach by bolting. Level and align motor with base.

B. Comply with mounting and anchoring requirements specified in Division 23 Section "Vibration and Seismic Controls for HVAC."

C. Connect motor leads to power source using rings and bolts or split bolts as needed. Insulation of connected motor leads shall be of the highest quality and designed to withstand the same temperature as the internal windings. Ordinary electrical tape is not generally suitable for this service and shall not be used as the only means of insulation. Wire nuts shall not be used. D. Motor power leads shall be marked at the source and at the connection box on the motor.

3.3 FIELD QUALITY CONTROL

A. Prepare for acceptance tests as follows:

1. Run each motor with its controller. Demonstrate correct rotation, alignment, and speed at motor design load.
2. Test interlocks and control features for proper operation.
3. Verify that current in each phase is within nameplate rating.

B. Testing: University's Representative may engage a qualified testing agency to perform the following field quality-control testing:

1. Perform each electrical test and visual and mechanical inspections stated in NETA ATS, Section 7.15.1 and certify compliance with test parameters.

C. After the University's testing agency is finished, correct any malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and the University shall retest.

3.4 ADJUSTING

A. Align motors, bases, shafts, pulleys and belts. Tension belts according to manufacturer's written instructions.

3.5 CLEANING

A. After completing equipment installation, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.

B. Clean motors, on completion of installation, according to manufacturer's written instructions.

END OF SECTION 23 0513

SECTION 23 0516 - EXPANSION FITTINGS AND LOOPS FOR HVAC PIPING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following pipe expansion joints and expansion compensation devices for mechanical piping systems:

1. Pipe bends and loops.
2. Alignment guides and anchors.

B. Related Sections include the following:

1. Division 23 Section "Steam and Condensate Heating Piping" for steam and condensate meters.

1.2 DEFINITIONS

A. BR: Butyl rubber.

B. Buna-N: Nitrile rubber.

C. CR: Chlorosulfonated polyethylene synthetic rubber.

D. CSM: Chlorosulfonyl-polyethylene rubber.

E. EPDM: Ethylene-propylene-diene terpolymer rubber.

F. NR: Natural rubber.

G. PTFE: Polytetrafluoroethylene plastic.

1.3 PERFORMANCE REQUIREMENTS

A. Compatibility: Products shall be suitable for piping system fluids, materials, working pressures, and temperatures.

B. Capability: Products shall absorb 200 percent of maximum axial movement between anchors.

1.4 SUBMITTALS

A. Product Data: For each type of pipe expansion joint and alignment guide indicated.

B. Shop Drawings: Signed and sealed by a qualified professional engineer.

1. Design Calculations: Calculate requirements for thermal expansion of piping systems and for selecting and designing expansion joints, loops, and bends.

2. Anchor Details: Detail fabrication of each anchor indicated. Show dimensions and methods of assembly and attachment to building structure.
3. Alignment Guide Details: Detail field assembly and attachment to building structure.
4. Schedule: Indicate type, manufacturer's number, size, material, and location for each expansion joint.

C. Product Certificates: For each type of pipe expansion joint, signed by product manufacturer per the manufactures data submitted.

D. Welding certificates.

E. Operation and Maintenance Data: For pipe expansion joints to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to the following:

1. Steel Shapes and Plates: AWS D1.1, "Structural Welding Code - Steel."
2. Welding to Piping: ASME Boiler and Pressure Vessel Code: Section IX.

B. Seismic Engineering: Seismic bracing and support design, mounting hardware and equipment, support systems, restraint systems, anchorage systems, and installation shall conform to the CBC requirements for Seismic Zone 4. Submit calculations, plans, and documents stamped by a qualified California registered engineer.

C. Structural Review: Seismic engineering submittal documents, seismic loads, anchorage support loads, and vertical loads applied to building structures and structural components shall be reviewed, analyzed, and subject to approval by the project structural engineer of record.

D. Flexible pipe connectors and expansion joints shall be rated for 150% of design maximum working pressure, or as recommended by the product Manufacturer.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

a.

2.2 ALIGNMENT GUIDES

A. Description: Steel, factory fabricated, with bolted two-section outer cylinder and base for alignment of piping and two-section guiding spider for bolting to pipe.

1. Manufacturers:

a. Adsco Manufacturing, LLC.
b. Ebba Iron Sales
c. Flexicraft Industries.
d. Hyspan Precision Products, Inc.
e. Metraflex, Inc.
f. Or equal.

2.4 MATERIALS FOR ANCHORS

A. Steel Shapes and Plates: ASTM A 36/A 36M.

B. Imbedded strut inserts:

C. Bolts and Nuts: ASME B18.10 or ASTM A 183, steel, hex head.

D. Washers: ASTM F 844, steel, plain, flat washers.

E. Mechanical Fasteners: Insert-wedge-type stud with expansion plug anchor for use in hardened Portland cement concrete, and tension and shear capacities appropriate for application.

1. Stud: Threaded, zinc-coated carbon steel.
2. Expansion Plug: Zinc-coated steel.
3. Washer and Nut: Zinc-coated steel.

F. Chemical Fasteners: Insert-type-stud bonding system anchor for use with hardened Portland cement concrete, and tension and shear capacities appropriate for application.

1. Bonding Material: ASTM C 881, Type IV, Grade 3, 2-component epoxy resin suitable for surface temperature of hardened concrete where fastener is to be installed.
2. Stud: ASTM A 307, zinc-coated carbon steel with continuous thread on stud, unless otherwise indicated.
3. Washer and Nut: Zinc-coated steel.

G. Concrete: Portland cement mix, 3000 psi minimum. Refer to Division 03 Section "Cast-inPlace Concrete" for formwork, reinforcement, and concrete.

H. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink, nonmetallic grout; suitable for interior and exterior applications.

1. Properties: Nonstaining, noncorrosive, and nongaseous.
2. Design Mix: 5000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.1 PIPE BEND AND LOOP INSTALLATION

A. Attach pipe bends and loops to anchors.

1. Steel Anchors: Attach by welding. Comply with ASME B31.9 and ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
2. Concrete Anchors: Attach by fasteners. Follow fastener manufacturer's written instructions.

B. Pipe bends and loops for high pressure steam system shall be of one continuous piece of pipe, welded at each end.

3.4 ALIGNMENT-GUIDE INSTALLATION

A. Install guides on piping adjoining pipe expansion joints and bends and loops.

B. Attach guides to pipe and secure to building structure.

3.5 ANCHOR INSTALLATION

A. Install anchors at locations to prevent stresses from exceeding those permitted by ASME B31.9 and to prevent transfer of loading and stresses to connected equipment.

B. Fabricate and install steel anchors by welding steel shapes, plates, and bars to piping and to structure. Comply with ASME B31.9 and AWS D1.1.

C. Construct concrete anchors of poured-in-place concrete of dimensions indicated and include embedded fasteners.

D. Install pipe anchors according to expansion-joint manufacturer's written instructions if expansion joints or compensators are indicated.

E. Use grout to form flat bearing surfaces for expansion fittings, guides, and anchors installed on or in concrete.

3.6 SEISMIC JOINTS

A. Install Seismic Joints according to the requirements of CBC Seismic Zone 4, and Project Geotechnical Reports.

B. Install seismic joints of sizes matching size of pipe in which they are installed.

C. Seismic joints shall be flexible stainless steel hose type, or double ball joint type.

D. Provide shut-off valve on main pipe side of seismic joint installations to isolate failed joints, allowing the system(s) to stay in service. E. Install seismic joints in all piping.

F. Ensure maintenance accessibility of seismic joints.

3.7 ROOFTOP AND OUTDOOR APPLICATIONS

A. Outdoor assemblies shall be fully weather-proof design and installation, with appropriate materials, and material coatings. Mounting hardware such as bolts, nuts, washers, anchors straps, brackets, fastening hardware etc., shall be stainless steel or HDG finished.

END OF SECTION 23 0516

SECTION 23 0519 - METERS AND GAGES FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following meters and gages for mechanical systems:

1. Thermometers.
2. Thermowells.
3. Gages.
4. Test plugs.
5. Flowmeters.
6. Thermal-energy meters.

B. Related Sections include the following:

1. Division 23 Section "Steam and Condensate Heating Piping" for steam and condensate meters.
2. Division 23 Section "Hydronic Piping and Valves" for hydronic system meters inside the building.

1.2 DEFINITIONS

A. CR: Chlorosulfonated polyethylene synthetic rubber.

B. EPDM: Ethylene-propylene-diene terpolymer rubber.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated; include performance curves.

B. Shop Drawings: Schedule for thermometers, gages, flowmeters and thermal-energy meters indicating manufacturer's number, scale range, and location for each.

C. Product Certificates: For each type of thermometer, gage, flowmeter and thermal-energy meter, signed by product manufacturer.

D. Operation and Maintenance Data: For flowmeters, and thermal-energy meters to include in emergency, operation, and maintenance manuals.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 LIQUIED IN GLASS THERMOMETERS

A. Manufacturers

1. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
2. Marsh Bellofram/Marshalltown.
3. Trerice, H. O. Co.
4. Weiss Instruments, Inc.
5. Weksler Instruments Operating Unit; Dresser Industries; Instrument Div.
7. Or equal.

B. Metal-Case, Industrial-Style, Liquid-in-Glass Thermometers: Standard: ASME B40.200.

1. Case: Cast aluminum; 9-inch nominal size unless otherwise indicated.
2. Case Form: Adjustable angle unless otherwise indicated.
3. Tube: Glass with magnifying lens and blue organic liquid.
4. Tube Background: Nonreflective aluminum with permanently etched scale markings graduated in deg F.
5. Window: Ultraviolet Protective Acrylic.
6. Stem: Aluminum, brass or stainless steel and of length to suit installation.
7. Design for Air-Duct Installation: With ventilated shroud.
8. Design for Thermowell Installation: Bare stem.
9. Connector: 1-1/4 inches- 18 UNEF -2A coupling nut
10. Accuracy: Plus or minus 1 percent of scale range or one scale division. RTD: plus or minus 0.6% of scale range.

2.3 THERMOWELLS

A. Manufacturers:

1. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
2. Marsh Bellofram/Marshalltown.
3. Trerice, H. O. Co.
4. Weiss Instruments, Inc.
6. Or equal.

B. Description: Pressure-tight, socket-type metal fitting made for insertion into piping and of type, diameter, and length required to hold thermometer.

C. Characteristics:

1. Threaded Brass.
2. Pressure Rating: Not less than piping system design pressure.
3. Stem Length: Extend 2" into fluid or to extend to center of pipe.
4. Extension for Insulated Piping: 2 inches nominal but not less than thickness of insulation.
5. Threaded Cap Nut: With chain permanently fastened to well and cap.

2.4 PRESSURE GAGES

A. Manufacturers:

1. Ashcroft Commercial Instrument Operations; Dresser Industries; Instrument Div.
2. Marsh Bellofram/Marshalltown.
3. Trerice, H. O. Co.
4. Weiss Instruments, Inc.
5. Or equal.

B. Direct-Mounting, Dial-Type Pressure Gages: Indicating-dial type complying with ASME B40.100.

1. Case: 4-1/2-inch diameter, cast aluminum, black finished, stem-mounted flangeless.
2. Pressure-Element Assembly: Bourdon tube, unless otherwise indicated.
3. Pressure Connection: Brass tube and socket.
4. Movement: Mechanical, with link to pressure element and connection to pointer.
5. Dial Face: Aluminum, white background with black graduations and markings.
6. Pointer: Adjustable black finish.
7. Window: Clear glass.
8. Ring: Friction type, 304 stainless steel.
9. Accuracy: Grade A, plus or minus 1 percent of full scale.
10. Range for Fluids under Pressure: Two times operating pressure.
11. Scale: Scale shall be psig.

C. Pressure-Gage Fittings:

1. Valves: NPS 1/4 brass or stainless-steel threaded ball type valve.
2. Syphons: NPS 1/4 coil of brass tubing or stainless steel with threaded ends.
3. Snubbers: ASME B40.100, NPS 1/4 brass bushing with corrosion-resistant, porous metal disc of material suitable for system fluid and working pressure.

2.5 TEST PLUGS

A. Manufacturers:

1. Peterson Equipment Co., Inc.
2. Sisco Manufacturing Co.
3. Or equal.

B. Description: Corrosion-resistant brass or stainless-steel body with core inserts and gasketed and threaded cap, with extended stem beyond insulation for units to be installed in insulated piping.

C. Minimum Pressure and Temperature Rating: 500 psig at 200 deg F.

D. Core Inserts: One or two self-sealing neoprene, valves gasketed orifice, suitable for inserting a 1/8" OD probe assembly.

1. Insert material for air, water, oil, or gas service at 20 to 200 deg F shall be CR.
2. Insert material for air or water service at minus 30 to plus 275 deg F shall be EPDM.

2.6 FLOWMETERS

A. Manufacturers:

1. Foxboro 84 Series.
2. Rosemount 8800CA.
3. Moore Products.
4. Endress + Hauser, Prowirl 77.
5. Or equal.

B. Vortex Type:

1. Description: Inline vortex type for installing between pipe flanges and measuring flow directly in gallons per minute.
2. Construction: Stainless-steel body; with integral transmitter and direct-reading scale, and class 150 lb ANSI B16.5 flanges for chilled water.
3. Pressure Rating: 150 psig for chilled water.
4. Temperature Rating: 40 deg F for chilled water.
5. Display: Visual instantaneous rate of flow, with register to indicate total volume in gallons. Provide in remote wall mounted NEMA 4x enclosure.
6. Integral Transformer: For low-voltage power operation.
7. Accuracy: Plus or minus 0.25 percent for liquids.
8. Provide with isolation valve to allow the flow sensor to be removed without interrupting the flow in the pipe.
9. Provide flow meter with Hart Communication Protocol. Meters shall have output of 4-20 ma for Campus automation and include totalizer.
10. Provide matched pair of temperature sensors and transmitters, 100-ohm platinum RTD in stainless steel wells for connection to the building automation system and calculate total Btu used.

PART 3 - EXECUTION

3.1 THERMOMETER APPLICATIONS

A. Install bimetallic-actuated dial thermometers in the following locations:

1. Inlet and outlet of each hydronic steam generator.
2. Inlet and outlet of each hydronic coil in air-handling units and built-up central systems.
3. Inlet and outlet of each hydronic heat exchanger.

4. Inlet and outlet duct of each air handling unit.

B. Install bimetallic-actuated dial thermometers at suction and discharge of each pump.

C. Provide the following temperature ranges for thermometers:

1. Heating Hot Water: 30 to 240 deg F, with 2-degree scale divisions.
2. Chilled Water: 0 to 100 deg F, with 2-degree scale divisions.
3. Process Chilled Water: 0 to 100 deg F, with 2-degree scale divisions.
4. Steam and Condensate: 50 to 400 deg F, with 5-degree scale divisions.
5. Air Ducts: 40 to 120 deg F, with 2-degree scale divisions.

3.2 GAGE APPLICATIONS

A. Install dry-case-type pressure gages at chilled-water and at all process chilled water heat exchangers. .

B. Install dry-case-type pressure gages at suction and discharge of each pump.

C. Provide the following pressure ranges for the gages or industry standard for pressure per manufacturer's recommendation:

1. Heating Hot Water Piping: 0 to 100 psi.
2. Chilled Water Piping: 0 to 100 psi.
3. Process Chilled Water Piping: 0 to 100 psi.
4. Steam Piping: 0 to 200 psi.

3.3 INSTALLATIONS

A. Install direct-mounting thermometers and adjust vertical and tilted positions.

B. Install thermowells with socket extending a minimum of 2 inches into fluid or to the center of pipe and in vertical position in piping tees where thermometers are indicated.

C. Duct Thermometer Support Flanges: Install in wall of duct where duct thermometers are indicated. Attach to duct with screws.

D. Install direct-mounting pressure gages in piping tees with pressure gage located on pipe at most readable position.

E. Install remote-mounting pressure gages on panel. Provide root valve at the main piping and needle valve at the remote panel.

F. Install ball valve and snubber fitting in piping for each pressure gage for fluids (except steam).

G. Install gate valve and syphon fitting in piping for each pressure gage for steam.

H. Install test plugs in piping.

I. Assemble and install connections, tubing, and accessories between flow-measuring elements and flowmeters as prescribed by manufacturer's written instructions.

J. Install flow meter elements in accessible positions in piping systems.

K. Install flow meter with the minimum length of straight piping as recommended by the manufacturer to meet manufacturer guarantee performance where possible.

L. Install differential-pressure-type flowmeter elements with at least minimum straight lengths of pipe upstream and downstream from element as prescribed by manufacturer's written instructions.

M. Install permanent indicators on walls or brackets in accessible and readable positions.

N. Install connection fittings for attachment to portable indicators in accessible locations.

O. Install flow meters in chilled water return piping leaving the building.

P. Assemble components and install flow meters.

Q. Mount meters on wall if accessible; if not, provide brackets to support meters.

3.4 CONNECTIONS

A. Install meters and gages adjacent to machines and equipment to allow service and maintenance for meters, gages, machines, and equipment.

B. Connect flowmeter-system elements to meters.

C. Connect flowmeter transmitters to meters.

D. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems." Work shall be performed by the electrical sub-contractor.

E. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables." Work shall be performed by the electrical sub-contractor.

3.5 ADJUSTING

A. Calibrate meters according to manufacturer's written instructions, after installation.

B. Adjust faces of meters and gages to proper angle for best visibility.

3.6 CLEANING

A. Clean windows of meters, and gages, and factory-finished surfaces. Replace cracked and broken windows, and repair scratched and marred surfaces with manufacturer’s touch-up paint.

END OF SECTION 23 0519

SECTION 23 0529 - HANGERS AND SUPPORTS FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following hangers and supports for mechanical system piping and equipment:

1. Steel pipe hangers and supports.
2. Trapeze pipe hangers.
3. Metal framing systems.
4. Thermal-hanger shield inserts.
5. Fastener systems.
6. Pipe stands.
7. Pipe positioning systems.
8. Equipment supports.

B. Related Sections include the following:

1. Division 05 Section "Metal Fabrications" for structural-steel shapes and plates for trapeze hangers for pipe and equipment support.
2. Division 23 Section "Common Work Results for HVAC" for metal supports, anchorages, and material and coating requirements for rooftop and outdoor applications.
3. Division 23 Section "Vibration and Seismic Controls for HVAC" for vibration isolation devices.
4. Division 23 Section "Expansion Fittings and Loops for HVAC Piping" for pipe guides and anchors.

1.2 DEFINITIONS

A. MSS: Manufacturers Standardization Society for The Valve and Fittings Industry Inc.

B. Terminology: As defined in MSS SP-90, "Guidelines on Terminology for Pipe Hangers and Supports."

1.3 PERFORMANCE REQUIREMENTS

A. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.

B. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

C. Design seismic-restraint hangers and supports shop drawing for piping and equipment in accordance with CBC for seismic zone 4.

1.4 SUBMITTALS

A. Product Data: For the following:

1. Steel pipe hangers and supports.
2. Thermal-hanger shield inserts.
3. Pipe positioning systems.

B. Shop Drawings: Signed and sealed by a qualified California registered professional engineer. Show fabrication and installation details and include calculations for the following:

4. Trapeze pipe hangers. Include Product Data for components.
5. Metal framing systems. Include Product Data for components.
6. Pipe stands. Include Product Data for components.
7. Equipment supports. C. Welding certificates.

1.5 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to the following:

1. AWS D1.1, "Structural Welding Code--Steel."
2. AWS D1.2, "Structural Welding Code--Aluminum."
3. AWS D1.3, "Structural Welding Code--Sheet Steel."
4. AWS D1.4, "Structural Welding Code--Reinforcing Steel." 5. ASME Boiler and Pressure Vessel Code: Section IX.

B. Seismic Engineering: Seismic bracing and support design, mounting hardware and equipment, support systems, restraint systems, anchorage systems, and installation shall conform to the CBC requirements for Seismic Zone 4. Submit calculations, plans, and documents stamped by a qualified California registered engineer.

C. Structural Review: Seismic engineering submittal documents, seismic loads, anchorage and support loads, and vertical loads applied to building structures and structural components shall be reviewed, analyzed, and approved by the project structural engineer of record.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 STEEL PIPE HANGERS AND SUPPORTS

A. Description: MSS SP-58, Types 1 through 58, factory-fabricated components. Refer to Part 3 "Hanger and Support Applications" Article for where to use specific hanger and support types.

B. Manufacturers:

1. B-Line Systems, Inc.; a division of Cooper Industries.
2. ERICO/Michigan Hanger Co.
3. Grinnell Corp.
4. Tolco Inc.
5. Superstrut.
6. PHD
7. Or equal.

C. Galvanized, Metallic Coatings: Pregalvanized or hot dipped.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

E. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion for support of bearing surface of piping.

2.3 TRAPEZE PIPE HANGERS

A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural-steel shapes with MSS SP-58 hanger rods, nuts, saddles, and U-bolts.

2.4 METAL FRAMING SYSTEMS

A. Description: MFMA-3, shop- or field-fabricated pipe-support assembly made of steel channels and other components.

B. Manufacturers:

1. B-Line Systems, Inc.; a division of Cooper Industries.
2. ERICO/Michigan Hanger Co.; ERISTRUT Div.
3. Power-Strut Div.; Tyco International, Ltd.
4. Tolco Inc.
5. Unistrut Corp.; Tyco International, Ltd.
6. PHD
7. Or equal.

C. Coatings: Manufacturer's standard finish, unless bare metal surfaces are indicated.

D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

2.5 THERMAL-HANGER SHIELD INSERTS

A. Description: 100-psig- minimum, compressive-strength insulation insert encased in sheet metal shield.

B. Manufacturers:

1. Pipe Shields, Inc.
2. ACME Construction
3. Bayside Insulation
4. PHD
5. Shaw – Piping Technology & Product
6. Clement
7. Or equal

C. Insulation-Insert Material for Cold Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate or ASTM C 552, Type II cellular glass with vapor barrier.

D. Insulation-Insert Material for Hot Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate or ASTM C 552, Type II cellular glass.

E. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

F. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

G. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature or per manufacturer’s submittal.

2.6 FASTENER SYSTEMS

A. Powder-Actuated Fasteners: Shall not be used unless approved by the University’s Representative and only for special situations. Gas driven fasteners or Ramset © might be utilized.

B. Mechanical-Expansion Anchors or: Insert-wedge-type zinc-coated, except exterior or corrosive environments shall be stainless steel, for use in hardened portland cement concrete with pullout, tension, and shear capacities appropriate for supported loads and building materials where used.

1. Manufacturers:

a. B-Line Systems, Inc.; a division of Cooper Industries.
b. Hilti, Inc.
c. ITW Ramset/Red Head.
d. Powers
e. Simpson Strong-Tie Company.

f. Or equal.

C. Concrete Inserts: Carbon steel, electro-galvanized, except exterior or corrosive environments shall be stainless steel, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used. UL listed for use in metal deck formed concrete and formed slabs for pre-positioning and attaching hanger rods in poured concrete decks. Suitable for seismic loads and brace attachments.

1. Manufacturers:

a. B-Line Systems, Inc.; a division of Cooper Industries.
b. ISAT (Blue Banger Hanger).

c. Simpson Strong-Tie Company (Blue Banger Hanger).
d. Tolco.
e. PHD
f. Or equal.

2.7 PIPE STAND FABRICATION

A. Pipe Stands, General: Shop or field-fabricated assemblies made of manufactured corrosion resistant components to support roof-mounted piping.

B. Compact Pipe Stand: One-piece plastic unit with integral-rod-roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.

1. Manufacturers:

a. ERICO/Michigan Hanger Co.
b. MIRO Industries.
c. Durablock
d. PHD
e. Or equal.

C. Low-Type, Single-Pipe Stand: One-piece stainless-steel base unit with plastic roller, for roof installation without membrane penetration.

1. Manufacturers:

a. MIRO Industries.
b. Durablock
c. PHD
d. Or equal.

D. High-Type, Single-Pipe Stand: Assembly of base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.

1. Manufacturers:

a. ERICO/Michigan Hanger Co.
b. Durablock
c. MIRO Industries.
d. Portable Pipe Hangers.
e. Or equal.

2. Base: Stainless steel.
3. Vertical Members: Two or more cadmium-plated-steel or stainless-steel, continuous thread rods.
4. Horizontal Member: Cadmium-plated-steel or stainless-steel rod with plastic or stainless steel, roller-type pipe support.

E. High-Type, Multiple-Pipe Stand: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.

1. Manufacturers:

a. Portable Pipe Hangers.
b. Durablock
c. Miro Industries
d. Or equal.

2. Bases: One or more plastic.
3. Vertical Members: Two or more protective-coated-steel channels.
4. Horizontal Member: Protective-coated-steel channel.
5. Pipe Supports: Galvanized-steel, clevis-type pipe hangers.

F. Curb-Mounting-Type Pipe Stands: Shop- or field-fabricated pipe support made from structural steel shape, continuous-thread rods, and rollers for mounting on permanent stationary roof curb.

G. Pipe Stands in Exterior Below Grade Vaults: Shop or field fabricated supports shall be electro-galvanized steel or stainless steel.

1. Manufacturers:
a. PPH
b. Or equal.

2.8 EQUIPMENT SUPPORTS

A. Description: Welded, shop- or field-fabricated equipment support made from structural-steel shapes.

2.9 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.

1. Properties: Nonstaining, noncorrosive, and nongaseous.
2. Design Mix: 5000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT APPLICATIONS

A. Specific hanger and support requirements are specified in Sections specifying piping systems and equipment.

B. Comply with MSS SP-69 for pipe hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized, metallic coatings for piping and equipment that will not have field-applied finish design for exterior use.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use padded hangers for piping that is subject to scratching.

F. Horizontal-Piping Hangers and Supports: Unless otherwise indicated on support details and drawings and except as specified in piping system Sections, install the following types:

1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of non-insulated or insulated stationary pipes, NPS 1/2 to NPS 30.
2. Clevis Hangers: For suspension of 120 to 450 deg F pipes, NPS 4 to NPS 16, requiring up to 4 inches of insulation every 25 ft.
3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes, NPS 3/4 to NPS 24, requiring clamp flexibility and up to 4 inches of insulation.
4. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes, NPS 1/2 to NPS 24, if little or no insulation is required.
5. Pipe Hangers (MSS Type 5): For suspension of pipes, NPS 1/2 to NPS 4, to allow off center closure for hanger installation before pipe erection.
6. Adjustable Swivel Split- or Solid-Ring Hangers (MSS Type 6): For suspension of non-insulated stationary pipes, NPS 3/4 to NPS 8.
7. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of non-insulated stationary pipes, NPS 1/2 to NPS 8.
8. Adjustable Band Hangers (MSS Type 9): For suspension of non-insulated stationary pipes, NPS 1/2 to NPS 8.
9. Adjustable Swivel-Ring Band Hangers (MSS Type 10): For suspension of non-insulated stationary pipes, NPS 1/2 to NPS 2.

10. Split Pipe-Ring with or without Turnbuckle-Adjustment Hangers (MSS Type 11): For suspension of non-insulated stationary pipes, NPS 3/8 to NPS 8.
11. Extension Hinged or 2-Bolt Split Pipe Clamps (MSS Type 12): For suspension of non-insulated stationary pipes, NPS 3/8 to NPS 3.
12. U-Bolts (MSS Type 24): For support of heavy pipes, NPS 1/2 to NPS 30.
13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
14. Pipe Saddle Supports (MSS Type 36): For support of pipes, NPS 4 to NPS 36, with steel pipe base stanchion support and cast-iron floor flange.
15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes, NPS 4 to NPS 36, with steel pipe base stanchion support and cast-iron floor flange and with U-bolt to retain pipe.
16. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion-type support for pipes, NPS 2-1/2 to NPS 36, if vertical adjustment is required, with steel pipe base stanchion support and cast-iron floor flange for steam and condensate only.
17. Single Pipe Rolls (MSS Type 41): For suspension of pipes, NPS 1 to NPS 30, from 2 rods if longitudinal movement caused by expansion and contraction might occur for steam and condensate only.
18. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes, NPS 2-1/2 to NPS 20, from single rod if horizontal movement caused by expansion and contraction might occur for steam and condensate only.
19. Complete Pipe Rolls (MSS Type 44): For support of pipes, NPS 2 to NPS 42, if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary for steam and condensate only.
20. Pipe Roll and Plate Units (MSS Type 45): For support of pipes, NPS 2 to NPS 24, if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is not necessary for steam and condensate only.
21. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes, NPS 2 to NPS 30, if vertical and lateral adjustment during installation might be required in addition to expansion and contraction for steam and condensate only.

G. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers, NPS 3/4 to NPS 20.
2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers, NPS 3/4 to NPS 20, if longer ends are required for riser clamps.

H. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
2. Steel Clevises (MSS Type 14): For 120 to 450 deg F piping installations.
3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 deg F piping installations.

I. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction to attach to top flange of structural shape. Provide with retaining bracket.
3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
6. C-Clamps (MSS Type 23): For structural shapes.
7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel Ibeams for heavy loads.
10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel Ibeams for heavy loads, with link extensions.
11. Malleable Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
12. Welded-Steel Brackets: For support of pipes from below, or for suspending from above by using clip and rod. Use one of the following for indicated loads:

    a. Light (MSS Type 31): 750 lb.
    b. Medium (MSS Type 32): 1500 lb.
    c. Heavy (MSS Type 33): 3000 lb.

13. Side-Beam Brackets (MSS Type 34): For sides of wooden beams only.
14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

J. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.

3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.

K. Spring Hangers and Supports: Unless otherwise indicated on the support details and drawings and except as specified in piping system Sections, install the following types:

1. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from base support.
2. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to absorb expansion and contraction of piping system from trapeze support.
3. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:

    a. Horizontal (MSS Type 54): Mounted horizontally.
    b. Vertical (MSS Type 55): Mounted vertically.
    c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

L. Comply with MSS SP-69 for trapeze pipe hanger selections and applications that are not specified in piping system Sections.

M. Comply with MFMA-102 for metal framing system selections and applications that are not specified in piping system Sections.

N. Use mechanical-expansion anchor attachments if concrete insert is not available in concrete construction.

O. HANGER AND SUPPORT INSTALLATION

P. Steel Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.

Q. Flexible connection located in horizontal piping shall be supported within 2 feet of each connector.

R. Trapeze Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping and support together on field-fabricated trapeze pipe hangers.

1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified above for individual pipe hangers.
2. Field fabricate from ASTM A 36/A 36M, steel shapes selected for loads being supported. Weld steel according to AWS D1.1.

S. Metal Framing System Installation: Arrange for grouping of parallel runs of piping and support together on field-assembled metal framing systems.

T. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping. Ok to encapsulate HHW.

U. Fastener System Installation:

1. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions. V. Pipe Stand Installation:

1. Pipe Stand Types except Curb-Mounting Type: Assemble components and mount on smooth roof surface. Do not penetrate roof membrane.
2. Curb-Mounting-Type Pipe Stands: Assemble components or fabricate pipe stand and mount on permanent, stationary roof curb. Refer to Division 07 Section "Roof Accessories" for curbs.

W. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

X. Equipment Support Installation: Fabricate from welded-structural-steel shapes.

Y. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

Z. Install lateral bracing with pipe hangers and supports to prevent swaying.

AA. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

BB. Load Distribution: Install hangers and supports so piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

CC. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and so maximum pipe deflections allowed by ASME B31.1 (for power piping) and ASME B31.9 (for building services piping) are not exceeded.

DD. Insulated Piping: Comply with the following:

1. Attach clamps and spacers to piping.

a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
c. Do not exceed pipe stress limits according to ASME B31.1 for power piping and ASME B31.9 for building services piping.

2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.

    a. Option: Thermal-hanger shield inserts may be used. Include steel weight distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.

3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.

    a. Option: Thermal-hanger shield inserts may be used. Include steel weight distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.

4.Shield Dimensions for Pipe: Per manufacturer's recommendation.

5. Insert Material: Length at least as long as protective shield.
6. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

7. Shields and inserts may be trimmed in the field to accommodate fittings and accessories.

EE. Hangers shall not be in direct contact with the pipe. Non-metallic coatings may be used for electrolytic protection where hangers are in direct contact with copper piping.

3.2 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make smooth bearing surface.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.3 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1 procedures for shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.

4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

3.4 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.5 PAINTING

A. Touch Up: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

B. Touch Up: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Division 09 painting Sections.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

3.6 ROOFTOP AND OUTDOOR APPLICATIONS

A. Outdoor assemblies shall be fully weather-proof design and installation. Mounting hardware such as bolts, nuts, washers, anchors straps, brackets, fastening hardware etc., shall be stainless steel or designed for exterior use.

B. Mounting hardware in below grade exterior vaults shall be electro-galvanized steel or stainless steel.

END OF SECTION 23 0529

SECTION 23 0548 - VIBRATION AND SEISMIC CONTROLS FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Elastomeric isolation pads and mounts.
2. Restrained elastomeric isolation mounts.
3. Restrained spring isolators.
4. Housed spring mounts.
5. Elastomeric hangers.
6. Spring hangers.
7. Spring hangers with vertical-limit stops.
8. Thrust limits.
9. Pipe riser resilient supports.
10. Resilient pipe guides.
11. Restrained vibration isolation roof-curb rails.
12. Seismic snubbers.
13. Restraining cables.
14. Steel and inertia, vibration isolation equipment bases.

B. Related Sections include the following:

1. Division 23 Section “Expansion Fittings and Loops for HVAC Piping” for flexible piping connectors.

1.2 DEFINITIONS

A. Z: seismic zone factor.

1.3 PERFORMANCE REQUIREMENTS

A. Conformance with the California Building Code seismic restraint requirements for seismic zone-4.

B. Z: 0.40

C. Component Seismic Coefficient: shall be per CBC Table 16-Q and the soil profile type for the site.

D. Seismic Importance Factor: 1.5 for anchorage of machinery and equipment required for lifesafety systems, 1.0 for other equipment. Life-safety systems would include air-handling units and exhaust fans serving stairwell pressurization fans or laboratories.

E. Component Response Modification Factor: shall be per CBC Table 16-O for the respective nonstructural components and equipment.

F. Component Amplification Factor: Shall be per CBC Table 16-O for the respective nonstructural components and equipment.

G. Sound and Vibration Performance: The Design-Build Team shall retain a licensed professional acoustical engineer for acoustic and vibration analysis and design. All systems shall be reviewed by the acoustical engineer for compliance with acoustics and vibration control contract document requirements. Provide acoustic and vibration design solutions, including system modifications, equipment modifications, additional sound treatment devices, all materials and devices, and all labor per the acoustical engineer's design solution reports, and recommendations.

H. All rotating and reciprocating equipment shall be statically and dynamically balanced to meet the following vibration limits under all design operating conditions and under specified vibration isolation:

Equipment Type	Vibration Limit (inches/sec, RMS)
Pumps	0.1
Direct Drive Fans	0.05
Belt-Driven Fans	0.1
Reciprocating Equipment	0.4
All Other Equipment	0.1

1. These vibration limits apply either on the bearings or the equipment support structure, whichever applicable.
2. The vibration limits shall include the effects of inertia mass or inertia bases, where applicable.
3. Equipment with variable frequency drives shall meet these limits throughout the entire frequency range that the equipment will operate.

I. Vibration Isolated Equipment with Variable Frequency Drives (VFD) shall not be operated below the following rotational speeds:

Specified Isolation Minimum Static Deflection	Minimum Allowed Equipment Rotational Speed (rpm)
Less than 1 inch	600
1 inch	500
2 inches	400
3 inches	350
4 inches	300
5 or more inches	250

1.4 SUBMITTALS

A. Product Data: Include load deflection curves for each vibration isolation device.

1. Manufacturer's model number for each vibration isolator, the equipment or ductwork or pipeline to which it is to be attached, and the number of isolators to be furnished for each installed system.
2. For steel spring mounts or hangers - free height, deflected height, solid height, isolator loading, and diameter of spring coil.
3. For neoprene isolators - free height, deflected height, and isolator loading.
4. An itemized list of all isolated equipment with detailed schedules showing isolators proposed for each piece of equipment, referencing materials and drawings.

B. Shop Drawings: Signed and sealed by a qualified California registered professional engineer. Include the following:

1. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
2. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes, and seismic loads. Include certification that riser system has been examined for excessive stress and that none will exist.
3. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, base weights, equipment static loads, power transmission, component misalignment, and cantilever loads.

    a. Show base construction for equipment; include dimensions, structural member sizes and support point locations.
    b. Dimensional and weight data for concrete inertia bases, steel and rail bases, and details of isolator attachment.

4. Seismic-Restraint Details: Detail fabrication and attachment of seismic restraints and snubbers. Show anchorage details and indicate quantity, diameter, and depth of penetration of anchors.

    a. For seismic slack cables - indicated method to achieve vertical restraint.

5. Submittals for Interlocking Snubbers: Include load deflection curves up to 1/2-inch deflection in x, y, and z planes.
6. Layout Drawings showing locations and sizes of braces for suspended piping and ductwork.

C. Welding certificates.

D. Manufacturer’s Certification: Upon completion of installation, submit written certification from equipment manufacturer that vibration isolation and seismic control devices are installed correctly and properly adjusted.

1.5 QUALITY ASSURANCE

A. Seismic-restraint devices shall have horizontal and vertical load testing and analysis performed according to CBC or shall bear anchorage preapproval "OPA" number, from OSHPD or another agency acceptable to University's Representative, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are not available, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified California registered professional engineer. Testing and calculations must include both shear and tensile loads and 1 test or analysis at 45 degrees to the weakest mode.

B. Seismic Engineering: Seismic bracing and support design, mounting hardware and equipment, support systems, restraint systems, anchorage systems, and installation shall conform to the CBC requirements for Seismic Zone 4. Submit calculations, plans, and documents stamped by a qualified California registered engineer.

C. Structural Review: Seismic engineering submittal documents, seismic loads, anchorage and support loads, and vertical loads applied to building structures and structural components shall be reviewed, analyzed, and approved by the project structural engineer of record.

D. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel."

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into base. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Amber/Booth Company, Inc.
2. California Dynamics Corp.
3. Kinetics Noise Control, Inc.
4. Mason Industries, Inc.
5. Or equal.
6. Caldine.

B. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 VIBRATION ISOLATORS

A. Elastomeric Isolator Pads: Oil- and water-resistant elastomer or natural rubber, arranged in single or multiple layers, molded with a nonslip pattern and galvanized steel baseplates of sufficient stiffness for uniform loading over pad area, and factory cut to sizes that match requirements of supported equipment.

1. Material: Bridge-bearing neoprene, complying with AASHTO M 251.
2. Durometer Rating: 50 or 60.
3. Number of Layers: As required. Use multiple layers, separated by steel shims, depending on supported equipment load. See manufacturer's data for load capacities.
4. Based on Mason SWM.

B. Elastomeric Mounts: Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements with factory-drilled, encapsulated top plate for bolting to equipment and with baseplate for bolting to structure. Color-code or otherwise identify to indicate capacity range.

1. Durometer Rating: 50 or 60.
2. Based on Mason ND.

C. Restrained Elastomeric Mounts: All-directional elastomeric mountings with seismic restraint.

1. Materials: Cast-ductile-iron housing containing two separate and opposing, molded, bridge-bearing neoprene elements that prevent central threaded sleeve and attachment bolt from contacting the casting during normal operation.
2. Neoprene: Shock-absorbing materials compounded according to AASHTO M251, the standard for bridge-bearing neoprene.
3. Based on Mason BR.

D. Spring Isolators: Freestanding, laterally stable, open-spring isolators.

1. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
2. Minimum Additional Travel: 50 percent of the required deflection at rated load.
3. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
4. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
5. Baseplates: Factory drilled for bolting to structure and bonded to 1/4-inch- thick, rubber isolator pad attached to baseplate underside. Baseplates shall limit floor load to 100 psig.
6. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.
7. Based on Mason SLF (or) SLFH.

E. Restrained Spring Isolators: Freestanding, steel, open-spring isolators with seismic restraint.

1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to wind loads or if weight is removed; factory-drilled baseplate bonded to 1/4-inch- thick, elastomeric isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Based on Mason SLR (or) SLRS.

F. Housed Spring Mounts: Housed spring isolator with integral seismic snubbers.

1. Housing: Ductile-iron or steel housing to provide all-directional seismic restraint.
2. Base: Factory drilled for bolting to structure.
3. Snubbers: Vertically adjustable to allow a maximum of 1/4-inch travel before contacting a resilient collar.
4. Based on Mason SSLFH.

G. Elastomeric Hangers: Double-deflection type, with molded, oil-resistant rubber or neoprene isolator elements bonded to steel housings with threaded connections for hanger rods. Colorcode or otherwise identify to indicate capacity range.

1. Based on Mason HD.

H. Spring Hangers: Combination coil-spring and elastomeric-insert hanger with spring and insert in compression.

1. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene, two elements. Steel washer-reinforced cup to support spring and bushing projecting through bottom of frame.
7. Based on Mason 30N.

I. Spring Hangers with Vertical-Limit Stop: Combination coil-spring and elastomeric-insert hanger with spring and insert in compression and with a vertical-limit stop.

1. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene, two elements.
7. Adjustable Vertical Stop: Steel washer with neoprene washer "up-stop" on lower threaded rod.

8. Based on Mason PC30N.

J. Thrust Limits: Combination coil spring and elastomeric insert with spring and insert in compression and with a load stop. Include rod and angle-iron brackets for attaching to equipment.

1. Frame: Steel, fabricated for connection to threaded rods and to allow for a maximum of 30 degrees of angular rod misalignment without binding or reducing isolation efficiency.
2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of the rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
6. Elastomeric Element: Molded, oil-resistant rubber or neoprene.
7. Coil Spring: Factory set and field adjustable for a maximum of 1/4-inch movement at start and stop.
8. Based on Mason WBI (or) WBD.

K. Pipe Riser Resilient Support: All-directional, acoustical pipe anchor consisting of 2 steel tubes separated by a minimum of 1/2-inch- thick, 60-durometer neoprene. Include steel and neoprene vertical-limit stops arranged to prevent vertical travel in both directions. Design support for a maximum load on the isolation material of 500 psig and for equal resistance in all directions.

1. Based on Mason ADA (or) ADAH.

L. Resilient Pipe Guides: Telescopic arrangement of 2 steel tubes separated by a minimum of 1/2inch- thick, 60-durometer neoprene. Factory set guide height with a shear pin to allow vertical motion due to pipe expansion and contraction. Shear pin shall be removable and reinsertable to allow for selection of pipe movement. Guides shall be capable of motion to meet location requirements.

1. Based on Mason VSG (or) VSGH.

2.4 SEISMIC-RESTRAINT DEVICES

A. Resilient Isolation Washers and Bushings: 1-piece, molded, bridge-bearing neoprene complying with AASHTO M 251 and having a durometer of 60, plus or minus 5, with a flat washer face.

1. Based on Mason HG.

B. Seismic Snubbers: All directional and factory fabricated using welded structural-steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.

1. Anchor bolts for attaching to concrete shall be seismic-rated, drill-in, and stud-wedge or female-wedge type.
2. Resilient Isolation Washers and Bushings: 1-piece, molded, bridge-bearing neoprene complying with AASHTO M 251 and having a durometer of 60, plus or minus 5.
3. Snubbers, and snubber quantities, shall be selected based upon calculation of forces/loads.

4. Based on Mason Z-1225, or Z-1011.

C. Restraining Cables: Galvanized steel aircraft cables with end connections made of steel assemblies that swivel to final installation angle and utilize two clamping bolts for cable engagement.

1. Based on Mason SCB/SCBH.

D. Anchor Bolts: Seismic-rated, drill-in, and stud-wedge or female-wedge type. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488/E 488M.

2.5 VIBRATION ISOLATION EQUIPMENT BASES.

A. Steel Base: Factory-fabricated, welded, structural-steel bases and rails.

1. Design Requirements: Lowest possible mounting height with not less than 1-inch clearance above the floor. Include equipment anchor bolts and auxiliary motor slide bases or rails. Include supports for suction and discharge elbows for pumps.
2. Structural Steel: Steel shapes, plates, and bars complying with ASTM A 36/A 36M. Bases shall have shape to accommodate supported equipment. Beam deflection shall not exceed 0.10 inches over entire length.
3. Support Brackets: Factory-welded steel angles on frame for outrigger isolation mountings and to provide for anchor bolts and equipment support.
4. Motor Mounts: Slide rails.
5. Based on Mason M, or WF.

B. Inertia Base: Factory-fabricated, welded, structural-steel bases and rails ready for field-applied, cast-in-place concrete.

1. Design Requirements: Lowest possible mounting height with not less than 1-inch clearance above the floor. Include equipment anchor bolts and auxiliary motor slide bases or rails. Include supports for suction and discharge elbows for pumps.
2. Structural Steel: Steel shapes, plates, and bars complying with ASTM A 36/A 36M. Bases shall have shape to accommodate supported equipment.

3. Support Brackets: Factory-welded steel angles on frame for outrigger isolation mountings and to provide for anchor bolts and equipment support.
4. Fabrication: Fabricate steel templates to hold equipment anchor-bolt sleeves and anchors in place during placement of concrete. Obtain anchor-bolt templates from supported equipment manufacturer.
5. Motor Mounts: Slide rails.
6. Based on Mason BMK, or KSL.

2.6 FACTORY FINISHES

A. Manufacturer's standard prime-coat finish ready for field painting.

B. Finish: Manufacturer's standard paint applied to factory-assembled and -tested equipment before shipping.

1. Powder coating on springs and housings.
2. All hardware shall be electrogalvanized. Exception: Hot-dip galvanized metal components for exterior use or within tunnels, trenches or mechanical rooms containing high temperature water or steam systems.
3. Nuts, bolts, and washers for outdoor use or wet applications shall be stainless steel.
4. Baked enamel for metal components on isolators for interior use.
5. Color-code or otherwise mark vibration isolation and seismic-control devices to indicate capacity range.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements, installation tolerances, and other conditions affecting performance.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install roof curbs, equipment supports, and roof penetrations as specified in Division 07 Section "Roof Accessories."

B. Install thrust limits at centerline of thrust, symmetrical on either side of equipment.

C. Install seismic snubbers on isolated equipment. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure. Seismic snubbers shall be as follows:

1. Equipment weighing less than 2400 pounds – Snubber shall be based on Mason Z-1225.
2. Equipment weighing greater than 2400 pounds – Snubber shall be based on Mason Z1011.
3. Snubbers, and snubber quantities, shall be selected based upon calculation of forces/loads.

D. Install restrains per detail provided by Seismic Engineer if no detail is provided, install restraining cables at each trapeze and individual pipe hanger. At trapeze anchor locations, shackle piping to trapeze. Install cables so they do not bend across sharp edges of adjacent equipment or building structure.

E. Install per seismic manufacturer, sized to prevent buckling, clamped with ductile-iron clamps to hanger rods for trapeze and individual pipe hangers. At trapeze anchor locations, shackle piping to trapeze as indicated on the detailed drawings. Requirements apply equally to hanging equipment. Do not weld angles to rods.

F. Install resilient bolt isolation washers on equipment anchor bolts.

G. Seismic restraint systems shall be installed in strict accordance with the manufacturer's seismic restraint guidelines manual and all certified submittal data. H. Branch lines may not be used to restrain main lines.

I. Piping crossing building seismic or expansion joints, passing from building to building, or supported from different portions of the building shall be installed to allow differential support displacements without damaging the pipe, equipment connections, or support connections. Pipe offsets, loops, anchors, and guides shall be installed as required to provide specified motion capability and limit motion of adjacent piping.

J. Do not brace a system to two independent structures such as ceiling and wall.

K. Provide appropriately sized openings in walls, floors, and ceilings for anticipated seismic movement. Provide fire seal systems in fire-rated walls.

L. Installation of seismic restraints shall not cause any change in position of equipment or piping, resulting in stresses or misalignment.

M. No rigid connections between equipment and the building structure shall be made that degrade the noise and vibration-isolation system specified.

N. Additional Seismic devices, mounts, and equipment bases shall be installed, type of device shall be selected by licensed structural engineer, or licensed acoustical engineer as required to meet project requirements.

O. Ductwork shall be installed with vibration isolation devices required to meet sound criteria.

P. Provide seismic joints in piping and ductwork crossing building seismic joints.

3.3 ACOUSTICAL SLEEVES

A. For interior pipe penetrations through STC 50 acoustical walls or above, provide acoustical caulking. Max ½" annular space.

B. Where piping or ductwork passes through Exterior walls or floors provide a split acoustical seal with minimum ¾ inch closed cell neoprene sponge bonded to the inner faces.

C. Once the pipe or duct is inserted through the seal, the seal shall be tightened to eliminate clearance between the inner sponge face and the penetrating element. Link Seal above or below grade

D. Concrete shall be packed around the seal to make it integral with the floor, wall or ceiling if such sleeve is not already in place around the pipe prior to the construction of the building member.

E. Where temperatures exceed 240ºF., 10 lb. density fiberglass shall be used in lieu of the sponge.

F. Coordinate entire installation with requirements of insulation and fire-stopping methods.

G. Seal shall be Mason Type SWS, Mason Type SPS, or equal.

3.4 PIPING ISOLATION:

A. Pipe support isolation shall comply with the following general guidelines:

1. Specified Extent of Isolation: Piping, 2 inches in diameter or greater, which is connected to vibration isolated equipment shall be isolated from the building structure (defined as any rigid building elements, such as normal structure; walls, whether load-bearing or not; and any other rigid components attached to the structure) using resilient supports, pipe guides, and penetration sleeves (as applicable) for a distance of 25 feet.
2. Spring isolators shall be selected for a static deflection, under load, of not less than 1 inch (25 mm). Type FSN or HS isolators (whichever is applicable to the mounting condition) shall be used.
3. Where lateral support of pipe risers is required within the specified limits of isolation, this shall be accomplished by use of Type FSN, or resilient lateral supports with the specified minimum static deflection.
4. Pipes that penetrate the building structure within the specified extent of isolation shall be isolated from the structure by use of resilient penetration sleeves and seals.
5. Drain piping connected to vibration-isolated equipment shall not rigidly contact the building structure or other non-isolated system.
6. Piping connected to vibration-isolated equipment shall be installed so that it does not strain or force out of alignment pipe flexes or vibration isolators supporting either the equipment or the piping.
7. Where pipes are racked together, the most stringent isolation requirement, as defined in this Section shall take precedence.
8. Passive Mechanical Equipment: Passive mechanical equipment refers to equipment without motors such as cooling coils, heat exchangers, etc. For passive mechanical equipment connected to vibration-isolated mechanical equipment by piping of length less than 25 feet):

a. Provide vibration isolation flexible pipe connections at passive equipment.

b. Support pipe connections between mechanical and passive equipment on hanger with the same type and deflection as the mechanical equipment support.

9. Unless otherwise required in this Section, gas, gravity drain, and fire protection piping are exempt from vibration isolation requirements.

3.5 SHEET METAL DUCT ISOLATION:

A. The following general guidelines shall be followed:

1. Specified Extent of Isolation: Intake ducts and discharge ducts from all fans or fan units (isolated or not) greater than 10 HP (7.5 KW) shall be isolated from the building structure (defined as any rigid building elements, such as normal structure; walls, whether load-bearing or not; and any other rigid components attached to the structure) using resilient supports, guides, and penetration sleeves (as applicable) for a distance of 25 feet.

2. Ductwork isolation requirements are based on duct equivalent diameters. For rectangular ductwork, the equivalent diameter is the diameter of duct having the same cross-sectional area.

3. Spring isolators shall be selected for a static deflection, under load, of not less than 1 inch (25 mm). Type FSN or HS isolators (whichever is applicable to the mounting condition) shall be used.

4. Type FSN spring supports or resilient lateral guides of the specified minimum static deflection shall be used whenever lateral support of vertical duct runs is required within the limits for isolation specified above.

5. Ductwork that penetrates the building structure within the limits of isolation specified below shall be isolated from the structure by use of resilient penetration sleeves and seals.

3.6 EQUIPMENT ISOLATION

A. Install duct, piping and electrical flexible connections to externally vibration-isolated equipment.

B. Flexible duct connections shall result in a loose and resilient connection and maintain a minimum clearance of 4” between the two sides that they connect.

C. Flexible connectors shall be used to connect all piping to isolated equipment, except equipment for which flexible connectors are not permitted by code.

D. Flexible pipe equipment connectors for all isolated equipment shall be as follows:

1. Spherical rubber expansion joints.
2. Flexible hose joints.
3. Double-ply stainless steel bellows without braided jackets.
4. Stainless steel corrugated hose, stainless steel sheath, with metal connectors with minimum specified live lengths. Hose type flexible connectors shall have minimum live lengths as specified in the 1999 ASHRAE Handbook, Table 46 (see below).

5. Locate isolation device downstream of shut-off valves.

Nominal Diameter (inches)	Minimum Live Length (inches)
0.75	12
1	12
1.5	12
2	12
2.5	12
3	18
4	18
5	24
6	24
8	24
10	24

E. Equipment Isolators: For equipment larger than 0.5 horsepower, use spring isolation device. For equipment smaller than 0.5 horsepower, use neoprene isolation device.

F. Install flex connections in parallel with motor shaft.

H. Equipment Isolation Schedule:

MARK	Motor Hp	Equipment RPM	VFD	Inertia Base Type	Isolator Type	Hot-Dip galva-nized	Static Deflec-tion (inches)	Comments
AHU	--	--	--	--	--	--	--	External Isolation for en-tire AHU not required
AHU Supply Fans	--	--	Yes	Mason M	Mason SLF	--	2	Internal fan isolation; di-rect drive fans
AHU Return Fans	--	--	Yes	Mason M	Mason SLF	--	2	Internal fan isolation; di-rect drive fans
AHU	--	--	--	Mason WF	Mason WFSLR SLF	--	3	External Isolation for en-tire AHU

MARK	Motor Hp	Equipment RPM	VFD	Inertia Base Type	Isolator Type	Hot-Dip galva-nized	Static Deflec-tion (inches)	Comments
AHU	--	--	--		Mason RSC	Yes	3	External Isolation for en-tire AHU
Pump	--	--	Yes	Mason KSL	Mason SLF	Yes	1	Install on concrete inertia bases
Roof-Mounted Exhaust Fans	--	--	--	Mason KSL	Mason KSLSLF	Yes	2	Centrifugal fan – vent set
Refrigeration Condensing Units	--	--	--	Mason M	Mason SLF	Yes	1	Basement & Loading Dock
Floor-mounted Fan Coils	--	--	--	Mason M	Mason SLF	--	1	
Suspended Fan Coils	--	--	--	--	Mason PC30N	--	1	

3.7 EQUIPMENT BASES

A. Fill concrete inertia bases, after installing base frame, with 3000-psi concrete; trowel to a smooth finish.

1. Cast-in-place concrete materials and placement requirements are specified in Division 03.

B. Concrete Bases: Anchor equipment to concrete base according to supported equipment manufacturer's written instructions for seismic codes at Project site.

1. Install dowel rods to connect concrete base to concrete floor. Install dowel rods on 18inch centers around the full perimeter of the base.
2. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base and anchor into structural concrete floor.
3. Place and secure anchorage devices. Use Setting Drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.
5. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
6. Cast-in-place concrete materials and placement requirements are specified in Division 03.

3.8 FIELD QUALITY CONTROL

A. Testing: Perform the following field quality-control testing:

1. Isolator seismic-restraint clearance.
2. Isolator deflection.
3. Snubber minimum clearances.

3.9 ADJUSTING

A. Adjust isolators after piping systems have been filled and equipment is at operating weight.

B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

C. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop.

D. Adjust active height of spring isolators.

E. Adjust snubbers according to manufacturer's written recommendations.

F. Adjust seismic restraints to permit free movement of equipment within normal mode of operation.

G. Torque anchor bolts according to equipment manufacturer's written recommendations to resist seismic forces.

3.10 CLEANING

A. After completing equipment installation, inspect vibration isolation and seismic-control devices. Remove paint splatters and other spots, dirt, and debris.

END OF SECTION 23 0548

SECTION 23 0553 – IDENTIFICATION FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following mechanical identification materials and their installation:

1. Equipment nameplates.
2. Equipment markers.
3. Equipment signs.
4. Access panel and door markers.
5. Pipe markers.
6. Duct markers.
7. Damper tags.
8. Stencils.
9. Valve tags.
10. Valve schedules/chart.
11. Warning tags.
12. Thermostats referencing terminal boxes.
13. Control devices and instruments

1.2 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples: For color, letter style, and graphic representation required for each identification material and device.

C. Valve Numbering Scheme. Provide hard-copy and electronic spreadsheet of valve schedule covering all valve tags. Coordinate numbering scheme prior to submittal.

D. Valve Plans and Schedules: For each piping system. Furnish extra copies (in addition to mounted copies) in maintenance manuals.

E. Air-Side Equipment Schedule: Provide hard copy and electronic spreadsheet of air-side equipment schedule covering damper, terminal boxes, instrumentation, etc. Coordinate numbering scheme prior to submittal.

F. System Drawings: For each piping system for each air system (exhaust included). Furnish system one-line plan drawings indicating valves, dampers, instruments, control devices, smoke detectors, and equipment addressed in this section. Furnish electronic spread sheets for each system. Coordinate numbering scheme prior to submittal.

G. Equipment Location Plans: For each system. Furnish plans showing equipment, equipment identification numbers/tags, and description.

1.3 QUALITY ASSURANCE

A. ASME Compliance: Comply with ASME A13.1, "Scheme for the Identification of Piping Systems," for letter size, length of color field, colors, and viewing angles of identification devices for piping.

B. NFPA Compliance: Comply with requirements of NFPA-99 for piping and equipment labeling and identification.

1.4 COORDINATION

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with location of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 MATERIALS

A. For fixture descriptions in other Part 2 articles where the subparagraph titles "Products," and "Manufacturers" introduce a list of manufacturers and their products or manufacturers only, the following requirements apply for product selection:

1. Products: Subject to compliance with requirements, provide one of the products specified in other Part 2 articles.
2. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified in other Part 2 articles.
3. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 EQUIPMENT IDENTIFICATION DEVICES

A. Equipment Nameplates: Metal, with data engraved or stamped, for permanent attachment on equipment.

1. Data:

a. Manufacturer, product name, model number, and serial number.
b. Capacity, operating and power characteristics, and essential data.
c. Labels of tested compliances.

2. Location: Accessible and visible.

3. Fasteners: As required to mount on equipment.

B. Equipment Markers: Engraved, color-coded laminated plastic. Include contact-type, permanent epoxy adhesive or rivets.

1. Terminology: Match schedules as closely as possible.
2. Data:
    a. Name and plan number.
    b. Equipment service.
    c. Design capacity.
    d. Other design parameters such as pressure drop, entering and leaving conditions, and speed.
3. Size: 2-1/2 by 4 inches for control devices, dampers, and valves; 4-1/2 by 6 inches for equipment.

C. Equipment Signs: ASTM D 709, Type I, cellulose, paper-base, phenolic-resin-laminate engraving stock; Grade ES-2, white surface, black phenolic core, with black melamine subcore. Fabricate in sizes required for message. Provide holes for mechanical fastening.

1. Data: Instructions for operation of equipment and for safety procedures.
2. Engraving: Manufacturer's standard letter style, of sizes and with terms to match equipment identification.
3. Thickness: 1/8 inch.
4. Provide signs on equipment that is automatically started to comply with CAL-OSHA requirements.
5. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

D. Access Panel and Door Markers: 1/16-inch- thick, engraved laminated plastic, with abbreviated terms and numbers corresponding to identification. Provide 1/8-inch center hole for attachment.

1. Fasteners: Self-tapping, stainless-steel screws or contact-type, permanent adhesive.

2.3 PIPING IDENTIFICATION DEVICES

A. Manufactured Pipe Markers, General: Preprinted, color-coded, with lettering indicating service, and showing direction of flow.

1. Colors: Comply with ASME A13.1, unless otherwise approved.
2. Lettering: Use piping system terms and abbreviations to meet ASME (ANSI) standard A13.1 as a recommended scheme for identification of pipe systems.
3. Pipes with OD, Including Insulation, Less Than 6 Inches: Full-band pipe markers extending 360 degrees around pipe at each location.
4. Pipes with OD, Including Insulation, 6 Inches and Larger: Either full-band or strip-type pipe markers at least three times letter height and of length required for label.
5. Arrows: Integral with piping system service lettering to accommodate both directions; or as separate unit on each pipe marker to indicate direction of flow.

B. Self-Adhesive Pipe Markers: Plastic with pressure-sensitive, permanent-type, self-adhesive back.

C. Plastic Tape: Continuously printed, vinyl tape at least 3 mils thick with pressure-sensitive, permanent-type, self-adhesive back.

1. Width for Markers on Pipes with OD, Including Insulation, Less Than 6 Inches: 3/4 inch minimum.
2. Width for Markers on Pipes with OD, Including Insulation, 6 Inches or Larger: 1-1/2 inches minimum.

2.4 DUCT IDENTIFICATION DEVICES

A. Duct Markers: Engraved, color-coded laminated plastic. Include direction and quantity of airflow and duct service (such as supply, return, and exhaust). Include contact-type, permanent epoxy adhesive. As an option, stencil may be used.

B. Automatic or Motorized Control Damper Tags: Same as valve tags.

2.5 STENCILS

A. Stencils: Prepared with letter sizes according to ASME A13.1 for piping; minimum letter height of 1-1/4 inches for ducts; and minimum letter height of 3/4 inch for access panel and door markers, equipment markers, equipment signs, and similar operational instructions.

1. Stencil Material: Aluminum.
2. Stencil Paint: Use for pipe marking, exterior, gloss, acrylic enamel black. Paint may be in pressurized spray-can form.
3. Identification Paint: Use for contrasting background, exterior, acrylic enamel in colors according to ASME A13.1.

2.6 VALVE TAGS

A. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2inch numbers, with numbering to meet ASME (ANSI) standard A13.1 as a recommended scheme for identification of pipe systems. Provide 5/32-inch hole for fastener.

1. Material: 19 Gage thick brass minimum 2” in diameter.
2. Valve-Tag Fasteners: Stainless steel chain, bronze chain or S-hook.

2.7 VALVE PLANS

A. Valve Plans: For each piping system, on standard-size or 11”x17” bond paper. Provide a plan per floor showing the location, valve number, control device number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.

1. Valve-Plan and Schedule Frames: Glazed display frame for removable mounting on masonry walls for each page of valve plan and schedule. Include mounting screws.
2. Frame: Extruded aluminum.
3. Glazing: ASTM C 1036, Type I, Class 1, Glazing Quality B, 2.5-mm, single-thickness glass.

2.8 WARNING TAGS

A. Warning Tags: Preprinted or partially preprinted, accident-prevention tags; of plasticized card stock with matte finish suitable for writing.

1. Size: 3 by 5-1/4 inches minimum.
2. Fasteners: Brass grommet and wire.
3. Nomenclature: Large-size primary caption such as DANGER, CAUTION, or DO NOT OPERATE.
4. Color: Yellow background with black lettering.

2.9 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Brady Corporation.
2. Seton Identification Products.
3. R&R Identification Co.

PART 3 - EXECUTION

3.1 APPLICATIONS, GENERAL

A. Products specified are for applications referenced in other Division 23 Sections. If more than single-type material, device, or label is specified for listed applications, selection is Installer's option.

3.2 EQUIPMENT IDENTIFICATION

A. Install and permanently fasten equipment nameplates on each major item of mechanical equipment that does not have nameplate or has nameplate that is damaged or located where not easily visible. Locate nameplates where accessible and visible.

B. Install equipment markers with permanent adhesive on or near each major item of mechanical equipment. Data required for markers may be included on signs, and markers may be omitted if both are indicated.

1. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering

for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

2. Data: Distinguish among multiple units, indicate operational requirements, indicate safety and emergency precautions, warn of hazards and improper operations, and identify units.
3. Locate markers where accessible and visible. Include markers for the following general categories of equipment:

    a. Main control and operating valves, including safety devices and hazardous units such as gas outlets.
    b. Meters
    c. Fuel-burning units, including boilers, furnaces, heaters, stills, and absorption units.
    d. Pumps, compressors, chillers, condensers, and similar motor-driven units.
    e. Heat exchangers, coils, evaporators, cooling towers, heat recovery units, and similar equipment.
    f. Fans, blowers, VAVs, venture valves, and mixing boxes.
    g. HVAC custom, central-station and zone-type air handling units.
    h. Tanks and pressure vessels.
    i. Humidifiers, water-treatment systems, and similar equipment.

C. Install access panel markers with screws on equipment access panels.

3.3 PIPING IDENTIFICATION

A. Install manufactured pipe markers indicating service on each piping system. Install with flow indication arrows showing direction of flow.

1. Pipes with OD, Including Insulation, Less Than 6 Inches: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, 1-1/2 inches wide, lapped at least 1-1/2 inches at both ends of pipe marker, and covering full circumference of pipe or self-adhesive vinyl.
2. Pipes with OD, Including Insulation, 6 Inches and Larger: Self-adhesive pipe markers. Use color-coded, self-adhesive plastic tape, at least 1-1/2 inches wide, lapped at least 3 inches at both ends of pipe marker, and covering full circumference of pipe or self-adhesive vinyl.
3. Do not use pipe markers and tapes for bare pipes conveying fluids at temperatures of 125 deg F or higher or self-adhesive vinyl.

B. Locate pipe markers and color bands where piping is exposed in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior non-concealed locations as follows:

1. One per room, visible from floor level.
2. Flow directions shall be indicated on each system.
3. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
4. Near penetrations through walls, floors, ceilings, and non-accessible enclosures.

5. At access doors, manholes, and similar access points that permit view of concealed piping.
6. Near major equipment items and other points of origination and termination.
7. Spaced at maximum intervals of 20 feet along each run. Located on each side of wall penetrations.

C. Stenciled Pipe Label Option: Stenciled labels may be provided instead of manufactured pipe labels, at Installer's option. Install stenciled pipe labels, complying with ASME A13.1, on each piping system.

1. Identification Paint: Use for contrasting background.
2. Stencil Paint: Use for pipe marking.

3.4 DUCT IDENTIFICATION

A. Install duct markers with permanent adhesive or stencil on air ducts in the following color codes:

1. Green: For cold-air supply ducts.
2. Yellow: For hot-air supply ducts.
3. Blue: For exhaust-, outside-, relief-, return-, and mixed-air ducts.
4. ASME A13.1 Colors and Designs: For hazardous material exhaust.
5. Letter Size: Minimum 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

B. Stenciled Duct Label Option: Stenciled labels, showing service and flow direction, may be provided instead of plastic-laminated duct labels, at Installer's option, if lettering larger than 1inch high is needed for proper identification because of distance from normal location of required identification.

C. Locate markers near points where ducts enter into concealed spaces and at maximum intervals of 50 feet (maximum intervals of 25 feet for exhaust ductwork) in each space where ducts are exposed or concealed by removable ceiling system.

D. Duct markers shall include air system type, and air system number.

3.5 VALVE-TAG INSTALLATION

A. Install tags on all valves (all types) and control devices in piping systems, except check valves; valves within factory-fabricated equipment and shutoff valves. List tagged valves in a valve schedule. Install tags on valves such that they will not interfere with the valve operation and maintenance.

B. Valve-Tag Application Schedule:

1. Information:

a. Service.
b. Floor.
c. Valve number.
d. Area served.
e. Normal position.
f. Duty.
g. Type (if not obvious).

2. Valve-Tag Size and Shape:
   a. 2 inches, round.

3.6 VALVE-PLAN INSTALLATION

A. Mount valve plan on wall in accessible location in each major equipment room.

3.7 WARNING-TAG INSTALLATION

A. Write required message on, and attach warning tags to, equipment and other items where required.

3.8 ADJUSTING

A. Relocate mechanical identification materials and devices that have become visually blocked by other work.

3.9 CLEANING

A. Clean faces of mechanical identification devices and glass frames of valve schedules.

END OF SECTION 23 0553

SECTION 23 0593 - TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes TAB to produce design objectives for the following:

1. Air systems.
2. Hydronic piping systems.
3. Steam systems.
4. HVAC equipment quantitative-performance settings.
5. Laboratory fume hood airflow balancing.
6. Exhaust hood airflow balancing.
7. Space pressurization testing and adjusting.
8. Vibration measuring.
9. Sound level measuring.
10. Indoor-air quality measuring.
11. Verifying that automatic control devices are functioning properly.
12. Reporting results of activities and procedures specified in this Section.

B. Related Sections include the following:

1. Division 01 Section “General Commissioning Requirements” and Division 23 Section “Commissioning of HVAC”, for project commissioning requirements.

1.2 DEFINITIONS

A. Adjust: To regulate fluid flow rate and air patterns at the terminal equipment, such as to reduce fan speed or adjust a damper.

B. Balance: To proportion flows within the distribution system, including submains, branches, and terminals, according to indicated quantities.

C. Barrier or Boundary: Construction, either vertical or horizontal, such as walls, floors, and ceilings that are designed and constructed to restrict the movement of airflow, smoke, odors, and other pollutants.

D. Draft: A current of air, when referring to localized effect caused by one or more factors of high air velocity, low ambient temperature, or direction of airflow, whereby more heat is withdrawn from a person's skin than is normally dissipated. E. NC: Noise criteria.

F. Procedure: An approach to and execution of a sequence of work operations to yield repeatable results.

G. RC: Room criteria.

H. Report Forms: Test data sheets for recording test data in logical order.

I. Smoke-Control System: An engineered system that uses fans to produce airflow and pressure differences across barriers to limit smoke movement.

J. Smoke-Control Zone: A space within a building that is enclosed by smoke barriers and is a part of a zoned smoke-control system.

K. Stair Pressurization System: A type of smoke-control system that is intended to positively pressurize stair towers with outdoor air by using fans to keep smoke from contaminating the stair towers during an alarm condition.

L. Static Head: The pressure due to the weight of the fluid above the point of measurement. In a closed system, static head is equal on both sides of the pump.

M. Suction Head: The height of fluid surface above the centerline of the pump on the suction side.

N. System Effect: A phenomenon that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.

O. System Effect Factors: Allowances used to calculate a reduction of the performance ratings of a fan when installed under conditions different from those presented when the fan was performance tested.

P. TAB: Testing, adjusting, and balancing.

Q. Terminal: A point where the controlled medium, such as fluid or energy, enters or leaves the distribution system.

R. Test: A procedure to determine quantitative performance of systems or equipment.

S. Testing, Adjusting, and Balancing (TAB) Firm: The entity responsible for performing and reporting TAB procedures.

1.3 SUBMITTALS

A. Qualification Data: Within 45 days from Contractor's Notice to Proceed, submit 8 copies of evidence that TAB firm and this Project's TAB team members meet the qualifications specified in "Quality Assurance" Article.

B. Contract Documents Examination Report: Submit 8 copies of the 100% Construction Documents review report as specified in Part 3.

C. Strategies and Procedures Plan: Within 90 days from Contractor's Notice to Proceed, submit 8 copies of TAB strategies and step-by-step procedures as specified in Part 3 "Preparation" Article. Include a complete set of report forms intended for use on this Project.

D. Certified TAB Reports: Submit four copies of the preliminary reports prepared, as specified in this Section, on approved forms certified by TAB firm. Submit eight copies of the final report.

E. Warranties specified in this Section.

1.4 QUALITY ASSURANCE

A. TAB Firm Qualifications: Engage a TAB firm certified by either AABC or NEBB. Submit proof of a minimum of five years of experience in work similar to that required by the Project.

B. TAB Conference: Meet with University's Representative on approval of TAB strategies and procedures plan to develop a mutual understanding of the details. Ensure the participation of TAB team members, equipment manufacturers' authorized service representatives, HVAC controls installers, and other support personnel. Provide seven days' advance notice of scheduled meeting time and location.

1. Agenda Items: Include at least the following:

a. Submittal distribution requirements.
b. The Construction Documents examination report.
c. TAB plan.
d. Work schedule and Project-site access requirements.
e. Coordination and cooperation of trades and subcontractors.
f. Coordination of documentation and communication flow.

C. Certification of TAB Reports: Certify TAB field data reports. This certification includes the following:

1. Review field data reports to validate accuracy of data and to prepare certified TAB reports.
2. Certify that TAB team complied with approved TAB plan and the procedures specified and referenced in this Specification.

D. TAB Report Forms: Use standard forms from AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems." or NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems."

E. Instrumentation Type, Quantity, and Accuracy: As described in AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems and NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems," Section II, "Required Instrumentation for NEBB Certification."

F. Instrumentation Calibration: Calibrate instruments at least every six months or more frequently if required by instrument manufacturer. Keep an updated record of instrument calibration that indicates date of calibration and the name of party performing instrument calibration.

1.5 PROJECT CONDITIONS

A. Partial University Occupancy: The University may occupy completed areas of building before Substantial Completion. Cooperate with the University during TAB operations to minimize conflicts with University's operations.

1.6 COORDINATION

A. Coordinate the efforts of factory-authorized service representatives for systems and equipment, HVAC controls installers, and other mechanics to operate HVAC systems and equipment to support and assist TAB activities.

B. Notice: Provide seven days' advance notice for each test. Include scheduled test dates and times.

C. Perform TAB after leakage and pressure tests on air and water distribution systems have been satisfactorily completed.

1.7 WARRANTY

A. National Project Performance Guarantee: Provide a guarantee on AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems" forms stating that AABC will assist in completing requirements of the Contract Documents if TAB firm fails to comply with the Contract Documents. Guarantee includes the following provisions:

1. The certified TAB firm has tested and balanced systems according to the Contract Documents.
2. Systems are balanced to optimum performance capabilities within design and installation limits.

B. Special Guarantee: Provide a guarantee on NEBB forms stating that NEBB will assist in completing requirements of the Contract Documents if TAB firm fails to comply with the Contract Documents. Guarantee shall include the following provisions:

1. The certified TAB firm has tested and balanced systems according to the Contract Documents.
2. Systems are balanced to optimum performance capabilities within design and installation limits.

PART 2 - PRODUCTS (Not Applicable)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine the Construction Documents to become familiar with Project requirements and to discover conditions in systems' designs that may preclude proper TAB of systems and equipment.

1. Construction Documents are defined in the General and Supplementary Conditions of Contract.
2. Verify provision of balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers. Verify

that quantities and locations of these balancing devices are accessible and appropriate for effective balancing and for efficient system and equipment operation. B. Examine approved submittal data of HVAC systems and equipment.

C. Examine Project Record Documents described in Division 01 Section "Project Record Documents."

D. Examine design data, including HVAC system descriptions, statements of design assumptions for environmental conditions and systems' output, and statements of philosophies and assumptions about HVAC system and equipment controls.

E. Examine equipment performance data including fan and pump curves. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system. Calculate system effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from those presented when the equipment was performance tested at the factory. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," Sections 7 through 10; or in SMACNA's "HVAC Systems--Duct Design," Sections 5 and 6. Compare this data with the design data and installed conditions.

F. Examine system and equipment installations to verify that they are complete and that testing, cleaning, adjusting, and commissioning specified in individual Sections have been performed.

G. Examine system and equipment test reports.

H. Examine HVAC system and equipment installations to verify that indicated balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers, are properly installed, and that their locations are accessible and appropriate for effective balancing and for efficient system and equipment operation.

I. Examine systems for functional deficiencies that cannot be corrected by adjusting and balancing.

J. Examine HVAC equipment to ensure that clean filters have been installed, bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.

K. Examine terminal units, such as variable-air-volume boxes, to verify that they are accessible and their controls are connected and functioning.

L. Examine strainers for clean screens and proper perforations.

M. Examine three-way valves, if any installed, for proper installation for their intended function. of diverting or mixing fluid flows.

N. Examine heat-transfer coils for correct piping connections and for clean and straight fins.

O. Examine system pumps to ensure absence of entrained air in the suction piping.

P. Examine equipment for installation and for properly operating safety interlocks and controls.

Q. Examine automatic temperature system components to verify the following:

1. Dampers, valves, and other controlled devices are operated by the intended controller.
2. Dampers and valves are in the position indicated by the controller.
3. Integrity of valves and dampers for free and full operation and for tightness of fully closed and fully open positions. This includes dampers in mixing boxes, and variableair-volume terminals.
4. Automatic modulating and shutoff valves, including two-way valves and three-way mixing and diverting valves, are properly connected.
5. Thermostats and humidistats are located to avoid adverse effects of sunlight, drafts, and cold walls.
6. Sensors are located to sense only the intended conditions.
7. Sequence of operation for control modes.
8. Controller set points are set at indicated values.
9. Interlocked systems are operating.
10. Changeover from heating to cooling mode occurs according to indicated values.

R. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

3.2 PREPARATION

A. Prepare a TAB plan that includes strategies and step-by-step procedures.

B. Complete system readiness checks and prepare system readiness reports. Verify the following:

1. Permanent electrical power wiring is complete.
2. Hydronic systems are filled, clean, and free of air.
3. Automatic temperature-control systems are operational.
4. Equipment and duct access doors are securely closed.
5. Balance, smoke, and fire dampers are open.
6. Isolating and balancing valves are open and control valves are operational.
7. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.
8. Windows and doors can be closed so indicated conditions for system operations can be met.

3.3 GENERAL PROCEDURES FOR TESTING AND BALANCING

A. Perform testing and balancing procedures on each system according to the procedures contained in AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems" or NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems" and this Section.

B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. After testing and balancing, close probe holes and patch insulation with new materials identical to those removed. Restore vapor barrier and finish according to insulation Specifications for this Project.

C. Mark equipment and balancing device settings with paint or other suitable, permanent identification material, including damper-control positions, valve position indicators, fan-speed control levers, and similar controls and devices, to show final settings.

D. Take and report testing and balancing measurements in inch-pound (IP) units.

3.4 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS

A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.

B. Prepare schematic diagrams of systems' "as-built" duct layouts.

C. For variable-air-volume systems, develop a plan to simulate diversity.

D. Determine the best locations in main and branch ducts for accurate duct airflow measurements.

E. Check airflow patterns from the outside-air louvers and dampers and the return- and exhaust-air dampers, through the supply-fan discharge and mixing dampers.

F. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.

G. Verify that motor starters are equipped with properly sized thermal protection.

H. Check dampers for proper position to achieve desired airflow path.

I. Check for airflow blockages.

J. Check condensate drains for proper connections and functioning.

K. Check for proper sealing of air-handling unit components.

L. Check for proper sealing of air duct system.

3.5 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.

1. Measure fan static pressures to determine actual static pressure as follows:

a. Measure outlet static pressure as far downstream from the fan as practicable and upstream from restrictions in ducts such as elbows and transitions.
b. Measure static pressure directly at the fan outlet or through the flexible connection.
c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from flexible connection and downstream from duct restrictions.

d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.

2. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and air-treating equipment. Simulate dirty filter operation and record the point at which maintenance personnel must change filters.
3. Measure static pressures entering and leaving other devices such as sound traps, heat recovery equipment, and air washers, under final balanced conditions.
4. Compare design data with installed conditions to determine variations in design static pressures versus actual static pressures. Compare actual system effect factors with calculated system effect factors to identify where variations occur. Recommend corrective action to align design and actual conditions.
5. Obtain approval from University's Representative before any adjustment of fan speed higher or lower than indicated speed. If a higher speed is needed, evaluate the system effects to determine and eliminate the cause of the increased resistance. System effect is a phenomenon that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system. Increasing the fan speed shall not be the solution. If the University approves, make required adjustments to pulley sizes, motor sizes, and electrical connections to accommodate fan-speed changes.
   Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full cooling, full heating, economizer, and any other operating modes to determine the maximum required brake horsepower.

B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.

1. Measure static pressure at a point downstream from the balancing damper and adjust volume dampers until the proper static pressure is achieved.

   a. Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.

2. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.

C. Measure terminal outlets and inlets without making adjustments.

1. Measure terminal outlets using a direct-reading hood or outlet manufacturer's written instructions and calculating factors.

D. Adjust terminal outlets and inlets for each space to indicated airflows within specified tolerances of indicated values. Make adjustments using volume dampers rather than extractors and the dampers at air terminals.

1. Adjust each outlet in same room or space to within specified tolerances of indicated quantities without generating noise levels above the limitations prescribed by the Contract Documents.
2. Adjust patterns of adjustable outlets for proper distribution without drafts.

3.6 PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

A. Compensating for Diversity: When the total airflow of all terminal units is more than the indicated airflow of the fan, place a selected number of terminal units at a maximum set-point airflow condition until the total airflow of the terminal units equals the indicated airflow of the fan. Select the reduced airflow terminal units so they are distributed evenly among the branch ducts.

B. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Set outside-air dampers at minimum, and return- and exhaust-air dampers at a position that simulates full-cooling load.
2. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.
3. Measure total system airflow. Adjust to within indicated airflow.
4. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use terminal-unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units as described for constant-volume air systems.
5. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow as described for constant-volume air systems.

    a. If air outlets are out of balance at minimum airflow, report the condition but leave outlets balanced for maximum airflow.

6. Remeasure the return airflow to the fan while operating at maximum return airflow and minimum outside airflow. Adjust the fan and balance the return-air ducts and inlets as described for constant-volume air systems.
7. Measure static pressure at the most critical terminal unit and adjust the static-pressure controller at the main supply-air sensing station to ensure that adequate static pressure is maintained at the most critical unit.
8. Record the final fan performance data.

C. Pressure-Dependent, Variable-Air-Volume Systems without Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Balance systems similar to constant-volume air systems.
2. Set terminal units and supply fan at full-airflow condition.

3. Adjust inlet dampers of each terminal unit to indicated airflow and verify operation of the static-pressure controller. When total airflow is correct, balance the air outlets downstream from terminal units as described for constant-volume air systems.
4. Readjust fan airflow for final maximum readings.
5. Measure operating static pressure at the sensor that controls the supply fan, if one is installed, and verify operation of the static-pressure controller.

6. Set supply fan at minimum airflow if minimum airflow is indicated. Measure static pressure to verify that it is being maintained by the controller.
7. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow as described for constant-volume air systems.

    a. If air outlets are out of balance at minimum airflow, report the condition but leave the outlets balanced for maximum airflow.

8. Measure the return airflow to the fan while operating at maximum return airflow and minimum outside airflow. Adjust the fan and balance the return-air ducts and inlets as described for constant-volume air systems.

D. Pressure-Dependent, Variable-Air-Volume Systems with Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Set system at maximum indicated airflow by setting the required number of terminal units at minimum airflow. Select the reduced airflow terminal units so they are distributed evenly among the branch ducts.
2. Adjust supply fan to maximum indicated airflow with the variable-airflow controller set at maximum airflow.
3. Set terminal units at full-airflow condition.
4. Adjust terminal units starting at the supply-fan end of the system and continuing progressively to the end of the system. Adjust inlet dampers of each terminal unit to indicated airflow. When total airflow is correct, balance the air outlets downstream from terminal units as described for constant-volume air systems.
5. Adjust terminal units for minimum airflow.

6. Measure static pressure at the sensor.
7. Measure the return airflow to the fan while operating at maximum return airflow and minimum outside airflow. Adjust the fan and balance the return-air ducts and inlets as described for constant-volume air systems.

3.7 GENERAL PROCEDURES FOR HYDRONIC SYSTEMS

A. Prepare test reports with pertinent design data and number in sequence starting at pump to end of system. Check the sum of branch-circuit flows against approved pump flow rate.

B. Prepare schematic diagrams of systems' "as-built" piping layouts.

C. Prepare hydronic systems for testing and balancing according to the following, in addition to the general preparation procedures specified above:

1. Open all manual valves for maximum flow.
2. Check expansion tank liquid level.
3. Check makeup-water-station pressure gage for adequate pressure for highest vent.
4. Check flow-control valves for specified sequence of operation and set at indicated flow.
5. Set differential-pressure control valves at the specified differential pressure. Do not set at fully closed position when pump is positive-displacement type unless several terminal valves are kept open.
6. Set system controls so automatic valves are wide open to heat exchangers.
7. Check pump-motor load. If motor is overloaded, throttle main flow-balancing device so motor nameplate rating is not exceeded.
8. Check air vents for a forceful liquid flow exiting from vents when manually operated.

D. Balance or measurements of the high temperature water system is not required.

3.8 PROCEDURES FOR HYDRONIC SYSTEMS

A. Measure pressure at pumps. Use the following procedures, except for positive-displacement pumps:

1. Verify impeller size by operating the pump with the discharge valve closed. Read pressure differential across the pump. Convert pressure to head and correct for differences in gage heights. Note the point on manufacturer's pump curve at zero flow and verify that the pump has the intended impeller size.
2. Check system resistance. With all valves open, read pressure differential across the pump and mark pump manufacturer's head-capacity curve.
3. Verify pump-motor brake horsepower. Calculate the intended brake horsepower for the system based on pump manufacturer's performance data. Compare calculated brake horsepower with nameplate data on the pump motor. Report conditions where actual amperage exceeds motor nameplate amperage.

B. Water balance systems at the University of California, Riverside campus is not necessary since the campus standard is to use Griswold Control Company’s automatic flow control valves with a variable flow pumping system and 2 way control valves.

C. Griswold Controls or equal automatic flow control valves are actuallyflow limiting devices, not automatic balancing valves. If the psid reading across the valve is between operating control range (i.e. 2-32 psid) than we are getting the correct flow. Include one psi to account for system aging and a safety factor. For a 2-32 psi valve a 3-psid is required, for 1-20 psi control range provide 2 psid, etc. Griswold has seven ranges available. The last number of the valve model denotes the lower limit of the control range. (e.g. model # 3522 means the valve should operate within a 2-32 PSID range.)

D. For air handling units with multiple coils, manual balancing valves shall be balanced. Adjust to provide design quantities. Use calibrated fitting and pressure gages to determine flow rates. Balance with automatic control valve fully open.

3.9 PROCEDURES FOR VARIABLE-FLOW HYDRONIC SYSTEMS

A. The following procedure shall be used for a heating water system with a variable speed pump.

1. Verify that the manual shut-off valves are fully open.
2. Verify that the piping system is clear and that the strainers are clean.
3. Verify that each coil has a Griswold or equal automatic flow valve installed and the flow arrow is pointed in the correct direction. Each valve shall have two factory tags connected to it. One tag shall be permanently affixed to the valve body and the other shall be hung from the pressure taps so that it is visible outside the insulation. The tag shall have the name of the air handler or system served printed on it (e.g. BRENAH01, NSVAV037, HOBAH01C, etc.) Record each valve's tag information in the TAB report.
4. Override the controls to open the heating control valves to full flow. Griswold automatic flow control valves will limit flow to each coil to the maximum required coil rate (gpm). Valves are accurate to within ±5% over 95% of the pressure differential (PSID) control range.
5. Test is to determine the minimum differential pressure set point for the variable frequency drive (VFD). Turn the heating pump on and ramp it up to the speed needed to maintain the differential pressure 1 psi above the minimum control range at the Griswold valve with the highest-pressure drop requirement, normally the longest run. The differential it to be measured at the factory supplied taps on each valve. Griswold Controls market a variety of instruments for the purpose. In any case, the gages used shall be recently calibrated and accurate to + or – 0.1% of full scale. Select a gage that has a range appropriate for the system pressure. Recognize that the differentials measured are low and that a small error is actual reading can still add up to a large differential error. A direct reading differential gage calibrated in inches of water may be used.
6. Check the remaining Griswold valves to verify that they are within their control pressure range.
7. Record the differential pressure at the differential pressure transmitter that will be used as the input for the pump speed control. Verify that the transmitter is reading the same differential and that the VFD controlling the pump is receiving the correct signal either directly or from the Building Automation System. The pressure reading shall become the VFD set point and recorded in the TAB report.

B. Record final measurements for hydronic equipment performance data sheets. Include entering and leaving water temperatures for heating and cooling coils, and for converters. Include entering and leaving dry bulb air temperatures (and wet bulb for cooling coils) for air handling units and reheat coils. Make air and water temperature measurements at the same time.

3.10

3.11 PROCEDURES FOR STEAM SYSTEMS

A. Measure and record upstream and downstream pressure of each piece of equipment.

B. Measure and record upstream and downstream steam pressure of pressure-reducing valves.

C. Check the setting and operation of automatic temperature-control valves, self-contained control valves, and pressure-reducing valves. Record the final setting.

D. Check the settings and operation of each safety valve. Record settings.

E. Verify the operation of each steam trap.

3.12 PROCEDURES FOR MOTORS

A. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:

1. Manufacturer, model, and serial numbers.
2. Motor horsepower rating.
3. Motor rpm.
4. Efficiency rating.
5. Nameplate and measured voltage, each phase.
6. Nameplate and measured amperage, each phase.
7. Starter thermal-protection-element rating.

B. Motors Driven by Variable-Frequency Controllers: Test for proper operation at speeds varying from minimum to maximum. Test the manual bypass for the controller to prove proper operation. Record observations, including controller manufacturer, model and serial numbers, and nameplate data. 1.

3.14 PROCEDURES FOR BOILERS

A. If hydronic, measure entering- and leaving-water temperatures and water flow.

B. If steam, measure entering-water temperature and flow and leaving steam pressure, temperature, and flow.

3.15 PROCEDURES FOR HEAT-TRANSFER COILS

A. Water Coils: Measure the following data for each coil:

1. Entering- and leaving-water temperature.
2. Water flow rate.
3. Water pressure drop.
4. Dry-bulb temperature of entering and leaving air.

5. Wet-bulb temperature of entering and leaving air for cooling coils.
6. Airflow.
7. Air pressure drop.

B. Steam Coils: Measure the following data for each coil:

1. Dry-bulb temperature of entering and leaving air.
2. Airflow.
3. Air pressure drop.
4. Inlet steam pressure.

3.16 PROCEDURES FOR TEMPERATURE MEASUREMENTS

A. During TAB, report the need for adjustment in temperature regulation within the automatic temperature-control system.

B. Measure indoor wet- and dry-bulb temperatures every other hour for a period of two successive eight-hour days, in each separately controlled zone, to prove correctness of final temperature settings. Measure when the building or zone is occupied.

C. Measure outside-air, wet- and dry-bulb temperatures.

3.17 PROCEDURES FOR LABORATORY FUME HOODS

A. Before performing laboratory fume hood testing, measure, adjust and record the supply airflow and airflow patterns of each supply air outlet that is located in the same room as the hood. Adjust the air outlet flow pattern to minimize turbulence and to achieve the desired airflow patterns at the face and inside the hood. Verify that adequate makeup air is available to achieve the indicated flow of the hood.

B. Fume Hood General Balancing Requirements:

1. Fume hoods shall be balanced with an inward flow, to a minimum of 100 feet per minute (fpm) face velocity across the opening, with a minimum of 70 fpm at any point.

2. Fume hoods equipped with automatic controls and occupancy sensors, shall be balanced for the controls system “unoccupied mode” (no employee working in the vicinity of the fume hood opening) to 60 fpm when all of the conditions of California Title 8 General Industrial Safety Order are met.

C. Measure, adjust, and record the airflow of each laboratory fume hood by duct Pitot-tube traverse with the laboratory fume hood sash in the design open position.

1. For laboratory fume hoods installed in variable exhaust systems, measure, adjust, and record the hood exhaust airflow at maximum and at minimum airflow conditions.
2. For laboratory fume hoods designed with integral makeup air, measure, adjust, and record the exhaust and makeup airflow.

D. For laboratory fume hoods that are connected to centralized exhaust systems using automatic dampers, adjust the damper controller to obtain the indicated exhaust airflow.

E. After balancing is complete, do the following:

1. Measure and record the static pressure at the hood duct connection with the hood operating at indicated airflow.
2. Measure and record the face velocity across the open sash face area. Measure the face velocity at each point in a grid pattern. Perform measurements at a maximum of 12 inches between points and between any point and the perimeter of the opening.

    a. For laboratory fume hoods designed to maintain a constant face velocity at varying sash positions, also measure and record the face velocity at 50 and 25 percent of the design open sash position.
    b. Calculate and report the average face velocity by averaging all velocity measurements.
    c. Calculate and report the exhaust airflow by multiplying the calculated average face velocity by the sash open area. Compare this quantity with the exhaust airflow measured by duct Pitot-tube traverse. Report differences.
    d. If the average face velocity is less than the indicated face velocity, retest the average face velocity and adjust hood baffles, fan drives, and other parts of the system to provide the indicated average face velocity.
3. Check each laboratory fume hood for the capture and containment of smoke by using a hand-held emitting device. Observe the capture and containment of smoke flow pattern across the open face and inside the hood. Make adjustments necessary to achieve the desired results.

F. With the room and laboratory fume hoods operating at indicated conditions, perform an "as installed" performance test of the laboratory fume hood according to ASHRAE 110. Test each laboratory fume hood(s) and document the test results.

3.18 PROCEDURES FOR EXHAUST HOODS

A. Measure, adjust, and record the airflow of each exhaust hood. Measure airflow by duct Pitottube traverse. If a duct Pitot-tube traverse is not possible, explain why, in the report, and explain the test method used.

B. After balancing is complete, do the following:

1. Measure and record the static pressure at the hood exhaust-duct connection.
2. Check the hood for capture and containment of smoke using a smoke emitting device. Observe the smoke pattern. Make adjustments to achieve optimum results.

3.19 PROCEDURES FOR SPACE PRESSURIZATION MEASUREMENTS AND ADJUSTMENTS

A. Before testing for space pressurization, observe the space to verify the integrity of the space boundaries. Verify that windows and doors are closed and applicable safing, gaskets, and sealants are installed. Report deficiencies and postpone testing until after the reported deficiencies are corrected.

B. Measure, adjust, and record the pressurization of each room, each zone, and each building by adjusting the supply, return, and exhaust airflows to achieve the indicated conditions.

C. Measure space pressure differential where pressure is used as the design criteria, and measure airflow differential where differential airflow is used as the design criteria for space pressurization.

1. For pressure measurements, measure and record the pressure difference between the intended spaces at the door with all doors in the space closed. Record the high-pressure side, low-pressure side, and pressure difference between each adjacent space.
2. For applications with cascading levels of space pressurization, begin in the most critical space and work to the least critical space.
3. Test room pressurization first, then zones, and finish with building pressurization.

D. To achieve indicated pressurization, set the supply airflow to the indicated conditions and adjust the exhaust and return airflow to achieve the indicated pressure or airflow difference.

E. For spaces with pressurization being monitored and controlled automatically, observe and adjust the controls to achieve the desired set point.

1. Compare the values of the measurements taken to the measured values of the control system instruments and report findings.
2. Check the repeatability of the controls by successive tests designed to temporarily alter the ability to achieve space pressurization. Test over pressurization and under pressurization, and observe and report on the system's ability to revert to the set point.
3. For spaces served by variable-air-volume supply and exhaust systems, measure space pressurization at indicated airflow and minimum airflow conditions.

F. In spaces that employ multiple modes of operation, such as normal mode and emergency mode or occupied mode and unoccupied mode, measure, adjust, and record data for each operating mode.

G. Record indicated conditions and corresponding initial and final measurements. Report deficiencies.

3.22 PROCEDURES FOR INDOOR-AIR QUALITY MEASUREMENTS

A. After air balancing is complete and with HVAC systems operating at indicated conditions, perform building flush out for a 14 day period.

3.23 TEMPERATURE-CONTROL VERIFICATION

A. Verify that controllers are calibrated and commissioned.

B. Check transmitter and controller locations and note conditions that would adversely affect control functions.

C. Record controller settings and note variances between set points and actual measurements.

D. Check the operation of limiting controllers (i.e., high- and low-temperature controllers).

E. Check free travel and proper operation of control devices such as damper and valve operators.

F. Check the sequence of operation of control devices. Note air pressures and device positions and correlate with airflow and water flow measurements. Note the speed of response to input changes.

G. Check the interaction of electrically operated switch transducers.

H. Check the interaction of interlock and lockout systems.

I. Check main control supply-air pressure and observe compressor and dryer operations.

J. Record voltages of power supply and controller output. Determine whether the system operates on a grounded or non-grounded power supply.

K. Note operation of electric actuators using spring return for proper fail-safe operations.

3.24 TOLERANCES

A. Set HVAC system airflow and water flow rates within the following tolerances:

1. Supply, Return, and Exhaust Fans and Equipment with Fans: 0 to plus 10 percent.
2. Individual room air outlets and inlets, and air flow rates not mentioned above: Minus l0 percent to plus l0 percent. Total room shall be ±10percent.
3. Heating-Water Flow Rate: +/- 5 percent.
4. Heating Hot Water Coils: ±5 percent.
5. Chilled-Water Flow Rate: +/- 5 percent.
6. Minimum Outside Air: 0 to 10 percent.
7. Air Terminal Units (Max): Minus 5 percent to plus l0 percent.
8. Exhaust Hoods/Cabinets: Minus 0 percent to plus l0 percent.
9. Chilled Water Pumps: Minus 0 percent to plus l0 percent.
10. Chilled Water Coils: Minus 5 percent to plus 5 percent.

3.25 REPORTING

A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to

HVAC systems and general construction to allow access for performance measuring and balancing devices.

B. Status Reports: As Work progresses, prepare reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

3.26 FINAL REPORT

A. General: Typewritten, or computer printout in letter-quality font, on standard bond paper, in three-ring binder, tabulated and divided into sections by tested and balanced systems.

B. Include a certification sheet in front of binder signed and sealed by the certified testing and balancing engineer.

C. Include a list of instruments used for procedures, along with proof of calibration.

D. Final Report Contents: In addition to certified field report data, include the following:

1. Pump curves.
2. Fan curves.
3. Manufacturers' test data.
4. Field test reports prepared by system and equipment installers.
5. Other information relative to equipment performance, but do not include Shop Drawings and Product Data.

E. General Report Data: In addition to form titles and entries, include the following data in the final report, as applicable:

1. Title page.
2. Name and address of TAB firm.
3. Project name.
4. Project location.
5. Architect's name and address.
6. Engineer's name and address.
7. Contractor's name and address.
8. Report date.
9. Signature of TAB firm who certifies the report.
10. Table of Contents with the total number of pages defined for each section of the report. Number each page in the report.
11. Summary of contents including the following:

    a. Indicated versus final performance.
    b. Notable characteristics of systems.
    c. Description of system operation sequence if it varies from the Contract Documents.

12. Nomenclature sheets for each item of equipment.

13. Data for terminal units, including manufacturer, type size, and fittings.
14. Notes to explain why certain final data in the body of reports varies from indicated values.
15. Test conditions for fans and pump performance forms including the following:

    a. Settings for outside-, return-, and exhaust-air dampers.
    b. Conditions of filters.
    c. Cooling coil, wet- and dry-bulb conditions.
    d. Face and bypass damper settings at coils.
    e. Fan drive settings including settings and percentage of maximum pitch diameter.
    f. Inlet vane settings for variable-air-volume systems.
    g. Settings for supply-air, static-pressure controller.
    h. Other system operating conditions that affect performance.

F. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present each system with single-line diagram and include the following:

1. Quantities of outside, supply, return, and exhaust airflows.
2. Water and steam flow rates.
3. Duct, outlet, and inlet sizes.
4. Pipe and valve sizes and locations.
5. Terminal units.
6. Balancing stations.
7. Position of balancing devices.

G. Air-Handling Unit Test Reports: For air-handling units with coils, include the following:

1. Unit Data: Include the following:

    a. Unit identification.
    b. Location.
    c. Make and type.
    d. Model number and unit size.
    e. Manufacturer's serial number.
    f. Unit arrangement and class.
    g. Discharge arrangement.
    h. Sheave make, size in inches, and bore.
    i. Sheave dimensions, center-to-center, and amount of adjustments in inches.
    j. Number of belts, make, and size.
    k. Number of filters, type, and size.

2. Motor Data:

    a. Make and frame type and size.
    b. Horsepower and rpm.
    c. Volts, phase, and hertz.
    d. Full-load amperage and service factor.
    e. Sheave make, size in inches, and bore.

f. Sheave dimensions, center-to-center, and amount of adjustments in inches.

3. Test Data (Indicated and Actual Values):

a. Total airflow rate in cfm.
b. Total system static pressure in inches wg.
c. Fan rpm.
d. Discharge static pressure in inches wg.
e. Filter static-pressure differential in inches wg.
f. Sound attenuator static-pressure differential in inches wg.
g. Preheat coil static-pressure differential in inches wg.
h. Cooling coil static-pressure differential in inches wg.
i. Heating coil static-pressure differential in inches wg.
j. Outside airflow in cfm.
k. Return airflow in cfm.
l. Outside-air damper position.
m. Return-air damper position.
n. Damper position(s). H. Apparatus-Coil Test Reports:

1. Coil Data:

a. System identification.
b. Location.
c. Coil type.
d. Number of rows.
e. Fin spacing in fins per inch o.c.
f. Make and model number.
g. Face area in sq. ft.
h. Tube size in NPS.
i. Tube and fin materials.
j. Circuiting arrangement.

2. Test Data (Indicated and Actual Values):

a. Airflow rate in cfm.
b. Average face velocity in fpm.
c. Air pressure drop in inches wg.
d. Outside-air, wet- and dry-bulb temperatures in deg F.
e. Return-air, wet- and dry-bulb temperatures in deg F.
f. Entering-air, wet- and dry-bulb temperatures in deg F.
g. Leaving-air, wet- and dry-bulb temperatures in deg F.
h. Water flow rate in gpm.
i. Water pressure differential in feet of head or psig.
j. Entering-water temperature in deg F.
k. Leaving-water temperature in deg F.
l. Refrigerant expansion valve and refrigerant types.
m. Refrigerant suction pressure in psig.

n. Refrigerant suction temperature in deg F.
o. Inlet steam pressure in psig.

I. Gas- Fired Heat Apparatus Test Reports: In addition to manufacturer's factory startup equipment reports, include the following:

1. Unit Data:

a. System identification.
b. Location.
c. Make and type.
d. Model number and unit size.
e. Manufacturer's serial number.
f. Fuel type in input data.
g. Output capacity in Btuh.
h. Ignition type.
i. Burner-control types.
j. Motor horsepower and rpm.
k. Motor volts, phase, and hertz.
l. Motor full-load amperage and service factor.
m. Sheave make, size in inches, and bore.
n. Sheave dimensions, center-to-center, and amount of adjustments in inches.

2. Test Data (Indicated and Actual Values):

a. Total airflow rate in cfm.
b. Entering-air temperature in deg F.
c. Leaving-air temperature in deg F.
d. Air temperature differential in deg F.
e. Entering-air static pressure in inches wg.
f. Leaving-air static pressure in inches wg.
g. Air static-pressure differential in inches wg.
h. Low-fire fuel input in Btuh.
i. High-fire fuel input in Btuh.
j. Manifold pressure in psig.
k. High-temperature-limit setting in deg F.
l. Operating set point in Btuh.
m. Motor voltage at each connection.
n. Motor amperage for each phase.
o. Heating value of fuel in Btuh.

J. Fan Test Reports: For supply, return, and exhaust fans, include the following:

1. Fan Data:

a. System identification.
b. Location.
c. Make and type.

d. Model number and size.
e. Manufacturer's serial number.
f. Arrangement and class.
g. Sheave make, size in inches, and bore.
h. Sheave dimensions, center-to-center, and amount of adjustments in inches.

2. Motor Data:

a. Make and frame type and size.
b. Horsepower and rpm.
c. Volts, phase, and hertz.
d. Full-load amperage and service factor.
e. Sheave make, size in inches, and bore.
f. Sheave dimensions, center-to-center, and amount of adjustments in inches.
g. Number of belts, make, and size.

3. Test Data (Indicated and Actual Values):

a. Total airflow rate in cfm.
b. Total system static pressure in inches wg.
c. Fan rpm.
d. Discharge static pressure in inches wg.
e. Suction static pressure in inches wg.

K. Round, Flat-Oval, and Rectangular Duct Traverse Reports: Include a diagram with a grid representing the duct cross-section and record the following:

1. Report Data:

a. System and air-handling unit number.
b. Location and zone.
c. Traverse air temperature in deg F.
d. Duct static pressure in inches wg.
e. Duct size in inches.
f. Duct area in sq. ft.
g. Indicated airflow rate in cfm.
h. Indicated velocity in fpm.
i. Actual airflow rate in cfm.
j. Actual average velocity in fpm.
k. Barometric pressure in psig.
l. Duct mounted sound attenuator static-pressure differential in inches wg and velocity in fpm.

L. Air-Terminal-Device Reports:

1. Unit Data:

a. System and air-handling unit identification.

b. Location and zone.
c. Test apparatus used.
d. Area served.
e. Air-terminal-device make.
f. Air-terminal-device number from system diagram.
g. Air-terminal-device type and model number.
h. Air-terminal-device size.
i. Air-terminal-device effective area in sq. ft.

2. Test Data (Indicated and Actual Values):

a. Airflow rate in cfm.
b. Air velocity in fpm.
c. Preliminary airflow rate as needed in cfm.
d. Preliminary velocity as needed in fpm.
e. Final airflow rate in cfm.
f. Final velocity in fpm.
g. Space temperature in deg F.

M. System-Coil Reports: For reheat coils and water coils of terminal units, include the following:

1. Unit Data:

a. System and air-handling unit identification.
b. Location and zone.
c. Room or riser served.
d. Coil make and size.
e. Flowmeter type.

2. Test Data (Indicated and Actual Values):

a. Airflow rate in cfm.
b. Entering-water temperature in deg F.
c. Leaving-water temperature in deg F.
d. Water pressure drop in feet of head or psig.
e. Entering-air temperature in deg F.
f. Leaving-air temperature in deg F.

N. Pump Test Reports: Calculate impeller size by plotting the shutoff head on pump curves and include the following:

1. Unit Data:

a. Unit identification.
b. Location.
c. Service.
d. Make and size.

e. Model and serial numbers.
f. Water flow rate in gpm.
g. Water pressure differential in feet of head or psig.
h. Required net positive suction head in feet of head or psig.
i. Pump rpm.
j. Impeller diameter in inches.
k. Motor make and frame size.
l. Motor horsepower and rpm.
m. Voltage at each connection.
n. Amperage for each phase.
o. Full-load amperage and service factor.
p. Seal type.

2. Test Data (Indicated and Actual Values):

a. Static head in feet of head or psig.
b. Pump shutoff pressure in feet of head or psig.
c. Actual impeller size in inches.
d. Full-open flow rate in gpm.
e. Full-open pressure in feet of head or psig.
f. Final discharge pressure in feet of head or psig.
g. Final suction pressure in feet of head or psig.
h. Final total pressure in feet of head or psig.
i. Final water flow rate in gpm.
j. Voltage at each connection.
k. Amperage for each phase.

O. Boiler Test Reports:

1. Unit Data:

a. Unit identification.
b. Location.
c. Service.
d. Make and type.
e. Model and serial numbers.
f. Fuel type and input in Btuh.
g. Number of passes.
h. Ignition type.
i. Burner-control types.
j. Voltage at each connection.
k. Amperage for each phase.

2. Test Data (Indicated and Actual Values):

a. Operating pressure in psig.
b. Operating temperature in deg F.
c. Entering-water temperature in deg F.

d. Leaving-water temperature in deg F.
e. Number of safety valves and sizes in NPS.
f. Safety valve settings in psig.
g. High-limit setting in psig.
h. Operating-control setting.
i. High-fire set point.
j. Low-fire set point.
k. Voltage at each connection.
l. Amperage for each phase.
m. Draft fan voltage at each connection.
n. Draft fan amperage for each phase.
o. Manifold pressure in psig.

S. Vibration Measurement Reports:

1. Date and time of test.
2. Vibration meter manufacturer, model number, and serial number.
3. Equipment designation, location, equipment, speed, motor speed, and motor horsepower.
4. Diagram of equipment showing the vibration measurement locations.
5. Measurement readings for each measurement location.
6. Calculate isolator efficiency using measurements taken.
7. Description of predominant vibration source.

T. Sound Measurement Reports: Record sound measurements on octave band and dBA test forms and on an NC or RC chart indicating the decibel level measured in each frequency band for both "background" and "HVAC system operating" readings. Record each tested location on a separate NC or RC chart. Record the following on the forms:

1. Date and time of test. Record each tested location on its own NC curve.
2. Sound meter manufacturer, model number, and serial number.
3. Space location within the building including floor level and room number.
4. Diagram or color photograph of the space showing the measurement location.
5. Time weighting of measurements, either fast or slow.
6. Description of the measured sound: steady, transient, or tonal.
7. Description of predominant sound source.

U. Indoor-Air Quality Measurement Reports for Each HVAC System:

1. HVAC system designation.
2. Date and time of test.
3. Outdoor temperature, relative humidity, wind speed, and wind direction at start of test.
4. Room number or similar description for each location.
5. Measurements at each location.
6. Observed deficiencies.

V. Instrument Calibration Reports:

1. Report Data:

a. Instrument type and make.
b. Serial number.
c. Application.
d. Dates of use.
e. Dates of calibration.

3.27 INSPECTIONS

A. Initial Inspection:

1. After testing and balancing are complete, operate each system and randomly check measurements to verify that the system is operating according to the final test and balance readings documented in the Final Report.
2. Randomly check the following for each system:

a. Measure airflow of at least 10 percent of air outlets.
b. Measure water flow of at least 5 percent of terminals.
c. Measure room temperature at each thermostat/temperature sensor. Compare the reading to the set point.
d. Measure sound levels at two locations.
e. Measure space pressure of at least 10 percent of locations.
f. Verify that balancing devices are marked with final balance position.
g. Note deviations to the Contract Documents in the Final Report.

B. Final Inspection:

1. After initial inspection is complete and evidence by random checks verifies that testing and balancing are complete and accurately documented in the final report, request that a final inspection be made by University's Representative.
2. TAB firm test and balance engineer shall conduct the inspection in the presence of University's Representative.
3. University Representative shall randomly select measurements documented in the final report to be rechecked. The rechecking shall be limited to either 10 percent of the total measurements recorded, or the extent of measurements that can be accomplished in a normal 8-hour business day.
4. If the rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."
5. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.
6. TAB firm shall recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes and resubmit the final report.
7. Request a second final inspection. If the second final inspection also fails, University shall contract the services of another TAB firm to complete the testing and balancing in accordance with the Contract Documents and deduct the cost of the services from the final payment.

3.28 ADDITIONAL TESTS

A. Within 180 days of completing TAB, if requested by the University's Representative perform additional testing and balancing to verify that balanced conditions are being maintained throughout and to correct unusual conditions.

B. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional testing, inspecting, and adjusting during near-peak summer and winter conditions.

END OF SECTION 23 0593

SECTION 23 0700 - HVAC INSULATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Insulation Materials:

    a. Cellular glass.
    b. Flexible elastomeric.
    c. Mineral fiber.

2. Fire-rated insulation systems.
3. Insulating cements.
4. Adhesives.
5. Mastics.
6. Lagging adhesives.
7. Sealants.
8. Factory-applied jackets.
9. Field-applied fabric-reinforcing mesh.
10. Field-applied cloths.
11. Field-applied jackets.
12. Tapes.
13. Securements.
14. Corner angles.

B. Related Sections:

1. Division 23 Section "Hydronic Distribution."
2. Division 22 Section "Plumbing Insulation."
3. Division 23 Section "Metal Ducts" for duct liners.
4. Division 23 Section "Hydronic Piping and Valves."

1.2 SUBMITTALS

A. Product Data: For each type of product indicated. Include thermal conductivity, thickness, and jackets (both factory and field applied, if any).

LEED Submittal:

1. Product Data for LEED-NC Credit EQ 4.1: For adhesives and sealants, including printed statement of VOC content.

C. Shop Drawings:

1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
2. Detail insulation application at pipe expansion joints for each type of insulation.
3. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
4. Detail removable insulation at piping specialties, equipment connections, and access panels.
5. Detail application of field-applied jackets.
6. Detail application at linkages of control devices.
7. Detail field application for each equipment type.

D. Qualification Data: For qualified Installer.

E. Field quality-control reports if requested by the University's Representative.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

B. Fire-Test-Response Characteristics: Insulation and related materials shall have fire-test response characteristics indicated, as determined by testing identical products per ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing and inspecting agency.

1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

C. Mockups: Before installing insulation, build mockups for each type of insulation and finish listed below to demonstrate quality of insulation application and finishes. Build mockups in the location indicated or, if not indicated, as directed by University's Representative. Use materials indicated for the completed Work.

1. Piping Mockups:

a. One each of a chilled water 90-degree threaded, welded, and flanged elbow.
b. One NPS 2-1/2 or larger valve.
c. One chilled water drain and strainer with removable portion of insulation.
d. One chilled water pressure temperature tap.
e. One chilled water mechanical coupling.

2. Ductwork Mockups:

a. Before installing special or alternate insulation, build mockups for each type of insulation and finish to demonstrate quality of insulation application and finishes. Build mockups using same materials as for the completed Work.

3. Equipment Mockups:

a. One in place chilled-water pump, if applicable to the project.
b. One in place tank or vessel, if applicable to the project.

4. For each mockup, fabricate removable sections to allow observation of application details for insulation materials, adhesives, mastics, attachments, and jackets.
5. Notify University's Representative seven days in advance of dates and times when mockups will be constructed.
6. Obtain University's Representative's approval of mockups before starting insulation application.
7. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless University's Representative specifically approves such deviations in writing.
8. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
9. Demolish and remove mockups when directed.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.5 COORDINATION

A. Coordinate size and location of supports, hangers, and insulation shields specified in Division 23 Section "Hangers and Supports for HVAC."

B. Coordinate clearance requirements with piping Installer for piping insulation application, duct Installer for duct insulation application, and equipment Installer for equipment insulation application. Before preparing piping and ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

1.6 SCHEDULING

A. Schedule insulation application after pressure testing systems. Insulation application may begin on segments that have satisfactory test results.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Comply with requirements in Part 3 schedule articles for where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.

D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

E. Definition of "Or Equal": Where products are specified by manufacturers' name and accompanied by the term "or equal", comply with provisions in Division 01 Section "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

F. Cellular Glass: Inorganic, incombustible, foamed or cellulated glass with annealed, rigid, hermetically sealed cells. Factory-applied jacket requirements are specified in "FactoryApplied Jackets" Article.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. Cell-U-Foam Corporation; Ultra-CUF.
    b. Pittsburgh Corning Corporation.
    c. Or equal.

2. Block Insulation: ASTM C 552, Type I.
3. Special-Shaped Insulation: ASTM C 552, Type III.
4. Board Insulation: ASTM C 552, Type IV.
5. Preformed Pipe Insulation without Jacket: Comply with ASTM C 552, Type II, Class 1.
6. Preformed Pipe Insulation with Factory-Applied ASJ or ASJ-SSL: Comply with ASTM C 552, Type II, Class 2.
7. Factory fabricate shapes according to ASTM C 450 and ASTM C 585.

G. Flexible Elastomeric: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C 534, Type I for tubular materials and Type II for sheet materials.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. Aeroflex USA Inc.; Aerocel.
    b. Armacell LLC; AP Armaflex.
    c. RBX Corporation; Insul-Sheet 1800 and Insul-Tube 180.
    d. Or equal.

H. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type II and ASTM C 1290, Type III with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. CertainTeed Corp.; Duct Wrap.
    b. Johns Manville; Microlite.
    c. Knauf Insulation; Duct Wrap.
    d. Manson Insulation Inc.; Alley Wrap.
    e. Owens Corning; All-Service Duct Wrap.
    f. Or equal.

I. High-Temperature (greater than 250 deg F), Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type V, without factory applied jacket.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. Johns Manville; HTB 23 Spin-Glas.
    b. Owens Corning; High Temperature Flexible Batt Insulations.
    c. Or equal.

J. Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 612, Type IA or Type IB. For duct and plenum applications, provide insulation with factory-applied FSK jacket. For equipment applications, provide insulation with factory-applied ASJ or with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. CertainTeed Corp.; Commercial Board.
    b. Fibrex Insulations Inc.; FBX.
    c. Johns Manville; 800 Series Spin-Glas.
    d. Knauf Insulation; Insulation Board.
    e. Manson Insulation Inc.; AK Board.
    f. Owens Corning; Fiberglas 700 Series.
    g. Or equal.

K. High-Temperature (greater than 250 deg F), Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 612, Type III, without factory applied jacket.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. Fibrex Insulations Inc.; FBX.
    b. Johns Manville; 1000 Series Spin-Glas.
    c. Owens Corning; High Temperature Industrial Board Insulations.
    d. Rock Wool Manufacturing Company; Delta Board.
    e. Roxul Inc.; Roxul RW.
    f. Thermafiber; Thermafiber Industrial Felt.
    g. Or equal.

L. Mineral-Fiber, Preformed Pipe Insulation:

1. Products: Subject to compliance with requirements, provide one of the following:

a. Fibrex Insulations Inc.; Coreplus 1200.
b. Johns Manville; Micro-Lok.
c. Knauf Insulation; 1000 Pipe Insulation.
d. Manson Insulation Inc.; Alley-K.
e. Owens Corning; Fiberglas Pipe Insulation.
f. Or equal.

M. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semi rigid board material with factory-applied ASJ complying with ASTM C 1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C 612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 deg F is 0.29 Btu x in./h x sq. ft. x deg F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

1. Products: Subject to compliance with requirements, provide one of the following:
a. CertainTeed Corp.; CrimpWrap.
b. Johns Manville; MicroFlex.
c. Knauf Insulation; Pipe and Tank Insulation.
d. Manson Insulation Inc.; AK Flex.
e. Owens Corning; Fiberglas Pipe and Tank Insulation.
f. Or equal.

N. Removable Insulation Blanket Covers:

1. Removable and replaceable thermal blanket insulating system complete with insulation and jacketing, including the following:

a. Inner Jacket: 16.5 oz./sq. yd. PTFE Teflon impregnated fiberglass.
b. Cloth Outer Jacket: 16.5 oz./sq. yd. PTFE Teflon impregnated fiberglass cloth double sewn.
c. Lock Stitch Blanket Construction: Double sewn lock stitch with a minimum of 7 stitches per inch. Raw jacket edges will have a trifold PTFE Teflon fiberglass cloth binding with Teflon coated fiberglass thread stitching.
d. Quilting Pins: Stainless steel tufts or pins placed at random locations no greater than 16” inches apart, with stainless steel speed washers for securing the quilting pin stem in place.
e. Fastening Options: Stainless Steel "D" ring strap with Velcro tab both matching straps are spaced along the closing seam edge no greater than 8" apart.
f. Insulation thickness: 2-inch minimum thickness, or as indicated on insulation schedule in Part 3.

2. Products:

a. Shanon Enterprises of W.N.Y., Inc.; Insultech LT 450TT.
b. Or equal.

2.2 FIRE-RATED INSULATION SYSTEMS

A. Fire-Rated Blanket: High-temperature, flexible, blanket insulation with FSK jacket that is tested and certified to provide a 1 or 2-hour fire rating as required by the installation and by a NRTL acceptable to Campus Fire Marshal.

1. Products: Subject to compliance with requirements, provide one of the following:

a. CertainTeed Corp.; FlameChek.
b. Johns Manville; Firetemp Wrap.
c. Nelson Firestop Products; Nelson FSB Flameshield Blanket.
d. Thermal Ceramics; FireMaster Duct Wrap.
e. 3M; Fire Barrier Wrap Products.
f. Unifrax Corporation; FyreWrap.
g. Or equal.

2.3 INSULATING CEMENTS

A. Mineral-Fiber Insulating Cement: Comply with ASTM C 195.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Insulco, Division of MFS, Inc.; Triple I.
b. P. K. Insulation Mfg. Co., Inc.; Super-Stik.
c. Or equal.

B. Mineral-Fiber, Hydraulic-Setting Insulating and Finishing Cement: Comply with ASTM C 449/C 449M.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Insulco, Division of MFS, Inc.; SmoothKote.
b. P. K. Insulation Mfg. Co., Inc.; PK No. 127, and Quik-Cote.
c. Rock Wool Manufacturing Company; Delta One Shot.
d. Or equal.

2.4 ADHESIVES

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to it and to surfaces to be insulated, unless otherwise indicated.

B. Cellular-Glass Adhesive: Solvent-based resin adhesive, with a service temperature range of minus 75 to plus 300 deg F.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Design Polymerics
b. Or equal.

2. For indoor applications and to comply with LEED-NC Credit EQ 4.1, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. Flexible Elastomeric Adhesive: Comply with MIL-A-24179A, Type II, Class I.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Aeroflex USA Inc.; Aeroseal.
b. Armacell LCC; 520 Adhesive.
c. Foster Products Corporation, H. B. Fuller Company; 85-75.
d. RBX Corporation; Rubatex Contact Adhesive.
e. Or equal.

2. For indoor applications and to comply with LEED-NC Credit EQ 4.1, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

D. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Design Polymerics
b. ITW TACC, Division of Illinois Tool Works; SP80, T1080
c. Marathon Industries, Inc.
d. Or equal.

2. For indoor applications and to comply with LEED-NC Credit EQ 4.1, use adhesive that has a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

E. ASJ Adhesive, and FSK Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.

1. Products: Subject to compliance with requirements, provide one of the following:
a. Design Polymerics
b. ITW TACC, Division of Illinois Tool Works; SP80, T1080
c. Marathon Industries, Inc.
d. Or equal.

2. For indoor applications and to comply with LEED-NC Credit EQ 4.1, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

F. PVC Jacket Adhesive: Compatible with PVC jacket.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. Dow Chemical Company (The); 739, Dow Silicone.
    b. Johns-Manville; Zeston Perma-Weld, CEEL-TITE Solvent Welding Adhesive.
    c. P.I.C. Plastics, Inc.; Welding Adhesive.
    d. Speedline Corporation; Speedline Vinyl Adhesive.
    e. Or equal.

2. For indoor applications and to comply with LEED NC Credit EQ 4.1, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.5 MASTICS

A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-C-19565C, Type II.

1. For indoor applications, use mastics that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

B. Vapor-Barrier Mastic: Water based; suitable for indoor and outdoor use on below ambient services.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. Childers Products, Division of ITW; CP-35.
    b. Foster Products Corporation, H. B. Fuller Company; 30-90.
    c. ITW TACC, Division of Illinois Tool Works; CB-50.
    d. Marathon Industries, Inc.; 590.
    e. Mon-Eco Industries, Inc.; 55-40.
    f. Vimasco Corporation; 749.
    g. Or equal.

2. Water-Vapor Permeance: ASTM E 96, Procedure B, 0.013 perm at 43-mil dry film thickness.
3. Service Temperature Range: Minus 20 to plus 180 deg F.
4. Solids Content: ASTM D 1644, 59 percent by volume and 71 percent by weight.
5. Color: White.

C. Breather Mastic: Water based; suitable for indoor and outdoor use on above ambient services.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. Childers Products, Division of ITW; CP-10.
    b. Foster Products Corporation, H. B. Fuller Company; 35-00.
    c. ITW TACC, Division of Illinois Tool Works; CB-05/15.
    d. Marathon Industries, Inc.; 550.
    e. Mon-Eco Industries, Inc.; 55-50.

f. Vimasco Corporation; WC-1/WC-5.
g. Or equal.

2. Water-Vapor Permeance: ASTM F 1249, 3 perms at 0.0625-inch dry film thickness.
3. Service Temperature Range: Minus 20 to plus 200 deg F.
4. Solids Content: 63 percent by volume and 73 percent by weight.
5. Color: White.

2.6 LAGGING ADHESIVES

A. Description: Comply with MIL-A-3316C Class I, Grade A and shall be compatible with insulation materials, jackets, and substrates.

1. For indoor applications, use lagging adhesives that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
2. Products: Subject to compliance with requirements, provide one of the following:

a. Childers Products, Division of ITW; CP-52.
b. Foster Products Corporation, H. B. Fuller Company; 81-42.
c. Marathon Industries, Inc.; 130.
d. Mon-Eco Industries, Inc.; 11-30.
e. Vimasco Corporation; 136.
f. Or equal.

3. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fireresistant lagging cloths over duct, equipment, and pipe insulation.
4. Service Temperature Range: Minus 50 to plus 180 deg F.
5. Color: White.

2.7 SEALANTS

A. Joint Sealants:

1. Joint Sealants for Cellular-Glass Products: Subject to compliance with requirements, provide one of the following:
   a. Childers Products, Division of ITW; CP-76.
   b. Foster Products Corporation, H. B. Fuller Company; 30-45.
   c. Marathon Industries, Inc.; 405.
   d. Mon-Eco Industries, Inc.; 44-05.
   e. Pittsburgh Corning Corporation; Pittseal 444.
   f. Vimasco Corporation; 750.
   g. Or equal.

B. Metal Jacket Flashing Sealants

1. Products: Subject to compliance with requirements, provide one of the following:
   a. Childers Products, Division of ITW; CP-76-8.
   b. Dow Corning

c. Foster Products Corporation, H. B. Fuller Company; 95-44.
d. Or equal.

2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F.
5. Color: Aluminum.

2.8 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:

1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
2. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.
3. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.
4. FSP Jacket: Aluminum-foil, fiberglass-reinforced scrim with polyethylene backing; complying with ASTM C 1136, Type II.

2.9 FIELD-APPLIED JACKETS

A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.

B. FSK Jacket: Aluminum-foil-face, fiberglass-reinforced scrim with kraft-paper backing.

C. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Johns Manville; Zeston.
b. P.I.C. Plastics, Inc.; FG Series.
c. Proto PVC Corporation; LoSmoke.
d. Speedline Corporation; SmokeSafe.
e. Or equal.

2. Adhesive: As recommended by jacket material manufacturer.
3. Color: White.
4. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.

a. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.

5. Factory-fabricated tank heads and tank side panels.

D. Metal Jacket:

1. Products: Subject to compliance with requirements, provide one of the following:

a. Childers Products, Division of ITW; Metal Jacketing Systems.
b. PABCO Metals Corporation; Surefit.
c. RPR Products, Inc.; Insul-Mate.
d. Or equal.

2. Aluminum Jacket: Comply with ASTM B 209, Alloy 3003, 3005, 3105 or 5005, Temper H-14.

a. Sheet and roll stock ready for shop or field sizing.
b. Finish and thickness are indicated in field-applied jacket schedules.
c. Moisture Barrier for Indoor Applications: 3-mil- thick, heat-bonded polyethylene or kraft paper.
d. Moisture Barrier for Outdoor Applications: 3-mil- thick, heat-bonded polyethylene or kraft paper.
e. Factory-Fabricated Fitting Covers:

1) Same material, finish, and thickness as jacket.
2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
3) End caps.
4) Beveled collars.
5) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

E. Underground Direct-Buried or trench Jacket: 125-mil- thick vapor barrier and waterproofing membrane consisting of a rubberized bituminous resin reinforced with a woven-glass fiber or polyester scrim and laminated aluminum foil. (Not required for pre-insulated piping systems.)

1. Products: Subject to compliance with requirements, provide one of the following:

a. Pittsburgh Corning Corporation; Pittwrap.
b. Polyguard; Insulrap No Torch 125.
c. Or equal.

2.10 TAPES

A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0835.
b. Compac Corp.; 104 and 105.

c. Ideal Tape Co., Inc., an American Biltrite Company; 428 AWF ASJ.
d. Venture Tape; 1540 CW Plus, 1542 CW Plus, and 1542 CW Plus/SQ.
e. Or equal.

2. Width: 3 inches.
3. Thickness: 11.5 mils.
4. Adhesion: 90 ounces force/inch in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch in width.
7. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.

B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
1. Products: Subject to compliance with requirements, provide one of the following:

a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0827.
b. Compac Corp.; 110 and 111.
c. Ideal Tape Co., Inc., an American Biltrite Company; 491 AWF FSK.
d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ.
e. Or equal.

2. Width: 3 inches.
3. Thickness: 6.5 mils.
4. Adhesion: 90 ounces force/inch in width.
5. Elongation: 2 percent.
6. Tensile Strength: 40 lbf/inch in width.
7. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.

C. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive. Suitable for indoor and outdoor applications.

1. Products: Subject to compliance with requirements, provide one of the following:
a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0555.
b. Compac Corp.; 130.
c. Ideal Tape Co., Inc., an American Biltrite Company; 370 White PVC tape.
d. Venture Tape; 1506 CW NS.
e. Or equal.

2. Width: 2 inches.
3. Thickness: 6 mils.
4. Adhesion: 64 ounces force/inch in width.
5. Elongation: 500 percent.
6. Tensile Strength: 18 lbf/inch in width.

D. Aluminum-Foil Tape: Vapor-retarder tape with acrylic adhesive.

1. Products: Subject to compliance with requirements, provide one of the following:
a. Avery Dennison Corporation, Specialty Tapes Division; Fasson 0800.

b. Compac Corp.; 120.
c. Ideal Tape Co., Inc., an American Biltrite Company; 488 AWF.
d. Venture Tape; 1525 CW, 1528 CW, and 1528 CW/SQ.
e. Or equal.

2. Width: 2 inches.
3. Thickness: 3.7 mils.
4. Adhesion: 100 ounces force/inch in width.
5. Elongation: 5 percent.
6. Tensile Strength: 34 lbf/inch in width.

2.11 SECUREMENTS

A. Bands:

1. Products: Subject to compliance with requirements, provide one of the following:

a. Childers Products; Bands.
b. PABCO Metals Corporation; Bands.
c. RPR Products, Inc.; Bands.
d. Or equal.

2. Aluminum: ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 3/4 inch wide with wing or closed seal.
3. Springs: For larger than 84-inch diameter tank applications. Twin spring set constructed of stainless steel with ends flat and slotted to accept metal bands. Spring size determined by manufacturer for application.

B. Insulation Pins and Hangers:

1. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.135-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.

a. Products: Subject to compliance with requirements, provide one of the following:

1) AGM Industries, Inc.; CWP-1.
2) GEMCO; Cupped Head Weld Pin.
3) Midwest Fasteners, Inc.; Cupped Head.
4) Nelson Stud Welding; CHP.
5) Or equal.

2. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- thick, galvanized-steel sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.

a. Products: Subject to compliance with requirements, provide one of the following:

1) AGM Industries, Inc.; RC-150.
2) GEMCO; R-150.
3) Midwest Fasteners, Inc.; WA-150.
4) Nelson Stud Welding; Speed Clips.
5) Or equal.

b. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in exposed locations.

3. Self-Sticking-Base Insulation Hangers for Equipment: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Self-sticking-base is not acceptable for use with ductwork insulation. Comply with the following requirements:

a. Products: Subject to compliance with requirements, provide one of the following:
1) AGM Industries, Inc.; Tactoo Insul-Hangers, Series TSA.
2) GEMCO; Press and Peel.
3) Midwest Fasteners, Inc.; Self Stick.
4) Or equal.

b. Baseplate: Galvanized carbon-steel sheet, 0.015 inch thick by 2 inches square.
c. Spindle: Low carbon steel, fully annealed, 0.105-inch-diameter (12 gage) shank, length to suit depth of insulation indicated.
d. Adhesive-backed base with a peel-off protective cover.

C. Wire: or 0.062-inch soft-annealed, galvanized steel.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. C & F Wire.
b. Childers Products.
c. PABCO Metals Corporation.
d. RPR Products, Inc.
e. Or equal.

2.12 CORNER ANGLES

A. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B 209, Alloy 3003, 3005, 3105 or 5005; Temper H-14.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.

1. Verify that systems and equipment to be insulated have been tested and are free of defects.
2. Verify that surfaces to be insulated are clean and dry.
3. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.3 GENERAL INSTALLATION REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment, ducts and fittings, and piping including fittings, valves, and specialties.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of equipment, duct system, and pipe system as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

G. Keep insulation materials dry during application and finishing.

H. Install insulation with tight longitudinal seams and end joints.

I. Install insulation with least number of joints practical.

J. On chilled water systems, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.

1. Install insulation continuously through hangers and around anchor attachments. On heating hot water systems, insulation to encapsulate hanger.
2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.

3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

L. Install insulation with factory-applied jackets as follows:

1. Draw jacket tight and smooth.
2. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket.
3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap.

4. Cover joints and seams with tape as recommended by insulation material manufacturer to maintain vapor seal.

M. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

P. For above ambient services, do not install insulation to the following:

1. Vibration-control devices.
2. Testing agency labels and stamps.
3. Nameplates and data plates.
4. Manholes.
5. Handholes.
6. Cleanouts.

Q. Existing pipe insulation damaged or affected by the work of this contract shall be repaired to comply with these specifications except that materials and thicknesses may match existing unless otherwise directed by the University’s Representative.

3.4 PENETRATIONS

A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.

1. Seal penetrations with flashing sealant.

2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
4. Seal jacket to roof flashing with flashing sealant.

B. Insulation Installation at Underground Exterior Wall Penetrations: Terminate insulation flush with sleeve seal. Seal terminations with flashing sealant.

C. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.

1. Seal penetrations with flashing sealant.
2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.
4. Seal jacket to wall flashing with flashing sealant.

D. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

E. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions. Terminate insulation at fire damper sleeves for fire-rated wall and partition penetrations. Externally insulate damper sleeves to match adjacent insulation and overlap duct insulation at least 2 inches.

1. Comply with requirements in Division 07 Section "Penetration Firestopping" for firestopping and fire-resistive joint sealers.

F. Insulation Installation at Floor Penetrations:

1. Duct: Install insulation continuously through floor penetrations that are not fire rated. For penetrations through fire-rated assemblies, terminate insulation at fire damper sleeves and externally insulate damper sleeve beyond floor to match adjacent duct insulation. Overlap damper sleeve and duct insulation at least 2 inches.
2. Pipe: Install insulation continuously through floor penetrations.
3. Seal penetrations through fire-rated assemblies. Comply with requirements in Division 07 Section "Penetration Firestopping."

3.5 EQUIPMENT, TANK, AND VESSEL INSULATION INSTALLATION

A. Mineral Fiber, Pipe and Tank Insulation Installation for Tanks and Vessels: Secure insulation with adhesive and anchor pins, speed washers, and or Bonding

1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of tank and vessel surfaces.
2. Groove and score insulation materials to fit as closely as possible to equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joints. Stagger end joints.
3. Protect exposed corners with secured corner angles.
4. Install adhesively attached or self-sticking insulation hangers and speed washers on sides of tanks and vessels as follows:

    a. Do not weld anchor pins to ASME-labeled pressure vessels.
    b. Select insulation hangers and adhesive that are compatible with service temperature and with substrate.
    c. On tanks and vessels, maximum anchor-pin spacing is 3 inches from insulation end joints, and 16 inches o.c. in both directions.
    d. Do not over compress insulation during installation.
    e. Cut and miter insulation segments to fit curved sides and domed heads of tanks and vessels.
    f. Impale insulation over anchor pins and attach speed washers.
    g. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

5. Secure each layer of insulation with aluminum bands.
6. Where insulation hangers on equipment and vessels are not permitted or practical and where insulation support rings are not provided, install a girdle network for securing insulation. Stretch pre-stressed aircraft cable around the diameter of vessel and make taut with clamps, turnbuckles, or breather springs. Place one circumferential girdle around equipment approximately 6 inches from each end. Install wire or cable between two circumferential girdles 12 inches o.c. Install a wire ring around each end and around outer periphery of center openings, and stretch pre-stressed aircraft cable radially from the wire ring to nearest circumferential girdle. Install additional circumferential girdles along the body of equipment or tank at a minimum spacing of 48 inches o.c. Use this network for securing insulation with tie wire or bands.
7. Stagger joints between insulation layers at least 3 inches.
8. Install insulation in removable segments on equipment access doors, manholes, hand holes, and other elements that require frequent removal for service and inspection.
9. Bevel and seal insulation ends around manholes, hand holes, ASME stamps, and nameplates.
10. For equipment with surface temperatures below ambient, apply mastic to open ends, joints, seams, breaks, and punctures in insulation.

B. Flexible Elastomeric Thermal Insulation Installation for Tanks and Vessels: Install insulation over entire surface of tanks and vessels.

1. Apply 100 percent coverage of adhesive to surface with manufacturer's recommended adhesive.
2. Seal longitudinal seams and end joints.

C. Insulation Installation on Pumps:

1. Hot Service Pumps: Insulation blanket with 1" thick silicone blanket.

2. Chilled Water Pumps: 2 in. 3 lb fiberglass board with .016 in. thick aluminum jacket.

3.6 GENERAL PIPE INSULATION INSTALLATION

A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.

B. Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.

C. Insulation Installation on Fittings, Couplings, Valves, Strainers, Flanges, and Unions:

1. Install insulation over fittings, couplings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity, unless otherwise indicated. On heating hot water systems, insulation to stop at valves.
2. Insulate pipe elbows using preformed fitting insulation Fitting insulation will be TIW or fiberglass. Insert provided by PVC fitting manufacturer. PVC covers to be 25/50 rated smoke safe.
3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit.
4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. PVC covers with factory applied inserts are acceptable.
5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below ambient services, provide a design that maintains vapor barrier.
6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. PVC covers with factory applied inserts are acceptable.
7. For services not specified to receive a field-applied jacket except for flexible elastomeric, install fitted PVC cover over elbows, and flanges. Terminate ends with PVC end caps or vapor barrier mastic. Tape PVC covers to adjoining insulation facing using PVC tape.

D. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes, vessels, and equipment. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with mastic.

E. Install removable insulation covers at locations indicated. Installation shall conform to the following:

1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
3. Construct removable valve insulation covers in same manner as for flanges except divide the two-part section on the vertical center line of valve body. PVC covers with factory applied inserts are acceptable.
4. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with factory applied ASJ finish.

3.7 REMOVABLE INSULATION JACKETING COVER APPLICATION

A. Apply removable insulating jacketing system on Heating Hot-Water (HHW), and High Temperature Hot-Water (HTW) systems, and other heating water systems as follows:

1. Valves.
2. Strainers.
3. Pumps.
4. Regulators.
5. Flow meters.
6. Flow control, balancing, and instrumentation devices.
7. Steam Trap assemblies.
8. Service connection piping to heat exchangers.

9. At VAV terminal units insulation to stop at valve trim

B. Blanket Overlap: Blanket will overlap mating flanges as well as existing insulation with a minimum of 2” overlap. Where blanket cannot overlap existing oversized insulation, blanket will butt up to existing insulation with a friction closing seam. Open gaps are not acceptable. Blanket diameters which are 2” larger than existing insulation must be capped to eliminate open air void.

C. Any one piece will not exceed 50 lbs. in weight.

3.8 CELLULAR-GLASS INSULATION INSTALLATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.

3. For insulation with factory-applied jackets on above ambient services, secure laps with outward clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets on below ambient services, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of same thickness as pipe insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Couplings, Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When preformed sections of insulation are not available, install mitered sections of cellular-glass insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of cellular-glass insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.9 FLEXIBLE ELASTOMERIC INSULATION INSTALLATION

A. Seal longitudinal seams and end joints with manufacturers recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

B. Insulation Installation on Pipe Flanges:

1. Install pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of sheet insulation of same thickness as pipe insulation.
4. Secure insulation to flanges and seal seams with manufacturers recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install mitered sections of pipe insulation.
2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed valve covers manufactured of same material as pipe insulation when available.
2. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.
4. Secure insulation to valves and specialties and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.10 MINERAL-FIBER INSULATION INSTALLATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each section with factory applied ASJ facing with Self Seal Lap (SSL).

If SSL is not provided:

1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above ambient surfaces, secure laps with outward clinched staples at 6 inches o.c.
4. For insulation with factory-applied jackets on below ambient surfaces, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

5. PVC Flange Cover with factory applied insulation insert is acceptable.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

3. PVC Cover with factory applied insulation insert is acceptable.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
4. Install insulation to flanges as specified for flange insulation application.

E. Blanket Insulation Installation on Ducts and Plenums: Secure with insulation pins.

1. Install self-adhesive pins on bottom of horizontal ducts and sides of vertical ducts per manufacturer recommendation. If recommendation not provided, install:

    a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
    b. Pins and adhesive may be omitted from top surface of horizontal, rectangular ducts and plenums.
    c. Do not over compress insulation during installation.
    d. Impale insulation over pins and attach speed washers.
    e. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from 1 edge and 1 end of insulation segment. Secure laps to adjacent insulation section with 1/2-inch outward-clinching staples, 1 inch o.c. Install vapor barrier consisting of factory- or field-applied jacket. Install vapor barrier tape at joints, seams, and protrusions.

    a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor barrier seal.
5. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface.
6. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch- wide strips of same material used to insulate duct.

F. Board Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.

1. Install self-adhesive pins and speed washers or cupped-head, capacitor discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:

    a. On duct sides with dimensions 18 inches and smaller, place pins along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
    b. On duct sides with dimensions larger than 18 inches, space pins 16 inches o.c. each way, and 3 inches maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
    c. Pins and adhesive may be omitted from top surface of horizontal, rectangular ducts and plenums.
    d. Do not over compress insulation during installation.
    e. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier.

    a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor barrier seal.
    b. Install vapor stops for ductwork and plenums operating below 50 deg F at 18foot intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Zshaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to 2 times the insulation thickness but not less than 3 inches.

5. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Groove and score insulation to fit as closely as possible to outside and inside radius of elbows. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
6. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with 6-inch- wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced 6 inches o.c.

3.11 FIELD-APPLIED JACKET INSTALLATION

A. Where FSK jackets are indicated, install as follows:

1. Draw jacket material smooth and tight.
2. Install lap or joint strips with same material as jacket.
3. Secure jacket to insulation with manufacturer's recommended adhesive.
4. Install jacket with 1-1/2-inch laps at longitudinal seams and 3-inch- wide joint strips at end joints.
5. Seal openings, punctures, and breaks in vapor-retarder jackets and exposed insulation with vapor-barrier tape.

B. Where PVC jackets are indicated, install with 1-inch overlap at longitudinal seams and end joints; for horizontal applications, install with longitudinal seams along top and bottom of tanks and vessels. Seal with manufacturers recommended adhesive.

1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

C. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.

3.12 FIRE-RATED INSULATION SYSTEM INSTALLATION

A. Where fire-rated insulation system is indicated, secure system to ducts and duct hangers and supports to maintain a continuous fire rating.

B. Insulate duct access panels and doors to achieve same fire rating as duct.

C. Install firestopping at penetrations through fire-rated assemblies. Fire-stop systems are specified in Division 07 Section "Penetration Firestopping."

D. Confirm that duct installer has provided adequate hangers for the added weight of the fire-rated insulation.

3.13 FINISHES

A. Duct, Equipment, and Pipe Insulation that is concealed with ASJ.

B. Duct, Equipment, and Pipe Insulation that is exposed in mechanical rooms, exterior of the building envelope, or in a tunnel with aluminum jacket.

C. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.

3.14 FIELD QUALITY CONTROL

A. Perform tests and inspections when requested and in the presence of University's Representative. The University will on request test and inspection if there is a concern with the installer's workmanship.

B. Tests and Inspections:

1. Inspect ductwork, randomly selected by University's Representative, by removing field applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to one location for each 20,000 cfm duct system.
2. Inspect field-insulated equipment, randomly selected by University's Representative, by removing field-applied jacket and insulation in layers in reverse order of their installation.

Extent of inspection shall be limited to one location for each type of equipment defined in the "Equipment Insulation Schedule" Article. For large equipment, remove only a portion adequate to determine compliance.

3. Inspect pipe, fittings, strainers, and valves, randomly selected by University's Representative, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to three locations of straight pipe, three locations of threaded fittings, three locations of welded fittings, for each pipe service defined in the "Piping Insulation Schedule, General" Article.

C. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.15 DUCT INSULATION SCHEDULE, GENERAL

A. Plenums and Ducts Requiring Insulation:

1. Indoor, concealed supply and outdoor air.
2. Indoor, exposed supply and outdoor air.
3. Indoor, concealed return located in non-conditioned space.
4. Indoor, exposed return located in non-conditioned space.
5. Outdoor, concealed supply and return.
6. Outdoor, exposed supply and return.
7. Sound attenuators or duct silencers if used in an insulated duct.

B. Items Not Insulated:

1. Fibrous-glass ducts.
2. Factory-insulated flexible ducts.
3. Factory-insulated plenums and casings.
4. Flexible connectors.
5. Vibration-control devices.
6. Factory-insulated access panels and doors.
7. Nameplates and data plates

3.16 DUCT AND PLENUM INSULATION SCHEDULE

DUCT INSULATION TABLE (INSTALL ON EXTERIOR OF DUCT)							
DUCT LOCATION	DUCT TYPE	TYPE	THICKNESS/R-VALUE (IN BTU/HR-FT^2-F)			JACKET	VAPOR BARRIER
			SUPPLY	RETURN	OUTSIDE AIR		

Mechanical, Machine & Utility Rooms	Round & Rectangular	blanket	1.5”/4.2	1.5”/4.2	1”/4.3	Factory FSK	Yes
Outdoors (on roof, or exposed)	Round & Rectangular	Internally lined	2”/8.7	2”/8.7	None	N/A	No
Indoors – Concealed (conditioned space)	Round & Rectangular	Blanket	1½”/4.2	None	1½”/4.2	Foil Scrim Kraft (reinforced)	Yes
Indoors – Concealed (nonconditioned space)	Round & Rectangular	Blanket	1½”/4.2	1½”/4.2	1½”/4.2	Foil Scrim Kraft (reinforced)	Yes
Indoors – Exposed within conditioned space	Round & Rectangular	Rigid	None	None	None	None	No
Indoors – Exposed within Nonconditioned space	Round & Rectangular	blanket	1.5”/8.7	None	None	None	Yes

3.17 EQUIPMENT INSULATION SCHEDULE, GENERAL

A. Materials and thicknesses for systems listed below are specified in schedules at the end of this Section. Provide removable insulation blanket covers on all un-insulated parts of boilers, heaters, heat exchangers, tanks, etc., that could accidentally be touched and cause a burn to maintenance staff.

B. Insulate the following indoor equipment:

1. Chilled-water centrifugal pump housings.
2. Hot-water centrifugal pump housings.
3. Domestic hot-water heaters and/or storage tanks, not factory insulated.
4. Heating hot-water air separators (small tanks).
5. Heat exchangers, not factory insulated.
6. Condensate receivers, not factory insulated.
7. Steam generators, not factory insulated.
8. Blowdown tanks, not factory insulated.
9. Flash tanks, not factory insulated.
10. Boilers, not factory insulated.

C. Omit insulation, except for chilled water system equipment, from the following:

1. Vibration-control devices.
2. Testing agency labels and stamps.
3. Nameplates and data plates.
4. Manholes.
5. Handholes.
6. Cleanouts.

3.18 EQUIPMENT INSULATION SCHEDULE

EQUIPMENT SERVICE	INSULATION THICKNESS	INSULATION TYPE	JACKET MATERIAL	VAPOR BARRIER	MINIMUM INSTALLED R-VALUE
35°F to 75°F (chilled-water heat exchangers, pumps and equipment)	2”	Mineral Fiber elastomeric	NA	Yes	7.1
<200°F (HHW, domestic and industrial water heat exchangers, pumps and equipment)	2”	Mineral fiber elastomeric	NA	No	5.6
>200°F (high temperature water, and steam heat exchangers and equipment)	4”	High temp glass blanket	Grey Silicone cloth/Blanket	No	10.6

3.19 PIPING INSULATION SCHEDULE, GENERAL

A. Application schedules identify piping system and indicate pipe size ranges and material, thickness, and jacket requirements.

3.20 INTERIOR PIPING INSULATION SCHEDULE

A. Service: Chilled-water supply and return.

1. Operating Temperature: 35 to 75 deg F.
2. Insulation Material: Fiberglass Piping Insulation ASJ Finish.
3. Insulation Thickness: Apply the following insulation thicknesses:

    a. Copper pipe, Up to 2” diameter: 1” insulation
    b. Steel pipe, 2-1/2” and larger: 1” insulation

4. Field-Applied Jacket: Aluminum in mech. room less than 8’ and roof piping..
5. Vapor Retarder Required: Yes.
6. Finish: None.

C. Service: Condenser-water supply and return, when directed by the University's Representative.

1. Operating Temperature: 50 to 105 deg F.
2. Insulation Material: Flexible elastomeric.
3. Insulation Thickness: Apply the following insulation thicknesses: 3/4".
4. Field-Applied Jacket: Aluminum in mech. room less than 8' and roof piping.
5. Vapor Retarder Required: No.
6. Finish: None.

D. Service: Heating hot-water supply and return.

1. Operating Temperature: 100 to 200 deg F.
2. Insulation Material: Preformed Mineral fiber.
3. Insulation Thickness: Apply the following insulation thicknesses:

    a. All Pipes, ¾" up to 1-1/4" branch lines: 1-1/2"
    b. All Pipes, 1-1/2" and larger: 2"

4. Field-Applied Jacket: Aluminum in mech. room less than 8' and roof piping.
5. Vapor Retarder Required: No.
6. Finish: None.

E. Service: Steam and condensate.

1. Operating Temperature: 450 deg F and lower.
2. Insulation Material: Preformed mineral fiber, with pre-molded mineral fiber fitting insulation.
3. Insulation Thickness: Apply the following insulation thicknesses:
4. Field-Applied Jacket: Aluminum in mech. room less than 8' and roof piping.
5. Vapor Retarder Required: No.
6. Finish: None.
7. Insulation Thickness: Apply the following insulation thicknesses:

PIPE SIZE	BRANCH TO 2", Note (1)	UP to 1"	1-1/4" to 2"	2-1/2" to 4"	5" and 6"	8" & LARGER
Steam, High Pressure	1.5"	2.5"	2.5"	3.0"	3.5"	3.5"
Steam, Med Pressure	1.5"	2.0"	2.5"	2.5"	3.5"	3.5"
Steam, Low Pressure	1.0"	1.5"	1.5"	2.0"	2.0"	3.5"
Steam Condensate	0.5"	1.5"	1.5"	1.5"	1.5"	1.5"

Note (1): Branch piping not exceeding 12 feet in length.

F. Service: Vents from condensate blow down tank, condensate receiver and steam relief valves.

1. Operating Temperature: 450 deg F or lower.
2. Insulation Material: High Temperature Mineral fiber, with jacket.
3. Insulation Thickness: Apply the following insulation thicknesses as listed for steam condensate in above table:
4. Field-Applied Jacket: Aluminum in mech. room less than 8’ and roof piping.
5. Vapor Retarder Required: No.
6. Finish: None.

3.21 EXTERIOR PIPING INSULATION SCHEDULE

A. All thickness per 3.20 above. Finish to be .016 Embossed Aluminum Jacketing.

B. Refer to Sections 232110 and 23 2213 for underground exterior chilled water and steam and condensate piping and insulation requirements.

END OF SECTION 23 0700

SECTION 23 0800 - COMMISSIONING OF HVAC

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes commissioning process requirements for HVAC&R systems, assemblies, and equipment.

B. Related Sections:

1. Division 01 Section "General Commissioning Requirements" for general commissioning process requirements.
2. OPR documentation prepared by the University contains requirements that apply to this Section.

1.2 DEFINITIONS

A. Design Builder: Includes Design Builder, Architect, and Engineer design professionals responsible for design of HVAC, electrical, controls for HVAC systems, and other related systems identified in the Contract for Construction with the University.

B. Commissioning Plan: A document that outlines the organization, schedule, allocation of resources, and documentation requirements of the commissioning process.

C. BoD: Basis of Design.

D. BoD-HVAC: HVAC systems basis of design.

E. CxA: Commissioning Authority.

F. OPR: Owner's (University) Project Requirements.

G. Systems, Subsystems, and Equipment: Where these terms are used together or separately, they shall mean "as-built" systems, subsystems, and equipment.

H. TAB: Testing, Adjusting, and Balancing.

1.3 DESIGN BUILDER'S RESPONSIBILITIES

A. The following responsibilities are in addition to those specified in Division 01 Section "General Commissioning Requirements."

B. Design Builder:

1. Attend procedures meeting for TAB Work.
2. Certify that TAB Work is complete.

C. Mechanical Subcontractor:

1. Attend TAB verification testing.
2. Provide measuring instruments and logging devices to record test data, and data acquisition equipment to record data for the complete range of testing for the required test period.

D. HVAC Instrumentation and Control Subcontractor: With the CxA, review control designs for compliance with the OPR and BoD, controllability with respect to actual equipment to be installed, and recommend adjustments to control designs and sequence of operation descriptions.

E. TAB Subcontractor:

1. Contract Documents Review: With the CxA, review the Contract Documents before developing TAB procedures.

a. Verify the following:

1) Accessibility of equipment and components required for TAB Work.
2) Adequate number and placement of duct balancing dampers to allow proper balancing while minimizing sound levels in occupied spaces.
3) Adequate number and placement of balancing valves to allow proper balancing and recording of water flow.
4) Adequate number and placement of test ports and test instrumentation to allow reading and compilation of system and equipment performance data needed to conduct both TAB and commissioning testing.
5) Air and water flow rates have been specified and compared to central equipment output capacities.
6) Building's pressurization requirements.

b. Identify discontinuities and omissions in the Contract Documents.
c. This review of the Contract Documents by the TAB Subcontractor satisfies requirements for a design review report as specified in Division 23 Section "Testing, Adjusting, and Balancing for HVAC."

2. Additional Responsibilities: Participate in tests specified in Division 23 Sections "Instrumentation and Controls" and Sequence of Operation.

F. Electrical Subcontractor:

1. With the Mechanical Subcontractor, coordinate installations and connections between and among electrical and HVAC systems, subsystems, and equipment.

1.4 CxA'S RESPONSIBILITIES

A. Provide Project-specific construction checklists and commissioning process test procedures for actual HVAC&R systems, assemblies, equipment, and components to be furnished and installed as part of the construction contract.

B. Direct commissioning testing.

C. Verify testing, adjusting, and balancing of Work are complete.

D. Provide test data, inspection reports, and certificates in Systems Manual.

1.5 COMMISSIONING DOCUMENTATION

A. The following are in addition to documentation specified in Division 01 Section "General Commissioning Requirements."

B. BoD HVAC: University will provide BoD-HVAC documents, to the CxA for use in developing the commissioning plan, systems manual, and operation and maintenance training plan.

C. Test Checklists: CxA with assistance of University's Representative shall develop test checklists for HVAC systems, subsystems, and equipment, including interfaces and interlocks with other systems. CxA shall prepare separate checklists for each mode of operation and provide space to indicate whether the mode under test responded as required. In addition to the requirements specified in Division 01 Section "General Commissioning Requirements," checklists shall include, but not be limited to, the following:

1. Calibration of sensors and sensor function.
2. Testing conditions under which test was conducted, including (as applicable) ambient conditions, set points, override conditions, and status and operating conditions that impact the results of test.
3. Control sequences for HVAC systems.
4. Strength of control signal for each set point at specified conditions.
5. Responses to control signals at specified conditions.
6. Sequence of response(s) to control signals at specified conditions.
7. Electrical demand or power input at specified conditions.
8. Power quality and related measurements.
9. Expected performance of systems, subsystems, and equipment at each step of test.
10. Narrative description of observed performance of systems, subsystems, and equipment. Notation to indicate whether the observed performance at each step meets the expected results.
11. Interaction of auxiliary equipment.
12. Issues log.

1.6 SUBMITTALS

A. The following submittals are in addition to those specified in Division 01 Section "General Commissioning Requirements."

B. Testing Procedures: CxA shall submit detailed testing plan, procedures, and checklists for each series of tests. Submittals shall include samples of data reporting sheets that will be part of the reports.

C. Certificate of Readiness: CxA shall compile certificates of readiness from Design Builder certifying that systems, subsystems, equipment, and associated controls are ready for testing.

D. Certificate of Completion of Installation, Prestart, and Startup: CxA shall certify that installation, prestart, and startup activities have been completed. Certification shall include completed checklists provided by TAB Subcontractor as specified in Division 23 Section "Testing, Adjusting, and Balancing for HVAC."

E. Certified Pipe Cleaning and Flushing Report: CxA shall certify that pipe cleaning, flushing, hydrostatic testing, and chemical treating have been completed.

F. Test and Inspection Reports: CxA shall compile and submit test and inspection reports and certificates, and shall include them in systems manual and commissioning report.

G. Corrective Action Documents: CxA shall submit corrective action documents.

H. Certified TAB Reports: CxA shall submit verified, certified TAB reports.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 TESTING PREPARATION

A. Prerequisites for Testing:

1. Certify that HVAC systems, subsystems, and equipment have been completed, calibrated, and started; are operating according to the OPR, BoD, and Contract Documents; and that Certificates of Readiness are signed and submitted.
2. Certify that HVAC instrumentation and control systems have been completed and calibrated; are operating according to the OPR, BoD, and Contract Documents; and that pretest set points have been recorded.
3. Certify that TAB procedures have been completed, and that TAB reports have been submitted, discrepancies corrected, and corrective work approved.
4. Test systems and intersystem performance after approval of test checklists for systems, subsystems, and equipment.
5. Set systems, subsystems, and equipment into operating mode to be tested (e.g., normal shut down, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions).
6. Verify each operating cycle after it has been running for a specified period and is operating in a steady-state condition.
7. Inspect and verify the position of each device and interlock identified on checklists. Sign off each item as acceptable, or failed. Repeat this test for each operating cycle that applies to system being tested.
8. Check safety cutouts, alarms, and interlocks with smoke control and life-safety systems during each mode of operation.

9. Annotate checklist or data sheet when a deficiency is observed.
10. Verify equipment interface with monitoring and control system and TAB criteria; include the following:

    a. Supply and return flow rates for VAV and constant volume systems in each operational mode.
    b. Operation of terminal units in both heating and cooling cycles.
    c. Minimum outdoor-air intake in each operational mode and at minimum and maximum airflows.
    d. Building pressurization.
    e. Total exhaust airflow and total outdoor-air intake.
    f. Operation of indoor-air-quality monitoring systems.

11. Verify proper responses of monitoring and control system controllers and sensors to include the following:

    a. For each controller or sensor, record the indicated monitoring and control system reading and the test instrument reading. If initial test indicates that the test reading is outside of the control range of the installed device, check calibration of the installed device and adjust as required. Retest malfunctioning devices and record results on checklist or data sheet.
    b. Report deficiencies and prepare an issues log entry.

12. Verify that HVAC equipment field quality-control testing has been completed and approved. CxA shall direct, witness, and document field quality-control tests, inspections, and startup specified in individual Division 23 Sections.

B. Testing Instrumentation: Install measuring instruments and logging devices to record test data for the required test period. Instrumentation shall monitor and record full range of operating conditions and shall allow for calculation of total capacity of system for each mode of operation. Operational modes include the following:

1. Occupied and unoccupied.
2. Warm up and cool down.
3. Economizer cycle.
4. Emergency power supply.
5. Life-safety and safety systems.
6. Smoke control.
7. Fire safety.
8. Stair pressurization system.
9. Temporary upset of system operation.
10. Partial occupancy conditions.
11. Special cycles.

3.2 TAB VERIFICATION

A. TAB Subcontractor shall coordinate with CxA for work required in Division 23 Section "Testing, Adjusting, and Balancing for HVAC." TAB Subcontractor shall copy CxA with required reports, sample forms, checklists, and certificates.

B. Design Builder, HVAC Subcontractor, and CxA shall witness TAB Work.

C. TAB Preparation:

1. TAB Subcontractor shall provide CxA with data required for "Pre-Field TAB Engineering Reports" specified in Division 23 Section "Testing, Adjusting, and Balancing for HVAC."

    a. CxA shall use this data to certify that prestart and startup activities have been completed for systems, subsystems, and equipment installation.

D. Ductwork Air Leakage Testing:

1. All portions of the mechanical room ducts, riser ducts and main trunk duct systems shall have ductwork air leakage testing. Only branch ducts downstream of terminal units and ductwork within the conditioned space shall not be tested. Ductwork air leakage testing shall be performed according to Division 23 Section "Metal Ducts," and shall be witnessed by the CxA.
2. On approval of preliminary ductwork air leakage testing report, the CxA shall coordinate verification testing of ductwork air leakage testing. Verification testing shall include random retests of portions of duct section tests, reported in preliminary ductwork air leakage testing report. The HVAC Subcontractor shall perform tests using the same instrumentation (by model and serial number) as for original testing; the CxA shall witness verification testing.

E. Verification of Final TAB Report:

1. CxA shall select, at random, 10 percent of report for field verification.
2. CxA shall notify TAB Subcontractor 10 days in advance of the date of field verification; however, notice shall not include data points to be verified. The TAB Subcontractor shall use the same instruments (by model and serial number) that were used when original data were collected.
3. Failure of an item is defined as follows:

    a. For all readings other than sound, a deviation of more than 10 percent.
    b. For sound pressure readings, a deviation of 3 dB. (Note: Variations in background noise must be considered.)

4. Failure of more than 10 percent of selected items shall result in rejection of final TAB report.

F. If deficiencies are identified during verification testing, CxA shall notify the HVAC Subcontractor and University's Representative, and shall take action to remedy the deficiency. Design Builder and University's Representative shall review final tabulated checklists and data

sheets to determine if verification is complete and that system is operating according to the Contract Documents.

G. CxA shall certify that TAB Work has been successfully completed.

3.3 TESTING

A. Test systems and intersystem performance after test checklists for systems, subsystems, and equipment have been approved.

B. Perform tests using design conditions whenever possible.

1. Simulate conditions by imposing an artificial load when it is not practical to test under design conditions and when written approval for simulated conditions is received from CxA. Before simulating conditions, calibrate testing instruments. Set and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.
2. Alter set points when simulating conditions is not practical and when written approval is received from CxA.
3. Alter sensor values with a signal generator when design or simulating conditions and altering set points are not practical. Do not use sensor to act as signal generator to simulate conditions or override values.

C. Scope of HVAC Subcontractor Testing:

1. Testing scope shall include entire HVAC installation for the project, from point of connection for high temperature water and for chilled water generation through distribution systems to each conditioned space. It shall include measuring capacities and effectiveness of operational and control functions.
2. Test all operating modes, interlocks, control responses, responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.

D. Detailed Testing Procedures: CxA, with HVAC Subcontractor, TAB Subcontractor, and HVAC Instrumentation and Control Subcontractor, shall prepare detailed testing plans, procedures, and checklists for HVAC systems, subsystems, and equipment.

E. Boiler Testing and Acceptance Procedures (if applicable): Testing requirements are specified in Division 23 boiler Sections. CxA shall review and comment on submittals, test data, inspector record, and boiler certification and shall compile information for inclusion in systems manual.

F. HVAC Instrumentation and Control System Testing:

1. Field testing plans and testing requirements are specified in Division 23 Sections "Instrumentation and Controls" and Sequence of Operation. The CxA, HVAC Subcontractor, and the HVAC Instrumentation and Control Subcontractor shall collaborate to prepare testing plans.

2. CxA shall convene a meeting of appropriate entities to review test report of HVAC instrumentation and control systems.

G. Pipe cleaning, flushing, hydrostatic tests, and chemical treatment requirements are specified in Division 23 Sections. HVAC Subcontractor shall prepare pipe system cleaning, flushing, and hydrostatic testing. CxA shall review and comment on plan and final reports. CxA shall certify that pipe cleaning, flushing, hydrostatic tests, and chemical treatment have been completed. Plan shall include the following:

1. Sequence of testing and testing procedures for each section of pipe to be tested, identified by pipe zone or sector identification marker. Markers shall be keyed Drawings for each pipe sector showing the physical location of each designated pipe test section. Drawings keyed to pipe zones or sectors shall be formatted to allow each section of piping to be physically located and identified when referred to in pipe system cleaning, flushing, hydrostatic testing, and chemical treatment plan.
2. Description of equipment for flushing operations.
3. Minimum flushing water velocity.
4. Tracking checklist for managing and ensuring that all pipe sections have been cleaned, flushed, hydrostatically tested, and chemically treated.

H. Energy Supply System Testing (if applicable): HVAC Subcontractor shall prepare a testing plan to verify performance of hot-water systems and equipment. Plan shall include the following:

1. Sequence of testing and testing procedures for each equipment item and pipe section to be tested, identified by pipe zone or sector identification marker. Markers shall be keyed to Drawings for each pipe sector showing the physical location of each designated pipe test section. Drawings keyed to pipe zones or sectors shall be formatted to allow each section of piping to be physically located and identified when referred to in system testing plan.
2. Tracking checklist for managing and ensuring that all pipe sections have been tested.

I. Heat-Generation System Testing (if applicable): HVAC Subcontractor shall prepare a testing plan to verify performance of boilers, feedwater equipment, furnaces, and auxiliary equipment. Plan shall include the following:

1. Sequence of testing and testing procedures for each item of equipment and section of pipe to be tested, identified by identification marker. Markers shall be keyed to Drawings for each pipe sector showing the physical location of each item of equipment and pipe test section. Drawings shall be formatted to allow each item of equipment and section of piping to be physically located and identified when referred to in the system testing plan.
2. Tracking checklist for managing and ensuring that all pipe sections have been tested.

J. Refrigeration System Testing (if applicable): HVAC Subcontractor shall prepare a testing plan to verify performance of, refrigerant compressors and condensers, and other refrigeration systems. Plan shall include the following:

1. Sequence of testing and testing procedures for each item of equipment and section of pipe to be tested, identified by identification marker. Markers shall be keyed to Drawings

showing the physical location of each item of equipment and pipe test section. Drawings shall be formatted to allow each item of equipment and section of piping to be physically located and identified when referred to in the system testing plan.

2. Tracking checklist for managing and ensuring that all pipe sections have been tested.

K. HVAC Distribution System Testing: HVAC Subcontractor shall prepare a testing plan to verify performance of air, steam, and hydronic distribution systems; special exhaust; and other distribution systems. Include HVAC terminal equipment and unitary equipment. Plan shall include the following:

1. Sequence of testing and testing procedures for each item of equipment and section of pipe to be tested, identified by identification marker. Markers shall be keyed to Drawings showing the physical location of each item of equipment and pipe test section. Drawings shall be formatted to allow each item of equipment and section of piping to be physically located and identified when referred to in the system testing plan.
2. Tracking checklist for managing and ensuring that all pipe sections have been tested.

L. Vibration and Sound Tests: HVAC Subcontractor shall prepare testing plans to verify performance of vibration isolation and seismic controls. CxA shall witness and certify tests and inspections.

M. Deferred Testing:

1. If tests cannot be completed because of a deficiency outside the scope of the HVAC system, the deficiency shall be documented and reported to University's Representative. Deficiencies shall be resolved and corrected by appropriate parties and test rescheduled.

N. Testing Reports:

1. Reports shall include measured data, data sheets, and a comprehensive summary describing the operation of systems at the time of testing.
2. Include data sheets for each controller to verify proper operation of the control system, the system it serves, the service it provides, and its location. For each controller, provide space for recording its readout, the reading at the controller's sensor(s), plus comments. Provide space for testing personnel to sign off on each data sheet.
3. Prepare a preliminary test report. Deficiencies will be evaluated by University's Representative to determine corrective action. Deficiencies shall be corrected and test repeated.
4. If it is determined that the system is constructed according to the Contract Documents, University's Representative will decide whether modifications required to bring the performance of the system to the OPR and BoD documents shall be implemented or if tests will be accepted as submitted. If corrective Work is performed, University's Representative will decide if tests shall be repeated and a revised report submitted.

END OF SECTION 23 0800

SECTION 23 0900 - INSTRUMENTATION AND CONTROLS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes control equipment for HVAC systems and components, including control components for terminal heating and cooling units not supplied with factory-wired controls. Building Management System (BMS) functions such as building equipment and building systems monitoring, alarm notification and reporting through the campus-wide BMS network for campus Facilities Management central operating plant supervision. B. Related Sections include the following:

1. Division 23 Section “Air Duct Accessories” and “Custom Air Handling Units” for control dampers.
2. Division 26 Section "Lighting Control Devices" for building lighting control system.
3. Division 28 Section "Digital Addressable Fire Alarm System" for fire and smoke detectors mounted in HVAC systems and equipment.

1.2 DEFINITIONS

A. BAC: Building Automated Control System (same as BMS).

B. BMS: Building Management System.

C. DDC: Direct-digital controls.

D. LAN: Local area network.

E. MS/TP: Master-slave/token-passing.

F. PICS: Protocol Implementation Conformance Statement.

1.3 SYSTEM DESCRIPTION

A. Control system consists of sensors, indicators, actuators, final control elements, interface equipment, other apparatus, accessories, and software connected to distributed controllers operating in a multi-user, multitasking environment on token-passing network and programmed to control mechanical systems.

1.4 SUBMITTALS

A. Product Data: Include manufacturer's technical literature for each control device. Indicate dimensions, capacities, performance characteristics, electrical characteristics, finishes for materials, and installation and startup instructions for each type of product indicated.

1. Each control device labeled with setting or adjustable range of control.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Schematic flow diagrams showing fans, pumps, coils, dampers, valves, sensing devices, and control devices.
2. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.
3. Details of control panel faces, including controls, instruments, and labeling.
4. Written description of sequence of operation.
5. Schedule of dampers including size, leakage, and flow characteristics.
6. Schedule of valves including size, type, leakage and flow characteristics.
7. Network Diagram: Detail network design, showing control composite with controllers, sub-systems, interface equipment, gateways and showing connection method to controlled and monitored systems and equipment. Diagram shall give an overview of work to be performed and shall indicate which contractor shall be responsible for providing hardware necessary to integrate sub-system control systems.
8. Trunk Cable Schematic: Showing programmable control unit locations and trunk data conductors.
9. Listing of connected data points, including connected control unit and input device.
10. System graphics indicating monitored systems, data (connected and calculated) point addresses, and operator notations.
11. System configuration showing peripheral devices, batteries, power supplies, diagrams, modems, and interconnections.

C. Samples: For each color required, of each type of thermostat cover.

D. Software and Firmware Operational Documentation: Include the following:

1. Software operating and upgrade manuals.
2. Program Software Backup: On a magnetic media or compact disc, complete with data files.
3. Device address list.
4. Printout of software application and graphic screens.
5. Software license required by and installed for DDC workstations and control systems.

E. Software Upgrade Kit: For University to use in modifying software to suit future power system revisions or monitoring and control revisions.

F. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.

G. Maintenance Data: For systems to include in maintenance manuals specified in Division 01. Include the following:

1. Maintenance instructions and lists of spare parts for each type of control device, electronic control cabinet and compressed-air station.

2. Interconnection wiring diagrams with identified and numbered system components and devices.
3. Keyboard illustrations and step-by-step procedures indexed for each operator function.
4. Inspection period, cleaning methods, cleaning materials recommended, and calibration tolerances.
5. Calibration records and list of set points.

H. Qualification Data: For firms and persons specified in "Quality Assurance" Article.

I. Project Record Documents: Record actual locations of control components, including control units, thermostats, and sensors. Revise Shop Drawings to reflect actual installation and operating sequences and set points established during commissioning.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who is an authorized representative of the automatic control system manufacturer for both installation and maintenance of units required for this Project.

B. Manufacturer Qualifications: A firm experienced in manufacturing automatic temperature control systems similar to those indicated for this Project and with a record of successful in-service performance.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70), Article 100, by a testing agency acceptable to University's Representative, and marked for intended use.

D. Comply with California Mechanical Code, "Installation of Air Conditioning and Ventilation Systems."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Factory-Mounted Components: Where control devices specified in this Section are indicated to be factory mounted on equipment, arrange for shipping of control devices to unit manufacturer.

1.7 COORDINATION

A. Coordinate location of thermostats, humidistats, and other exposed control sensors with plans and room details before installation.

B. Coordinate equipment with Division 26 Section "Lighting Control Devices" to achieve compatibility with equipment that interfaces with that system.

C. Coordinate equipment with Division 28 Section "Digital Addressable Fire Alarm Systems" to achieve compatibility with equipment that interfaces with that system.

D. Coordinate supply of conditioned electrical circuits for control units and operator workstation.

E. Coordinate equipment with Division 26 Section "Panelboards" to achieve compatibility with starter coils and annunciation devices.

F. Coordinate equipment with Division 26 Section "Motor-Control Centers" to achieve compatibility with motor starters and annunciation devices.

G. Coordinate location of all control cabinets, conduit with Electrical, Mechanical, Fire Alarm, and Security subcontractors to ensure that all panelsconduits are accessible for maintenance and operation and that there is no duplication of effort in installing conduit and tubing supports. Division 26 will install their support rack with at least 25% extra capacity for control conduits and tubing. Division 26 will coordinate with controls electrician wherever rack will need to be made to accommodate the control electrician.

H. Room numbers: Confirm room numbers being used in programming are the final numbers assigned by Facilities Management.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the two following to be compatible with existing Campus Standard central energy monitoring control systems in fit, form and function:

1. Electric, Electronic, DDC Systems and Control Systems Components:

a. Apogee – Siemens Building Technologies to seamlessly tie into existing campus Ethernet energy management system 600 network.
b. Metasys – Johnson Controls, Inc., Controls Group (Branch network), to seamlessly tie into existing campus Ethernet energy management system 600 network. No distributors or local representatives will be acceptable.

2. Interface Graphic Software:

a. Wonderware Graphics - The DDC system shall communicate through a serial interface to the Wonderware Corporation protocol graphic software.

B. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 DDC NETWORK COMMUNICATION AND OPERATOR WORKSTATION

A. Operator Station: Microcomputer station with printer.

B. Workstation: IBM-compatible microcomputer with minimum configuration as follows:

1. Processor: Intel, Pentium 4, 2.0 MHz.
2. Random-Access Memory: 1028 MB.
3. Cache Memory: 256 kB.
4. Graphics: Super video graphic adapter (SVGA), minimum 1280 x 1024 pixels, 128-MB EDO video memory.
5. Monitor: 17 inches, color, LCD type flat screen.
6. Keyboard: QWERTY, 105 keys in ergonomic shape.
7. Floppy-Disk Drives: 1.44 MB.
8. Hard-Disk Drive: 40 GB.
9. CD-Read/Write Drive: 48x.
10. Mouse: Three button.
11. Operating System: Microsoft Windows XP, or later.
12. Network Connection: Ethernet fiber optic connection.
13. Port Communication: USB interface ports to communicate with digital controllers, and printer.
14. UPS Backup Capacity: 30 minutes of operation required.

C. Printer: Color, ink-jet type as follows:

1. Print Head: 1440 x 1440 dpi photoquality color resolution.
2. Internal Memory Buffer: 32 kB.
3. Paper Handling: Minimum of 100 sheets.
4. Print Speed: Minimum of 8 ppm in black and 4 ppm in color.
5. Printer Communication: USB printer cable.

D. Application Software: Include the following:

1. Input/output capability from operator station.
2. Operator system access levels via software password.
3. Database creation and support.
4. Dynamic color graphic displays.
5. Alarm processing.
6. Event processing.
7. Automatic restart of field equipment on restoration of power.
8. Data collection.
9. Graphic development on workstation.
10. Maintenance management.

E. The design of the BAS shall network operator workstations and stand-alone DDC Controllers. The network architecture shall consist of three levels, a campus-wide (Management Level Network) Ethernet network based on TCP/IP protocol, high performance peer-to-peer building level network(s) and DDC Controller floor level local area networks with access being totally transparent to the user when accessing data or developing control programs.

F. The design of BAS shall allow the co-existence of new DDC Controllers with existing DDC Controllers in the same network without the use of gateways or protocol converters.

G. System shall have the capability to be an OPC Server for dynamic communication with OPC Clients over an Ethernet network. At a minimum, the following must be supported:

H. Peer-to-Peer Building Level Network:

1. All operator devices either network resident or connected via dial-up modems shall have the ability to access all point status and application report data or execute control functions for any and all other devices via the peer-to-peer network. No hardware or software limits shall be imposed on the number of devices with global access to the network data at any time.
2. The peer-to-peer network shall support a minimum of 100 DDC controllers and PC workstations
3. Each PC workstation shall support a minimum of 4 peer to peer networks hardwired or dial up.
4. The system shall support integration of third party systems (fire alarm, security, lighting, PCL, chiller, boiler) via panel mounted open protocol processor. This processor shall exchange data between the two systems for interprocess control. All exchange points shall have full system functionality as specified herein for hardwired points.
5. Field panels must be capable of integration with open standards including Modbus, BACnet, and Lonworks as well as with third party devices via existing vendor protocols.
6. Telecommunication Capability:

    a. Auto-dial/auto-answer communications shall be provided to allow DDC Controllers to communicate with remote operator stations and/or remote terminals via telephone lines, as indicated in the sequence of operations.
    b. Auto-dial DDC Controllers shall automatically place calls to workstations to report alarms or other significant events. The auto-dial program shall include provisions for handling busy signals, "no answers" and incomplete data transfers.
    c. Operators at dial-up workstations shall be able to perform all control functions, all report functions and all database generation and modification functions as described for workstations connected via the network. Routines to automatically answer calls from remote DDC or HVAC Mechanical Equipment Controllers shall be inherent in the Controller. The use of additional firmware or software is not acceptable. The fact that communications are taking place with remote DDC or HVAC & Mechanical Equipment Controllers over telephone lines shall be completely transparent to an operator.
    d. Multiple modems shall be supported by DDC or HVAC & Mechanical Equipment Controllers on the Peer-to-Peer Network to ensure continuous communication to workstation.

I. Management Level Network:

1. All PCs shall simultaneously direct connect to the Ethernet and Building Level Network without the use of an interposing device.
2. Operator Workstation shall be capable of simultaneous direct connection and communication with BACnet, OPC, and Apogee networks without the use of interposing devices.

3. The Management Level Network shall not impose a maximum constraint on the number of operator workstations.
4. When appropriate, any controller residing on the peer to peer building level networks shall connect to Ethernet network without the use of a PC or a gateway with a hard drive.
5. Any PC on the Ethernet Management Level Network shall have transparent communication with controllers on the building level networks connected via Ethernet, as well as, directly connected building level networks. Any PC shall be able to interrogate any controller on the building level network.
6. Any break in Ethernet communication from the PC to the controllers on the building level networks shall result in an alarm notification at the PC.
7. The Management Level Network shall reside on industry standard Ethernet utilizing standard TCP/IP, IEEE 802.3.
8. Access to the system database shall be available from any client workstation on the Management Level Network.

2.3 DDC CONTROLLER FLOOR LEVEL NETWORK:

A. This level communication shall support a family of application specific controllers and shall communicate with the peer-to-peer network through DDC Controllers for transmission of global data.

2.4 DDC & HVAC MECHANICAL EQUIPMENT CONTROLLERS

A. The DDC & HVAC Mechanical Equipment Controllers shall reside on the Building Level Network and communicate directly with the server using industry standard Ethernet utilizing standard TCP/IP, IEEE 802.3. Each DDC & HVAC Controller is to be directly connected to the existing campus FACNET domain via Ethernet connection.

B. DDC & HVAC Mechanical Equipment Controllers shall use the same programming language and tools. DDC & HVAC Mechanical Equipment Controllers which require different programming language or tools on a network are not acceptable.

C. DDC & HVAC Mechanical Equipment Controllers which do not meet the functions specified in Section 2.4.1 and Section 2.5 for DDC Controllers or Section 2.4.2 and Section 2.5 for HVAC Mechanical Equipment Controllers are not acceptable.

D. DDC Controllers shall be a 16-bit stand-alone, multi-tasking, multi-user, real-time digital control processors consisting of modular hardware with plug-in enclosed processors, communication controllers, power supplies and input/output point modules. Controller size shall be sufficient to fully meet the requirements of this specification and the attached point I/O schedule. Each controller shall support a minimum of three (3) Floor Level Application Specific Controller Device Networks.

E. Each DDC Controller shall have sufficient memory to support its own operating system and databases, including:

1. Control processes.

2. Energy management applications.
3. Alarm management applications including custom alarm messages for each level alarm for each point in the system.
4. Historical/trend data for points specified.
5. Maintenance support applications.
6. Custom processes.
7. Operator I/O.
8. Dial-up communications.
9. Manual override monitoring.

F. Each DDC Controller shall support firmware upgrades without the need to replace hardware.

G. Provide all processors, power supplies and communication controllers so that the implementation of a point only requires the addition of the appropriate point input/output termination module and wiring.

H. DDC Controllers shall provide a minimum two RS-232C serial data communication ports for operation of operator I/O devices such as industry standard printers, operator terminals, modems and portable laptop operator's terminals. DDC Controllers shall allow temporary use of portable devices without interrupting the normal operation of permanently connected modems, printers or terminals. Controllers shall have industry standard Ethernet utilizing standard TCP/IP, IEEE 802.3 connections.

I. As indicated in the point I/O schedule, the operator shall have the ability to manually override automatic or centrally executed commands at the DDC Controller via local, point discrete, on-board hand/off/auto operator override switches for digital control type points and gradual switches for analog control type points.

1. Switches shall be mounted either within the DDC Controllers key-accessed enclosure, or externally mounted with each switch keyed to prevent unauthorized overrides.
2. DDC Controllers shall monitor the status of all overrides and inform the operator that automatic control has been inhibited. DDC Controllers shall also collect override activity information for reports.

J. DDC Controllers shall provide local LED status indication for each digital input and output for constant, up-to-date verification of all point conditions without the need for an operator I/O device. Graduated intensity LEDs or analog indication of value shall also be provided for each analog output. Status indication shall be visible without opening the panel door.

K. Each DDC Controller shall continuously perform self-diagnostics, communication diagnosis and diagnosis of all panel components. The DDC Controller shall provide both local and remote annunciation of any detected component failures, low battery conditions or repeated failure to establish communication.

L. Isolation shall be provided at all peer-to-peer network terminations, as well as all field point terminations to suppress induced voltage transients consistent with:

1. RF-Conducted Immunity (RFCI) per ENV 50141 (IEC 1000-4-6) at 3 V.

2. Electro Static Discharge (ESD) Immunity per EN 61000-4-2 (IEC 1000-4-2) at 8 kV air discharge, 4 kV contact.
3. Electrical Fast Transient (EFT) per EN 61000-4-4 (IEC 1000-4-4) at 500 V signal, 1 kV power.
4. Output Circuit Transients per UL 864 (2,400V, 10A, 1.2 Joule max).
5. Isolation shall be provided at all peer-to-peer panels' AC input terminals to suppress induced voltage transients consistent with:

    a. IEEE Standard 587-1980.
    b. UL 864 Supply Line Transients.
    c. Voltage Sags, Surge, and Dropout per EN 61000-4-11 (EN 1000-4-11).

M. In the event of the loss of normal power, there shall be an orderly shutdown of all DDC Controllers to prevent the loss of database or operating system software. Non-volatile memory shall be incorporated for all critical controller configuration data and battery backup shall be provided to support the real-time clock and all volatile memory for a minimum of 60 days.

1. Upon restoration of normal power, the DDC Controller shall automatically resume full operation without manual intervention.
2. Should DDC Controller memory be lost for any reason, the user shall have the capability of reloading the DDC Controller via the local RS-232C port, via telephone line dial-in or from a network workstation PC.

N. Provide a separate DDC Controller for each AHU or other HVAC system as indicated in Section 3.02. It is intended that each unique system be provided with its own point resident DDC Controller.

O. HVAC Mechanical Equipment Controllers shall be a 12-bit stand-alone, multi-tasking, multi-user, real-time digital control processors consisting of modular hardware with plug-in enclosed processors.

P. Each HVAC Mechanical Controller shall have sufficient memory to support its own operating system and databases, including:

1. Control processes.
2. Energy management applications.
3. Alarm management applications including custom alarm messages for each level alarm for each point in the system.
4. Historical/trend data for points specified.
5. Maintenance support applications.
6. Custom processes.
7. Operator I/O.
8. Dial-up communications.

Q. Each HVAC Mechanical Equipment Controller shall support firmware upgrades without the need to replace hardware.

R. HVAC Mechanical Equipment Controllers shall provide a RS-232C serial data communication port for operation of operator I/O devices such as industry standard printers, operator terminals, modems and portable laptop operator's terminals.

S. HVAC Mechanical Equipment Controllers shall provide local LED status indication for each digital input and output for constant, up-to-date verification of all point conditions without the need for an operator I/O device.

T. Each HVAC Mechanical Equipment Controller shall continuously perform self-diagnostics, communication diagnosis and diagnosis of all components. The HVAC Mechanical Equipment Controller shall provide both local and remote annunciation of any detected component failures, low battery conditions or repeated failure to establish communication.

U. Isolation shall be provided at all peer-to-peer network terminations, as well as all field point terminations to suppress induced voltage transients consistent with:

1. RF-Conducted Immunity (RFCI) per ENV 50141 (IEC 1000-4-6) at 3 V.
2. Electro Static Discharge (ESD) Immunity per EN 61000-4-2 (IEC 1000-4-2) at 8 kV air discharge, 4 kV contact.
3. Electrical Fast Transient (EFT) per EN 61000-4-4 (IEC 1000-4-4) at 500 V signal, 1 kV power.
4. Output Circuit Transients per UL 864 (2,400V, 10A, 1.2 Joule max).
5. Isolation shall be provided at all peer-to-peer panel's AC input terminals to suppress induced voltage transients consistent with:

    a. IEEE Standard 587-1980.
    b. UL 864 Supply Line Transients.
    c. Voltage Sags, Surge, and Dropout per EN 61000-4-11 (EN 1000-4-11).

V. In the event of the loss of normal power, there shall be an orderly shutdown of all HVAC Mechanical Equipment Controllers to prevent the loss of database or operating system software. Non-volatile memory shall be incorporated for all critical controller configuration data and battery backup shall be provided to support the real-time clock and all volatile memory for a minimum of 72 hours.

1. Upon restoration of normal power, the HVAC Mechanical Equipment Controller shall automatically resume full operation without manual intervention.
2. Should HVAC Mechanical Equipment Controller memory be lost for any reason, the user shall have the capability of reloading the HVAC Mechanical Equipment Controller via the local RS-232C port, via telephone line dial-in or from a network workstation PC.

2.5 DDC & HVAC MECHANICAL EQUIPMENT CONTROLLER RESIDENT SOFTWARE FEATURES

A. General: The software programs specified in this Section shall be provided as an integral part of DDC and HVAC Mechanical Equipment Controllers and shall not be dependent upon any higher level computer for execution.

1. All points shall be identified by up to 30 character point name and 16 character point descriptor. The same names shall be used at the PC workstation.
2. All digital points shall have user defined two-state status indication (descriptors with minimum of 8 characters allowed per state (i.e. summer/winter)).

B. Control Software Description:

1. The DDC and HVAC Mechanical Equipment Controllers shall have the ability to perform the following pre-tested control algorithms:

   a. Two-position control.
   b. Proportional control.
   c. Proportional plus integral control.
   d. Proportional, integral, plus derivative control.
   e. Automatic tuning of control loops.

C. DDC and HVAC Mechanical Equipment Controllers shall provide the following energy management routines for the purpose of optimizing energy consumption while maintaining occupant comfort.

1. Start-Stop Time Optimization (SSTO) shall automatically be coordinated with event scheduling. The SSTO program shall start HVAC equipment at the latest possible time that will allow the equipment to achieve the desired zone condition by time of occupancy. The SSTO program shall also shut down HVAC equipment at the earliest possible time before the end of the occupancy period, and still maintain desired comfort conditions.

   a. The SSTO program shall operate in both the heating and cooling seasons.

      1) It shall be possible to apply the SSTO program to individual fan systems.
      2) The SSTO program shall operate on both outside weather conditions as well as inside zone conditions and empirical factors.

   b. The SSTO program shall meet the local code requirements for minimum outside air while the building is occupied.

2. Event Scheduling: Provide a comprehensive menu driven program to automatically start and stop designated points or groups of points according to a stored time.

   a. It shall be possible to individually command a point or group of points.
   b. For points assigned to one common load group, it shall be possible to assign variable time delays between each successive start or stop within that group.
   c. The operator shall be able to define the following information:

      1) Time, day.
      2) Commands such as on, off, auto, and so forth.
      3) Time delays between successive commands.

4) There shall be provisions for manual overriding of each schedule by an appropriate operator.

d. It shall be possible to schedule events up to one year in advance.

1) Scheduling shall be calendar based.
2) Holidays shall allow for different schedules.

3. Enthalpy switchover (economizer) .The Energy Management Control Software (EMCS) will control the position of the air handler relief, return, and outside air dampers. If the outside air dry bulb temperature falls below changeover set point the EMCS will modulate the dampers to provide 100 percent outside air. The user will be able to quickly changeover to an economizer system based on dry bulb temperature and will be able to override the economizer cycle and return to minimum outside air operation at any time.
4. Temperature-compensated duty cycling.

a. The DCCP (Duty Cycle Control Program) shall periodically stop and start loads according to various patterns.
b. The loads shall be cycled such that there is a net reduction in both the electrical demands and the energy consumed.

5. Automatic Daylight Savings Time Switchover: The system shall provide automatic time adjustment for switching to/from Daylight Savings Time.
6. Night setback control: The system shall provide the ability to automatically adjust setpoints for night control.
7. The Peak Demand Limiting (PDL) program shall limit the consumption of electricity to prevent electrical peak demand charges.

a. PDL shall continuously track the amount of electricity being consumed, by monitoring one or more electrical kilowatt-hour/demand meters. These meters may measure the electrical consumption (kWh), electrical demand (kW), or both.
b. PDL shall sample the meter data to continuously forecast the demand likely to be used during successive time intervals.
c. If the PDL forecasted demand indicates that electricity usage is likely to exceed a user preset maximum allowable level, then PDL shall automatically shed electrical loads.
d. Once the demand peak has passed, loads that have been shed shall be restored and returned to normal control.

D. DDC and HVAC Mechanical Equipment Controllers shall be able to execute custom, job-specific processes defined by the user, to automatically perform calculations and special control routines.

1. A single process shall be able to incorporate measured or calculated data from any and all other DDC and HVAC Mechanical Equipment Controllers on the network. In addition, a single process shall be able to issue commands to points in any and all other DDC and HVAC Mechanical Equipment Controllers on the network. Database shall support 30 character, English language point names, structured for searching and logs.

2. Processes shall be able to generate operator messages and advisories to operator I/O devices. A process shall be able to directly send a message to a specified device or cause the execution of a dial-up connection to a remote device such as a printer or pager.
3. DDC and HVAC Mechanical Equipment Controller shall provide a HELP function key, providing enhanced context sensitive on-line help with task orientated information from the user manual.
4. DDC and HVAC Mechanical Equipment Controller shall be capable of comment lines for sequence of operation explanation.

E. Alarm management shall be provided to monitor and direct alarm information to operator devices. Each DDC and HVAC Mechanical Equipment Controller shall perform distributed, independent alarm analysis and filtering to minimize operator interruptions due to non-critical alarms, minimize network traffic and prevent alarms from being lost. At no time shall the DDC and HVAC Mechanical Equipment Controllers ability to report alarms be affected by either operator or activity at a PC workstation, local I/O device or communications with other panels on the network.

1. All alarm or point change reports shall include the point's English language description and the time and date of occurrence.
2. The user shall be able to define the specific system reaction for each point. Alarms shall be prioritized to minimize nuisance reporting and to speed operator response to critical alarms. A minimum of six priority levels shall be provided for each point. Point priority levels shall be combined with user definable destination categories (PC, printer, DDC Controller, etc.) to provide full flexibility in defining the handling of system alarms. Each DDC and HVAC Mechanical Equipment Controller shall automatically inhibit the reporting of selected alarms during system shutdown and start-up. Users shall have the ability to manually inhibit alarm reporting for each point.
3. Alarm reports and messages will be directed to a user-defined list of operator devices or PCs based on time (after hours destinations) or based on priority.
4. In addition to the point's descriptor and the time and date, the user shall be able to print, display or store a 200 character alarm message to more fully describe the alarm condition or direct operator response.
5. In dial-up applications, operator-selected alarms shall initiate a call to a remote operator device.

F. A variety of historical data collection utilities shall be provided to manually or automatically sample, store and display system data for points as specified in the I/O summary.

1. Any point, physical or calculated may be designated for trending. Any point, regardless of physical location in the network, may be collected and stored in each DDC and HVAC Mechanical Equipment Controllers point group. Two methods of collection shall be allowed: either by a pre-defined time interval or upon a pre-defined change of value. Sample intervals of l minute to 7 days shall be provided. Each DDC and HVAC Mechanical Equipment Controller shall have a dedicated RAM-based buffer for trend data and shall be capable of storing a minimum of __ data samples. All trend data shall be available for transfer to a Workstation without manual intervention.
2. DDC and HVAC Mechanical Equipment Controllers shall also provide high resolution sampling capability for verification of control loop performance. Operator-initiated

automatic and manual loop tuning algorithms shall be provided for operator-selected PID control loops as identified in the point I/O summary.

a. Loop tuning shall be capable of being initiated either locally at the DDC and HVAC Mechanical Equipment Controller, from a network workstation or remotely using dial-in modems. For all loop tuning functions, access shall be limited to authorized personnel through password protection.

G. DDC and HVAC Mechanical Equipment Controllers shall be capable of automatically accumulating and storing run-time hours for digital input and output points and automatically sample, calculate and store consumption totals for analog and digital pulse input type points, as specified in the point I/O schedule.

H. The peer to peer network shall allow the DDC and HVAC Mechanical Equipment Controllers to access any data from or send control commands and alarm reports directly to any other DDC and HVAC Mechanical Equipment Controller or combination of controllers on the network without dependence upon a central or intermediate processing device. DDC and HVAC Mechanical Equipment Controllers shall send alarm reports to multiple workstations without dependence upon a central or intermediate processing device. The peer to peer network shall also allow any DDC and HVAC Mechanical Equipment Controller to access, edit, modify, add, delete, back up, and restore all system point database and all programs.

1. The peer to peer network shall allow the DDC and HVAC Mechanical Equipment Controllers to assign a minimum of 50 passwords access and control priorities to each point individually. The logon password (at any PC workstation or portable operator terminal) shall enable the operator to monitor, adjust and control the points that the operator is authorized for. All other points shall not be displayed on the PC workstation or portable terminal (e.g. all base building and all tenant points shall be accessible to any base building operators, but only tenant points shall be accessible to tenant building operators). Passwords and priorities for every point shall be fully programmable and adjustable.

2.6 FLOOR LEVEL NETWORK APPLICATION SPECIFIC CONTROLLERS (ASC)

A. Each DDC Controller shall be able to extend its performance and capacity through the use of remote application specific controllers (ASCs) through Floor Level LAN Device Networks.

B. Each ASC shall operate as a stand-alone controller capable of performing its specified control responsibilities independently of other controllers in the network. Each ASC shall be a microprocessor-based, multi-tasking, real-time digital control processor. Provide the following types of ASCs as a minimum:

1. Central System Controllers.
2. Terminal Equipment Controllers.

C. Each ASC shall be capable of control of the terminal device independent of the manufacturer of the terminal device.

D. Central System Controllers:

1. Provide for control of central HVAC systems and equipment including, but not limited to, the following:

    a. Custom or Built-up air handling systems.
    b. Laboratory Exhaust System interfacing with building Air Handling Systems.
    c. Process Chilled water systems.
    d. Heating Hot Water Heat Exchangers systems.
    e. Steam and back-up Steamsystems.

2. Controllers shall include all point inputs and outputs necessary to perform the specified control sequences. Provide a hand/off/automatic switch for each digital output for manual override capability. Switches shall be mounted either within the controller's key-accessed enclosure, or externally mounted with each switch keyed to prevent unauthorized overrides. In addition, each switch position shall be supervised in order to inform the system that automatic control has been overridden.
3. Each controller shall support its own real-time operating system. Provide a time clock with battery backup to allow for stand-alone operation in the event communication with its DDC Controller is lost and to insure protection during power outages.
4. All programs shall be field-customized to meet the user's exact control strategy requirements. Central System controllers utilizing pre-packaged or canned programs shall not be acceptable. As an alternative, provide DDC Controllers for all central equipment in order to meet custom control strategy requirements.
5. Programming of central system controllers shall utilize the same language and code as used by DDC Controllers to maximize system flexibility and ease of use. Should the system controller utilize a different control language, provide a DDC Controller to meet the specified functionality.
6. Each controller shall have connection provisions for a portable operator's terminal. This tool shall allow the user to display, generate or modify all point databases and operating programs.

E. Terminal Equipment Controllers:

1. Provide for control of each piece of equipment, including, but not limited to, the following:

    a. Variable Air Volume (VAV) boxes.
    b. Unit Conditioners.
    c. Unit Ventilators.
    d. Room Pressurization.

2. Controllers shall include all point inputs and outputs necessary to perform the specified control sequences. Analog outputs shall be industry standard signals such as 24V floating control, 0-10v, allowing for interface to a variety of modulating actuators.
3. All controller sequences and operation shall provide closed loop control of the intended application. Closing control loops over the FLN, BLN or MLN is not acceptable. F. Digital Energy Monitors:

1. Provide three phase digital watt-meters with pre-wired CTs. All watt-meter electronics shall be housed within the CTs. CTs shall include sizes capable of mounting directly on a power bus. Diagnostics visible to the installing electrician (without an operator tool) shall indicate: proper operation, mis-wiring or low power-factor, device malfunction, and over-load condition. The meters shall include the following:

    a. The device shall be UL Listed, and shall comply with ANSI C12.1 accuracy specification. The minimum CT/meter combined accuracy shall be no greater than 1% of reading over the range of 5% to 100% of rated load. The meter shall not require calibration.
    b. The wattmeter shall directly connect to power from 208 through 480 with no potential transformer. In-line fuses for each voltage tap phase shall be included.
    c. The wattmeter CTs shall be split-core and at minimum be sized to accommodate loads ranging from 100 to 2400 Amps. The CTs shall be volt-signal type, and shall not require shorting blocks.
    d. The wattmeter shall reside directly on the Floor Level Network along with other FLN devices. Data transferred shall include:

        1) kW & kWH.
        2) Consumption.
        3) Demand.
        4) Power Factor.
        5) Current.
        6) Voltage.
        7) Apparent Power.
        8) Reactive Power.

2.7 LOCAL USER DISPLAY

A. Where specified in the sequence of operation or points list, the controllers on the peer to peer building level network shall have a display and keypad for local interface. A keypad shall be provided for interrogating and commanding points in the controller.

1. The display shall use the same security password and access rights for points in the display as is used in the associated controller.
2. The LCD display shall be a minimum of a 2 line 40 character display.
3. The LCD display shall include the full point name, value (numeric, digital or state text), point priority and alarm status on one screen.
4. The LCD shall dynamically update the value, priority, and alarm status for the point being displayed.
5. The display shall be mounted either on the door of the enclosure or remote from the controller.

2.8 WORKSTATION OPERATOR INTERFACE

A. Basic Interface Description:

1. Operator workstation interface software shall minimize operator training through the use of English language prompting, 30 character English language point identification, online help, and industry standard PC application software. Interface software shall simultaneously communicate with up to 4 Building Level Networks and share data between any of the 4 networks. The software shall provide, as a minimum, the following functionality:

    a. Real-time graphical viewing and control of environment.
    b. Scheduling and override of building operations.
    c. Collection and analysis of historical data.
    d. Point database editing, storage and downloading of controller databases.
    e. Alarm reporting, routing, messaging, and acknowledgment.
    f. Display dynamic data trend plot:

        1) Must be able to run multiple plots simultaneously.
        2) Each plot must be capable of supporting 10 pts/plot minimum.
        3) Must be able to command points directly off dynamic trend plot application.

    g. Definition and construction of dynamic color graphic displays.
    h. Program editing.
    i. Transfer trend data to 3rd party software.
    j. Scheduling reports.
    k. Operator Activity Log.
    l. Open communications via OPC Server.
    m. Open communications via BACnet Client & Server.

2. Provide a graphical user interface which shall minimize the use of keyboard through the use of a mouse or similar pointing device and "point and click" approach to menu selection.
3. The software shall provide a multi-tasking type environment that allows the user to run several applications simultaneously. BAS software shall run on a Windows NT 32 bit operating. These Windows applications shall run simultaneously with the BAS software. The mouse or Alt-Tab keys shall be used to quickly select and switch between multiple applications. The operator shall be able to work in Microsoft Word, Excel, and other Windows based software packages, while concurrently annunciating on-line BAS alarms and monitoring information.

    a. Provide functionality such that any of the following may be performed simultaneously on-line, and in any combination, via user-sized windows. Operator shall be able to drag and drop information between applications, reducing the number of steps (i.e. Click on a point on the alarm screen and drag it to the dynamic trend graph application to initiate a dynamic trend).

        1) Dynamic color graphics and graphic control.
        2) Alarm management, routing to designated locations, and customized messages.
        3) Year in advance event and report scheduling.
        4) Dynamic trend data definition and presentation.

5) Graphic definition and construction.
6) Program and point database editing on-line.

b. If the software is unable to display several different types of displays at the same time, the BAS contractor shall provide at least two operator workstations.
c. Report and alarm printing shall be accomplished via Windows Print Manager, allowing use of network printers.

4. Operator specific password access protection shall be provided to allow the user/manager to limit workstation control, display and data base manipulation capabilities as deemed appropriate for each user, based upon an assigned password. Operator privileges shall "follow" the operator to any workstation logged onto (up to 999 user accounts shall be supported).
5. Reports shall be generated on demand or via pre-defined schedule and directed to CRT displays, printers or disk. As a minimum, the system shall allow the user to easily obtain the following types of reports:

a. A general listing of all or selected points in the network.
b. List of all points currently in alarm.
c. List of all points currently in override status.
d. List of all disabled points.
e. List of all points currently locked out.
f. List of user accounts and access levels.
g. List all weekly schedules.
h. List of holiday programming.
i. List of limits and deadbands.
j. Custom reports from 3rd party software.
k. System diagnostic reports including, list of DDC panels on line and communicating, status of all DDC terminal unit device points.
l. List of programs.

6. Scheduling and Override:

a. Provide a calendar type format for simplification of time-of-day scheduling and overrides of building operations. Schedules reside in the PC workstation, DDC Controller, and HVAC Mechanical Equipment Controller to ensure time equipment scheduling when PC is off-line, PC is not required to execute time scheduling. Provide override access through menu selection or function key. Provide the following spreadsheet graphic types as a minimum:

1) Weekly schedules.
2) Zone schedules, minimum of 200 unique zones.
3) Scheduling for up to 365 days in advance.
4) Schedule reports to print at PC.

7. Collection and Analysis of Historical Data:

a. Provide trending capabilities that allow the user to easily monitor and preserve records of system activity over an extended period of time. Any system point may be trended automatically at time-based intervals or change of value, both of which shall be user-definable. Trend data may be stored on hard disk for future diagnostics and reporting. Additionally, trend data may be archived to network drives or removable disk media for future retrieval.
b. Trend data reports shall be provided to allow the user to view all trended point data. Reports may be customized to include individual points or predefined groups of at least six points. Provide additional functionality to allow predefined groups of up to 250 trended points to be easily transferred on-line to Microsoft Excel. DDC contractor shall provide custom designed spreadsheet reports for use by the owner to track energy usage and cost, equipment run times, equipment efficiency, and/or building environmental conditions. DDC contractor shall provide setup of custom reports including creation of data format templates for monthly or weekly reports.

B. Dynamic Color Graphic Displays:

1. At the Central Plant, the system shall communicate through a serial interface to the Wonderware Corporation protocol graphic software. This interface shall be a program language, which communicates directly with the Wonderware program in the Central Plant, without the aid of a translator box, interface panel, or sub-program language or processor.
2. Create a minimum of 1 color graphic floor plan displays and system schematics for each piece of mechanical equipment, including air handling units, chilled water systems and hot water boiler systems, and room level terminal units, shall be provided by the BAS contractor as indicated in the point I/O schedule of this specification to optimize system performance, analysis and speed alarm recognition.
3. The operator interface shall allow users to access the various system schematics and floor plans via a graphical penetration scheme, menu selection or text-based commands. Graphics software shall permit the importing of Autocad or scanned pictures for use in the system.
4. Dynamic temperature values, humidity values, flow values and status indication shall be shown in their actual respective locations and shall automatically update to represent current conditions without operator intervention and without pre-defined screen refresh rates.

    a. Sizable analog bars shall be available for monitor and control of analog values; high and low alarm limit settings shall be displayed on the analog scale. The user shall be able to "click and drag" the pointer to change the setpoint.
    b. Provide the user the ability to display blocks of point data by defined point groups; alarm conditions shall be displayed by flashing point blocks.
    c. Equipment state can be changed by clicking on the point block or graphic symbol and selecting the new state (on/off) or setpoint.
    d. State text for digital points can be defined up to eight characters.

5. Colors shall be used to indicate status and change as the status of the equipment changes. The state colors shall be user definable.
6. The windowing environment of the PC operator workstation shall allow the user to simultaneously view several applications at a time to analyze total building operation or to

allow the display of a graphic associated with an alarm to be viewed without interrupting work in progress.

7. A clipart library of HVAC and automation symbols shall be provided including fans, valves, motors, chillers, AHU systems, standard ductwork diagrams and laboratory symbols. The user shall have the ability to add custom symbols to the clipart library.
8. A dynamic display of the site specific architecture showing status of controllers, PC workstations and networks shall be provided.

C. System Configuration & Definition:

1. Network wide control strategies shall not be restricted to a single DDC Controller or HVAC Mechanical Equipment controller, but shall be able to include data from any and all other network panels to allow the development of Global control strategies.
2. Provide automatic backup and restore of all DDC controller and HVAC Mechanical Equipment controller databases on the workstation hard disk. In addition, all database changes shall be performed while the workstation is on-line without disrupting other system operations. Changes shall be automatically recorded and downloaded to the appropriate DDC Controller or HVAC Mechanical Equipment Controller. Changes made at the DDC Controllers or HVAC Mechanical Equipment Controllers shall be automatically uploaded to the workstation, ensuring system continuity.
3. System configuration, programming, editing, graphics generation shall be performed online. If programming and system back-up must be done with the PC workstation off-line, the BAS contractor shall provide at least 2 operator workstations.

D. Alarm Management:

1. Alarm Routing shall allow the user to send alarm notification to selected printers or PC location based on time of day, alarm severity, or point type.
2. Alarm Notification shall be provided via two alarm icons, to distinguish between routine, maintenance type alarms and critical alarms. These alarm icons shall be displayed when user is working in other Windows programs. The BAS alarm display screen shall be displayed when the user clicks on the alarm icon.
3. Alarm Display shall list the alarms with highest priority at the top of the display. The alarm display shall provide selector buttons for display of the associated point graphic and message. The alarm display shall provide a mechanism for the operator to sort alarms.
4. Alarm messages shall be customizable for each point to display detailed instructions to the user regarding actions to take in the event of an alarm.

2.9 FIELD DEVICES

A. Provide instrumentation as required for monitoring, control or optimization functions.

B. Room Temperature Sensors: Digital room sensors shall have LCD display, day / night override button, and set point slide adjustment override options. Cover shall be white. The setpoint slide adjustment can be software limited by the automation system to limit the amount of room adjustment.

1. Temperature Monitoring Range: +20/120°F.
2. Output signal: Changing Resistance.
3. Accuracy at Calibration Point: ±0.5°F.
4. Set Point and Display Range: 55° to 95° F.

C. Liquid Immersion Temperature:

1. The temperature sensors shall be furnished and installed in stainless steel wells that are threaded in the pipe using "thread-o-let" fittings or equivalent at locations approved by the University's Representative.
2. Each temperature sensor shall be resistance type fabricated with reference grade platinum wire, 100 ohm RTD based on a "Din Curve". Two separate temperature signals shall be individually transmitted to the BTU computer via separate wiring. Accuracy of the system shall be + 0.5°F. or + 0.1% of the measured temperature. Temperature measurements using gas or mercury filled bulbs will not be allowed for BTU calculations
3. Manufacturer shall be Minco and sensor range will match the medium that it will measure.
4. Duct (single point) Temperature:

    a. Temperature Monitoring Range: +20/120°F (-7°/49°C).
    b. Output Signal: Changing resistance.
    c. Accuracy at Calibration Point: ±0.5°F (+/-0.3°C).

5. Duct Average Temperature:

    a. Temperature Monitoring Range: +20° ±120°F (-7°/+49°C).
    b. Output Signal: 4 – 20 mA DC.
    c. Accuracy at Calibration Point: ±0.5°F (±03°C).
    d. Sensor Probe Length: 25' L (7.3m).

6. Outside Air Temperature:

    a. Temperature Monitoring Range: -58°±122° F (-50ºC to +50ºC).
    b. Output Signal: 4 – 20 mA DC.
    c. Accuracy at Calibration Point: ±0.5°F (+/-0.3°C).

D. Liquid Differential Pressure Transmitter:

1. Ranges:

    a. 0-5/30 inches H20.
    b. 0-25/150 inches H20.
    c. 0-125/750 inches H20.
    d. 0-30 psi.
    e. 0-50 psi.

2. Output: 4 – 20 mA DC.
3. Calibration Adjustments: Zero and span.
4. Accuracy: ±-0.2% of span.

5. Linearity: ±-0.1% of span.
6. Hysteresis: ±-0.05% of span.

E. Differential Pressure:

1. Unit for fluid flow proof shall be Penn P74.
2. Range: 8 to 70 psi.
3. Differential: 3 psi.
4. Maximum Differential Pressure: 200 psi.
5. Maximum Pressure: 325 psi.
6. Unit for air flow shall be Siemens Building Technologies SW141.
7. Set Point Ranges:

    a. 0.5" WG to 1.0" WG (124.4 to 248.8 Pa).
    b. 1.0" WG to 12.0" WG (248.8 to 497.6 Pa).

F. Static Pressure Sensor:

1. Range:

    a. 0 to .5" WG (0 to 124.4 Pa).
    b. 0 to 1" WG (0 to 248.8 Pa).
    c. 0 to 2" WG (0 to 497.7 Pa).
    d. 0 to 5" WG (0 to 1.2 kPa).
    e. 0 to 10" WG (0 to 2.5 kPa).

2. Output Signal: 4 – 20 mA VDC.
3. Combined Static Error: 0.5% full range.
4. Operating Temperature: -40º to 175º F (-40C to 79.5ºC).

G. Air Pressure Sensor:

1. Range:
    a. 0 to 0.1 in. water (0 to 24.9 Pa).
    b. 0 to 0.25 in. water (0 to 63.2 Pa).
    c. 0 to 0.5 in. water (0 to 124.5 Pa).
    d. 0 to 1.0 in. water (o to 249 Pa).
    e. 0 to 2.0 in water 90 to 498 Pa).
    f. 0 to 5.0 in. water (0 to 1.25 kPa).
    g. 0 to 10.0 in. water (0 to 2.49 kPa).

2. Output signal: 4 to 20 mA.
3. Accuracy: ±1.0% of full scale.

H. Humidity Sensors:

1. Range: 0 to 100% RH.
2. Sensing Element: Bulk Polymer.

3. Output Signal: 4 – 20 mA DC.
4. Accuracy: At 77°F (25ºC) ± 2% RH.

I. Pressure to Current Transducer:

1. Range:

   a. 3 to 15 psig (21 to 103 kPa) or
   b. 3 to 30 psig (21 to 207 kPa).

2. Output Signal: 4 – 20 mA.
3. Accuracy: ± 1% of full scale (± 0.3 psig).
4. All automatic temperature control valves in water lines shall be provided with Characterized throttling plugs and shall be sized for minimum 25% of the system pressure drop or 5 psi, whichever is less.

   a. Two position valves shall be line size.

J. Electric Damper Actuators:

1. Electric control shall be Siemens Building Technologies OpenAir™ direct coupled actuators on dampers with an area of less than 5 sq ft.
2. Electric Damper actuators shall be Brushless DC Motor Technology with stall protection, bi-directional, all metal housing, manual override, independently adjustable dual auxiliary switch.

   a. For parallel fan isolation damper actuators, provide fail safe spring return closer.
   b. The actuator assembly shall include the necessary hardware and proper mounting and connection to a standard ½" diameter shaft or damper blade.

3. Actuators shall be designed for mounting directly to the damper shaft without the need for connecting linkages.
4. All actuators having more than 100 lb-in torque output shall have a self-centering damper shaft clamp that guarantees concentric alignment of the actuator's output coupling with the damper shaft. The self-centering clamp shall have a pair of opposed "v" shaped toothed cradles; each having two rows of teeth to maximize holding strength. A single clamping bolt shall simultaneously drive both cradles into contact with the damper shaft.
5. All actuators having more than a 100 lb-in torque output shall accept a 1" diameter shaft directly, without the need for auxiliary adapters.
6. All actuators shall be designed and manufactured using ISO9000 registered procedures, and shall be Listed under Standards UL873 and CSA22.2 No. 24-93 l.
7. Actuator Accessories: Equip each unit with visible position indicators, 125% torque rating (over application torque demand), go second stroke-cycle adjustable stroke stops, installation hardware, positive feedback positioners, and adjustable start and operating ranges, and for parallel fan isolation dampers provide spring return to "failsafe" position.

2.10 CONTROL VALVES

A. Control Valves: Factory fabricated, of type, body material, and pressure class based on the maximum pressure and temperature rating of the piping system, valves shall fail in the closed position unless otherwise indicated.

B. NPS 2 and Smaller:

1. Glove Valve,Bronze body, bronze, or 316 SS trim, rising stainless steel stem, renewable compositiondisc, and screwed ends.
2. Characterized port Ball Valve: Bronze body, SS ball.

C. Globe Valves: NPS 2-1/2 and Larger shall not be used.

D. Characterized port Ball Valves: NPS 1½ and Larger: Iron Body, stainless steel trim, flanged ends, renewable internal components.

E. Hydronic system: globe or ball valves shall have the following characteristics:

3. Rating: ANSI Class 150.
4. Internal Construction: Replaceable plugs and seats of stainless steel, bronze, or Monel. Globe valves shall be single seated.
5. Sizing: 3-psig maximum ensure valve selection Cv for a head/pressure loss of 10 feet, 50% of coil pressure drop at design flow rate, or 20% of system ΔP, whichever is greater.
6. Flow Characteristics: Two-way valves shall have equal percentage characteristics; threeway valves shall have linear characteristics. Operators shall close valves against pump shutoff head pressure – minimum 100 psig for central plant chilled water applications. Three-way valves are prohibited in the chilled water system. Use of three-way valves in heating water systems shall be limited to end-of-run installations as approved by the University during the design.
7. Leakage rate shall be 0.1% of rated valve flow coefficient (C_v) for soft-seated valves and 0.5% for metal-to-metal seated valves.
8. Turndown ratio: 100:1.
9. Large Valves: For flow rates greater than 100 GPM, valves shall be characterized port ball type as manufactured by Fisher, Samson Controls or Valtek.

G. Steam System Control Valves: The University main campus does not distribute steam for general heating purposes. Control valves shall be packaged by the equipment manufacturer and fully compatible with the steam system where they are installed (e.g. cage washer booster heater). Work in the University's Central Generating Facility is special construction and is not covered by this section.

H. Terminal Unit Control Valves: Bronze body, bronze or PTFE trim, replaceable plugs and seats, threaded ends.

1. Rating: Class 125 for service at 125 psig and 250 deg F operating conditions.
2. Sizing: 3-psig maximum pressure drop at design flow rate, to close against pump shutoff head or 100-psig. Positioners are not required.
3. Flow Characteristics: Valves shall have equal percentage characteristics.
4. Actuators: Actuator shall provide visual indication of valve position if electronically actuated.

5. Type: Terminal unit valves may be globe or characterized-port ball valves.
6. Manufacturers: Siemens, Griswold, or equal.

I. Two-position Isolation valves: Where indicated, provide motor operated gate valves for isolating hydronic boilers and steam boilers.

5. Gate valves shall be OS&Y, Iron-body, bronze-mounted. Actuators shall be AUMA.

2.12 MISCELLANEOUS DEVICES

A. Thermostats:

1. Room thermostats shall be of the gradual acting type with adjustable sensitivity.
2. They shall have a bi-metal sensing element capable of responding to a temperature change of one-tenth of one degree. (Provide all thermostats with limit stops to limit adjustments as required.)
3. Thermostats shall be arranged for either horizontal or vertical mounting.
4. In the vertical position thermostat shall fit on a mullion of movable partitions without overlap.
5. Mount the thermostat covers with tamper-proof socket head screws.

B. Fan Inlet Airflow Measuring Station (Provided by unit manufacturer):

1. Each station shall contain total and static pressure sensing manifolds, internal piping and external pressure transmission ports with flexible tubing and quick-connect fittings. Fabricate of galvanized steel, size for fan inlet in which mounted. Maximum pressure loss through station of 0.08 inches water gage at 1500 fpm. Station shall have accuracy of 2%. Identify by model number, size, area, and specified airflow capacity.

C. Current Sensing Relay:

1. Provide solid-state, adjustable, current operated relay. Provide a relay which changes switch contact state in response to an adjustable set point value of current in the monitored A/C circuit.
2. Adjust the relay switch point so that the relay responds to motor operation under load as an "on" state and so that the relay responds to an unloaded running motor as an "off" state. A motor with a broken belt is considered an unloaded motor.
3. Provide for status device for all fans and pumps.

D. Occupancy Sensor: Dual technology, motion and passive infrared, with time delay, daylight sensor lockout, sensitivity control, and 180-degree field of view with vertical sensing adjustment, for flush mounting. Occupancy sensor provided and mounted by Division 26 where required.

E. Carbon-Dioxide Sensor and Transmitter: Single detectors, using solid-state infrared sensors, suitable over a temperature range of 23 to 130 deg F, calibrated for 0 to 2 percent, with continuous or averaged reading, 4 to 20 mA output, and wall mounted. May be combined with space temperature sensor.

F. Room Thermostat Cover Construction: Manufacturer's standard locking covers.

1. Set-Point Adjustment: Concealed in public multiuse areas and exposed in private offices or limited user areas.
2. Set-Point Indication: Concealed for concealed set-point adjustment and exposed for exposed set-point adjustment.
3. Thermometer: Concealed for concealed setpoint adjustment and exposed for exposed set-point adjustment. Spiral bimetal.
4. Color: White.
5. Orientation: Vertical unless architectural layout won't allow vertical installation..

G. Uninterruptible Power Supply (UPS):

1. UPS will be sized to maintain panel or computer for a minimum of 30 minutes.
2. Eaton Powerware with hardwire connection or equal.
3. 120VAC 60hz input and output power +/- 10%
4. Transfer time 0 ms.
5. 150% surge capacity.
6. 0-40°C operating temperature.

2.13 CONTROL PANELS

A. Controllers, relays, switches, etc., located in equipment rooms shall be mounted in enclosed control panels with hinged locking doors. Key locks for all panels shall be keyed alike. The enclosures will be rated, as a minimum, NEMA 1.

B. Indicating devices shall be mounted on the face of the control panel door where specified.

C. Control devices, including digital indicators, located in areas subject to outside weather conditions shall be mounted inside weatherproof enclosures rated NEMA 4x.

D. The location of each panel is to allow convenient access for maintenance. Panels shall be mounted in equipment rooms, not in offices or public access areas.

E. Nameplates of engraved plastic or metal describing the function of the device shall be permanently attached beneath each panel mounted control device.

F. Power supply shall be dedicated circuit. Provide locking circuit breaker and label breaker "ATC Panel in Room No. xxx."

G. All HVAC major equipment (para. 2.5) control panels, not application specific or floor level controllers, Siemens MEC, MBC panels or Johnson Controls NAE, NCM, DX 9100 panels as specific examples will require 30 minutes back up power on an uninterruptible power supply.

2.14 CONTROL CABLE

A. Minimum wiring shall be 20 gage Belden 9154 twisted shielded pair or equivalent with different color code selection. Color-code 24 VDC wiring: black is negative and white is positive.

B. Exposed wiring in equipment rooms and inside walls (both line and low voltage) shall be routed in conduit, wire or cable trays. Installation shall be square with the walls of the buildings.

C. Above accessible ceilings, low voltage conductors may be UL listed plenum cable. Install the cable parallel to building walls.

D. In buildings with cable trays, plenum cable shall be run in the cable trays.

E. Wiring in control panels shall be neat and orderly in workmanship. Label wiring with point name.

F. Conduit run between any two interface or control panels shall be sized to provide an additional twenty-five percent of wiring capacity for future control modifications.

G. Instrument and output device wiring shall be labeled at every termination including both sides of interim splices within panels. Labels are required for wire pairs, and not for individual wires. Labels shall be installed within two inches of termination, or in the case of I/O devices around the wire jacket anywhere in the device wiring cavity within six inches of termination. Labels shall be machine printed with indelible ink on heat shrinkable plastic tubing (Brady Sleeve Wiremaker Label WMS-211-319). In no case are self-adhesive labels accepted, unless machine printed and protected with clear heat shrinkable tubing.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that conditioned power supply is available to control units and operator workstation.

B. Verify that duct-, pipe-, and equipment-mounted devices and wiring are installed before proceeding with installation.

3.2 INSTALLATION

A. Install equipment level and plumb.

B. Install software in control units and operator workstation. Implement all features of programs to specified requirements and as appropriate to sequence of operation.

C. Connect and configure equipment and software to achieve sequence of operation specified.

D. Verify location of thermostats, humidistats, CO2 sensors, and other exposed control sensors with plans and room details before installation. Locate all 48 inches above the floor.

1. Install averaging elements in ducts and plenums in crossing or zigzag pattern.

E. Install guards on thermostats in the following locations:

1. Entrances.
2. Public areas.

3. Where indicated.

F. Install damper motors on outside of duct in warm areas, not in locations exposed to outdoor conditions without providing watertight protection. Damper actuators shall NOT be supported from or connected to ductwork. Provide structural support or connect to floor or masonry wall. Damper actuators shall move the controlled damper smoothly and without stalling or hesitation through its complete range of motion against the maximum air static anticipated without visible deflection or bending of any mounting component and without slop or play in the actuator its mounting method or points of connection to the damper.

G. Install labels and nameplates to identify control components according to Division 23 Section "Identification for HVAC."

H. Install hydronic instrument wells, valves, and other accessories according to Division 23 Section "Hydronic Piping and Valves" or “High Temperature Water Piping” as applicable.

I. Install steam and condensate instrument wells, valves, and other accessories according to Division 23 Section "Steam and Condensate Heating Piping."

J. Install duct volume-control dampers according to Division 23 Sections specifying air ducts.

K. Install electronic and fiber-optic cables according to Division 27 Section for communication backbone cabling.

3.3 ELECTRICAL WIRING AND CONNECTION INSTALLATION

A. Install raceways, boxes, and cabinets according to Division 26 Section "Raceways and Boxes for Electrical Systems."

B. Install building wire and cable according to Division 26 Section "Low Voltage Electrical Power Conductors and Cables."

C. Install signal and communication cable according to Division 27 requirements for communications, and communications backbone cabling.

1. Conceal cable, except in mechanical rooms and areas where other conduit and piping are exposed.
2. Install exposed cable in raceway.
3. Install concealed cable in raceway.
4. Bundle and harness multiconductor instrument cable in place of single cables where several cables follow a common path.
5. Fasten flexible conductors, bridging cabinets and doors, along hinge side; protect against abrasion. Tie and support conductors.
6. Number-code or color-code conductors for future identification and service of control system, except local individual room control cables.

D. Connect manual-reset limit controls independent of manual-control switch positions. Automatic duct heater resets may be connected in interlock circuit of power controllers.

E. Connect hand-off-auto selector switches to override automatic interlock controls when switch is in hand position.

3.4 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

1. Install piping adjacent to machine to allow service and maintenance.

B. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including piping and electrical connections. Report results in writing.

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper unit operation. Remove malfunctioning units, replace with new units, and retest.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment, and retest.
4. Pressure test high-pressure control air piping at 150 psig and low-pressure control air piping at 30 psig for 2 hours, with maximum 1-psig loss.
5. Calibration test electronic controllers by disconnecting input sensors and stimulating operation with compatible signal generator.
6. Isolation dampers shall be demonstrated at maximum fan pressure showing that the actuator moves the damper smoothly through its full range of motion without hesitation or stalling and with no visible deflection of any components.

B. Engage a factory-authorized service representative to perform startup service.

C. Replace damaged or malfunctioning controls and equipment.

1. Start, test, and adjust control systems.
2. Demonstrate compliance with requirements, including calibration and testing, and control sequences.
3. Adjust, calibrate, and fine tune circuits and equipment to achieve sequence of operation specified.

D. Verify DDC as follows:

1. Verify software including automatic restart, control sequences, scheduling, reset controls, and occupied/unoccupied cycles.
2. Verify operation of operator workstation.
3. Verify local control units including self-diagnostics.
4. Verify operation of controls at Central Plant and HVAC Shop workstations.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's maintenance personnel to adjust, operate, and maintain control systems and components.

1. Train University's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
2. Provide operator training on data display, alarm and status descriptors, requesting data, executing commands, calibrating and adjusting devices, resetting default values, and requesting logs. Include a minimum of 40 hours' dedicated instructor time on-site.
3. Review data in maintenance manuals. Refer to Division 01 Section "Operation and Maintenance Data."
4. Schedule training with University, through University's Representative. Refer to Division 01 Section "Demonstration and Training.".

3.7 ON-SITE ASSISTANCE

A. Occupancy Adjustments: Within one year of date of Substantial Completion, provide up to three Project site visits, when requested by University's Representative, to adjust and calibrate components and to assist University's personnel in making program changes and in adjusting sensors and controls to suit actual conditions.

3.8 POINTS LIST

A. The DDC shall be capable of the minimum following points for the indicated system.

1. 100% Outdoor Air Units:

    a. Supply fan status and alarm.
    b. Start/stop/auto operation of fan(s).
    c. Air flow in cfm, from flow measuring station.
    d. VFD drive speed, from communications link.
    e. Coil(s) or supply air discharge temperature.
    f. Control valve positions.
    g. Outside air temperature (typical).
    h. Downstream static pressure.
    i. Motor current, from VFD communications link.
    j. Fault status of variable frequency drive (VFD).
    k. High static pressure alarm.
    l. Smoke detector alarm.
    m. Isolation dampers.

2. Recirculating AHUS:

    a. Supply and return fan status and alarm.
    b. Start/stop/auto operation of fan(s).
    c. Air flow in cfm, from flow measuring station.
    d. VFD drive speed, from communications link.
    e. Mixed and return air temperature.
    f. Coil(s) discharge temperature(s).
    g. Control valve positions (heating and cooling).
    h. Downstream static pressure.
    i. Motor current, from VFD communications link.
    j. Fault status of variable frequency drive (VFD).
    k. CO2 return air in ppm or in the room where the occupant load is 40 sq. foot per person or below.
    l. CO2 outside air intake in ppm.
    m. High static pressure alarm.
    n. Smoke detector alarm.
    o. Outside air, return and relief dampers, and position.
    p. Isolation dampers (at paired units only).

3. Lab Exhaust Fans:

    a. Fan status (on/off/alarm).
    b. VFD drive speed, from communications link.
    c. Duct static pressure.
    d. Fault status of variable frequency drive (VFD).
    e. Motor current, from VFD communications link.
    f. Isolation dampers.
    g. Bypass dampers.

4. Pumps:

    a. Pump status (on/off/alarm).
    b. VFD drive speed, from communications link.
    c. Downstream static pressure.
    d. Differential pressure and pressure ranges.
    e. Fault status of variable frequency drive (VFD).
    f. Motor current, from VFD communications link.

5. Domestic Hot Water Circulating Pumps:

    a. Pump status (on/off/alarm).

6. Heat exchangers and Water Heaters:

a. Heating water supply and return temperature.
b. Control valve, and position.
c. Pump status.
d. Supply and return temperatures for Domestic Hot Water and HHW return temperature.
e. Supply and return temperatures for Industrial Hot Water and HHW return temperature.

7. CHW system:

a. CHW flow meter.
b. Supply and return temperature sensors.

8. Steam system:

a. Steam flow meter.
b. Steam pressure and Temperature sensors (supply and return).
c. Steamcontrol valve, and valve position.

9. Terminal units:

a. Terminal unit cfm.
b. Room temperature.
c. Thermostat set point temperature.
d. Downstream supply air temperature.
e. Reheat coil valve, and position.
f. Connection to occupancy sensor relay.

10. Process Cooling Water system:

a. See detail on plans for system requirements, and system alarms.

11. Building system functions:

a. Building exhaust fans (start/stop/status).
b. Domestic Cold Water volume metering.
c. Natural gas volume metering.
d. Cold room temperature/common trouble alarm.
e. Steam heat exchanger alarm: (2) temperature sensors (for redundancy), in Heating Hot Water system for high water temperature alarm notification, valve closure, and pump off.
f. All VFD's: Fault status of variable frequency drive (VFD).
g. Lab Controls panel trouble alarms.
h. Fan Coil space setpoint and high temperature alarm.
i. Sump pump high-level alarms.
j. Lab air low pressure alarms.
k. Lab vacuum pump pressure alarms.
l. Emergency generator alarm, fuel oil tank level and leak monitor alarms.

m. Emergency generator status (on/off).
n. Automatic Transfer Switch; position, and common trouble.
o. Liquid sensors (transformer vaults/rooms).
p. Outdoor air temperature, humidity, and enthalpy.
q. Water Softener and RO Producer common trouble alarms.
r. Sewage/Storm Ejector High Level Alarms.
s. Condensate Pump alarm.
t. Oxygen Monitor/Sensors – common alarm.

12. Atrium Smoke Purge System:

a. See detail on plans for system requirements, and system alarms.

END OF SECTION 23 0900

SECTION 23 0993 – CONTROL SEQUENCES – GENERAL AND AIRSIDE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the contract, including general and supplementary conditions and Division 01 specifications, apply to this section.

PART 2 - PRODUCTS

2.1 GENERAL

A. Refer to Section 230900 – Instrumentation and Control for HVAC.

PART 3 - EXECUTION

3.1 GENERAL

A. This section is a supplement to the control diagrams on the drawings. The control diagrams generally indicate control devices as well as some desired logic. This section provides the basis for the sequences of operations, the control logic, device location clarification, measurements, as well as the general intent of the outcome for the control systems.

B. The Execution Section Paragraphs are arranged in an alternate way to improve the clarity of the intent by avoiding duplication and repetition of the requirements common to multiple systems.

C. The abbreviations AFD, ASD, and VFD are used interchangeably and all represent the same adjustable speed drive controller for a motor.

3.2 POST-OCCUPANCY CONTROLS OPTIMIZATION REQUIREMENTS

A. After owner occupancy, the heating and cooling loads will dramatically change from when the control systems were initially set up in an empty building due to the owner's use of the building. The owner's actual occupancy of the building will also be slightly different from his initial programming assumptions shown on the design drawings. Optimization/alteration of the control system initial set-up will be required to meet the owner's specific occupancy.

B. The controls contractor, together with the mechanical contractor and TAB contractor are responsible for optimizing and dialing in the performance of the systems to meet the needs of the owner's occupancy conditions. The plans and specs require basic elements of adjustability (automatic and manual) to be provided in the vendor's proprietary controls systems. The

controls contractor is the expert in his installed control systems and shall optimize and adjust many theoretical design setpoints to accommodate the as-built equipment and system conditions (which vary from the theoretical design assumptions) and the owner's actual occupancy.

C. After the owner has moved in, the controls contractor shall be responsible to optimize the operation, setpoints, and control logic for the as-built systems to alleviate owner comfort or operational complaints.

D. Prior to providing troubleshooting guidance, the engineer reserves the right to request documented validation of system set-up sign-off sheets, printouts of actual control software code, control data trends for suspected problem areas, re-TAB of suspected problem areas, and documentation of contractors self-troubleshooting efforts. It is the contractors burden to provide written documentation to the engineer to prove the systems are installed and set up according to the design intent.

3.3 GENERAL REQUIREMENTS FOR ALL SYSTEMS:

A. CONTROLLER POWER: The power for equipment control panels shall be powered from the line side of the starter for the equipment controlled or from a separate circuit (by Div. 23) so that the controller will continue to have power and will stay on the BAS network when the unit is turned off or is off due to failure.

B. EMERGENCY POWER: If the equipment being controlled is on emergency power, then the controller must be on emergency power also.

C. CONTROL DEVICE POWER: The basis for control and monitoring of all actuators and control devices is to use low voltage 24V power. The controls contractor shall provide low voltage wiring for all controls. Since different controls contractors would execute the control wiring in different ways, the project documents do not include locations for source 120V power to feed the 24V power wiring – that task shall be the responsibility of the successful controls contractor. The controls contractor shall coordinate with the electrical contractor and compensate the electrical contractor for desired quantities and locations for 120V power sources to feed their low voltage system design.

D. 24V DAMPER AND VALVE ACTUATORS: The basis of design is for 24V low voltage actuators for all air-side dampers and water side valve actuators. The intent is for the controls contractor to have exclusive responsibility for installation and operation of all control systems – including the smoke and fire-smoke dampers.

E. SCHEDULES: The schedules shall be based upon a 24 hour, 365day calendar with exception days and holidays.

1. For multi building facilities provide four levels of scheduling. They shall be Area, Group, Building, and Unit. Units will be assigned into buildings, buildings into groups, and groups into areas. Each piece of equipment shall reference all of these schedules and if any of them are occupied, the equipment shall go into occupied mode.
2. For single building facilities provide four levels of scheduling. They shall be Building, Floor, Wing, and Unit. Units shall be assigned to wings, wings into floors, and floors into buildings. Each piece of equipment shall reference all of these schedules and if any

of them are occupied, the equipment shall go into occupied mode. If the building does not have multiple floors or wings, then those respective schedules may be eliminated.

F. ACTIVE SET POINTS: The control sequences shall reference active cooling and heating analog values. These values shall be set to the occupied set points during occupied mode and the unoccupied set points in unoccupied mode.

G. PRE/POST OCCUPANCY MODES: Each piece of equipment and system shall have pre and post occupancy variables to indicate how many hours before and after occupancy the equipment shall operate in pre/post occupancy mode. In pre/post occupancy mode, the equipment shall use occupied set points but shall use either no outside air or alternate ventilation rates.

H. ACTUATOR FEEDBACK: Provide BAS monitoring of position feedback of valve and damper actuators. The purpose for this requirement is for user identification of malfunctioning actuators at the BAS front end graphic screens, and to assist in commissioning, and to reduce the troubleshooting time schedule. End switches are not an acceptable method of monitoring partial positions. An actuator feedback alarm shall be generated if the position feedback differs from the commanded position by more than 15% for 5 minutes. Graphic points shall include the following for each actuator:

a. Commanded Position.
b. Position Feedback.
c. Feedback Alarm

I. PID LOOP TUNING: It is expected that the controls technicians shall provide PID loop tuning for the various controlled systems to avoid overshooting and oscillation. At the minimum Proportional gain and the Integral time values shall be adjusted based upon device manufacturers recommendations, and the control technicians shall be able to discuss their P and I values with the engineer and commissioning authority. Common P&I values can be used for similar groups of devices (such as all supply VFD's or all 2-way HW control valves, etc). Derivative time should be 0 or off for most HVAC control loops. Only high reaction speed control loops, such as in laboratories and clean rooms, shall include D values. Small reheat valves are particularly subject to hunting, so loop tuning shall be included for those devices.

J. VARIABLE FREQUENCY/ADJUSTABLE SPEED DRIVE CONTROL AND MONITORING: The basic specification for VFD equipment requires a CAT 5 connection to the control system. The controls contractor shall incorporate the VFD's manufacturer's data format to at least display the internal set-up values (generally in the range of 50-100 data points) and operating values if the operator chooses to observe the operation of a VFD on a separate graphics/data screen. The basic VFD operating data described in subsequent sections shall be provided on the related equipment graphics screen. Providing the operator the ability to quickly evaluate and troubleshoot a VFD and related motor from the BAS front-end is a high value feature since improperly operating VFD's can waste large amounts of unnecessary energy, and of course comfort complaints.

K. ALARM PRIORITY: The BAS shall provide alarms in a logical manner to assist the facility operator in prioritizing alarms. Alarm tags shall include the point name, general equipment name, priority level, and alarm description. For example: KRMC:P07:AHU07_CCTEMP, AHU-7 Cooling Coil Temperature Sensor, Medium Priority, High leaving air temperature 5F

above set point. Prioritize alarms based upon the following criteria. Submit alarm priority to engineer for review.

High Priority – equipment failure, freezing, over heating, etc.
Low Priority – high/low temperatures, pressures, dirty filters, diagnostics, etc.

L. Provide function to delete all alarms from the print queue manually if desired. Provide function to sort alarms by priority and print alarms by priority. Provide a graphic page to view both priority alarms. Provide a local error message link in the lower corner of the graphic display of the AHU to display just error messages associated with the pieces of equipment displayed in the graphic page.

High Priority Alarm List. Provide a link to display the last 10 high priority alarm messages associated with the piece of equipment.
Low Priority Alarm List. Provide a link to display the last 10 low priority error messages.

M. CURRENT TRANSDUCER (CT) PROGRAMMING LOGIC: All new constant speed fan motors and pumps shall have analog current transducers (CT) which provide a continuous amp draw signal. The normal amp draw for each constant speed motor shall be recorded and stored AFTER test and balancing is complete. Program a high limit alarm when current is 25% higher than "normal" for 5 minutes. Program a low limit alarm when current is 50% of "normal" for 5 minutes. The low limit shall be used for proof of flow. If amp draw is below low limit then either flow is very low, or a fan belt broke.

N. PREDICTIVE MAINTENANCE TRENDING GRAPH: For all fixed speed motors with analog current transducers, continuously calculate a 30 day average of motor amp draw (record amp draw only when motor is on). Compare the actual motor amp draw with the 30 day average. If the actual amp draw is 10% higher (adjustable) than the 30-day trailing average, then provide a low level alarm for "high motor amp draw – anticipate failure". A high amp draw is a prediction of motor or bearing failure.

O. EMERGENCY POWER SOURCE. If only selected equipment and systems are to run on emergency power, then the power source for those control devices shall originate from emergency power.

P. HOT AND CHILLED WATER EMERGENCY POWER. If only portions of the hot or chilled water systems are intended to operate during emergency power, then spring-return closed valves shall be used on non-emergency powered water valve actuators. This is to direct the water to only the intended usage. Fewer branch line spring-return closed isolation valves can be substituted for many coil valves.

3.4 GRAPHIC DISPLAYS AT OPERATOR INTERFACE

A. Create graphical display pages for the equipment and systems on the project, including but not limited to the following. Refer to other paragraphs for specific requirements for data points.

1. Air handling/Rooftop units

2. Building Central Systems – including (chilled water booster pumps, hot water heating systems including steam to HHW heat exchanger systems, Process Cooling System including chilled water to process cooling water heat exchangers and pump systems, etc)
3. VAV box summary table (see description)
4. Reheat coil summary table (see description)
5. Air filter summary table (see description)
6. Fan coil units
7. Supply and exhaust fans
8. Smoke control systems

B. Provide floor plan graphic screens which represent the location of the equipment, for click-through of that equipment.

C. Floor plans shall also include data points for space temperature setpoints and measured values. Each room on the floorplan shall be mapped to a color coded reference chart which displays the measured room temperature in color. There shall be two color coded temperature maps for the floorplans – the first for measured temperature, and the second for difference between the temperature setpoint and the measured temperature. The color code shall be darker blue for cooler rooms, yellow for comfortable rooms, and orange/red for progressively warmer rooms. The same color scheme of shades of blue for colder rooms and shades of red for warmer rooms shall be used for the differential temperature map of the difference between setpoint and actual measurement temperature.

D. Provide a link on each graphic page to the written sequence of operations for that system or piece of equipment.

E. Provide a time/date stamp on the graphic display so it will be shown when captured and printed.

F. Provide a graphical representation for each piece of equipment controlled. Display all sensor points in appropriate locations to the actual placement of the sensors. Provide on/off/position indications for motors, actuators, etc. Display the set points for various control loops adjacent to the actual sensor readings, such as supply air temperature set point and actual temperature, pre-heat coil temperature set point and actual temperature, etc. If the control loop is 'off', such as pre-heating, then show 'off' in the set point display box. Provide a direct link to a floor plan of the building with the area served by the AHU highlighted. Provide a direct link to the Filter Status page.

G. For each piece of equipment, provide a photo-link to a digital photo (or multiple photos for larger pieces of equipment) of the piece of equipment shown in the graphical display.

H. Provide a "Maintenance" screen link to each piece of equipment and system which allows the Owner to input and manage maintenance related items for each piece of equipment. The Maintenance screen shall include data fields for the owner to input make/model numbers for items such as fan belts, motor sizes, filter sizes and quantities, oil type, etc., as well as date field for recording servicing dates.

I. The graphic screen development for equipment and systems shall include displayed data points for the values listed in the various paragraphs. When a particular equipment graphic screen gets too cluttered, it is acceptable that a second page be utilized for the displaying of the non-critical (but still required and desired) data points. In all cases where there is a setpoint variable used in

a control algorithm, the associated measured value shall also be displayed to provide the operator with a visual indication of the accuracy of the PID control loop operation.

3.5 PACKAGED EQUIPMENT CONTROLS INTERFACE

A. It is common for project equipment from manufacturers to have self-contained controls and microprocessor logic such as packaged steam boilers skids, container type humidifiers, some VAV boxes, etc. The self-contained equipment's controls should be 'connected' and integrated into the overall control system for the project. Internal data points related to operation should be pulled from the self-contained control system so that the operator can view operating data points. And key adjustable operating setpoints such as temperatures and pressures should be able to be input into the self-contained equipment's control system.

B. If equipment substitutions are made, then the equipment's self-contained control package should include the control logic and sequence capabilities described in the subsequent paragraphs. Not all features will be available from all manufacturers, which means the controls contractor may have to provide supplementary control logic on stand-alone controllers to meet the sequence of operations design intent.

3.6 VARIABLE FLOW EQUIPMENT IN PARALLEL

A. When variable flow fans or pumps are arranged for parallel flow, the variable speed drives for those motors shall be synchronized to run at the same speed.

B. For parallel fans and pumps, the operating pressure setpoint logic shall be determined in multiple equipment level controllers, or in a separate wall-mounted controller. Turning off one AHU, fan or pump for maintenance shall not interrupt the variable speed of the remaining units. Daisy-chaining from one variable speed drive to another is not acceptable since turning off the lead drive will disrupt the signal to the downstream drives.

3.7 GLOBAL AND LOCAL CONTROL

A. The local control system is defined as the hardware and software for a piece of equipment or a sub-system to operate properly. For example, an air handling unit and associated remote temperature sensors, and static pressure sensors is considered a local control system.

B. The global control system is the overall network which connects the local control systems together, and connects them with a master controller with global oversight.

C. The local control systems shall be installed and set-up to operate properly in both stand-alone mode as well as normally connected to the global control system. During system commissioning, stand-alone operation shall be validated by disconnecting the global network connection and observing the equipment operating normally – or in a special stand-alone mode if specified.

D. If no stand-alone mode is specified, then the stand-alone mode for the equipment/system shall be the current mode of operation when the global network connection as lost.

3.8 AIR SIDE SYSTEM AND EQUIPMENT BASIC CONTROL REQUIREMENTS

A. General Requirements. The following basic features shall be included for every air handling unit, blower coil unit, and fan-coil units. These basic items are not duplicated in subsequent sections. For units without a specific device or mode, such as no heating capability, then that mode is obviously not required.

1. START/STOP. Each air handler and controls shall be enabled / disabled by the BAS. Unit controls shall operate automatically when energized.
2. NORMALLY ON/OFF. The normally OFF (disabled) status shall be: fans off, smoke dampers closed, return air damper open, outside air damper closed, chilled water valve closed, hot water valve closed. The normally ON status shall be: fans on and outside air dampers enabled, chilled and hot water valves enabled.
3. OUTDOOR AIR DAMPER ACTUATORS: All outdoor air damper actuators shall be modulating type spring return CLOSED, so they will close automatically on loss of utility or control power. 100% outdoor air units can have 2-position damper actuators, with spring return closed.
4. MINIMUM OA. The outside air volume shall be set up (with TAB) as a minimum damper position during occupied periods - along with active means of controlling the OA volume in VAV systems according to ASHRAE 62 or Title 24 requirements.
5. FIRE ALARM SHUTDOWN RELAY: A relay from the fire alarm system shall initiate a contactor in the AHU fan starter or VFD which turns off the AHU fans upon an alarm signal from the fire alarm system.
6. DUCT SMOKE DETECTORS: The Electrical division shall provide duct smoke detectors (compatible with their fire alarm system) for installation by the Mechanical. The fire alarm contractor shall be responsible to wire the devices to the fire alarm system.
7. INTERCONNECTS: Associated exhaust and supply fans shall be started and stopped through control power from the load side transformer for their respective air handling systems. If supply fan fails proof of flow, then the associated exhaust fans shall turn off, and zone smoke dampers shall lose power and spring closed.
8. OCCUPIED MODE: Provide an Occupied mode of operation for each unit. During the Occupied mode, the unit shall operate according to the listed sequences of operation, but generally the outside air damper shall be open to provide minimum outdoor ventilation and the active set points shall be set to the occupied set points. The AHU supply fans shall operate continuously in occupied mode.
9. UNOCCUPIED MODE: Provide an Unoccupied mode of operation for each AHU. In general, the outside air damper shall be closed and the active set points shall be set to the unoccupied set points. When the space temperatures exceed the unoccupied high and low limits, then the AHU shall be enabled (with the OA damper closed) until the space temperatures are met. The AHU supply fan shall not run during deadband mode between the high and low temperature limits. The unoccupied high space temperature limit should be initially set to 80F, and the low limit set to 60F. The outside air damper may open during unoccupied mode if economizer cooling is possible.
10. HEATING MODE: When the space temperature falls below the active heating set point, the controller shall enable the heating sequence. Once the temperature rises above the setpoint plus the deadband (2 degrees (ADJ)) then the unit will enter deadband mode.
11. COOLING MODE: When the space temperature rises above the cooling set point, the controller shall sequence the stages of cooling to maintain space temperature set point.

Once the temperature falls below the setpoint minus the deadband (2 degrees (ADJ)) then the unit will enter deadband mode.

12. DEADBAND MODE: In deadband mode, between a high and low setpoint, neither heating or cooling shall be enabled.
13. PRE-HEAT RESET. The pre-heat coil leaving air temperature setpoint shall be a derived value of the main unit Supply (not coil leaving) air temperature low limit setpoint (usually 54F or 55F) minus 5F. The intent is to provide a deadband between heating and cooling coil temperatures to avoid simultaneous operation, and to account for some fan reheat.

3.9 GENERAL AIR HANDLING UNIT CONTROL SEQUENCES

A. This section describes the requirements and sequences for the various components used on air handling units. Refer to the control diagrams for the layout of the various components and the related control sequences and for specific AHU sequence of operations.

B. GRAPHICS. The main graphics page for the air handling units shall include all physical equipment, virtual modes of operation, variable values, etc. Remote system data shall be pulled in and displayed along with local alarms including the following:

1. Outside air temperature from remote sensor if necessary
2. Outside air humidity from remote sensor if necessary
3. Mixed air temperature
4. Local alarms: low temperature, equipment failure, high pressure, etc.

C. RETURN AND EXHAUST FAN GRAPHICS. The speed control method is listed in another paragraph. Provide the following additional control connections: binary input for VFD alarm, analog input for VFD speed monitoring, analog input for VFD kW power consumption. The kW power consumption shall be used for proof of flow. Graphic Points:

1. Fan Start/Stop
2. VFD commanded speed
3. VFD speed feedback
4. VFD status
5. Amps/kW – Bar graph with marks identifying normal with new and loaded filters
6. Minimum RF Amps
7. Fan Proof of flow – Graphic showing fan rotating
8. Static Pressure
9. Static Pressure Set Point (Adjustable)

D. AHU COIL TEMPERATURE RESET. The main supply air temperature setpoint (leaving the AHU, not the coil) shall be the controlling temperature for heating and cooling coils in the AHU. The coil leaving temperature sensors are generally for monitoring, not necessarily control. The main supply air temperature sensor (if indicated on diagrams) and setpoint shall be used to provide control input to the coil logic. For draw-through AHU's, the cooling coil leaving air temperature scheduled on the drawings includes provisions for a few degrees of supply fan heat. So a desired 55F supply air temperature is generally achieved with a leaving cooling coil temperature of 51-53F, and the sensors should be configured to show that operation.

E. SIMULTANEOUS HEATING AND COOLING CONTROL. In most modes of operation, simultaneous heating and cooling is not necessary. It may be necessary in certain modes such as high-humidity control mode, or precision environmental control such as laboratories. Include control logic, or appropriate temperature setpoint offsets to prevent unnecessary simultaneous heating and cooling.

F. CHILLED WATER COOLING COIL. The cooling coil control valve shall be modulated by the supply air temperature logic of the air handling unit. When the supply air temperature is above the set point, modulate the chilled water valve open to maintain set point. Set point varies based upon reset schedule. Provide a minimum setpoint value to prevent the user from lowering the supply air temperature below the designed value – which results in a problem called 'low delta-T'. The CHW Return Temperature sensor leaving the coil is one of the most valuable points used for verifying proper operation, and for troubleshooting problems – it shall not be eliminated in post-bid cost reduction exercises. Graphic Points:

1. CHW Coil Leaving Air Temp
2. CHW Coil temperature setpoint (reset)
3. Pre-treated outside air temperature if applicable.
4. Supply Air Temperature
5. Supply Air Temperature Set Point
6. CHW Valve commanded position
7. CHW Valve Feedback
8. CHW Valve Feedback Alarm
9. CHW Return Temperature (leaving the coil)
10. CHW Supply Temperature (from Chiller Plant)
11. CHW Supply Set Point (from Chiller Plant)
12. Design Min CHW Delta T (usually the coil's design delta-T)
13. Low CHW Delta T Alarm (whenever the entering and leaving chilled water temperature difference is lower than the coil's design delta-T)

G. FILTER PRESSURE MONITORING: Provide differential pressure sensors (not switches) for all individual filter sections, pre and final. Observe and set clean fliter pressure drop setpoint during startup (with clean filters). The dirty setpoint shall be initially set to 2x the clean setpoint – or as otherwise listed in the equipment schedule, or as directed by the engineer. Both clean and dirty values shall be a displayed in the AHU graphic screen. Dirty setpoints shall not exceed the manufacturer's maximum pressure rating for the filters. For guidance, pre-filters usually should not exceed 0.45" (the frames will collapse), and 90%-99% filters usually should not exceed 1.3". Refer to the Filter Status Programming paragraph for more information.

1. Graphic Points:

    a. Current Filter Pressure Drop for Each Bank
    b. Dirty Limit for Each Bank
    c. Dirty Filter Alarm for Each Bank

2. Substitution requirement for DP Switches: If a post-bid cost cutting substitution of DP switches is proposed in lieu of DP sensors, then the following setup labor and costs shall be included in the substitution scope of work:

a. Field measurement of clean filter pressure drop. Calculation of 2x clean pressure drop for dirty pressure drop, in lieu of specific direction found in equipment schedules.
b. Manual set-up of pressure switch 'dirty' pressure setting using a Magnehelic gauge.
c. Hand-write with a permanent marker the pressure value (e.g. 0.45 in. w.g.) that the switch contact closure was set to on or nearby the physical switch itself.

H. TERMINAL HW REHEAT COILS. Associated downstream duct reheat coils shall be interlocked with air handler to energize reheat controls with air handler operation. Reset the supply air temperature set point to maintain space temperature. Modulate the hot water valve to maintain supply air temperature set point. Provide room sensors with occupant set point adjustment for reheat coils and limit adjustment from 66°F to 74° F. (note low temperature setting on reheat system actually saves energy because reheating is minimized). Supply air temperature set point information is utilized by the air handler controller for discharge air temperature control.

1. Graphic Points:

a. HW Valve position
b. Space temperature
c. Space temperature set point
d. Supply air temperature
e. HW supply temperature (from heat exchanger)
f. HW supply set point (from heat exchanger)

I. SUPPLY AIR TEMPERATURE RESET – TERMINAL BOX REHEAT. Provide supply air temperature reset logic control. The design supply air temperature (leaving the unit) shall be 55°F (unless directed otherwise). The reheat coils (elec or HW) will use cascade control which will calculate the desired leaving temperature from the reheat coil, and the leaving device temperature shall be recorded. The AHU supply air set point shall be reset upwards when all of the reheat boxes are calling for some reheat. to the minimum reheat coil set point for the reheat coils served by this air handling unit. The downstream terminal units shall be polled to see whether any is near full cooling. If none are in full cooling, then the supply air temperature setpoint can be raised 0.5F degree. After a 5 minute delay, the downstream terminal units shall be polled again. If one is in full cooling, then lower the supply air temperature 0.5F. If none are in full cooling, then raise the supply air temperature up 0.5F. The design supply air temperature shall be 55°F (unless scheduled otherwise) on startup, and shall be reset based upon terminal unit demand. Any space or return air humidity sensor shall override supply air reset for 30 minutes (adjustable) when the space humidity rises above the adjustable high limit set point 60% RH. Provide a reheat coil table graphics screen. Provide a check box in the reheat coil table to allow the user to include/exclude coils in the reset schedule calculation logic. Graphic Points:

1. Minimum associated reheat leaving air temperature set point enabled for control
2. Minimum associated reheat leaving air temperature set point.
3. Supply Air temperature set point. (max of 62F, min of scheduled cooling coil LAT + 2F)
4. Supply air temperature.

J. HOT WATER PRE-HEAT COIL. The pre-heating coil control valve shall have a setpoint which can be modulated by the supply air temperature logic of the air handling unit. The pre-heat coil discharge temperature setpoint shall be initially calculated to be the cooling coil leaving air temperature setpoint minus 5F (52F – 5F = 47F). The pre-heat temperature setpoint shall then be adjusted up or down based upon the supply air temperature reset logic. Maintaining a temperature offset will prevent simultaneous pre-heating and cooling. The user should not have to adjust the pre-heat setpoint, it should be managed entirely by the offset from the supply air reset logic. In ECONOMIZER mode, the pre-heat coil shall be Off. The pre-heat coil shall have low limit freeze prevention logic to engage the pre-heat coil valve to maintain >40F during all modes of operating including Economizer, a low level alarm shall alert the operator that a low temperature problem exists. The HW Preheat Return Temperature sensor leaving the coil is one of the most valuable points used for verifying proper operation, and for troubleshooting problems – it shall not be eliminated in post-bid cost reduction exercises. Graphic Points:

1. HW Pre Heat Coil Leaving Air Temp
2. HW Pre Heat Coil Setpoint (reset)
3. Supply Air Temperature
4. Supply Air Temperature Set Point
5. HW Valve commanded position
6. HW Valve Feedback
7. HW Valve Feedback Alarm
8. HW Return Temperature (leaving the coil)
9. HW Supply Temperature (from heat exchanger)
10. HW Supply Set Point (from heat exchanger)
11. Design HW Delta T
12. Low Limit Temperature Alarm (>40F)

K. HOT WATER RE-HEAT COIL. The re-heating coil control valve shall have a setpoint which can be modulated by the supply air temperature logic of the air handling unit, or by a space temperature sensor if it is a single zone unit. The re-heat coil discharge temperature setpoint shall be reset by the supply air temperature reset logic. (if the re-heat coil is the last process, then the re-heat temperature and the supply air temperature values would be the same.) The re-heat temperature setpoint shall then be adjusted up or down based upon the supply air temperature reset logic (or space sensor). There may be a high humidity limiting control logic mode which over-cools for moisture removal – in that mode the re-heat coil would be enabled to operate normally by the supply air temperature setpoint (to prevent overcooling). The user should not have to adjust the re-heat setpoint, it should be managed entirely by the offset from the supply air reset logic, or the space setpoint. In ECONOMIZER mode, the re-heat coil shall be Off. The HW reheat Return Temperature sensor leaving the coil is one of the most valuable points used for verifying proper operation, and for troubleshooting problems – it shall not be eliminated in post-bid cost reduction exercises. Graphic Points:

1. HW Re Heat Coil Leaving Air Temp
2. HW Re-heat coil temperature setpoint (reset)
3. Space temperature (if single zone unit).
4. Supply Air Temperature (can serve as reheat coil discharge sensor too if it the last device)
5. Supply Air Temperature Set Point

6. HW Valve commanded position
7. HW Valve Feedback
8. HW Valve Feedback Alarm
9. HW Return Temperature (leaving the coil)
10. HW Supply Temperature (from heat exchanger)
11. HW Supply Set Point (from heat exchanger)
12. Design HW Delta T

L. ECONOMIZER MODE: Provide control logic to mix the OA and RA to the supply air temperature reset value to minimize mechanical cooling, using a Mixed Air temperature sensor and setpoint reset. A comparative dry bulb temperature switch is generally used to turn on/off the economizer mode. Economizer mode shall be enabled when the OA dry bulb temperature is less than the RA dry bulb temperature. The mixed/return air and OA damper actuators shall operate inversely. As the mixed air temperature drops, the OA damper shall modulate from open to the minimum ventilation position. When the minimum ventilation position is reached, then Economizer mode can be turned Off to allow the pre-heat coil to operate normally. Relief may or may not be actively controlled. In some arid regions, the contractor may substitute dry bulb temperature comparative dry bulb temperature control methods for review and approval. Ensure the temperature/humidity sensors for the enthalpy controller are in locations with active airstreams to continuously measure differences between the OA and RA conditions. Graphic points:

1. Economizer Mode on/off (based upon comparative enthalpy switch)
2. Economizer dry bulb temperature values if approved for temperature control
3. Mixed Air temperature setpoint, based upon offset from Supply air temperature reset value.

M. OCCUPIED MODE. When indexed to the occupied mode (either automatically, or manually overridden) the supply air fan shall be enabled and the various components of the AHU shall be enabled. In occupied mode the OA damper should be enabled Open to bring in ventilation air for the occupants.

a. Heating Mode – When the space temperature falls below the heating set point, the controller shall sequence the stages of heating to maintain space temperature set point.
b. Cooling Mode – When the space temperature rises above the cooling set point, the controller shall sequence the stages of cooling to maintain space temperature set point.
c. Dehumidification Mode – When the space humidity exceeds the high humidity limit of 60%, then dehumidification model shall be enabled. Dehumidification mode shall operate until the relative humidity drops below 56% or after 30 minutes. There shall be a 10minute time delay before the system can re-enter dehumidification mode. Dehumidification mode is essentially lowering the cooling coil leaving temperature to its lower design point to remove moisture from the airstream, thereby lowering the space relative humidity. The control logic may include stages of heating to prevent overcooling the space – which drives up the relative humidity even farther.
d. High and Low Occupied Temperature Setpoints. The space setpoints are generally user adjustable within a pre-defined range of temperatures – for normally occupied

spaces. Initially limit user adjustability between a low of 72F and a high of 78F. After occupancy, it is expected that some of the sensors limits will need to be adjusted. For normally unoccupied spaces such as electric rooms, provide a higher high limit of 80F.

N. UNOCCUPIED MODE. When indexed to the unoccupied mode (either automatically, or manually overridded), the supply fan shall be disabled and the unit shall essentially shut down. Ensure all OA/relief dampers and smoke/isolation dampers are closed

a. Heating Mode – When a space temperature falls below the unoccupied space temperature heating set point, the supply air fan shall be enabled. The various modes of heating shall be enabled to achieve the unoccupied space temperature set point. The outside air damper shall remain fully closed and the return air damper shall remain fully open.
b. Cooling Mode – When the space temperature rises above the unoccupied space temperature cooling set point, the supply air fan shall be enabled. The stages of cooling shall be enabled to achieve the unoccupied space temperature set point. The outside air damper shall remain fully closed and the return air damper shall remain fully open.
c. High and Low Unoccupied Temperature setpoints. The AHU shall be off when the space temperatures are in the deadband between the High and Low temperature setpoints. When the temperature exceeds the High and Low setpoints – the AHU shall be enabled with the intention of serving only the outlying space if possible. The High and Low Unoccupied space temperature setpoints shall be adjustable, and shall initially be set to the following for normally occupied spaces:

1) High: 80F occupied space.
2) Low: 60F

O. DEHUMIDIFICATION MODE. When return air (or space) humidity sensor reads above high humidity setpoint of 60% (adjustable, but limited between 55% and 70%, unless specified otherwise for a special space)), then the supply air temperature reset shall be reset back to the design setpoint (typically 55°F), and the supply air temperature reset logic shall be disabled for 30 minutes (adjustable). Graphic Points:

1. Dehumidification mode status.
2. Humidity reading of space and return humidity sensors.
3. Supply Air temperature reset set point.
4. Supply air temperature.
5. Dehumidification mode timer status.
6. High humidity setpoint (limit user adjustability between 60% and 70%)
.

P. FIRE ALARM SHUTDOWN. Electrical shall provide an addressable fire alarm shut down relay to be installed in the AHU starter control circuit which shuts down the AHU on a call from the fire alarm system. When the fire alarm system commands the AHU to shut down, associated smoke dampers shall lose power and spring return close, and associated exhaust fans shall turn off.

Q. DUCT SMOKE DETECTORS. Duct smoke detectors compatible with the fire alarm system shall be furnished by Electrical. Install duct smoke detectors in the supply and return duct (prior to any branch ducts) of air handling units with capacity greater than 2,000 cfm, or as required by local code.

R. FREEZE PROTECTION – FREEZESTAT. A low temperature cutoff type switch shall be used to stop the fan when the serpentine sensing element senses temperatures below the setpoint. The setpoint shall initially be 35°F. The device shall be manually reset. The sensing element shall not be less than one linear foot per square foot of coil surface area. The sensing element shall be installed on the downstream side of the coil.

S. FREEZE PROTECTION – SOFT PROTECTION. When any water coil leaving air temperature sensor detects a temperature below 40°F, then the outside air damper shall close, the water valve shall open, and send a high priority alarm. If the air temperature is below 35°F for more than 15 minutes, then disable the air handling unit, and send a high priority alarm. Graphic points:

1. Freeze protection status (normal, soft protection mode, shutdown mode).
2. Freeze protection alarm.

T. TRENDING. Set up the following trends for the AHUs. For each trend group, provide trend durations as indicated.

1. Temperature Performance. Daily and Monthly. Store data collected every 30 minutes (adjustable). Ensure data storage device is large enough to handle at least 2 years of data collection.

    a. Outside air temperature
    b. Return air temperature
    c. Mixed air temperature
    d. Return air humidity, or space humidity
    e. Pre-heat coil leaving air temperature
    f. Cooling coil leaving air temperature
    g. Supply air temperature
    h. Supply air temperature reset value

U. ALARMS. Provide low priority alarms for the following items in addition to the standard high and low priority alarms listed in the alarm requirements.

1. ‘Low supply duct static pressure.’ When the fan is On and the measured supply duct static pressure is more than 0.2” below the setpoint for more than 30 minutes.
2. ‘Low chilled water return temperature’ when the coil leaving chilled water temperature is below 52°F for more than 30 minutes, and the cooling coil is enabled. (this is a low delta-T prevention alarm)
3. ‘High leaving chilled water temperature’ when the leaving chilled water temperature is higher than 64°F for more than 30 minutes, and the cooling coil valve is enabled. (this is preventive maintenance alarm that either the coil strainer is clogged, heating is improperly enabled, or the inlet air temperatures are out of bounds)

3.10 CHW VARIABLE AIR VOLUME AHU

A. In addition to the Basic and General requirements listed in previous paragraphs, provide the items specific on the drawings for this type of operation

B. In addition, provide the following additional control connections: binary input for VFD alarm, analog input for VFD speed monitoring, analog input for VFD kW power consumption. The kW power consumption shall be used for proof of flow. Graphic Points:

1. Supply Fan Start/Stop
2. VFD commanded speed
3. VFD speed feedback
4. VFD status (alarms, etc)
5. Amps/kW – Bar graph with marks identifying normal with new and loaded dirty filters
6. Minimum SF Amps
7. Fan Proof of flow – Graphic showing fan rotating
8. Duct Static Pressure
9. Duct Static Pressure Set Point (Adjustable) (0.01 in w.g. accuracy)

3.11 CHW 100% OUTSIDE AIR AHU

A. In addition to the Basic and General requirements listed in previous paragraphs, provide the items specific on the drawings for this type of operation.

3.12 EXHAUST FANS - GENERAL

A. In addition to the Basic and General requirements listed in previous paragraphs, provide the items specific on the drawings for this type of operation.

B. The controller shall initiate an alarm under the following conditions:

C. EXHAUST FANS ASSOCIATED WITH AHU'S: When the intent is for exhaust fans in an AHU zone to balance the outside air volumes, the exhaust fan shall be enabled with the "associated" air handling unit is enabled. When its associated air handling unit is off, the exhaust fan shall be off. The controls requirement is for the exhaust fan starter control circuit to be connected to the associated AHU starter circuit – so when the AHU is turned off (either remotely or manually), then the exhaust fan's control circuit loses power and turns off too.

D. SCHEDULED OPERATION: When the exhaust fan operation is by occupancy schedule, the BAS time of day schedule and occupancy modes shall turn on and off the exhaust fans.

E. SWITCHED FANS: Provide on/off control for exhaust fans on manual switches.

F. LAB VAV EXHAUST FANS: For multiple parallel fans provide logic to control all fan speed controllers to the same signal based upon duct static pressure setpoint. Each fan shall have separate control wiring back to a remote controller – they shall not be daisy chained together so if one fails the other downstream fans fail too.

1. If there is a plenum bypass damper included for minimum airflow, provide actuator and controls for the bypass damper. Logic shall be to only open the bypass damper when the fans are at minimum speed, and the duct static pressure is above the setpoint. This will minimize exhausting conditioned space air.

G. SMOKE CONTROL EXHAUST FANS: Refer to plans.

3.13 FAN COIL UNITS - CHILLED WATER

A. GENERAL. In addition to the sequence indicated on the plans, the following paragraphs describe control sequences for independent control loops for the fan coil units. General Graphic Points include but are not limited to:

1. Occupied/Unoccupied Mode
2. Supply air temperature (refer to control diagram)
3. Space temperature
4. Space or RA relative humidity
5. Dehumidification mode
6. Space cooling temperature set point
7. Space pre- or re-heating temperature set point
8. CHW and HW Valve position (or call % for cooling)
9. Supply Fan Start/Stop
10. Fan status
11. Amps/kW – Bar graph with marks
12. Minimum supply fan Amps
13. Fan Proof of flow – Graphic showing fan rotating
14. HW Valve position (or call % for heating)

B. SAFETY DEVICES. Provide safety devices including condensate overflow switches, fire alarm shutdown if required by AHJ, duct smoke detectors if required by AHJ.

3.14 FILTER STATUS PROGRAMMING

A. Provide static pressure sensor across each pre and final filter section which provides a continuous static pressure signal.

B. Coordinate with mechanical and TAB contractor to determine ‘clean’ filter drop, and ‘dirty’ filter drop values as listed by the submitted manufacturer. Typically, the pre-filter clean and dirty pressure drops are 0.3” and 0.6” respectively. Typically, the final filter clean and dirty pressure drops are 0.7” and 1.5” respectively.

C. If the static pressure exceeds the dirty filter pressure limit, then provide an alarm which indicates the specific AHU filter is dirty.

D. Indicate current pressure drops and dirty limit on each AHU and FCU graphic page.

E. Provide a separate graphic page on the new, BAS which is dedicated to filters. Provide a table which indicates all filters for all AHUs, the current pressure drop and the dirty pressure drop, as well as a 'dirty filter' indication for all filters sections that exceed the dirty pressure drop. An example of the table is as follows.

Unit Name	***Location***	***Filter Type***	***Pressure Drop Actual***	***Dirty Limit***	***Dirty?***	***Filter Type and Size***	***Quantity***
AHU-1	Mech room 1	Pre	Actual Press Drop	0.6"	Yes/no	By mech contractor	By mech contractor
AHU-1	Mech room 1	Final	Actual press drop	1.5"	Yes/no	By mech contractor	By mech contractor
AHU-2	Mech room 2	Pre	Actual Press drop	0.6"	Yes/no	By mech contractor	By mech contractor

F. For each air handling unit graphical screen provide a button to access a separate graphical screen containing just reheat coils associated with that air handling unit.

3.15 AHU REHEAT COIL PROGRAMMING TABLE

A. Provide a reheat coil table similar to the following for each AHU/RTU with reheat coils:

Reheat Coil	***Serving Room***	***Sensor Set point***	***Space Temp***	***Temp Difference***	***Command Valve Position***	***Actual Valve Position***	***Supply Air Reset Calc***	***Coil Problem?***
1	Clean storage	Input from sensor	Input from sensor	Sensor set point – space temp	45%	46 %	ν Yes □ No	Yes/ no
2	Corridor	Input from sensor	Input from sensor	Sensor set point – space temp	21%	21 %	ν Yes ÍNo	Yes/ no
3	Office 23	Input from sensor	Input from sensor	Sensor set point – space temp	10%	10 %	□ Yes ν No	Yes/ no

B. Provide diagnostic logic in the "Coil Problem" column to identify a problem if a) temp difference is more than 2F for more than 10 minutes, b) or the actual valve position differs from the commanded position by 5% for more than 10 minute Provide diagnostic logic in the "Coil Problem" column to identify a problem if a) temp difference is more than 2F for more than 10 minutes, b) or the actual valve position differs from the commanded position by 5% for more than 10 minutes.

C. Pick boxes shall be in the “Supply Air Reset Calc” column to allow the user to include or exclude a particular reheat coil valve form the reset calculation.

END OF SECTION 230993

SECTION 23 0994 – CONTROL SEQUENCE - WATERSIDE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the contract, including general and supplementary conditions and Division 01 specifications, apply to this section.

PART 2 - PRODUCTS

2.1 GENERAL

A. Refer to Section 230900 – Instrumentation and Control for HVAC.

PART 3 - EXECUTION

3.1 GENERAL

A. This section is a supplement to the control diagrams on the drawings. The control diagrams generally indicate control devices as well as some desired logic. This section provides the basis for the sequences of operations, the control logic, device location clarification, measurements, as well as the general intent of the outcome for the control systems.

B. The Execution Section Paragraphs are arranged in an alternate way to improve the clarity of the intent by avoiding duplication and repetition of the requirements common to multiple systems.

C. The abbreviations AFD, ASD, and VFD are used interchangeably and all represent the same adjustable speed drive controller for a motor.

D. This section includes specific requirements for Waterside control sequences. General and Airside control sequence provisions are included in another Section.

3.2 GENERAL REQUIREMENTS FOR WATERSIDE SYSTEMS:

A. CONTROLLER POWER: The power for equipment control panels shall be powered from the line side of the starter for the equipment controlled or from a separate circuit (by Div. 23) so that the controller will continue to have power and will stay on the BAS network when the unit starter is turned off or is off due to failure.

B. EMERGENCY POWER: If the equipment being controlled is on emergency power, then the controller must also be on emergency power along with the associated devices. Spring return closed valves on coils and equipment and/or zones must be used to restrict limited emergency power mode water flow to only the equipment on emergency power. Consult with the engineer.

C. CONTROL DEVICE POWER: The basis for control and monitoring of all actuators and control devices is to use low voltage 24V power. The controls contractor shall provide low voltage wiring for all controls. Since different controls contractors would execute the control wiring in different ways, the project documents do not include locations for source 120V power to feed the 24V power wiring – that task shall be the responsibility of the successful controls contractor. The controls contractor shall coordinate with the electrical contractor and compensate the electrical contractor for desired quantities and locations for 120V power sources to feed their low voltage system design.

D. GRAPHIC DISPLAYS AT OPERATOR INTERFACE – WATERSIDE SPECIFIC: Create graphical display pages for the equipment and systems on the project, including but not limited to the following. Refer to other paragraphs for specific requirements for data points.

1. Pumps
2. Heat Exchangers
3. Boilers and Heaters
4. Domestic Hot Water System – monitoring only
    a.

E. General Graphic Point Displays for Equipment

1. Microprocessor Based Equipment Controllers

    a. In addition to the following points listed for general graphics screens, clicking on a piece of equipment with a microprocessor based controller (VFD, chiller, etc) shall bring up a separate screen listing operating values for that piece of equipment, as extracted through common industry protocols (BACnet, Lontalk, Modbus, etc).

2. Pumps:

    a. Pump start/stop command
    b. Cumulative pump start total
    c. Proof and Operating amp/kW – Bar Graph with marks
    d. Minimum, maximum pump amps (From TAB)
    e. Pump alarm – fault from VFD and/or proof failure from current sensor
    f. VFD drive status

3. Heat Exchanger:

    a. All temperatures in and out
    b. All commanded valve positions
    c. All actual valve positions
    d. Alarm if actual valve position differs from commanded position by >20%

4. Heating System & Boilers

    a. Loop pumps & VFD – refer to “Pumps”
    b. Master Boiler Control Panel – major status points, including outdoor air reset
    c. Individual Boilers – inlet & outlet temps, status, burner fire rate, associated pump & 3-way valve.

d. Main loop water temperatures and temperature setpoints including reset schedule setpoint.

5. Domestic Hot Water Heating System

a. Heater status
b. Pump status –recirculation pump, booster pump, etc
c. Supply water temperatures for each main loop

6. BTU Meters

a. Access to available current points – including but not limited to temperature, flow, pressure, etc.
b. Access to cumulative BTU/hr recorded data

3.3 PACKAGED EQUIPMENT CONTROLS INTERFACE

A. It is common for project equipment from manufacturers to have self-contained controls and microprocessor logic such as packaged pump systems, boilers, condensing units, etc. The self-contained equipment's controls should be 'connected' and integrated into the overall control system for the project. Internal data points related to operation should be pulled from the self-contained control system so that the operator can view operating data points. And key adjustable operating setpoints such as temperatures and pressures should be able to be input into the self-contained equipment's control system.

B. If equipment substitutions are made, then the equipment's self-contained control package should include the control logic and sequence capabilities described in the subsequent paragraphs. Not all features will be available from all manufacturers, which means the controls contractor may have to provide supplementary control logic on stand-alone controllers to meet the sequence of operations design intent.

3.4 WATER SIDE SYSTEM AND EQUIPMENT BASIC CONTROL REQUIREMENTS

A. General Requirements. The following basic features shall be included for water side equipment and systems. These basic items are not duplicated in subsequent sections.

1. START/STOP. Each piece of equipment shall be enabled / disabled by the BAS. Unit controls shall operate automatically when energized.
2. NORMALLY ON/OFF. The normally OFF (disabled) status shall be equipment off and isolation valves closed. The normally ON status shall be equipment on and isolation valves open.
3. VALVE ACTUATORS: Actuators shall be 24V and shall be the responsibility of the controls contractor.
4. OCCUPIED MODE: Provide an Occupied mode of operation for each unit or system. During the Occupied mode, the unit shall operate according to the listed sequences of operation.
5. UNOCCUPIED MODE: Provide an Unoccupied mode of operation for each unit or system. During the Unoccupied mode, the temperature setpoint range may be increased, and some equipment may be off.

6. DEADBAND MODE: In deadband mode between On and Off setpoints, the equipment may be off.
7. DP SENSOR TUBE TAPS: Taps for differential pressure sensors (and switches) in piping shall be on the SIDE of the pipe, not on the top. When the taps are on the top, air can accumulate in the tubing and in the sensor causing early failure.
8. ISOLATION VALVES. The actuated isolation valves for equipment are intended to be full line-size, however, they may be required to modulate.
9. PUMP AND COOLING TOWER FAN PROOF OF FLOW. Constant and 2-speed motors shall be provided with current sensors (not switches). An adjustable software variable for amp or kW shall be used for proof of flow. The initial proof variable setpoint shall be 50% of normal power level as measured by TAB. Variable speed motors with VFD's shall use a kW output value from the drive. The initial proof variable setpoint shall be slightly higher than the power level at the internal minimum speed setpoint.

3.5 CHILLED WATER SYSTEM TEMPERATURE REFERENCE

A. Refer to drawings for sequence:

Main Chilled Water Loop Supply Temp	44F
Main Chilled Water Loop expected Return Temp	64F
Main Chilled Water Loop Delta-T (return – supply)	20F

B. Refer to drawings for sequence

1. Building chilled water pumps shall be variable speed with VFDs.
2. All pump VFD's shall operate at the same speed (all parallel pumps should operate at the same speed). Pump speed signals shall be independently wired to the pump controller. Daisy-chaining from one VFD to another VFD is not permitted because turning off the first VFD will result in a loss of speed signal to the downstream drives.
3. For systems sized for a single pump handling normal flow, and a backup pump, the normal sequence for lead/lag failure and rotation shall be used. (also called Duty and Backup).
4. Upon indication of a loss of flow through the lead pump for a continuous duration of 15 seconds (adjustable), an alarm signal shall be received at the BAS. Upon continued loss of flow for an additional 30 seconds (adjustable) the BAS shall turn ON the Lag pumping unit. The initiation and proof of flow of the Lag pump shall initiate an orderly shutdown of the failed secondary pump.

3.6 DOMESTIC HOT WATER SYSTEM

A. Provide monitoring of the status of equipment including loop pumps, booster pumps, heaters, as well as the main supply loop temperatures. Provide a system loop graphic for the domestic hot water system.

B. Provide current sensors to monitor pumps if they were not provided by the plumbing installing contractor.

3.7 CHEMICAL TREATMENT SYSTEMS

A. Provide interlocking controls for the chemical treatment systems to coordinate operation of the systems. Basically, the chemical treatment system shall only be ON when the associated system is on.

B. Provide a condenser water system blowdown meter if it is not provided by the chemical treatment vendor.

C. Since chemical treatment systems are highly variable from various vendors, coordinate with the successful chemical treatment vendor for controls and interlocks required for proper system operation.

3.8 HEAT EXCHANGERS:

A. Refer to drawing for heat exchanger sequence:

3.9 BTU METERS

A. Provide a BTU/hr meter for individual buildings and separate tenant spaces for recording actual BTU usage for the purposes of individual billing. If the tenant space cannot be metered in one location then each piece of local equipment shall be metered. The equipment shall be appropriately labeled for used in legal tenant billing.

B. Provide a database suitable for collecting, analyzing, reporting, and billing on BTU usage.

3.10 STEAM

A. Control for steam systems is generally limited because few steam line devices are actively controlled by the building management system. Refer to the Hot Water System controls for the water side sequence of operations.

B. Packaged Boiler Controls.

1. Packaged boiler controls are expected to be provided by the manufacturer. Work with the boiler manufacturer's start-up representative to provide all customary and code required controls including, but not limited to:

    a. Low boiler water level alarms and shutdown
    b. High boiler water level alarms and shutdown

C. Condensate Return Pumps

1. Condensate return pumps shall be self-contained and operate by high and low level sensors in the tank. When the tank is full, pumps turn on to return condensate back to the boiler plant. When the tank is empty, the pumps turn off automatically.

END OF SECTION 23 0994

SECTION 23 2110 - HYDRONIC DISTRIBUTION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes piping for hydronic distribution systems for chilled water piping outside the building. Piping includes pipes, fittings, valves, insulation, and specialties for the following:

1. Manufactured, pre-insulated piping systems.

B. Related Sections include the following:

1. Division 03 Section "Cast-in-Place Concrete" for concrete aggregate used in conduit systems for pipe supports.
2. Division 23 Section "Hydronic Piping and Valves" for hydronic piping systems inside the building.

1.2 PERFORMANCE REQUIREMENTS

A. Provide components and installation capable of producing chilled water piping systems with the following minimum working-pressure ratings: (Note: Some Part 2 Products are specified with higher pressure rating requirements.)

1. Chilled-Water Piping: 150 psig**.**

1.3 DEFINITIONS

A. The following are industry abbreviations for plastic and rubber piping materials:

1. PVC: Polyvinyl chloride plastic.

B. Thermal Conductivity and Apparent Thermal Conductivity (k-Value): As defined in ASTM C 168. In this Section, these values are the result of the formula Btu x in./h x sq. ft. x deg F or W/m x K at the temperature differences specified. Values are expressed as Btu or W.

1. Example: Apparent Thermal Conductivity (k-Value): 0.26 or 0.037.

1.4 SUBMITTALS

A. Product Data: Include carrier piping, insulation type and k-value, jacket, end seals, and major components for each cased piping system.

B. Shop Drawings:

1. Provide signed and sealed calculations by a qualified professional engineer for pre-manufactured pre-insulated piping systems.

2. Calculate requirements for expansion compensation for underground piping.

3. Show expansion compensators, offsets, and loops with appropriate materials to allow piping movement in the required locations. Show anchors and guides that restrain piping movement with calculated loads, and show concrete thrust block dimensions.
4. Show pipe sizes, locations, and elevations. Show piping in trench, conduit, and cased pipe with details showing clearances between piping, and show insulation thickness.
5. Thrust block calculations and soil bearing strength values shall be subject to the approval of the civil or structural engineer of record.

C. Coordination Drawings: Show pipe sizes, locations, and elevations. Show other piping in same trench and clearances from hydronic distribution piping. Indicate interface and spatial relationship between manholes, piping, and proximate structures.

D. Profile Drawings: Show system piping in elevation. Draw profiles at horizontal scale of not less than 1 inch equals 50 feet and at vertical scale of not less than 1 inch equals 5 feet. Indicate manholes and piping. Show types, sizes, materials, and elevations of other utilities crossing hydronic distribution piping.

E. Field Reports: Indicate and interpret test results for compliance with performance requirements.

1. Manufacturer's Installation Report: Manufacturer's field inspection report, approved and signed by authorized factory agent.

F. Warranties: Special warranties specified in this Section.

1.5 COORDINATION

A. Coordinate pipe-fitting pressure classes with products specified in related Sections to allow matching of flange bolt holes.

B. Coordinate underground utility routing with new and existing utilities.

C. Coordinate piping system thrust block design and installation.

1.6 QUALITY ASSURANCE

A. Preconstruction conference: Conduct conference at Project Site to comply with requirements of Division 01 Section "Project Management and Coordination."

B. Manufacturer's Approved Installation Methods: The entire installation shall conform to the requirements of the piping system manufacturer, including thrust block layout and design.

1.7 PROJECT CONDITIONS

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by the University or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify University Representative no fewer than two weeks in advance of proposed utility interruptions.

2. Do not proceed with utility interruptions without the University's Representative written permission.

1.8 WARRANTY

A. General Warranty: The special warranty specified in this Article shall not deprive the University of other rights the University may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Pre-Insulated Underground Piping Systems:

a. Perma-Pipe, Inc. – Extu-Therm
b. Rovanco Corp.
c. Thermal Pipe Systems, Inc.
d. Or equal.

B. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 INSULATED PIPING SYSTEM

A. Service Pipe

1. Std. weight, ASTM A53 Gr. B ERW carbon steel.

B. Joints:

1. Butt welded for 2.5" and larger.
2. Butt or socket welded for 2" and smaller

C. Insulation:

1. General: Terms used in this Article are defined in ASTM C 168.
2. Insulation Type: Polyurethane – 90% closed cell piping insulation:

a. Thermal conductivity (K-valve): 0.16 at 75 deg F. mean temperature.
b. Density: 2-3-lb/cu. Ft. average.

c. Jacket: Seamless HDPE per ASTM D 1248, type 3, Class 3

4. End Seals: Seals shall be designed and factory fabricated to prevent the ingress of moisture into the system. Painted on end seals of any type shall not be allowed.
5. Pipe Joint Insulation System: Provide manufacturer's field-applied insulation and jacketing option on field joints. Piping joints shall be insulated to match factory-applied insulation R-value, and jacketed with heat-shrink type outer jacketing.

2.3 JOINING MATERIALS

A. Gasket Materials: ASME B16.21, nonmetallic, asbestos free, rubber, and suitable for system liquid.

B. Flange Bolts and Nuts: stainless steel.

C. Solvent Cements for Joining PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.

D. Welding Filler Metals: Comply with AWS D10.12 for welding material appropriate for wall thickness of steel pipe to be welded.

2.4 VALVES

A. Refer to specification 23 2113, Hydronic Piping and Valves

B. Valve Boxes**:** Cast iron valve boxes for shut off valves buried in ground shall be complete with bell bottoms, extension piece, top and cover. Boxes shall be suitable for the types of valves with which they are used. Lids shall have the letters CHWS or CHWR embossed on the top surface.

2.5 CORROSION-PROTECTION ENCASEMENT FOR PIPING

A. Encasement for Underground Metal Piping: ASTM A 674 or AWWA C105, PE film, 0.008inch minimum thickness, tube or sheet.

PART 3 - EXECUTION

3.1 TRENCHING AND BACKFILLING

A. Refer to Division 31 Section "Earth Moving" for excavating, trenching, bedding, and backfilling for underground piping.

3.2 FITTING AND JOINT CONSTRUCTION

A. Fitting, Joints: Prepare piping and fittings and join according to manufacturer's written instructions.

3.3 PIPING INSTALLATION

A. General Locations and Arrangements: Drawings indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated, unless deviations to layout are approved on Coordination Drawings.

B. Install piping free of sags and bends.

C. Locate groups of pipes parallel to each other, spaced to permit valve servicing.

D. Install fittings for changes in direction and branch connections.

E. Fittings shall have ends sealed with tape prior to pouring concrete thrust blocks.

F. Provide manufacturer’s optional end seals, field-installed insulation at joints and fittings, and field-installed heat-shrink wrap type jacketing. Outer jacketing shall be water-tight.

G. Remove any standing water in the bottom of trench.Bedding depth and spacing between piping shall be in accordance with manufacturers installation insturctions.

H. Do not insulate piping or backfill piping trench until field quality-control testing has been completed and results approved.

I. Install drains at low points inside the building consisting of tee fitting, 3/4-inch NPS ball valve, and short 3/4-inch NPS threaded nipple and cap.

J. Make reductions in pipe sizes using eccentric reducer fitting installed with level side up.

K. Install flanges according to manufacturer's written instructions.

L. Refer to Division 23 Section "Common Work Results for HVAC" for sleeves and mechanical sleeve seals through exterior building, trench, and tunnel walls.

M. Piping Connections: Make piping connections to existing steel distribution piping and building steel piping system with flanges.

N. Provide engineered thrust blocks and ancu0rs on buried piping where determined by manufacturers Engineer and shown on manufacturers shop drawings.

1. Thrust blocks shall be concrete having a compressive strength of not less than 2000 psi after 28 days and shall be in accordance with Division 03, Section “Cast-In-Place Concrete.”
2. Thrust blocks shall be placed between solid ground and the fitting to be anchored. The base and the thrust bearing sides of the thrust blocks shall be poured directly against undisturbed earth.
3. The sides of the thrust blocks not subject to thrust may be poured against forms.
4. Thrust blocks shall be placed so that the joints for all fittings will be accessible for repair in the future. No pipe joint shall be embedded in concrete.
5. The thrust blocks shall provide for transfer of thrusts and reactions without exceeding the allowable stress of the concrete and shall be installed in accordance with pipe manufacturer's instructions.

O. Pipe expansion shall be installed per pip manufacturer's written instructions.

1. Provide underground alignment guide and secure with concrete thrust blocks if recommended by manufacturer’s written instructions.

3.4 IDENTIFICATION INSTALLATION

A. Install continuous plastic underground warning tapes and detectable wire for non-metallic piping during back-filling of trenches for underground hydronic distribution piping. Refer to Division 31 Section "Earth Moving" for warning-tape and detectable wire materials and devices and their location and installation.

3.5 FIELD QUALITY CONTROL

A. Provide manufacturer’s field construction supervision and installation inspection services with complete written report. Obtain manufacturer’s written installation approval prior to trench backfilling.

B. Prepare hydronic piping for testing according to ASME B31.9 and as follows:

1. Leave joints, including welds, uninsulated and exposed for examination during test.
2. Isolate equipment. Do not subject equipment to test pressure.

3. Fill system. Use ambient temperature water.
4. Install relief valve set at pressure no more than one-third higher than test pressure.
5. Use vents installed at high points to release trapped air while filling system.

C. Test hydronic piping as follows:

1. Subject piping system to hydrostatic test pressure at 150 PSI or 1.5 times the design pressure, whichever is greater, for four hours. There shall be no decrease in pressure allowed over the four hour test.
2. After hydrostatic test pressure has been applied, examine piping, joints, and connections for leakage throughout the testing period. Eliminate leaks by tightening, repairing, or replacing components as appropriate, and repeat hydrostatic test until there are no leaks.
3. Prepare a written report of testing.

b Hydronic piping may be pre-tested with air at 100 psi. After successful testing, pipe may be buried and hydrostatically tested at a later date.

3.6 CLEANING

A. Inspect finish of exposed, hydronic piping, including outlets, valves, specialties, and devices, after installation is complete. Remove burrs, dirt, and debris. Repair damaged finishes including chips, scratches, and abrasions.

B. Clean and flush hydronic piping. Remove, clean, and replace strainer screens. Remove disposable fine-mesh strainers in pump suction diffusers after cleaning and flushing piping but before balancing.

END OF SECTION 23 2110

SECTION 23 2113 - HYDRONIC PIPING AND VALVES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes piping, special-duty valves, and hydronic specialties for hot-water heating, chilled-water cooling, process cooling loops, and condenser water systems; makeup water for these systems; blowdown drain lines; and condensate drain piping.

B. Related Sections include the following:

1. Division 07 Section "Penetration Firestopping" for materials and methods for sealing pipe penetrations through fire and smoke barriers.
2. Division 07 Section "Joint Sealants" for materials and methods for sealing pipe penetrations through exterior walls.
3. Division 23 Section "Common Work Results for HVAC" for general piping materials and installation requirements.
4. Division 23 Section "Hangers and Supports for HVAC" for pipe supports, product descriptions, and installation requirements. Hanger and support spacing is specified in this Section.
5. Division 23 Section "Mechanical Vibration and Seismic Controls for HVAC" for flexible pipe support and anchorage product descriptions, and installation requirements.
6. Division 23 Section "Expansion Fittings and Loops for HVAC Piping" for flexible pipe accessory product descriptions, and installation requirements.
7. Division 23 Section "Meters and Gages for HVAC" for thermometers, flow meters, and pressure gages.
8. Division 23 Section "Identification for HVAC" for labeling and identifying hydronic piping.
9. Division 23 Section "Hydronic Pumps" for pumps, motors, and accessories for hydronic piping.
10. Division 23 Section “HVAC Water Treatment” for chemicals, feeders and water treatment requirements.
11. Division 23 Section "Instrumentation and Controls" for temperature-control valves and sensors.

1.2 SUBMITTALS

A. Product Data: For each type of valve indicated. Include flow and pressure drop curves based on manufacturer's testing for valves, diverting fittings, manual calibrated balancing valves, and automatic flow-control valves.

B. Shop Drawings: Detail fabrication of pipe anchors, hangers, special pipe support assemblies, alignment guides, expansion joints and loops, and their attachment to the building structure. Detail location of anchors, alignment guides, and expansion joints and loops.

C. Welding Certificates: Copies of certificates for welding procedures and personnel.

D. Field Test Reports: Written reports of tests specified in Part 3 of this Section. Include the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Failed test results and corrective action taken to achieve requirements.

E. Maintenance Data: For hydronic specialties and special-duty valves to include in maintenance manuals specified in Division 01.

F. Piping, fittings, and accessories: For each type of materials indicated, including gaskets.

1.3 QUALITY ASSURANCE

A. Delete paragraph below if no welding. Welding: Qualify processes and operators according to the ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

B. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1.

1.4 COORDINATION

A. Coordinate layout and installation of hydronic piping and suspension system components with other construction, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.

B. Coordinate pipe sleeve installations for foundation wall penetrations.

C. Coordinate piping installation with roof curbs, equipment supports, and roof penetrations. Roof specialties are specified in Division 07 Sections.

D. Coordinate pipe fitting pressure classes with products specified in related Sections.

E. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into base. Concrete, reinforcement, and formwork requirements are specified in Division 03 Sections.

F. Coordinate installation of pipe sleeves for penetrations through exterior walls and floor assemblies. Coordinate with requirements for firestopping specified in Division 07 Section "Penetration Firestopping" for fire and smoke wall and floor assemblies.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Grooved Mechanical-Joint Fittings and Couplings:

a. Anvil International, Inc.
b. Victaulic Company of America.
c. Or equal.

2. Manual Calibrated Balancing Valves:

a. Armstrong
b. Griswold Controls.
c. Tour and Andersson
d. Victaulic Company of America
e. Or equal.

3. Pressure-Reducing Valves:

a. Conbraco Industries, Inc.
b. Hersey
c. Febco
d. Watts Industries, Inc.; Watts Regulators.
e. Or equal.

4. Safety Valves:

a. Conbraco Industries, Inc.
b. ITT McDonnell & Miller Div.; ITT Fluid Technology Corp.
c. Kunkle Valve Division.
d. Spence Engineering Company, Inc.
e. Or equal.

5. Automatic Flow-Control Valves:

    a. Griswold Controls.
    b. Or equal (No known equal).

6. Expansion Tanks:

    a. Amtrol, Inc.
    b. Armstrong Pumps, Inc.
    c. Bell & Gossett
    d. Taco, Inc.
    e. Wheatley
    f. Or equal.

7. Air Separators and Air Purgers:

    a. Bell and Gossett
    b. Spiro Research Company; Spirotherm, Inc.
    c. Or equal

8. Piping and fittings:

    a. Pipe and fittings shall be of domestic, or foreign.

B. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 PIPING MATERIALS

A. General: Refer to Part 3 "Piping Applications" Article for applications of pipe and fitting materials.

2.3 COPPER TUBE AND FITTINGS

A. Drawn-Temper Copper Tubing: ASTM B 88, Type L.

B. Wrought-Copper Fittings: ASME B16.22.

C. Wrought-Copper Unions: ASME B16.22.

D. Solder Filler Metals: ASTM B 32, Alloy E.

E. Brazing Filler Metals: AWS A5.8, Classification BAg-1 (silver).

F. Press Fittings

G. T-Drill

2.4 STEEL PIPE AND FITTINGS

A. Steel Pipe, NPS ¾ through NPS 1½: ASTM A 53, Type S (seamless) Grade A or B, Schedule 40, black steel, plain ends.

B. Steel Pipe, NPS 2 through NPS 10: ASTM A 53, Type S (seamless) or Type ERW (welded) Grade A or B, Schedule 40, black steel, plain ends.

C. Steel Pipe, NPS 12 and larger: ASTM A 53, Type S or Type ERW (welded) Grade B, 0.375 inch wall thickness, black steel, plain ends.

D. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53, Schedule 40, black steel; seamless.

E. Malleable-Iron or Steel Threaded Fittings: ASME B16.3, Classes 150 and 300 or steel.

1. Fabricated per ASME

F. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300.

G. Cast-Iron Pipe Flanges and Flanged Fittings: ASME B16.1, Classes 25, 125, and 250; raised ground face, and bolt holes spot faced.

H. Wrought Cast- and Forged-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:

1. Material Group: 1.1.
2. End Connections: Butt welding.
3. Facings: Raised or flat face.

I. Grooved Mechanical-Joint Fittings: ASTM A 536, Grade 65-45-12 ductile iron; ASTM A 47, Grade 32510 malleable iron; ASTM A 53, Type S, Grade B fabricated steel; or ASTM A 106, Grade B steel fittings with grooves or shoulders designed to accept grooved end couplings.

J. Grooved Mechanical-Joint Couplings: Ductile- or malleable-iron housing and EPDM gasket of central cavity pressure-responsive design; with nuts, bolts, locking pin, locking toggle, or lugs to secure grooved pipe and fittings.

K. Welding Materials: Comply with Section II, Part C, of the ASME Boiler and Pressure Vessel Code for welding materials appropriate for wall thickness and for chemical analysis of pipe being welded.

L. Gasket Material: Thickness, material, and type suitable for fluid to be handled; and design temperatures and pressures.

M. Flexible Connectors and Expansion Joints: See Division 23, Section "Expansion Fittings and Loops for HVAC Piping".

2.5 VALVES

A. Ball Valves: (Sizes NPS ½"– 2", typical)

1. Two-Piece, copper-alloy, MSS SP-110, Bronze body with full-port, 316 stainless steel ball and stem PTFE seats; and 600-psig minimum CWP rating and blowout-proof stem. Stem length shall clear insulation.

    a. Conbraco Industries, Inc.; Apollo Div. Model #77-140 (threaded) or Model #77-240 (soldered)
    b. Milwaukee.
    c. NIBCO Inc.
    d. Or equal.

B. AWWA, Cast-Iron Gate Valves for non-hot water applications:

1. Manufacturers:

    a. American Cast Iron Pipe Co.; American Flow Control Div.
    b. Crane Co.; Crane Valve Group; Stockham Div.
    c. Grinnell Corporation; Mueller Co.; Water Products Div.
    d. Mueller
    e. NIBCO INC.
    f. United States Pipe and Foundry Company.
    g. Milwaukee.
    h. RP&C.
    i. Bonney Forge.
    j. Or equal.

2. Nonrising-Stem, Resilient-Seated Gate Valves: AWWA C509, gray- or ductile-iron body and bonnet; with bronze or gray- or ductile-iron gate, resilient seats, bronze stem, and stem nut.

    a. Minimum Working Pressure: 200 psig.
    b. End Connections: Mechanical joint, or flanged.
    c. Interior and Exterior Coating: Complying with AWWA C550, epoxy.

C. Cast-Iron Gate Valves for hot water applications:

1. Manufacturers:

    a. Type I, Cast-Iron, Rising-Stem Gate Valves:

1) Crane Co.; Crane Valve Group; Crane Valves.
2) Crane Co.; Crane Valve Group; Jenkins Valves.
3) Crane Co.; Crane Valve Group; Stockham Div.
4) Milwaukee Valve Company.
5) NIBCO INC.
6) Powell, Wm. Co.
7) Walworth Co.
8) Watts Industries, Inc.; Water Products Div.
9) Or equal.

2. Cast-Iron Gate Valves, General: MSS SP-70, Type I.

a. Class 125, OS&Y, Cast-Iron Gate Valves: Cast-iron body with bronze trim, renewable bronze seat rings, rising stem, and tapered solid-wedge disc.

D. Check Valves:

1. Sizes NPS ¾"– 2": Horizontal Swing Bronze Check Valve, Class 125, MSS-SP-80, two-piece bronze body and seat, full port, blowout proof, threaded ends.

a. Crane Co.; Crane Valve Group; Crane Valves
b. Crane Co.; Crane Valve Group; Stockham Div.
c. NIBCO INC.
d. Spriax Sarco
e. Or equal.

2. Sizes NPS 2½"- larger: Swing Check, Type 1, Class 125, MSS-SP-71, cast-iron body, flanged with bronze seat and bronze trim, bolted cap.

a. Crane Co.; Crane Valve Group; Crane Valves. 373.
b. Crane Co.; Crane Valve Group; Stockham Div. G931.
c. NIBCO INC. F-918-B.
d. Or equal.
e. Spirax Sarco.
f. Mueller.

3. Sizes NPS ¾" – 2": Non-slam Check, Class 125, bronze body and seat, tight shut-off, threaded ends. Rated for 200 °F applications.

a. Conbraco Industries, Inc.; Apollo Div. 62-100.

b. Crane Co.; Crane Valve Group; Stockham Div.
c. NIBCO INC. T-480.
d. Spirax Sarco.
e. Mueller.
f. Or equal.

4. Sizes NPS 2½"-larger: Non-slam Check, Type 1, Class 125, MSS-SP-71, cast-iron body, flanged with bronze seat and bronze trim, bolted cap.

a. Crane Co.; Crane Valve Group; Crane Valves.
b. Crane Co.; Crane Valve Group; Stockham Div.
c. NIBCO INC. F-910.
d. Spirax Sarco.
e. Mueller.
f. Or equal.

E. Iron Butterfly Valves:

1. Sizes 2 ½" and larger: 150 psig CWP rating, cast/ductile iron construction, tight shutoff, lug pattern EPDM liner, lever operator, Aluminum ,bronze or ductile iron disc, epoxy coated body.

a. DeZurik.
b. Henry J. Pratt Company
c. NIBCO INC.
d. Milwaukee ML 224-E-A
e. Or equal.

F. Manual Calibrated Balancing Valves, NPS 2 and Smaller: Bronze body, ball type, 125-psig working pressure, 250 deg F maximum operating temperature, and having threaded ends. Valves shall have calibrated orifice or venturi, connections for portable differential pressure meter with integral seals, and be equipped with a memory stop to retain manually set position.

G. Manual Calibrated Balancing Valves, NPS 2-1/2 and Larger: Cast-iron or steel body, ball type, 125-psig working pressure, 250 deg F maximum operating temperature, and having flanged or grooved connections. Valves shall have calibrated orifice or venturi, connections for portable differential pressure meter with integral seals, and be equipped with a memory stop to retain manually set position.

H. Pressure-Reducing Valves: Diaphragm-operated, bronze or brass body with low inlet pressure check valve, inlet strainer removable without system shutdown, and noncorrosive valve seat and stem. Select valve size, capacity, and operating pressure to suit system. Valve shall be factory set at operating pressure and have capability for field adjustment.

I. Safety Valves: Diaphragm-operated, bronze or brass body with brass and rubber, wetted, internal working parts; shall suit system pressure and heat capacity and shall comply with the ASME Boiler and Pressure Vessel Code, Section IV.

J. Automatic Flow- Limiting Device: factory set to maintain constant flow with plus or minus 5 percent over system pressure fluctuations, and equipped with test probes. Each valve shall have an identification tag outside of insulation attached by chain, and be factory marked with the zone identification, valve number, and flow rate. The body shall bear factory standard product tag. Valve shall be line size and one of the following designs depending on the system:

1. Gray-iron or brass body, designed for 175 psig at 200 deg F with stainless-steel cartridge/piston and spring.
2. Brass body, designed for 175 psig at 200 deg F with stainless-steel cartridge/piston and spring.

K. Pressure Sustaining and Pressure Regulating Valve: The valve shall be hydraulically operated, single diaphragm-actuated, globe or angle pattern. The valve shall consist of three major components: the body with seat installed, the cover with bearings installed, and the diaphragm assembly. The diaphragm assembly shall be the only moving part and shall form a sealed chamber in the upper portion of the valve, separating operating pressure from line pressure.

1. Valve body shall be of cast Ductile Iron material and have stainless steel trim.
2. The valve shall contain a resilient, synthetic rubber disc, with a rectangular cross-section contained on three and one-half sides by a disc retainer and forming a tight seal against a single removable seat insert.
3. The diaphragm assembly containing a non-magnetic 303 stainless steel stem of sufficient diameter to withstand high hydraulic pressures shall be fully guided at both ends by a bearing in the valve cover and an integral bearing in the valve seat. The seat shall be a solid, one-piece design and shall have a minimum of a five-degree taper on the seating surface for a positive, drip-tight shut off.
4. The pressure reducing pilot control shall be a direct-acting, adjustable, spring-loaded, normally open, diaphragm valve with stainless steel trim designed to permit flow when controlled pressure is less than the spring setting. The pilot control is held open by the force of the compression on the spring above the diaphragm and it closes when the delivery pressure acting on the underside of the diaphragm exceeds the spring setting. The pilot control system shall include a fixed orifice. The pilot system shall include an opening speed control on all valves 3” and smaller on the model 92-01 and 4” and smaller on the model 692-01, as standard equipment. The pilot control shall have a second downstream sensing port which can be utilized to install a pressure gauge.
5. The pressure sustaining pilot control shall be a direct-acting adjustable spring loaded control which opens when upstream pressure exceeds the spring setting on the pilot. The pilot control system shall include an X44A strainer & orifice assembly.

6. A full range of spring settings shall be available in ranges of 0 to 450 psi. Downstream spring range shall be 2-30 psi.
7. A direct factory representative shall be made available for start-up service, inspection and necessary adjustments.
8. The valve shall be a Cla-Val Co. Model No. 750-01 Combination Pressure Reducing & Sustaining Valve as manufactured by Cla-Val Co., Newport Beach, CA 92659-0325 or equal.

L. Refer to Part 3 "Valve Applications" Article for applications of each valve.

M. Combination duty type valves and fittings shall not be used.

N. Combination Assemblies: Individual threaded components, ball valves, control valve, automatic flow limiting device of brass body construction, fitted with pressure and temperature test valves, strainer, and designed for 300 psig at 250 deg F for duct or terminal mounted heating coils. See Campus Standard detail.

2.6 HYDRONIC SPECIALTIES

A. Manual Air Vent Bronze body ball valve with stainless steel ball; NPS ½.

B. Automatic Air Vent: Designed to vent automatically with float principle; bronze body and nonferrous internal parts; 150-psig working pressure; 240 deg F operating temperature; with NPS 1/4 discharge connection and NPS ½" or ¾" inlet connection. Provide only one automatic air vent in system at air separator.

C. Expansion Tanks: Welded carbon steel, rated for 125-psig working pressure and 250 deg F maximum operating temperature with rustproof coating. Separate air charge from system water to maintain design expansion capacity by a flexible diaphragm securely sealed into tank. Include drain fitting and taps for pressure gage and air-charging fitting. Support vertical tanks with steel legs or base; support horizontal tanks with steel saddles. Factory fabricate and test tank with taps and supports installed and labeled according to the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1, shipped with minimum of 12 psig charge.

D. Air Separators: Welded black steel; ASME constructed and labeled for 150 psig minimum working pressure and 270 deg F maximum operating temperature; tangential Viton seal and Oring brass vent head and skim valve, copper coalescing medium, non-ferrous float, in-line inlet and outlet connections; threaded connections for NPS 2 and smaller; flanged connections for NPS 2-1/2 and larger; threaded blowdown connection. Provide units in sizes for full-system flow capacity with pressure loss performance of less than one foot of water, and maximum velocity of 4 feet per second, as manufactured by Spirotherm, or equal as manufactured by

others with greater than line size inlet as required to meet performance requirement of less than one foot of water at design flow capacity. E. Y-Pattern Strainers NPS 2 and smaller:

1. Strainers 2" and smaller for heating and air conditioning water service shall be based on Watts No. 777 or an equivalent strainer by Armstrong or equal, 400 psig WOG bronze body, threaded, Y-pattern, 20-mesh stainless steel screen, with a full size drain connection and ball valve.

F. Y-Pattern Strainers NPS 2-1/2 and larger:

1. Strainers 2-1/2" and larger for heating and air conditioning water service shall be based on Watts No. 77F-DI, Keckely Style "A", or an equivalent strainer by Armstrong or equal, Class 125 cast-iron body, flanged, Y-pattern, stainless steel screen, with a drain connection and ball valve (as described elsewhere herein).

G. Suction Diffuser: Angle or straight pattern, 175-psig pressure rating, cast-iron body and end cap, pump-inlet fitting; with bronze startup and bronze or stainless-steel permanent strainers; bronze or stainless-steel straightening vanes; drain plug; and factory- or field-fabricated support.

PART 3 - EXECUTION

3.1 PIPING APPLICATIONS

A. Hot Water Heating and Chilled Water (above ground):

1. NPS 2 and smaller: Type L copper; with 95-5 soldered wrought copper fittings.
2. NPS 2-1/2 and larger: Black steel pipe, ASTM A53, Type S (seamless) or Type ERW (welded); with standard weight ASTM A234 forged steel fittings for butt-weld connection or 150 lb; or grooved mechanical joint coupling and fittings with roll grooved mechanical joints.

B. Heating and Chilled Water Pot Feeder:

1. Type L Copper: Type L copper: with Alloy E soldered, BCup-5 AWS A5.8/A5.8M per ASME and wrought copper fittings.

C. Equipment Connections

1. NPS 2 and smaller: Use union connections.
2. NPS 2-1/2 and larger: Use flange connections.
3. Dissimilar metals: Where piping is connected to equipment with different materials, such as ferrous to copper, use brass union, brass coupler, brass pipe/nipple in order to prevent

electrolysis.

4. Valves: Provide shut-off duty isolation valves at all equipment.

D. Condensate Drain Lines: Type L drawn-temper copper tubing with soldered joints.

3.2 VALVE APPLICATIONS

A. General-Duty Valve Applications for hydronic systems unless otherwise noted, use the following valve types:

Type	**Minimum Size**	**Maximum Size**	**Valve Service:**
Ball	¾"	2 "	Shut-off, and Throttling duty.
Gate, AWWA (chilled water)	2½"	12"	Shut-off duty.
Butterfly (chilled water)	2 ½"	n/a	Shut-off duty.
Gate, rising stem (HHW water)	2½"	n/a	Shut-off duty.
Butterfly (HHW water)	2 ½"	n/a	Shut-off duty.
Ball - Check (HHW)	¾"	2"	Check valve.

B. Install main building shut-off valves for hydronic systems.

C. Install shutoff duty valves at each riser branch connection to supply and return mains, at supply connection to each piece of equipment, unless only one piece of equipment is connected in the branch line.

D. Install auto flow limiting balancing valves in the return water line of each heating or cooling element. Install manual calibrated balancing valve at split coils as shown on the University's standard coil piping diagram.

E. Reheat Coils: Provide combination assemblies as described in Part 2, with flow limiting device and where equipment has rotating motors.

F. Hydronic systems which utilize flow limiting devices as balancing means shall include flow limiting devices on all system user branch take-off's at heat exchange device for system uniformity and proper system balance and operation.

G. Combination duty type valves and fittings shall not be used.

H. See Division 23 Section "Instrumentation and Controls" for hydronic control valve requirements.

I. Install check valves at each pump discharge and elsewhere as required to control flow direction.

J. Install safety valves on hot-water generators and elsewhere as required by the ASME Boiler and Pressure Vessel Code. Install safety-valve discharge piping, without valves, to floor. Comply with the ASME Boiler and Pressure Vessel Code, Section VIII, Division 1, for installation requirements.

K. Install pressure-reducing valves on hot-water generators and elsewhere as required to regulate system pressure.

L. All water valves operating between 32 and 95°F and larger than 2" shall be CHW butterfly valves. Where the valves are insulated to prevent sweating (e.g. chilled water) the valves shall be non- rising stem. Other applications may be either rising stem or non-rising stem as required. Except where buried outside, the valves shall have handwheels. Buried valves shall have 2" square operating nut.

3.3 PIPING INSTALLATIONS

A. Refer to Division 23 Section "Common Work Results for HVAC" for basic piping installation requirements.

B. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

C. Install drains, consisting of a tee fitting, NPS 3/4 ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

D. Install piping level or at a uniform grade of 0.2 percent in direction of flow or a drain.

E. Where possible, reduce pipe sizes using eccentric reducer fitting installed with level side up- top flat.

F. Install branch connections to mains using tee fittings in main pipe, with the takeoff coming out the bottom or top of the main pipe or using fabricated saddles per ASME B31.9 criteria. For up-feed risers, install the takeoff coming out the top of the main pipe where possible.

G. Install strainers on supply side of each control valve, pressure-reducing valve, solenoid valve, in-line pump, and elsewhere as indicated. Install NPS 3/4 nipple and ball valve in blowdown connection of strainers NPS 2 and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2.

H. Anchor piping for proper direction of expansion and contraction.

I. Do not use groove-joint fittings on insulated piping system, unless insulation system is specifically designed for groove-joint fittings. J. Avoid underground piping.

K. Piping penetrations shall be carefully detailed. Insulation through penetrations shall be continuous.

L. Bushings and short nipples shall be used only where necessary.

M. Avoid pipe joints located over, or within 2 feet of electrical equipment. If it cannot be avoided provide with drip pans.

N. Teflon tape shall be utilized for threaded pipe joints.

O. Provide pipe and fittings of similar materials so dielectric fittings are not needed; i.e. only brass and bronze fittings with copper piping.

P. Grooved Mechanical-Joint Fittings and Couplings:

1. Piping shall be roll grooved only. Cut groove piping is not allowed.
2. Gaskets shall be EPDM.
3. Install per manufacturer's installation instructions.

3.4 HANGERS AND SUPPORTS

A. Hanger, support, and anchor devices are specified in Division 23 Section "Hangers and Supports for HVAC." Comply with requirements below for maximum spacing of supports. B. Install the following pipe attachments:

1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze When necessary..
4. Spring hangers to support vertical runs.

C. Install hangers for steel piping with the following maximum spacing and minimum rod sizes:

NPS	Maximum span (feet)	Minimum rod size (inches)
3/4	7’	¼”
1	7 ‘	¼”
1-1/2	9’	3/8”
2	10’	3/8”
2-1/2	11’	3/8”
3	12’	3/8”
4	14’	½”
6	17’	½”
8	19’	5/8”
10	20’	¾”
12	23’	7/8”
14	25’	1”
16	27’	1”
18	28’	1-1/4”
20	30’	1-1/4”
24	32’	1-1/4”

D. Install hangers for drawn-temper copper piping with the following maximum spacing and minimum rod sizes. Comply with hanger manufacture spacing requirements.

NPS	Maximum span (feet)	Minimum rod (inches)
3/4	5 ‘	1/4 “
1	6 ‘	1/4 “
1-1/2	8 ‘	3/8 “
2	8 ‘	3/8 “
2-1/2	9 ‘	3/8 “
3	10 ‘	3/8 “

E. Support vertical runs at roof and at each floor.

3.5 PIPE JOINT CONSTRUCTION

A. Refer to Division 23 Section "Common Work Results for HVAC" for joint construction

requirements for soldered and brazed joints in copper tubing; threaded, welded, and flanged joints in steel piping.

3.6 HYDRONIC SPECIALTIES INSTALLATION

A. Install manual air vents at high points in piping, at heat-transfer coils, and elsewhere as required for system air venting.

B. Install one automatic air vent per system in mechanical equipment rooms only at air separator for system air venting.

C. Install in-line air separators in pump suction lines. Install drain valve on units NPS 2 and larger.

D. Install expansion tanks on floor. Vent and purge air from hydronic system, and ensure tank is properly charged with air to suit system design requirements.

E. Provide pot-feeder in heating systems and only in non-central plant chilled water systems.

3.7 TERMINAL EQUIPMENT CONNECTIONS

A. Size for supply and return piping connections shall be same as for equipment connections.

B. Install shut-off valves, strainers, accessories.

C. Install control valves in accessible locations close to connected equipment.

D. Never install bypass piping around control valves.

E. Install ports for pressure and temperature gages at coil inlet connections.

3.8 FIELD QUALITY CONTROL

A. Prepare hydronic piping according to ASME B31.9 and as follows:

1. Leave joints, including welds, uninsulated and exposed for examination during test.
2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
3. Flush system with city water. Clean strainers.
4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
5. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.

B. Perform the following tests on hydronic piping:

1. Use ambient temperature water as a testing medium.
2. While filling system, use vents installed at high points of system to release trapped air. Use drains installed at low points for complete draining of liquid.
3. Check expansion tanks to determine that they are not air bound and that system is full of water.
4. Subject piping system to hydrostatic test at 150 PSI or 1.5 times the design pressure, whichever is greater, for four hours. There shall be no decrease in pressure over the four hour test period. Isolate equipment subject to damage from test pressure. Make no test against a service valve or meter. Isolate from the system all existing piping and new or existing equipment that may be damaged by test pressure. Test only new piping unless instructed otherwise. Final connection between new and existing piping shall be tested at normal system operating pressures and monitored for leaks for three working days. Verify that stress due to pressure at bottom of vertical runs does not exceed either 90 percent of specified minimum yield strength or 1.7 times "SE" value in Appendix A of ASME B31.9, "Building Services Piping."
5. After hydrostatic test pressure has been applied, examine piping, joints, and connections for leakage throughout the testing period. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
6. Prepare written report of testing.

c Hydronic piping outside the building may be pre-tested with air at 100 psi. Upon successful testing, pipe may be buried and tested at a later date.

3.9 ADJUSTING

A. Perform these adjustments before operating the system:

1. Open valves to fully open position.
2. Check pump for proper direction of rotation.
3. Set automatic fill valves for required system pressure.
4. Check air vent at air separator and determine if it is operating freely (automatic type).
5. Check air vents at high points of system and bleed air completely (manual type).
6. Set temperature controls so all coils are calling for full flow.
7. Check and set operating temperatures of heating and chilled water systems to design requirements.
8. Lubricate motors and bearings.

3.10 CLEANING

A. Flush hydronic piping systems with clean water. Remove and clean or replace strainer screens. After cleaning and flushing hydronic piping systems, but before balancing, remove disposable fine-mesh strainers in pump suction diffusers.

END OF SECTION 23 2113

SECTION 23 2123 - HYDRONIC PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following categories of hydronic pumps for hydronic systems:

1. In-line circulators.
2. Vertical in-line pumps.
3. End-suction pumps.

B. Related Sections include the following:

1. Division 23 Section "Variable Frequency Drives" for variable frequency drive requirements.
2. Division 23 Section "Motors for HVAC" for general motor requirements.
3. Division 23 Section "Mechanical Vibration and Seismic Controls for HVAC" for inertia pads, isolation pads, spring supports, and spring hangers.

1.2 SUBMITTALS

A. Product Data: Include certified performance curves and rated capacities including pump efficiency, BHP, RPM, Head, GPM; shipping, installed, and operating weights; furnished specialties; final impeller dimensions; motor specifications; and accessories for each type of product indicated. Indicate pump's operating point on curves.

B. Shop Drawings: Show pump layout and connections. Include Setting Drawings with templates for installing foundation and anchor bolts and other anchorages.

1. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field-installed wiring.

C. Maintenance Data: For pumps to include in maintenance manuals specified in Division 01.

D. Provide pump alignment report that documents, as a minimum, the initial and final shaft orientations, and the changes made.

1.3 QUALITY ASSURANCE

A. UL Compliance: Fabricate and label pumps to comply with UL 778, "Motor-Operated Water Pumps," for construction requirements.

B. Product Options: Provide pumps based on the specific types and models indicated. Other manufacturers' pumps with equal performance characteristics may be considered. Refer to Division 01 regarding substitutions.

C. Regulatory Requirements: Fabricate “Pumps for Nomenclature, Definitions, Application and Operation," and HI 1.6, "Centrifugal Pump Tests."

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70), Article 100, by a testing agency acceptable to University's Representative.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Manufacturer's Preparation for Shipping: Clean flanges and exposed machined metal surfaces and treat with anticorrosion compound after assembly and testing. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.

B. Store pumps in dry location.

C. Retain protective covers for flanges and protective coatings during storage.

D. Protect bearings and couplings against damage from sand, grit, and other foreign matter.

E. Comply with pump manufacturer's written rigging instructions.

1.5 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03 Section "Cast-in-Place Concrete."

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Mechanical Seals: One entirely complete mechanical seal kit for each pump.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following or equal:

1. In-Line Circulators:

a. Armstrong Pumps Inc.
b. Aurora Pumps.
c. Bell & Gossett
d. Grundfos Pumps Corp.
e. Paco Pumps.

2. Vertical In-Line Pumps:

a. Armstrong Pumps Inc.

b. Aurora Pumps.
c. Paco Pumps.

4. Flexible-Coupled, End-Suction Pumps:

a. Armstrong Pumps Inc.
b. Aurora Pumps
c. Bell & Gossett
d. Grundfos Pumps Corp.
e. Paco Pumps
f. Peerless Pump Co.
g. Weinman Pumps

B. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 GENERAL PUMP REQUIREMENTS

A. Pump Units: Factory assembled and tested.

B. Motors: Refer to Section “Motors for HVAC” in Division 23. Select each motor to be non-overloading over full range of pump performance curve.

2.3 IN-LINE CIRCULATORS

A. Description: Horizontal, in-line, centrifugal, single-stage, bronze-fitted, radially split case design; rated for 125-psig minimum working pressure and a continuous water temperature of 225 deg F.

1. Casing: Cast iron, with threaded companion flanges for piping connections, and threaded gage tappings at inlet and outlet connections.
2. Impeller: PES composite (30% glass-filled), single suction, and keyed to shaft.
3. Shaft and Sleeve: Aluminum shaft with stainless-steel sleeve.
4. Seals: Mechanical type. Include carbon-steel rotating ring, stainless-steel spring, ceramic seat, and EPDM Elastomers.
5. Pump Bearings: Aluminum oxide ceramics.
6. Motor Bearings: Oil-lubricated, sleeve type.
7. Coupling: Flexible, capable of absorbing torsional vibration and shaft misalignment.
8. Motor: Resiliently mounted to pump casing.

2.4 VERTICAL IN-LINE PUMPS

A. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, separately coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted vertically. Rate pump for 125-psig minimum working pressure and a continuous water temperature of 225 deg F.

B. Pump Construction:

1. Casing: Radially split, cast iron, with replaceable bronze wear rings, threaded gage tappings at inlet and outlet, and threaded companion-flange connections.
2. Impeller: ASTM B 584, cast bronze, fully enclosed type; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw.
3. Pump Shaft: Stainless steel.

C. Mechanical Seal: Stainless steel multi-spring outside balanced type with Viton secondary seal, carbon rotating face and silicon carbide stationary seat. Provide 316 stainless steel gland plate. Provide factory installed flush line with manual vent. Provide with a lower seal chamber throttle bushing to ensure seals maintain positively cooling and lubrication.

D. Coupling: Axially split spacer coupling. Rigid spacer type of high tensile aluminum alloy. Coupling to be designed to be easily removed on site to reveal a space between the pump and motor shafts sufficient to remove all mechanical seal components for servicing and to be replaced without disturbing the pump or motor.

E. Motor: Rigidly mounted to pump casing with lifting eye and supporting lugs in top of motor enclosure.

2.6 FLEXIBLE-COUPLED, END-SUCTION PUMPS

A. Description: Base-mounted, centrifugal, flexible-coupled, end-suction, single-stage, bronze fitted, back-pull-out, radially split case design; rated for 175-psi minimum working pressure and a continuous water temperature of 250 deg F max.

1. Casing: Cast iron, with flanged piping connections, drain plug at low point of volute, threaded gage tappings at inlet and outlet connections, and integral feet or other means on volute to support weight of casing and attached piping. Casing shall allow removal and replacement of impeller without disconnecting piping.
2. Impeller: ASTM B 584, cast bronze, statically and dynamically balanced, closed, overhung, single suction, keyed to shaft, and secured by locking cap screw.
3. Wear Rings: Replaceable, bronze casing ring.
4. Shaft and Sleeve: Steel shaft with bronze sleeve.
5. Seals: Mechanical, with Hi resist seat, carbon washer, viton elastomer, stainless steel spring and parts.
6. Pump shaft bearings: Grease-lubricated ball bearings in cast-iron housing.
7. Coupling: Flexible-spacer type, capable of absorbing torsional vibration and shaft misalignment; with flange and sleeve section that can be disassembled and removed without removing pump or motor.
8. Coupling Guard: Dual rated; ANSI B15.1, Section 8; OSHA 1910.219 approved; steel; removable; attached to mounting frame.
9. Mounting Frame: Welded-steel frame and cross members, factory fabricated from ASTM A 36/A 36M channels and angles. Fabricate for mounting pump casing, coupling guard, and motor. Field-drill motor-mounting holes for field-installed motors.
10. Motor: Secured to mounting frame, with adjustable alignment.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation.

1. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.
2. Examine foundations and inertia bases for suitable conditions where pumps are to be installed.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PUMP INSTALLATION

A. Install pumps according to manufacturer's written instructions.

1. Install pumps according to HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation."

B. Install pumps to provide access for periodic maintenance, including removing motors, impellers, couplings, and accessories.

C. Support pumps and piping separately so piping is not supported by pumps, and loads are not transferred to pump flanges. Adjust pipe hangers so that flange gaskets require only slight moderate force to overcome frictional resistance when slip into place.

D. Install pumps according to manufacturer’s instructions.

E. Suspend in-line pumps using continuous-thread hanger rod and vibration-isolation hangers. Install seismic bracing as required by CBC.

F. Verify installation requirements with acoustic consultant and requirements. Provide base, pad, isolators, flexible connectors, inertia bases, and other sound treatment devices according to acoustic consultant’s recommendations.

G. Set base-mounted pumps on concrete foundation. Disconnect coupling halves before setting. Do not reconnect couplings until alignment operations have been completed.

1. Support pump baseplate on rectangular metal blocks and shims, or on metal wedges with small taper, at points near foundation bolts to provide a gap of 3/4 to 1-1/2 inches between pump base and foundation for grouting.
2. Adjust metal supports or wedges until pump and driver shafts are level. Check coupling faces and suction and discharge flanges of pump to verify that they are level and plumb.

3.3 ALIGNMENT

A. A millwright or manufacturer's representative startup technician shall align pump and motor shafts and piping connections after setting them on foundations, after grout has been set and foundation bolts have been tightened, and after piping connections have been made.

B. Comply with pump and coupling manufacturers' written instructions.

C. Adjust pump and motor shafts for angular and offset alignment by methods specified in HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation."

1. Alignment shall be reverse dial indicator or laser method.
2. Indicated run-out shall not exceed 0.001 inches.
3. Angular and offset misalignment shall be as follows:

	Maximum Angularity	Maximum Offset
1200 rpm	0.0015"	0.003"
1800 rpm	0.0010"	0.002"
3600 rpm	0.0005"	0.001"

D. After alignment is correct, tighten foundation bolts evenly but not too firmly. Completely fill baseplate with non-shrink, nonmetallic grout while metal blocks and shims or wedges are in place. After grout has cured, fully tighten foundation bolts.

3.4 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Shop drawings show specific locations.

B. Install piping adjacent to machine to allow service and maintenance and shall is no case cause a tripping hazard.

C. Connect piping to pumps. Install valves that are the same size as piping connected to pumps.

D. Install suction and discharge pipe sizes equal to or greater than diameter of pump nozzles.

E. Install isolation valves on suction and discharge sides of pump.

F. Strainers: Install pipe strainer, or suction diffuser with strainer on floor-mounted pumps. Exception: Basket strainer shall be used on the suction of condenser water pumps.

G. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.

H. Check Valves: Install non-slam check valves on pump discharge line. Exception: Omit check valve when pump serves a single story building and it is a single pump mounted on the lowest floor.

I. Install inertia base and vibration isolation when not installed on slab on grade.

J. Install temperature and pressure gages on pump suction and discharge. Install at integral pressure-gage tappings where provided.

K. Install electrical connections for power, controls, and devices.

L. Electrical power and control wiring and connections are specified in Division 26 Sections. Rotate junction box on pump motor to provide the most direct power wiring connection from the source.

M. Ground equipment.

1. Tighten electrical connectors and terminals according to manufacturer's published torque tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

3.5 COMMISSIONING

A. Verify that pumps are installed and connected according to the Contract Documents.

B. Verify that electrical wiring installation complies with manufacturer's written instructions and the Contract Documents.

C. Perform the following preventive maintenance operations and checks before starting:

1. Lubricate bearings.
2. Remove grease-lubricated bearing covers, flush bearings with kerosene, and clean thoroughly. Fill with new lubricant according to manufacturer's written instructions.
3. Disconnect coupling and check motor for proper rotation that matches direction marked on pump casing.
4. Verify that pumps are free to rotate by hand and that pumps for handling hot liquids are free to rotate with pumps hot and cold. Do not operate pumps if they are bound or drag, until cause of trouble is determined and corrected.
5. Check suction piping connections for tightness to avoid drawing air into pumps.
6. Clean strainers.
7. Verify that pump controls are correct for required application.

D. Starting procedure for pumps with shutoff power not exceeding safe motor power is as follows:

1. Prime pumps by opening suction valves and closing drains, and prepare pumps for operation.
2. Open discharge valves, pumps should not be operated against dead shutoff.
3. Start motors.
4. Open discharge valves slowly.
5. Check general mechanical operation of pumps and motors.

E. Refer to Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for detailed requirements for testing, adjusting, and balancing hydronic systems and Division 23 Section “Commissioning of HVAC”.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train University's maintenance personnel to adjust, operate, and maintain hydronic pumps as specified below:

1. Train University's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining pumps.
2. Review data in maintenance manuals. Refer to Division 01 Section "Operation and Maintenance Data."
3. Schedule training with University's Representative.

END OF SECTION 23 2123

SECTION 23 2213 - STEAM AND CONDENSATE PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following for LP and HP steam and condensate piping:

1. Pipe and fittings.
2. Strainers.
3. Flash tanks.
4. Safety valves.
5. Pressure-reducing valves.
6. Steam traps.
7. Thermostatic air vents
8. Vacuum breakers.
9. Steam and condensate meters.
10. Exhaust vent heads.
11. Muffling orifice plates.
12. Noise suppressors.

1.3 DEFINITIONS

A. HP Systems: High-pressure piping operating at more than 15 psig as required by ASME B31.1.

B. LP Systems: Low-pressure piping operating at 15 psig or less as required by ASME B31.9.

1.4 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressures and temperatures:

1. HP Steam Piping 16 to 80 psig: 125 psig
2. LP Steam Piping: 100 psig.
3. Low Pressure Condensate Piping: 100 psig at 340 deg F.
4. High Pressure Condensate Piping (16 PSIG – 100 PSIG): 150 psig at 365 deg F
5. Pumped Condensate: 100 psig at 225 deg F.
6. Cold Water Make-up Piping: 80 psig at 150 deg F.
7. Boiler Feedwater Piping: Equal to 150 percent of the piping system pressure to which it is attached.

8. Boiler Blowdown Piping: Equal to pressure of the piping system to which it is attached.
9. Drain Piping: Equal to pressure of the piping system to which it is attached.
10. Boiler Trim Piping: Equal to pressure of the piping system to which it is attached.
11. Air-Vent and Vacuum-Breaker Piping: Equal to pressure of the piping system to which it is attached.
12. Safety-Valve-Inlet and -Outlet Piping: Equal to pressure of the piping system to which it is attached.

1.5 SUBMITTALS

A. Product Data: For each type of the following:

1. Pipe and fittings.
2. Strainers.
3. Flash tanks.
4. Safety valves.
5. Pressure-reducing valves.
6. Steam traps.
7. Thermostatic air vents
8. Vacuum breakers.
9. Steam and condensate meters.
10. Exhaust vent heads.
11. Steam filter – Element type.
12. Steam separators.
13. Muffling orifice plates.
14. Noise suppressors.

B. Shop Drawings: Detail, [1/4 inch equals 1 foot] scale, flash tank assemblies and fabrication of pipe anchors, hangers, pipe, multiple pipes, alignment guides, and expansion joints and loops and their attachment to the building structure. Detail locations of anchors, alignment guides, and expansion joints and loops.

C. Qualification Data: For Installer.

D. Welding certificates.

E. Field quality-control test reports.

F. Operation and Maintenance Data: For valves, safety valves, pressure-reducing valves, steam traps, air vents, vacuum breakers, and meters to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Installer Qualifications:

B. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code - Steel."

C. Pipe Welding: Qualify processes and operators according to the following:

1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

D. ASME Compliance: Comply with ASME B31.9, "Building Services Piping" for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp flash tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

PART 2 - PRODUCTS

2.1 STEEL PIPE AND FITTINGS

A. Steel Pipe: ASTM A 53/A 53M, black steel, plain ends, Type, Grade, and Schedule as indicated in Part 3 piping applications articles.

B. Steel Pipe: ASTM A 106, black steel, plain ends, Type, Grade, and Schedule as indicated in Part 3 piping applications articles.

C. Malleable Iron Threaded Fittings: ASME B16.4; Classes 150 add 300 as indicated in Part 3 piping applications articles.

D. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300 as indicated in Part 3 piping applications articles.

E. Cast-Iron Threaded Flanges and Flanged Fittings: ASME B16.1, Classes 125 and 250 as indicated in Part 3 piping applications articles; raised ground face, and bolt holes spot faced.

F. Wrought Carbon Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.

G. Wrought Carbon Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:

1. Material Group: 1.1.
2. End Connections: Butt welding.
3. Facings: Raised face.

H. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, black steel of same Type, Grade, and Schedule as pipe in which installed.

2.2 BELOW GRADE STEAM PIPING AND CONDENSATE RETURN PIPING

A. Manufacturers

1. Perma-Pipe “Multi-Therm 500” or Ultratherm
2. Thermacor “Duo-Therm 505”
3. Rovanco “Hi-Temp Rhinocoat Conduit or Hi-Temp System”

4.

B. Description: All underground heat distribution lines shall be fiber glass jacketed steel conduit or 20 mil fusion epoxy coated steel jacketed conduit..

1. All straight sections, fittings, anchors and other accessories shall be factory prefabricated to job dimensions, and designed to minimize the number of field welds.
2. Each system layout shall be computer analyzed by the piping system manufacturer to determine stresses and movements of the service pipe. These calculations shall account for the interaction and movement of the existing pipe to create one piping system, fully integrated.
3. The system design shall be in strict conformance with ANSI B31.1 latest edition, and stamped by a registered professional engineer. Factory trained field technical assistance shall be provided for the critical periods of the installation; i.e., unloading, field joint instruction and testing.

C. Service Pipe:

1. Steam pipe shall be Standard weight carbon steel pipe, ASTM A106 Grade B, seamless or EWR.
2. Condensate piping shall be schedule 80 carbon steel, ASTM A106 Grade B or ASTM A53 Grade B.
3. Butt welded joints 2.5 inches and larger
4. Socket welded for 2 inches and below.
5. Where possible, straight sections shall be supplied in 40 foot random length with 6 inches of piping exposed at each end for field joint fabrication.

D. Subassemblies:

1. End seals, gland seals and anchors shall be designed and factory prefabricated to prevent the ingress of moisture into the system.
2. All subassemblies shall be designed to allow for complete draining and drying of the conduit system.

E. Service Pipe Insulation:

1. Insulation shall be FOAMGLAS cellular glass insulation, as manufactured by Pittsburgh Corning Corporation, in accordance with ASTM C-552 Standard Specification for Cellular Glass Thermal Insulation. The FOAMGLAS insulation shall be fabricated in half, curved sidewall, V-Groove or StrataFab insulation sections mineral wool, and calcium silicate insulation as an option.
2. The bore coating shall be Hydrocal B-11 gypsum cement, manufactured by U.S. Gypsum Corporation.
3. The insulation shall be secured to the pipe by stainless steel bands. Insulation thickness shall be as shown on the drawings.

F. Outer Conduit:

1. The steel conduit casing shall be smooth wall, welded steel conduit of the thickness specified below:

Conduit Size	Conduit Thickness
6" - 26"	10 Gauge
28" - 36"	6 Gauge
38" - 42"	4 Gauge

G. Pipe Supports:

1. All pipes within the outer casing shall be supported at not more than 10 foot intervals. These supports shall be designed to allow for continuous airflow and drainage of the conduit in place. The straight supports shall be designed to occupy not more than 10% of the annular air space. Supports shall be of the type where insulation thermally isolates the carrier pipe from the outer conduit.
2. The surface of the insulation shall be protected at the support by a sleeve not less than 12 inches long, fitted with traverse and, where required, rotational arresters.

2.3 JOINING MATERIALS

A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
b. Narrow-Face Type: For raised-face, Class 125, cast-iron and steel flanges.

B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

C. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

D. Welding Materials: Comply with Section II, Part C, of ASME Boiler and Pressure Vessel Code for welding materials appropriate for wall thickness and for chemical analysis of pipe being welded.

2.4 VALVES

A. Gate, Globe, Check, Ball, and Butterfly Valves: Comply with requirements specified in Division 23 Section "General-Duty Valves for HVAC Piping."

B. Gate Valves, Flanged/Threaded:
1. Outdoor
   a. Low Pressure, High Temp/Low Temp
   b. High Pressure, High Temp/Low Tem
2. Indoor
   a. Low Pressure, High Temp/Low Temp
   b. High Pressure, High Temp/Low Temp

3. Manufacturers:

   a. Milwaukee.

   b. RP&C.

   c. Bonney Forge.

   d. NIBCO Inc.

C. Stop-Check Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Crane Co.
   b. Jenkins Valves; a Crane Company.
   c. Lunkenheimer Valves.
   d. A.Y. McDonald Mfg. Co.

2. Body and Bonnet: Malleable iron.
3. End Connections: Flanged.
4. Disc: Cylindrical with removable liner and machined seat.
5. Stem: Brass alloy.
6. Operator: Outside screw and yoke with cast-iron handwheel.
7. Packing: Polytetrafluoroethylene-impregnated packing with two-piece packing gland assembly.
8. Pressure Class: 125.

2.5 STRAINERS FOR LOW PRESSURE STEAM SYSTEMS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Armstrong International
2. Hoffman Specialty
3. Mueller Steam Specialties
4. O.C. Keckley Co.
5. Spirax Sarco

B. Y-Pattern Strainers:

1. NPS 2 and Smaller:

   a. Body: ASTM A 126, Class B cast iron with bolted cover and bottom drain connection.
   b. End Connections: Threaded ends for strainers NPS 2 and smaller; flanged ends for strainers NPS 2-1/2 and larger.
   c. Strainer Screen: Stainless-steel, per manufacturer’s recommended chart, and perforated stainless-steel basket with 50 percent free area.

d. Tapped blowoff plug.
e. CWP Rating: 125-psig working steam pressure.

2. NPS 2-1/2 and Larger:

a. Body: ASTM A 126, Class B cast iron or ASTM A216 Grade WCB Carbon Steel with bolted cover and bottom drain connection.
b. End Connections: Threaded ends for strainers NPS 2 and smaller; flanged ends for strainers NPS 2-1/2 and larger.
c. Strainer Screen: Stainless-steel, per manufacturer's recommended sizes or perforated stainless-steel basket with 50 percent free area.
d. Tapped blowoff plug.
e. CWP Rating: 125-psig working steam pressure.

2.6 STRAINERS FOR HIGH PRESSURE STEAM SYSTEMS (16 PSIG – 80 PSIG)

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Armstrong International
2. Hoffman Specialty
3. Mueller Steam Specialties
4. O.C. Keckley Co.
5. Spirax Sarco

B. Y-Pattern Strainers:

1. Body: ASTM A 126, Class B cast iron or ASTM A216 Grade WCB Carbon Steel, with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for strainers NPS 2 and smaller; flanged ends for strainers NPS 2-1/2 and larger.
3. Strainer Screen: Stainless-steel, per manufacturer's recommended sizes or perforated, and perforated stainless-steel basket with 50 percent free area.
4. Tapped blowoff plug.
5. CWP Rating: 125-psig working steam pressure.

2.7 FLASH TANKS

A. Shop or factory fabricated of welded steel according to ASME Boiler and Pressure Vessel Code, for 150-psig rating; and bearing ASME label. Fabricate with tappings for low-pressure steam and condensate outlets, high-pressure condensate inlet, air vent, safety valve, and legs.

2.8 SAFETY VALVES

A. Bronze or Brass Safety Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Armstrong International, Inc.
b. Kunkle Valve; a Tyco International Ltd. Company.
c. Spirax Sarco, Inc.
d. Watts Water Technologies, Inc.

2. Disc Material: Forged copper alloy.
3. End Connections: Threaded inlet and outlet.
4. Spring: Fully enclosed steel spring with adjustable pressure range and positive shutoff, factory set and sealed.
5. Pressure Class: 250.
6. Drip-Pan Elbow: Cast iron and having threaded or flanged inlet and outlet connections.
7. Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code.

B. Cast-Iron Safety Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Armstrong International, Inc.
b. Kunkle Valve; a Tyco International Ltd. Company.
c. Spirax Sarco, Inc.
d. Watts Water Technologies, Inc.

2. Disc Material: Forged copper alloy with bronze nozzle.
3. End Connections: Raised-face flanged inlet and threaded or flanged outlet connections.
4. Spring: Fully enclosed cadmium-plated steel spring with adjustable pressure range and positive shutoff, factory set and sealed.
5. Pressure Class: 250.
6. Drip-Pan Elbow: Cast iron and having threaded or flanged inlet, outlet, and drain, with threads complying with ASME B1.20.1.
7. Exhaust Head: Cast iron and having threaded or flanged inlet and drain, with threads complying with ASME B1.20.1.
8. Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code.

2.9 PRESSURE-REDUCING VALVES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Armstrong International, Inc.
2. Hoffman Specialty; Division of ITT Industries.
3. Leslie Controls, Inc.
4. Spence Engineering Company, Inc.
5. Spirax Sarco, Inc.

B. Size, Capacity, and Pressure Rating: Factory set for inlet and outlet pressures indicated.

C. Description: Pilot-actuated, diaphragm type, with adjustable pressure range and positive shutoff.

D. Body: Cast iron.

E. End Connections: Threaded connections for valves NPS 2 and smaller and flanged connections for valves NPS 2-1/2 and larger.

F. Trim: Hardened stainless steel.

G. Head and Seat: Replaceable, main head stem guide fitted with flushing and pressure-arresting device cover over pilot diaphragm.

H. Gaskets: Non-asbestos materials.

I. Capacities and Characteristics: Refer to Drawings for Steam Pressure Reducing Valve Schedule.

2.10 STEAM TRAPS

A. Float and Thermostatic Traps:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Armstrong International, Inc.
    b. Hoffman Specialty; Division of ITT Industries.
    c. Spirax Sarco, Inc.

2. Body and Bolted Cap: ASTM A 126, cast iron.
3. End Connections: Threaded.
4. Float Mechanism: Replaceable, stainless steel.
5. Head and Seat: Hardened stainless steel.
6. Trap Type: Balanced pressure.
7. Thermostatic Bellows: Stainless steel or monel.
8. Thermostatic air vent capable of withstanding 45 deg F of superheat and resisting water hammer without sustaining damage.
9. Vacuum Breaker: Thermostatic with phosphor bronze bellows, and stainless steel cage, valve, and seat.
10. Maximum Operating Pressure: 125 psig.

B. Inverted Bucket Traps:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Armstrong International, Inc.
    b. Hoffman Specialty; Division of ITT Industries.
    c. Spirax Sarco, Inc.

2. Body and Cap: Cast iron.
3. End Connections: Threaded.
4. Head and Seat: Stainless steel.
5. Valve Retainer, Lever, and Guide Pin Assembly: Stainless steel.
6. Bucket: Brass or stainless steel.
7. Strainer: Integral stainless-steel inlet strainer within the trap body.
8. Air Vent: Stainless-steel thermostatic vent.
9. Pressure Rating: 250 psig.

2.11 THERMOSTATIC AIR VENTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Armstrong International, Inc.
   b. Hoffman Specialty; Division of ITT Industries.
   c. Spirax Sarco, Inc.

B. Body: Cast iron, bronze or stainless steel.

C. End Connections: Threaded.

D. Float, Valve, and Seat: Stainless steel.

E. Thermostatic Element: Phosphor bronze bellows in a stainless-steel cage.

F. Pressure Rating: 125 psig.

G. Maximum Temperature Rating: 350 deg F.

2.12 VACUUM BREAKERS

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Armstrong International, Inc.
   b. Hoffman Specialty; Division of ITT Industries.
   c. Spirax Sarco, Inc.

2. Body: Cast iron, bronze, or stainless steel.
3. End Connections: Threaded.
4. Sealing Ball, Retainer, Spring, and Screen: Stainless steel.
5. O-ring Seal: EPR.
6. Pressure Rating: 125 psig.
7. Maximum Temperature Rating: 350 deg F.

2.13 STEAM METERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. EMCO Flow Systems; Division of Advanced Energy Company.
2. Preso Meters; a division of Racine Federated Inc.
3. Spirax Sarco, Inc.

B. Meters shall have a microprocessor to display totalizer flow, flow rate, temperature, pressure, time, and date; alarms for high and low flow rate and temperature.

1. Computer shall have 4 to 20-mA or 2 to 10volt output for temperature, pressure, and contact closure for flow increments.
2. Independent timers to store four peak flow rates and total flow.
3. Interface compatible with central workstation described in Division 23 Section "Instrumentation and Control for HVAC."
4. Microprocessor Enclosure: NEMA 250, Type 4.

C. Sensor: Venturi, of stainless-steel construction, for insertion in pipeline between flanges. At least 10:1 turndown with plus or minus 1 percent accuracy over full-flow range.

D. Sensor: Vortex type with stainless-steel wetted parts and wafer or flange connections; and with a piezoelectric sensor removable and serviceable without shutting down the process. At least 10:1 turndown with plus or minus 1 percent accuracy over full-flow range.

E. Sensor: Spring-loaded, variable-area flowmeter type; density compensated with stainless-steel wetted parts and wafer or flange connections. At least 10:1 turndown with plus or minus 2 percent accuracy over full-flow range.

2.14 CONDENSATE METERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Central Station Steam Co.
2. Lincoln Meter Company.

B. Body: Cast iron, bronze, or brass.

C. Turbine: Copper, brass, or stainless steel.

D. Connections: Threaded for NPS 2 and smaller and flanged for NPS 2-1/2.

E. Totalizer: Meters shall have a microprocessor to display flow, flow rate, time, and date; alarms for high and low flow rate, pressure, and temperature.

1. Computer shall have 4- to 20-mA or 2- to 10-volt output for temperature, pressure, and contact closure for flow increments.
2. Independent timers to store four peak flow rates and total flow.

3. Interface compatible with central workstation specified in Division 23 Section "Instrumentation and Control for HVAC."
4. Microprocessor Enclosure: NEMA 250, Type 4.

F. Pressure Rating: 15 psig.

G. Maximum Temperature Rating: 250 deg F.

2.15 EXHAUST VENT HEADS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Spirax Sarco

B. Constructed of austenitic stainless steel with internal baffle to separate entrained water from steam discharge.

C. Provide vent heads with threaded or flanged connections.

D. Provide unit with threaded drain connection.

2.16 MUFFLING ORIFICE PLATES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Spence Engineering Co.

B. Constructed of a steel plate with a stainless steel plate welded to the primary plate and designed to fit between two ANSI flanges.

C. Unit shall be designed to provide 6-10 dBa noise reduction in the steam line.

2.17 NOISE SUPPRESSORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Spence Engineering Co.

B. Constructed of welded steel with stainless steel acoustic material. Provide with Class 150 flanged end connections.

C. Units shall be designed to provide 10 – 28 dBa noise reduction in the steam line.

PART 3 - EXECUTION

3.1 LOW PRESSURE STEAM SYSTEMS

A. Low Pressure Steam: NPS 2 and Smaller: Standard weight, ASTM A53, Type "S, E, or F". Grade A or B, black steel pipe; ASTM A126/ANSI B16.4 Class 300 Malleable Iron; threaded joints. 3000# Forged Steel, threaded or socket weld fittings

B. Low Pressure Steam: NPS 2-1/2 and Larger: Standard weight, ASTM A53, Type "E" or "F", Grade A or B or Type "S", Grade B, black steel pipe; ASTM A234 Class 150 seamless or EWR, carbon steel weld fittings.

C. Low Pressure Condensate: NPS 2 and Smaller: Extra strong ASTM A53, Type "E", "F" or "S", Grade A or B black steel pipe; ASTM A126/ANSI B16.4 Class 300 Malleable Iron; threaded joints. 3000# Forged Steel, threaded or socket weld fittings.

D. Low Pressure Condensate: NPS 2-1/2 and Larger: Extra strong ASTM A53, Grade "B", Type "E" or Type "S" black steel pipe; ASTM A234 Class 300 seamless, carbon steel weld fittings.

3.2 HIGH PRESSURE STEAM SYSTEMS (16 PSIG – 80 PSIG)

A. High Pressure Steam: NPS 2 and Smaller: Standard weight, ASTM A53, Grade "B" Type "S" black steel pipe; ASTM A126/ANSI B16.4 Class 300 Malleable Iron; threaded joints. 3000# Forged Steel, threaded or socket weld fittings.

B. High Pressure Steam: NPS 2-1/2 and Larger: Standard weight, ASTM A53, Type "E" or Type "S", Grade B, black steel pipe; ASTM A234 Class 150 seamless, carbon steel weld fittings.

C. High Pressure Condensate: NPS 2 and Smaller: Extra strong ASTM A53, Grade "B", Type "S" black steel pipe; ASTM A126/ANSI B16.4 Class 300 Malleable Iron; threaded joints. 3000# Forged Steel, threaded or socket weld fittings.

D. High Pressure Condensate: NPS 2-1/2 and Larger: Extra strong ASTM A53, Grade "B", Type "E" or Type "S" black steel pipe; ASTM A234 Class 300 seamless, carbon steel weld fittings.

3.3 ANCILLARY PIPING APPLICATIONS

A. Cold water make-up piping:

1. Type L drawn-temper copper tubing, wrought-copper fittings, and soldered joints.

B. Boiler Feedwater Piping: Same materials and joining methods as for piping specified for the service in which feedwater piping is installed.

C. Blowdown-Drain Piping: Same materials and joining methods as for piping specified for the service in which blowdown drain is installed.

D. Air-Vent Piping:

1. Inlet: Same as service where installed.
2. Outlet: Type K annealed-temper copper tubing with soldered or flared joints.

E. Vacuum-Breaker Piping: Outlet, same as service where installed.

F. Safety-Valve-Inlet and -Outlet Piping: Same materials and joining methods as for piping specified for the service in which safety valve is installed.

3.4 VALVE APPLICATIONS

A. Install shutoff duty valves at branch connections to steam supply mains, at steam supply connections to equipment, and at the outlet of steam traps.

B. Install safety valves on pressure-reducing stations and elsewhere as required by ASME Boiler and Pressure Vessel Code. Install steam safety-valve discharge drip pan ell fittings with steam vent piping run directly outdoors or as indicated on Drawings. All vent piping to be supported independently from steam safety valves. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.

3.5 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Use indicated piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

B. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping free of sags and bends.

G. Install fittings for changes in direction and branch connections.

H. Install piping to allow application of insulation.

I. Select system components with pressure rating equal to or greater than system operating pressure.

J. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

K. Install drains, consisting of a tee fitting, NPS 3/4 gate valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

L. Install steam supply piping at a minimum uniform grade of 0.2 percent downward in direction of steam flow.

M. Install condensate return piping at a minimum uniform grade of 0.4 percent downward in direction of condensate flow.

N. Reduce pipe sizes on horizontal piping runs using eccentric reducer fitting installed with level side down.

O. Install branch connections to mains using tee fittings in main pipe, with the branch connected to top of main pipe or 45 degrees from the top of main pipe.

P. Install valves according to Division 23 Section "General-Duty Valves for HVAC Piping."

Q. Properly align piping before installation of valves. Install valves in strict accordance with valve manufacturer's installation recommendations. Do not support weight of piping on valve ends.

R. Install swing check valves in the horizontal position with the hinge pin level.

S. Install swing check valves where specified and detailed and at steam trap condensate lines where they rise at the outlet of steam traps. Provide isolation valves to allow repair or replacement of check valve.

T. Install all valves with the stem in the upright position. Valves may be installed with the stem in the horizontal or 45 degrees above horizontal where space limitation does not allow installation in an upright position or where large valves are provided with chain wheel operators.

U. In general, install valves located within six feet (6') of the floor level, out from under equipment, and in accessible locations with adequate clearance around hand wheels or levers for easy operation.

V. Install globe valves for throttling service and control device or meter by-pass.

W. Install quick-opening valves at boiler water level safety switches with drain piping extended down to nearest floor drain.

X. Where valves 2-1/2" and larger are located more than 12'-0" above the finished floor, install valve with stem in the horizontal position and provide a chain wheel operator.

Y. Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated.

Z. Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.

AA. Install strainers on supply side of control valves, pressure-reducing valves, traps, and elsewhere as indicated. Install NPS 3/4 nipple and gate valve in blowdown connection of strainers NPS 2 and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2.

BB. Install expansion loops, expansion joints, anchors, and pipe alignment guides as specified in Division 23 Section "Expansion Fittings and Loops for HVAC Piping."

CC. Identify piping as specified in Division 23 Section "Identification for HVAC Piping and Equipment."

DD. Install drip legs at low points and natural drainage points such as ends of mains, bottoms of risers, and ahead of pressure regulators, and control valves.

1. On straight runs with no natural drainage points, install drip legs at intervals not exceeding 200 feet.
2. Size drip legs same size as main. In steam mains NPS 6 and larger, drip leg size can be reduced, but to no less than NPS 4.

EE. Flash Tank:

1. Pitch condensate piping down toward flash tank.
2. If more than one condensate pipe discharges into flash tank, install a check valve in each line.
3. Install tank vent connected into low pressure steam main.
4. Install safety valve at tank top. Safety valve set to discharge at same pressure as low pressure system safety valve setting.
5. Install full-port ball valve, and swing check valve on condensate outlet.
6. Install inverted bucket or float and thermostatic trap at low-pressure condensate outlet, sized for three times the calculated heat load.
7. Install pressure gage on low-pressure steam outlet according to Division 23 Section "Meters and Gages for HVAC Piping."

3.6 STEAM-TRAP INSTALLATION

A. Install steam traps in accessible locations as close as possible to connected equipment.

B. For low pressure systems, install gate valve, strainer, and union upstream from trap; install union, test tee with gate valve and gate valve downstream from trap unless otherwise indicated.

C. For high pressure systems, install gate valve, strainer, and union upstream from trap; install union, test tee with gate valve, check valve and gate valve downstream from trap unless otherwise indicated.

3.7 PRESSURE-REDUCING VALVE INSTALLATION

A. Install pressure-reducing valves in accessible location for maintenance and inspection.

B. Install bypass piping around pressure-reducing valves, with globe valve Cv selected such that the pressure drop across the wide open globe valve is equal to the upstream steam pressure minus the downstream steam pressure when steam is flowing through the globe valve at the design maximum steam flow through the larger pressure reducing valve (for duplex valve stations).

C. Install gate valves on both sides of pressure-reducing valves.

D. Install eccentric reducers both upstream and downstream of pressure reducing valves, with the eccentric reducers oriented to create a level flow path from the upstream and downstream piping through the pressure reducing valve.

E. Install unions or flanges on both sides of pressure-reducing valves having threaded- or flanged-end connections respectively.

F. Install pressure gages on low-pressure side of pressure-reducing valves after the bypass connection according to Division 23 Section "Meters and Gages for HVAC Piping."

G. Install strainers upstream for pressure-reducing valve.

H. Install safety valve downstream from pressure-reducing valve station and at locations detailed.

I. Avoid locating steam traps below the level of low pressure condensate return mains. Provide a condensate pumping unit to lift condensate to drain into the low pressure condensate return main if the low pressure steam trap is located below the condensate return main.

3.8 STEAM OR CONDENSATE METER INSTALLATION

A. Install meters with lengths of straight pipe upstream and downstream according to meter manufacturer's instructions.

B. Provide data acquisition wiring. Refer to Division 23 Section "Instrumentation and Control for HVAC."

C. Install eccentric reducers both upstream and downstream of steam flow meters with the eccentric reducers oriented to create a level flow path from the upstream and downstream piping through the steam flow meter. If the steam flow meters are constructed with integral concentric pipe reduction, provide a drip leg and trap upstream of the meter to collect any liquid condensate before it blows through the meter.

3.9 SAFETY VALVE INSTALLATION

A. Install safety valves according to ASME B31.9, "Building Services Piping."

B. Install steam safety-valve discharge drip pan elbow fittings with steam vent piping run vertically directly outdoors or as indicated on Drawings. All vent piping to be supported independently from steam safety valves.

C. Install drip-pan elbow fitting adjacent to safety valve and pipe

D. Pipe drip pan elbow drain connection to nearest floor drain.

3.10 HANGERS AND SUPPORTS

A. Install hangers and supports according to Division 23 Section "Hangers and Supports for HVAC Piping and Equipment." Comply with requirements below for maximum spacing.

B. Comply with mounting and anchoring requirements for seismic installations. Seismic restraints are specified in Division 23 Section "Seismic Restraint for HVAC Piping and Equipment."

C. Install the following pipe attachments:

1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
4. Spring hangers to support vertical runs.

D. Install hangers with the following maximum spacing and minimum rod sizes:

1. NPS 3/4through NPS 1-1/4: Maximum span, 8 feet; minimum rod size, 3/8 inch.
2. NPS 1-1/2 through NPS 3: Maximum span, 10 feet; minimum rod size, 3/8 inch.
3. NPS 4 through NPS 6 Maximum span, 10 feet; minimum rod size, 1/2 inch.
4. NPS 8: Maximum span, 14 feet; minimum rod size, 5/8 inch.
5. NPS 10: Maximum span, 14 feet; minimum rod size, 3/4 inch.
6. NPS 12: Maximum span, 14 feet; minimum rod size, 7/8 inch.
7. NPS 14: Maximum span, 20 feet; minimum rod size, 1 inch.
8. NPS 16: Maximum span, 20 feet; minimum rod size, 1 inch.
9. NPS 18: Maximum span, 20 feet; minimum rod size, 1-1/4 inches.
10. NPS 20: Maximum span, 20 feet; minimum rod size, 1-1/4 inches.

E. Support vertical runs at roof, at each floor, and at 10-foot intervals between floors.

3.11 PIPE JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 23 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

E. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

F. Mitered ells, notched tees, and “orange peel” reducers are not acceptable. On threaded piping, bushings are not acceptable.

G. “Weldolets” and “Threadotlets” may be used for branch takeoffs up to one half (1/2) the diameter of the main.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.12 TERMINAL EQUIPMENT CONNECTIONS

A. Size for supply and return piping connections shall be the same as or larger than equipment connections.

B. Install traps Y-strainers and control valves in accessible locations close to connected equipment.

C. Install a minimum of two elbows in the pipe line connecting to terminal equipment to provide flexibility for expansion and contraction of the piping system.

D. Install offsets in terminal device pipe connections to allow for service and replacement of the terminal device

E. Install bypass piping with globe valve around control valve. If parallel control valves are installed, only one bypass is required. Select the bypass globe valve with a Cv such that the pressure drop across the bypass valve wide open is equal to the pressure drop across the controlv valve when it is wide open.

F. Install vacuum breakers downstream from control valve, close to coil inlet connection or heat exchanger body.

G. Install a drip leg with steam trap upstream of the control valve at coil inlet. Provide a Y-strainer located upstream from the control vavle

3.13 FIELD QUALITY CONTROL

A. Prepare steam and condensate piping according to ASME B31.9, "Building Services Piping," and as follows:

1. Leave joints, including welds, uninsulated and exposed for examination during test.
2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
3. Flush system with clean water. Clean strainers.
4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.

B. Perform the following tests on steam and condensate piping:

1. Use ambient temperature city water as a testing medium unless there is risk of damage due to freezing.
2. Subject piping system to hydrostatic test pressure listed below, but not less than 1.5 times the working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength.

System	Test Pressure
Low Pressure Steam (0 psig – 15 psig)	100 psig
Low Pressure Condensate (0 psig – 15 psig)	100 psig
High Pressure Steam (16 psig – 100 psig)	150 psig
High Pressure Condensate (16 psig – 100 psig)	150 psig
Condensate Pump Discharge	100 psig

3. After hydrostatic test pressure has been applied for at least 4 hours, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components and repeat hydrostatic test until there are no leaks. Caulking of joints will not be acceptable.

C. Prepare written report of testing.

END OF SECTION 23 2213

SECTION 23 2213 - STEAM AND CONDENSATE PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following for LP and HP steam and condensate piping:

1. Pipe and fittings.
2. Strainers.
3. Flash tanks.
4. Safety valves.
5. Pressure-reducing valves.
6. Steam traps.
7. Thermostatic air vents
8. Vacuum breakers.
9. Steam and condensate meters.
10. Exhaust vent heads.
11. Muffling orifice plates.
12. Noise suppressors.

1.3 DEFINITIONS

A. HP Systems: High-pressure piping operating at more than 15 psig as required by ASME B31.1.

B. LP Systems: Low-pressure piping operating at 15 psig or less as required by ASME B31.9.

1.4 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressures and temperatures:

1. HP Steam Piping: 16 to 80 psig 125 psig
2. LP Steam Piping: 15 psig
3. Low Pressure Condensate Piping: 15 psigat 340 deg F.
4. High Pressure Condensate Piping (16 PSIG – 100 PSIG): 150 psigat 365 deg F
5. Pumped Condensate: 100 psigat 225 deg F.
6. Cold Water Make-up Piping: 80 psig at 150 deg F.
7. Boiler Feedwater Piping: Equal to 150 percent of the piping system pressure to which it is attached.

8. Boiler Blowdown Piping: Equal to pressure of the piping system to which it is attached.
9. Drain Piping: Equal to pressure of the piping system to which it is attached.
10. Boiler Trim Piping: Equal to pressure of the piping system to which it is attached.
11. Air-Vent and Vacuum-Breaker Piping: Equal to pressure of the piping system to which it is attached.
12. Safety-Valve-Inlet and -Outlet Piping: Equal to pressure of the piping system to which it is attached.

1.5 SUBMITTALS

A. Product Data: For each type of the following:

1. Pipe and fittings.
2. Strainers.
3. Flash tanks.
4. Safety valves.
5. Pressure-reducing valves.
6. Steam traps.
7. Thermostatic air vents
8. Vacuum breakers.
9. Steam and condensate meters.
10. Exhaust vent heads.
11. Steam filter – Element type.
12. Steam separators.
13. Muffling orifice plates.
14. Noise suppressors.

B. Shop Drawings: Detail, [1/4 inch equals 1 foot] scale, flash tank assemblies and fabrication of pipe anchors, hangers, pipe, multiple pipes, alignment guides, and expansion joints and loops and their attachment to the building structure. Detail locations of anchors, alignment guides, and expansion joints and loops.

C. Qualification Data: For Installer.

D. Welding certificates.

E. Field quality-control test reports.

F. Operation and Maintenance Data: For valves, safety valves, pressure-reducing valves, steam traps, air vents, vacuum breakers, and meters to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Installer Qualifications:

B. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code - Steel."

C. Pipe Welding: Qualify processes and operators according to the following:

1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

D. ASME Compliance: Comply with ASME B31.9, "Building Services Piping" for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp flash tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

PART 2 - PRODUCTS

2.1 STEEL PIPE AND FITTINGS

A. Steel Pipe: ASTM A 53/A 53M, black steel, plain ends, Type, Grade, and Schedule as indicated in Part 3 piping applications articles.

B. Steel Pipe: ASTM A 106, black steel, plain ends, Type, Grade, and Schedule as indicated in Part 3 piping applications articles.

C. Cast-Iron Threaded Fittings: ASME B16.4; Classes 125 add 150 as indicated in Part 3 piping applications articles.

D. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300 as indicated in Part 3 piping applications articles.

E. Cast-Iron Threaded Flanges and Flanged Fittings: ASME B16.1, Classes 125 and 250 as indicated in Part 3 piping applications articles; raised ground face, and bolt holes spot faced.

F. Wrought Carbon Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.

G. Wrought Carbon Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:

1. Material Group: 1.1.
2. End Connections: Butt welding.
3. Facings: Raised or flat face.

H. Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, black steel of same Type, Grade, and Schedule as pipe in which installed.

2.2 BELOW GRADE STEAM PIPING AND CONDENSATE RETURN PIPING

A. Manufacturers

1. Perma-Pipe “Multi-Therm 500” or Ultratherm
2. Thermacor “Duo-Therm 505”

3. Rovanco "Hi-Temp Rhinocoat Conduit or Hi-Temp System"

B. Description: All underground heat distribution lines shall be insulated jacketed steel conduit or 20 mil fusion epoxy coated steel jacketed conduit.

1. All straight sections, fittings, anchors and other accessories shall be factory prefabricated to job dimensions, and designed to minimize the number of field welds.
2. Each system layout shall be computer analyzed by the piping system manufacturer to determine stresses and movements of the service pipe. These calculations shall account for the interaction and movement of the existing pipe to create one piping system, fully integrated.
3. The system design shall be in strict conformance with ANSI B31.1 latest edition, and stamped by a registered professional engineer.

C. Service Pipe:

1. Steam pipe shall be Standard weight carbon steel pipe, ASTM A53 Grade B, EWR.
2. Condensate piping shall be extra heavy carbon steel, ASTM A106 Grade B or ASTM A53 Grade B.
3. Butt welded joints 2.5 inches and larger
4. Socket welded for 2 inches and below.
5. Where possible, straight sections shall be supplied in 40 foot random length with 6 inches of piping exposed at each end for field joint fabrication.
6. Buried steam pipe and pipe inside exterior vaults shall be standard weight carbon steel, ASTM A53 Grade B, EWR.
7. Buried steam condensate pipe and pipe inside exterior vaults shall be extra heavy carbon steel, ASTM A53 Grade B, EWR.

D. Subassemblies:

1. End seals, gland seals and anchors shall be designed and factory prefabricated to prevent the ingress of moisture into the system.
2. All subassemblies shall be designed to allow for complete draining and drying of the conduit system.

E. Service Pipe Insulation:

1. Insulation shall be Aerogel, calcium silicate, mineral wool, or calcium silicate insulation as an option.
2. The insulation shall be secured to the pipe by stainless steel bands. Insulation thickness shall be as shown on the drawings.

F. Outer Conduit:

1. The steel conduit casing shall be smooth wall, welded steel conduit of the thickness specified below:

Conduit Size	Conduit Thickness

6" - 26"	10 Gauge
28" - 36"	6 Gauge
38" - 42"	4 Gauge

G. Leak Detection:

1. Leak detection is not required on buried steam or steam condensate piping.

H. Pipe Supports:

1. All pipes within the outer casing shall be supported at not more than 10 foot intervals. These supports shall be designed to allow for continuous airflow and drainage of the conduit in place. The straight supports shall be designed to occupy not more than 10% of the annular air space. Supports shall be of the type where insulation thermally isolates the carrier pipe from the outer conduit.
2. The surface of the insulation shall be protected at the support by a sleeve not less than 12 inches long, fitted with traverse and, where required, rotational arresters.

2.3 JOINING MATERIALS

A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
c. Flexible metallic gaskets (Flexitallic or equal) may be used.

B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

C. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

D. Welding Materials: Comply with Section II, Part C, of ASME Boiler and Pressure Vessel Code for welding materials appropriate for wall thickness and for chemical analysis of pipe being welded.

2.4 VALVES

A. Ball Valve:

1. Class 300 Steel Ball Valves with Full Port and Stainless-Steel Trim:
a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1) Conbraco Industries, Inc. Apollo 88A-900 Series

2) Jamesbury; Metso.
3) NIBCO INC., Model F-535-CS-F-66-FS

b. Description:
1) Standard: MSS SP-72.
2) CWP Rating: 720 psig.
3) Body Design: Split body.
4) Body Material: Carbon steel, ASTM A 216, Type WCB.
5) Ends: Flanged.
6) Seats: PTFE.
7) Stem: Stainless steel.
8) Ball: Stainless steel, vented.
9) Port: Full.

B. Check Valve:

1. Class 150, Bronze Swing Check Valves with Bronze Disc:
a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1) Milwaukee Valve Company.
2) NIBCO INC.
3) Stockham; Crane Energy Flow Solutions.
b. Description:
1) Standard: MSS SP-80, Type 3.
2) CWP Rating: 300 psig.
3) Body Design: Horizontal flow.
4) Body Material: ASTM B 62, bronze.
5) Ends: Threaded.
6) Disc: Bronze.

C. Gate Valve:

1. Class 125, OS&Y, Iron Gate Valves:
a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1) Jenkins Valves; Crane Energy Flow Solutions.
2) Milwaukee Valve Company, F-2894-M
3) NIBCO INC.
4) Powell Valves.
5) Stockham; Crane Energy Flow Solutions.
b. Description:
1) Standard: MSS SP-70, Type I.
2) NPS 2-1/2 to NPS 12, CWP Rating: 200 psig.
3) NPS 14 to NPS 24, CWP Rating: 150 psig.
4) Body Material: ASTM A 126, gray iron with bolted bonnet.
5) Ends: Flanged.
6) Trim: Bronze.
7) Disc: Solid wedge.
8) Packing and Gasket: Asbestos free.
c. Valve in exterior vaults
1) Epoxy coated exterior body

D. Stop-Check Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Crane Co.
   b. Jenkins Valves; a Crane Company.
   c. Lunkenheimer Valves.
   d. A.Y. McDonald Mfg. Co.

2. Body and Bonnet: Malleable iron.
3. End Connections: Flanged.
4. Disc: Cylindrical with removable liner and machined seat.
5. Stem: Brass alloy.
6. Operator: Outside screw and yoke with cast-iron handwheel.
7. Packing: Polytetrafluoroethylene-impregnated packing with two-piece packing gland assembly.
8. Pressure Class: 250.

2.5 STRAINERS FOR LOW PRESSURE STEAM SYSTEMS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Armstrong International
2. Hoffman Specialty
3. Mueller Steam Specialties
4. O.C. Keckley Co.
5. Spirax Sarco

B. Y-Pattern Strainers:

1. NPS 2 and Smaller:

   a. Body: ASTM A 126, Class B cast iron with bolted cover and bottom drain connection.
   b. End Connections: Threaded ends for strainers NPS 2 and smaller; flanged ends for strainers NPS 2-1/2 and larger.
   c. Strainer Screen: Stainless-steel, 60 mesh strainer, and perforated stainless-steel basket with 50 percent free area.
   d. Tapped blowoff plug.
   e. CWP Rating: 250-psig working steam pressure.

2. NPS 2-1/2 and Larger:

   a. Body: ASTM A 126, Class B cast iron with bolted cover and bottom drain connection.

b. End Connections: Threaded ends for strainers NPS 2 and smaller; flanged ends for strainers NPS 2-1/2 and larger.
c. Strainer Screen: Stainless-steel, 60 mesh strainer, and perforated stainless-steel basket with 50 percent free area.
d. Tapped blowoff plug.
e. CWP Rating: 250-psig working steam pressure.

2.6 STRAINERS FOR HIGH PRESSURE STEAM SYSTEMS (16 PSIG – 80 PSIG)

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Armstrong International
2. Hoffman Specialty
3. Mueller Steam Specialties
4. O.C. Keckley Co.
5. Spirax Sarco

B. Y-Pattern Strainers:

1. Body: ASTM A 126, Class B cast iron, with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for strainers NPS 2 and smaller; flanged ends for strainers NPS 2-1/2 and larger.
3. Strainer Screen: Stainless-steel, 60 mesh strainer, and perforated stainless-steel basket with 50 percent free area.
4. Tapped blowoff plug.
5. CWP Rating: 250-psig working steam pressure.

2.7 FLASH TANKS

A. Shop or factory fabricated of welded steel according to ASME Boiler and Pressure Vessel Code, for 150-psig rating; and bearing ASME label. Fabricate with tappings for low-pressure steam and condensate outlets, high-pressure condensate inlet, air vent, safety valve, and legs.

2.8 SAFETY VALVES

A. Bronze or Brass Safety Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Armstrong International, Inc.
b. Kunkle Valve; a Tyco International Ltd. Company.
c. Spirax Sarco, Inc.
d. Watts Water Technologies, Inc.

2. Disc Material: Forged copper alloy.

3. End Connections: Threaded inlet and outlet.
4. Spring: Fully enclosed steel spring with adjustable pressure range and positive shutoff, factory set and sealed.
5. Pressure Class: 250.
6. Drip-Pan Elbow: Cast iron and having threaded or flanged inlet and outlet connections.
7. Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code.

B. Cast-Iron Safety Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Armstrong International, Inc.
   b. Kunkle Valve; a Tyco International Ltd. Company.
   c. Spirax Sarco, Inc.
   d. Watts Water Technologies, Inc.

2. Disc Material: Forged copper alloy with bronze nozzle.
3. End Connections: Raised-face flanged inlet and threaded or flanged outlet connections.
4. Spring: Fully enclosed cadmium-plated steel spring with adjustable pressure range and positive shutoff, factory set and sealed.
5. Pressure Class: 250.
6. Drip-Pan Elbow: Cast iron and having threaded or flanged inlet, outlet, and drain, with threads complying with ASME B1.20.1.
7. Exhaust Head: Cast iron and having threaded or flanged inlet and drain, with threads complying with ASME B1.20.1.
8. Size and Capacity: As required for equipment according to ASME Boiler and Pressure Vessel Code.

2.9 PRESSURE-REDUCING VALVES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Armstrong International, Inc.
2. Hoffman Specialty; Division of ITT Industries.
3. Leslie Controls, Inc.
4. Spence Engineering Company, Inc.
5. Spirax Sarco, Inc.

B. Size, Capacity, and Pressure Rating: Factory set for inlet and outlet pressures indicated.

C. Description: Pilot-actuated, diaphragm type, with adjustable pressure range and positive shutoff.

D. Body: Cast iron.

E. End Connections: Threaded connections for valves NPS 2 and smaller and flanged connections for valves NPS 2-1/2 and larger.

F. Trim: Hardened stainless steel.

G. Head and Seat: Replaceable, main head stem guide fitted with flushing and pressure-arresting device cover over pilot diaphragm.

H. Gaskets: Non-asbestos materials.

I. Capacities and Characteristics: Refer to Drawings for Steam Pressure Reducing Valve Schedule.

2.10 STEAM TRAPS

A. Float and Thermostatic Traps:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Armstrong International, Inc.
    b. Hoffman Specialty; Division of ITT Industries.
    c. Spirax Sarco, Inc.

2. Body and Bolted Cap: ASTM A 126, cast iron.
3. End Connections: Threaded.
4. Float Mechanism: Replaceable, stainless steel.
5. Head and Seat: Hardened stainless steel.
6. Trap Type: Balanced pressure.
7. Thermostatic Bellows: Stainless steel or monel.
8. Thermostatic air vent capable of withstanding 45 deg F of superheat and resisting water hammer without sustaining damage.
9. Vacuum Breaker: Thermostatic with phosphor bronze bellows, and stainless steel cage, valve, and seat.
10. Maximum Operating Pressure: 125 psig.

B. Inverted Bucket Traps:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Armstrong International, Inc.
    b. Hoffman Specialty; Division of ITT Industries.
    c. Spirax Sarco, Inc.

2. Body and Cap: Cast iron.
3. End Connections: Threaded.
4. Head and Seat: Stainless steel.
5. Valve Retainer, Lever, and Guide Pin Assembly: Stainless steel.

6. Bucket: Brass or stainless steel.
7. Strainer: Integral stainless-steel inlet strainer within the trap body.
8. Air Vent: Stainless-steel thermostatic vent.
9. Pressure Rating: 250 psig.

2.11 THERMOSTATIC AIR VENTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Armstrong International, Inc.
   b. Hoffman Specialty; Division of ITT Industries.
   c. Spirax Sarco, Inc.

B. Body: Cast iron, bronze or stainless steel.

C. End Connections: Threaded.

D. Float, Valve, and Seat: Stainless steel.

E. Thermostatic Element: Phosphor bronze bellows in a stainless-steel cage.

F. Pressure Rating: 125 psig.

G. Maximum Temperature Rating: 350 deg F.

2.12 VACUUM BREAKERS

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Armstrong International, Inc.
   b. Hoffman Specialty; Division of ITT Industries.
   c. Spirax Sarco, Inc.

2. Body: Cast iron, bronze, or stainless steel.
3. End Connections: Threaded.
4. Sealing Ball, Retainer, Spring, and Screen: Stainless steel.
5. O-ring Seal: EPR.
6. Pressure Rating: 125 psig.
7. Maximum Temperature Rating: 350 deg F.

2.13 STEAM METERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   1. EMCO Flow Systems; Division of Advanced Energy Company.

2. Preso Meters; a division of Racine Federated Inc.
3. Spirax Sarco, Inc.

B. Meters shall have a microprocessor to display totalizer flow, flow rate, temperature, pressure, time, and date; alarms for high and low flow rate and temperature.

1. Computer shall have 4 to 20-mA or 2 to 10 volt output for temperature, pressure, and contact closure for flow increments.
2. Independent timers to store four peak flow rates and total flow.
3. Interface compatible with central workstation described in Division 23 Section "Instrumentation and Control for HVAC."
4. Microprocessor Enclosure: NEMA 250, Type 4.

C. Sensor: Venturi, of stainless-steel construction, for insertion in pipeline between flanges. At least 10:1 turndown with plus or minus 1 percent accuracy over full-flow range.

D. Sensor: Vortex type with stainless-steel wetted parts and wafer or flange connections; and with a piezoelectric sensor removable and serviceable without shutting down the process. At least 10:1 turndown with plus or minus 1 percent accuracy over full-flow range.

E. Sensor: Spring-loaded, variable-area flowmeter type; density compensated with stainless-steel wetted parts and wafer or flange connections. At least 10:1 turndown with plus or minus 2 percent accuracy over full-flow range.

2.14 CONDENSATE METERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Central Station Steam Co.
2. Lincoln Meter Company.

B. Body: Cast iron, bronze, or brass.

C. Turbine: Copper, brass, or stainless steel.

D. Connections: Threaded for NPS 2 and smaller and flanged for NPS 2-1/2.

E. Totalizer: Meters shall have a microprocessor to display flow, flow rate, time, and date; alarms for high and low flow rate, pressure, and temperature.

1. Computer shall have 4- to 20-mA or 2- to 10-volt output for temperature, pressure, and contact closure for flow increments.
2. Independent timers to store four peak flow rates and total flow.
3. Interface compatible with central workstation specified in Division 23 Section "Instrumentation and Control for HVAC."
4. Microprocessor Enclosure: NEMA 250, Type 4.

F. Pressure Rating: 15 psig.

G. Maximum Temperature Rating: 250 deg F.

2.15 EXHAUST VENT HEADS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Spirax Sarco

B. Constructed of austenitic stainless steel with internal baffle to separate entrained water from steam discharge.

C. Provide vent heads with threaded or flanged connections.

D. Provide unit with threaded drain connection.

2.16 MUFFLING ORIFICE PLATES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Spence Engineering Co.

B. Constructed of a steel plate with a stainless steel plate welded to the primary plate and designed to fit between two ANSI flanges.

C. Unit shall be designed to provide 6-10 dBa noise reduction in the steam line.

2.17 NOISE SUPPRESSORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Spence Engineering Co.

B. Constructed of welded steel with stainless steel acoustic material. Provide with Class 150 flanged end connections.

C. Units shall be designed to provide 10 – 28 dBa noise reduction in the steam line.

PART 3 - EXECUTION

3.1 LOW PRESSURE STEAM SYSTEMS

A. Low Pressure Steam: NPS 2 and Smaller: Standard weight, ASTM A53, Type “F” black steel pipe; ASTM A126/ANSI B16.4 Class 125 cast-iron fittings; threaded joints.

B. Low Pressure Steam: NPS 2-1/2 and Larger: Standard weight, ASTM A53, Type "E" or Type "S", Grade B, black steel pipe; ASTM A234 Class 150 seamless, carbon steel weld fittings.

C. Low Pressure Condensate: NPS 2 and Smaller: Extra strong ASTM A53, Type "F" black steel pipe; ASTM A126/ANSI B16.4 Class 125 cast-iron fittings; threaded joints.

D. Low Pressure Condensate: NPS 2-1/2 and Larger: Extra strong ASTM A53, Grade "B", Type "E" or Type "S" black steel pipe; ASTM A234 minimum Class 150 seamless, carbon steel weld fittings.

3.2 HIGH PRESSURE STEAM SYSTEMS (16 PSIG – 80 PSIG)

A. High Pressure Steam: NPS 2 and Smaller: Standard weight, ASTM A53, Grade "B" Type "S" black steel pipe; ASTM A126/ANSI B16.4 Class 125 cast-iron fittings; threaded joints.

B. High Pressure Steam: NPS 2-1/2 and Larger: Standard weight, ASTM A53, Type "E" or Type "S", Grade B, black steel pipe; ASTM A234 Class 150 seamless, carbon steel weld fittings.

C. High Pressure Condensate: NPS 2 and Smaller: Extra strong ASTM A53, Grade "B", Type "S" black steel pipe; ASTM A126/ANSI B16.4 Class 125 cast-iron fittings; threaded joints.

D. High Pressure Condensate: NPS 2-1/2 and Larger: Extra strong ASTM A53, Grade "B", Type "E" or Type "S" black steel pipe; ASTM A234 Class 300 seamless, carbon steel weld fittings.

3.3 ANCILLARY PIPING APPLICATIONS

A. Cold water make-up piping:

1. Drawn-temper copper tubing, wrought-copper fittings, and soldered joints.

B. Boiler Feedwater Piping: Same materials and joining methods as for piping specified for the service in which feedwater piping is installed.

C. Blowdown-Drain Piping: Same materials and joining methods as for piping specified for the service in which blowdown drain is installed.

D. Air-Vent Piping:

1. Inlet: Same as service where installed.
2. Outlet: Type K annealed-temper copper tubing with soldered or flared joints.

E. Vacuum-Breaker Piping: Outlet, same as service where installed.

F. Safety-Valve-Inlet and -Outlet Piping: Same materials and joining methods as for piping specified for the service in which safety valve is installed.

3.4 VALVE APPLICATIONS

A. Install shutoff duty valves at branch connections to steam supply mains, at steam supply connections to equipment, and at the outlet of steam traps.

B. Install safety valves on pressure-reducing stations and elsewhere as required by ASME Boiler and Pressure Vessel Code. Install steam safety-valve discharge drip pan ell fittings with steam vent piping run directly outdoors or as indicated on Drawings. All vent piping to be supported independently from steam safety valves. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.

3.5 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Use indicated piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

B. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping free of sags and bends.

G. Install fittings for changes in direction and branch connections.

H. Install piping to allow application of insulation.

I. Select system components with pressure rating equal to or greater than system operating pressure.

J. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.

K. Install drains, consisting of a tee fitting, NPS 3/4 gate valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

L. Install steam supply piping at a minimum uniform grade of 0.2 percent downward in direction of steam flow.

M. Install condensate return piping at a minimum uniform grade of 0.4 percent downward in direction of condensate flow.

N. Reduce pipe sizes on horizontal piping runs using eccentric reducer fitting installed with level side down.

O. Install branch connections to mains using tee fittings in main pipe, with the branch connected to top of main pipe or 45 degrees from the top of main pipe.

P. Install valves according to Division 23 Section "General-Duty Valves for HVAC Piping."

Q. Properly align piping before installation of valves. Install valves in strict accordance with valve manufacturer's installation recommendations. Do not support weight of piping on valve ends.

R. Install swing check valves in the horizontal position with the hinge pin level.

S. Install swing check valves where specified and detailed and at steam trap condensate lines where they rise at the outlet of steam traps. Provide isolation valves to allow repair or replacement of check valve.

T. Install all valves with the stem in the upright position. Valves may be installed with the stem in the horizontal or 45 degrees above horizontal where space limitation does not allow installation in an upright position or where large valves are provided with chain wheel operators.

U. In general, install valves located within six feet (6') of the floor level, out from under equipment, and in accessible locations with adequate clearance around hand wheels or levers for easy operation.

V. Install globe valves for throttling service and control device or meter by-pass.

W. Install quick-opening valves at boiler water level safety switches with drain piping extended down to nearest floor drain.

X. Where valves 2-1/2" and larger are located more than 12'-0" above the finished floor, install valve with stem in the horizontal position and provide a chain wheel operator.

Y. Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated.

Z. Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.

AA. Install strainers on supply side of control valves, pressure-reducing valves, traps, and elsewhere as indicated. Install NPS 3/4 nipple and gate valve in blowdown connection of strainers NPS 2 and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2.

BB. Install expansion loops, expansion joints, anchors, and pipe alignment guides as specified in Division 23 Section "Expansion Fittings and Loops for HVAC Piping."

CC. Identify piping as specified in Division 23 Section "Identification for HVAC Piping and Equipment."

DD. Install drip legs at low points and natural drainage points such as ends of mains, bottoms of risers, and ahead of pressure regulators, and control valves.

1. On straight runs with no natural drainage points, install drip legs at intervals not exceeding 200 feet.
2. Size drip legs same size as main. In steam mains NPS 6 and larger, drip leg size can be reduced, but to no less than NPS 4.

EE. Flash Tank:

1. Pitch condensate piping down toward flash tank.
2. If more than one condensate pipe discharges into flash tank, install a check valve in each line.
3. Install tank vent connected into low pressure steam main.
4. Install safety valve at tank top. Safety valve set to discharge at same pressure as low pressure system safety valve setting.
5. Install full-port ball valve, and swing check valve on condensate outlet.
6. Install inverted bucket or float and thermostatic trap at low-pressure condensate outlet, sized for three times the calculated heat load.
7. Install pressure gage on low-pressure steam outlet according to Division 23 Section "Meters and Gages for HVAC Piping."

3.6 STEAM-TRAP INSTALLATION

A. Install steam traps in accessible locations as close as possible to connected equipment.

B. For low pressure systems, install gate valve, strainer, and union upstream from trap; install union, test tee with gate valve and gate valve downstream from trap unless otherwise indicated.

C. For high pressure systems, install gate valve, strainer, and union upstream from trap; install union, test tee with gate valve, check valve and gate valve downstream from trap unless otherwise indicated.

3.7 PRESSURE-REDUCING VALVE INSTALLATION

A. Install pressure-reducing valves in accessible location for maintenance and inspection.

B. Install bypass piping around pressure-reducing valves, with globe valve Cv selected such that the pressure drop across the wide open globe valve is equal to the upstream steam pressure minus the downstream steam pressure when steam is flowing through the globe valve at the design maximum steam flow through the larger pressure reducing valve (for duplex valve stations).

C. Install gate valves on both sides of pressure-reducing valves.

D. Install eccentric reducers both upstream and downstream of pressure reducing valves, with the eccentric reducers oriented to create a level flow path from the upstream and downstream piping through the pressure reducing valve.

E. Install unions or flanges on both sides of pressure-reducing valves having threaded- or flanged-end connections respectively.

F. Install pressure gages on low-pressure side of pressure-reducing valves after the bypass connection according to Division 23 Section "Meters and Gages for HVAC Piping."

G. Install strainers upstream for pressure-reducing valve.

H. Install safety valve downstream from pressure-reducing valve station and at locations detailed.

I. Avoid locating steam traps below the level of low pressure condensate return mains. Provide a condensate pumping unit to lift condensate to drain into the low pressure condensate return main if the low pressure steam trap is located below the condensate return main.

3.8 STEAM OR CONDENSATE METER INSTALLATION

A. Install meters with lengths of straight pipe upstream and downstream according to meter manufacturer's instructions.

B. Provide data acquisition wiring. Refer to Division 23 Section "Instrumentation and Control for HVAC."

C. Install eccentric reducers both upstream and downstream of steam flow meters with the eccentric reducers oriented to create a level flow path from the upstream and downstream piping through the steam flow meter. If the steam flow meters are constructed with integral concentric pipe reduction, provide a drip leg and trap upstream of the meter to collect any liquid condensate before it blows through the meter.

3.9 SAFETY VALVE INSTALLATION

A. Install safety valves according to ASME B31.9, "Building Services Piping."

B. Install steam safety-valve discharge drip pan elbow fittings with steam vent piping run vertically directly outdoors or as indicated on Drawings. All vent piping to be supported independently from steam safety valves.

C. Install drip-pan elbow fitting adjacent to safety valve and pipe

D. Pipe drip pan elbow drain connection to nearest floor drain.

3.10 HANGERS AND SUPPORTS

A. Install hangers and supports according to Division 23 Section "Hangers and Supports for HVAC Piping and Equipment." Comply with requirements below for maximum spacing.

B. Comply with mounting and anchoring requirements for seismic installations. Seismic restraints are specified in Division 23 Section "Seismic Restraint for HVAC Piping and Equipment."

C. Install the following pipe attachments:

1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
4. Spring hangers to support vertical runs.

D. Install hangers with the following maximum spacing and minimum rod sizes:

1. NPS 3/4through NPS 1-1/4: Maximum span, 8 feet; minimum rod size, 3/8 inch.
2. NPS 1-1/2 through NPS 3: Maximum span, 10 feet; minimum rod size, 3/8 inch.
3. NPS 4 through NPS 6 Maximum span, 10 feet; minimum rod size, 1/2 inch.
4. NPS 8: Maximum span, 14 feet; minimum rod size, 5/8 inch.
5. NPS 10: Maximum span, 14 feet; minimum rod size, 3/4 inch.
6. NPS 12: Maximum span, 14 feet; minimum rod size, 7/8 inch.
7. NPS 14: Maximum span, 20 feet; minimum rod size, 1 inch.
8. NPS 16: Maximum span, 20 feet; minimum rod size, 1 inch.
9. NPS 18: Maximum span, 20 feet; minimum rod size, 1-1/4 inches.
10. NPS 20: Maximum span, 20 feet; minimum rod size, 1-1/4 inches.

E. Support vertical runs at roof, at each floor, and at 10-foot intervals between floors.

3.11 PIPE JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 23 Sections specifying piping systems.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

D. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

E. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

F. Mitered ells, notched tees, and “orange peel” reducers are not acceptable. On threaded piping, bushings are not acceptable.

G. "Weldolets" and "Threadotlets" may be used for branch takeoffs up to one half (1/2) the diameter of the main.

H. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.12 TERMINAL EQUIPMENT CONNECTIONS

A. Size for supply and return piping connections shall be the same as or larger than equipment connections.

B. Install traps Y-strainers and control valves in accessible locations close to connected equipment.

C. Install a minimum of two elbows in the pipe line connecting to terminal equipment to provide flexibility for expansion and contraction of the piping system.

D. Install offsets in terminal device pipe connections to allow for service and replacement of the terminal device

E. Install bypass piping with globe valve around control valve. If parallel control valves are installed, only one bypass is required. Select the bypass globe valve with a Cv such that the pressure drop across the bypass valve wide open is equal to the pressure drop across the controlv valve when it is wide open.

F. Install vacuum breakers downstream from control valve, close to coil inlet connection or heat exchanger body.

G. Install a drip leg with steam trap upstream of the control valve at coil inlet. Provide a Y-strainer located upstream from the control vavle

3.13 FIELD QUALITY CONTROL

A. Prepare steam and condensate piping according to ASME B31.9, "Building Services Piping," and as follows:

1. Leave joints, including welds, uninsulated and exposed for examination during test.
2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
3. Flush system with clean water. Clean strainers.
4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.

B. Perform the following tests on steam and condensate piping:

1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing.

2. Subject piping system to hydrostatic test pressure listed below, but not less than 1.5 times the working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength.

System	Test Pressure
Low Pressure Steam (0 psig – 15 psig)	100 psig
Low Pressure Condensate (0 psig – 15 psig)	100 psig
High Pressure Steam (16 psig – 100 psig)	150 psig
High Pressure Condensate (16 psig – 100 psig)	150 psig
Condensate Pump Discharge	100 psig

3. After hydrostatic test pressure has been applied for at least 4 hours, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components and repeat hydrostatic test until there are no leaks. Caulking of joints will not be acceptable.

4. Buried piping may be pre-tested with air at 100 psi. Upon successful test, pipe may be buried and hydrostatically tested at a later date.

C. Prepare written report of testing.

END OF SECTION 23 2213

SECTION 23 2223 - STEAM CONDENSATE PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes electric-driven steam condensate pumps.

1.3 SUBMITTALS

A. Product Data: Include certified performance curves and rated capacities, operating characteristics, furnished specialties, and accessories for each type of product indicated. Indicate pump's operating point on curves. Include receiver capacity and material.

B. Shop Drawings: Show pump layout and connections. Include setting drawings with templates for installing foundation and anchor bolts and other anchorages.

1. Wiring Diagrams: Power, signal, and control wiring.

C. Operation and Maintenance Data: For pumps to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain all electric driven steam condensate pumps through one source from a single manufacturer. Obtain all pressure powered steam condensate pumps through one source from a single manufacturer.

B. Product Options: Drawings indicate size, profiles, and dimensional requirements of steam condensate pumps and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. ASME Compliance: Fabricate and label steam condensate pumps to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Manufacturer's Preparation for Shipping: Clean flanges and exposed machined metal surfaces and treat with anticorrosion compound after assembly and testing. Protect flanges, pipe openings, and nozzles with wooden flange covers or with screwed-in plugs.

B. Store steam condensate pumps in dry location.

C. Retain protective covers for flanges and protective coatings during storage.

D. Protect bearings and couplings against damage from sand, grit, and other foreign matter.

E. Comply with pump manufacturer's written rigging instructions.

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 DUPLEX FLOOR MOUNTED ELECTRIC-DRIVEN STEAM CONDENSATE PUMPS

A. Description: Factory-fabricated, packaged, electric-driven pumps; with receiver, pump(s), controls, and accessories suitable for operation with steam condensate.

B. Configuration: Duplex floor-mounting pumps with receiver and float switches; rated to pump minimum 210 deg F steam condensate.

1. Manufacturers:

a. Nicholson Steam Trap; a division of Spence Engineering Company, Inc.
b. Roth Pump Company.
c. Spence Engineering Company, Inc.; Division of Circor International, Inc.
d. Spirax Sarco, Inc.

2. Receiver: Floor-mounting, close-grained cast iron or welded steel; externally adjustable float switches; with water-level gage, steam condensate thermometer, discharge-pressure gage for each pump, bronze gate valves between receiver and pumps, flanges for pump

mounting, and lifting eyebolts.

3. Inlet Strainer: Cast iron with self-cleaning bronze screen, dirt pocket, and cleanout plug on receiver inlet.
4. Pumps: Centrifugal, close coupled, vertical design, permanently aligned, and bronze fitted; with replaceable bronze case rings, stainless-steel shafts, and mechanical seals; mounted on receiver flanges; rated to operate with a minimum of 2 feet of NPSH.
5. Control Panel: NEMA 250, Type 1 enclosure with hinged door and grounding lug, mounted on pump; factory wired for single external electrical connection; and with the following components within cabinet:

    a. Motor controller for each pump.
    b. Electrical pump alternator to operate pumps in lead-lag sequence and allow both pumps to operate on receiver high level.
    c. Manual lead-lag control to override electrical pump alternator to manually select the lead pump.
    d. Momentary contact "TEST" push button on cover for each pump.
    e. Numbered terminal strip.
    f. Disconnect switch.
    g. Fused transformer for control circuit.

6. Capacities and Characteristics: Refer to Condensate Pump Schedule on the Drawings for unit capacities and characteristics.

2.3 BASIN MOUNTED ELECTRIC-DRIVEN STEAM CONDENSATE PUMPS

A. Description: Factory-fabricated, packaged, electric-driven pumps; with receiver, pump(s), controls, and accessories suitable for operation with steam condensate.

B. Configuration: Underground duplex pump with basin and float switches; rated to pump 200 deg F steam condensate.

1. Manufacturers:
    a. Nicholson Steam Trap; a division of Spence Engineering Company, Inc.
    b. Roth Pump Company.
    c. Spence Engineering Company, Inc.; Division of Circor International, Inc.
    d. Spirax Sarco, Inc.

2. Basin: Cast iron, with hub-type inlets.
3. Basin Cover: Cast iron or steel with gasketed openings for access, pumps, pump shafts, control rods, discharge piping, and vent connections.

    a. Anchor Flange: Cast iron, attached to basin, in location and of size required to anchor basin to concrete slab.

4. Pumps: Wet-pit mounted, vertical, flexible coupled, and suspended.

    a. Casing: Cast iron with open inlet.
    b. Shaft and Bearings: Stainless-steel shaft with oil-lubricated, bronze, intermediate sleeve bearings; 48-inch maximum intervals where basin depth is more than 48 inches; and grease-lubricated, ball-type, thrust bearings.

c. Shaft Couplings: Flexible, capable of absorbing vibration.
d. Seals: Mechanical; with carbon rotating ring, bearing on a ceramic seat held by a stainless-steel spring, and enclosed by a flexible bellows and gasket.
e. Motors: Vertically mounted on cast-iron pedestal.
f. Pump Discharge Piping: Manufacturer's standard steel or bronze pipe, unless otherwise indicated.

5. Control Panel: NEMA 250, Type 1 enclosure with hinged door and grounding lug; mounted on pump; factory wired for single external electrical connection; and with the following components within cabinet:

a. Motor controller for each pump.
b. Electrical pump alternator to operate pumps in lead-lag sequence and allow both pumps to operate on receiver high level.
c. Manual lead-lag control to override electrical alternator to manually select the lead pump.
d. Momentary contact "TEST" push button on cover for each pump.
e. Numbered terminal strip.
f. Disconnect switch.
g. Fused transformer for control circuit.

6. Capacities and Characteristics: Refer to Basin Mounted Condensate Pump Schedule on the Drawings for unit capacities and characteristics.

2.4 ELEVATED RECEIVER ELECTRIC-DRIVEN STEAM CONDENSATE PUMPS

A. Description: Factory-fabricated, packaged, electric-driven pumps; with receiver, pump(s), controls, and accessories suitable for operation with steam condensate.

B. Configuration: Duplex floor-mounting pump with elevated receiver, float switches, and connecting piping; rated to pump 212 deg F steam condensate.

1. Manufacturers:
a. Nicholson Steam Trap; a division of Spence Engineering Company, Inc.
b. Roth Pump Company.
c. Spence Engineering Company, Inc.; Division of Circor International, Inc.
d. Spirax Sarco, Inc.

2. Receiver: Close-grained cast iron or welded steel, mounted on fabricated-steel supports; externally adjustable float switches; with water-level gage, steam condensate thermometer, pump discharge pressure gages, bronze isolation valves between receiver and pumps, and lifting eyebolts.
3. Inlet Strainer: Cast iron with self-cleaning bronze screen, dirt pocket, and cleanout plug on receiver inlet.
4. Pumps: Centrifugal, close coupled, permanently aligned, and bronze fitted; with replaceable bronze case rings, stainless-steel shafts, and mechanical seals; mounted on base below receiver; rated to operate with a minimum of 2 feet of NPSH.
5. Pipe: ASTM A 53/A 53M, Type S, Grade B or ASTM A 106; Schedule 80; seamless steel.
6. Fittings NPS 2 and Smaller: ASME B16.1, Class 125 cast iron, threaded.

7. Fittings NPS 2-1/2 and Larger: ASTM A 234/A 234M, extra strong steel, for welded connections.
8. Control Panel: NEMA 250, Type 1 enclosure with hinged door and grounding lug; mounted on pump; factory wired for single external electrical connection; and with the following components within cabinet:

    a. Motor controller for each pump.
    b. Electrical pump alternator to operate pumps in lead-lag sequence and allow both pumps to operate on receiver high level.
    c. Manual lead-lag control to override electrical alternator to manually select the lead pump.
    d. Momentary contact "TEST" push button on cover for each pump.
    e. Numbered terminal strip.
    f. Disconnect switch.
    g. Fused transformer for control circuit.

9. Capacities and Characteristics: Refer to Elevated Receiver Condensate Pump Schedule on the Drawings for unit capacities and characteristics.

2.5 PRESSURE-POWERED STEAM CONDENSATE PUMPS

A. Manufacturers:

1. Armstrong Fluid Handling; Div. of Armstrong International, Inc.
2. Nicholson Steam Trap; a division of Spence Engineering Company, Inc.
3. Spence Engineering Company, Inc.; Division of Circor International, Inc.
4. Spirax Sarco, Inc.

B. Description: Factory-fabricated, pressure-powered pumps with mechanical controls, valves, piping connections, and accessories suitable for pumping steam condensate using steam.

C. Configuration: Duplex pump with float-operated valve control.

1. Pump Body: Cast iron.
2. Piping Connections: Threaded; for steam condensate, operating medium, vent, and indicated accessories.
3. Level Gage: Glass site gage with shutoff cocks.
4. Valves: Manufacturer's standard check valves on inlet and outlet.
5. Internal Parts: Stainless-steel float, springs, and actuating mechanism.
6. Valve Seals: Replaceable from exterior.
7. Receiver: Cast iron or welded steel, factory mounted on steel supports; with water-level site glass and threaded piping connections.
8. Pipe: ASTM A 53/A 53M, Type S, Grade B or ASTM A 106; Schedule 80; seamless steel.
9. Fittings: ASME B16.1, Class 125 cast iron, threaded.

2.6 MOTORS

A. Comply with requirements in Division 23 Section "Common Motor Requirements for HVAC

Equipment."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation tolerances and other conditions affecting performance of work.

B. Examine rough installation of steam condensate piping.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install pumps according to HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation."

B. Install pumps to provide access for periodic maintenance including removing motors, impellers, couplings, and accessories.

C. Support pumps and piping separately so piping is not supported by pumps.

D. Install pumps on concrete bases. Anchor pumps to bases using inserts or anchor bolts.

E. Install thermometers and pressure gages.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Install steam supply for pressure-powered pumps as required by Division 23 Section "Steam and Condensate Heating Piping."

D. Install compressed-air supply for pressure-powered pumps as required by Division 22 Section "General-Service Compressed-Air Piping."

E. Install gate and check valves on inlet and outlet of pressure-powered pumps.

F. Install check valve, gate valve, and globe valve at pump discharge connections for each electric-driven pump.

G. Pipe drain to nearest floor drain for overflow and drain piping connections.

H. Install full-size vent piping to outdoors, terminating in 180-degree elbow at point above highest steam system connection or as indicated.

I. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

J. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.4 STARTUP SERVICE

A. Verify that steam condensate pumps are installed and connected according to the Contract Documents.

B. Complete installation and startup checks according to manufacturer's written instructions.

C. Clean strainers.

D. Set steam condensate pump controls.

E. Set pump controls for automatic start, stop, and alarm operation.

F. Perform the following preventive maintenance operations and checks before starting:

1. Set float switches to operate at proper levels.
2. Set throttling valves on pump discharge for specified flow.
3. Check motors for proper rotation.
4. Test pump controls and demonstrate compliance with requirements.
5. Replace damaged or malfunctioning pump controls and equipment.
6. Verify that pump controls are correct for required application.

G. Start steam condensate pumps according to manufacturer's written startup instructions.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain steam condensate pumps. Refer to Division 01 Section "Demonstration and Training."

END OF SECTION 23 2223

SECTION 23 2500 - HVAC WATER TREATMENT

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes water-treatment systems for the following:

1. Cleaning of piping systems.
2. Chemical feeder equipment.
3. Treatment for closed systems, heating water systems, clean steam system piping (closed system).

1.2 SUBMITTALS

A. Submit manufacturer's installation instructions.

B. Include data on chemical feeder, procedures, and treatment programs.

C. Include step-by-step instructions on test procedures including target concentrations.

D. Submit product data indicating chemical treatment materials, chemicals, and equipment.

E. Submit reports indicating start-up of treatment and systems are completed and operating properly.

F. Submit reports indicating analysis of system water after cleaning and after treatment.

1.3 QUALITY ASSURANCE

A. University's Representative Manufacturer: Company specializing in manufacturing the products specified in this Section with minimum three years documented experience. Company shall have local representatives with water analysis laboratories and full time service personnel.

1.4 REGULATORY REQUIREMENTS

A. Conform to applicable codes for addition of non- potable chemicals to building mechanical systems, and for delivery to public sewage systems.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the specified manufacturers.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 MATERIALS

A. System Cleaner:

1. Liquid alkaline compound with emulsifying agents and detergents to remove grease and petroleum products; sodium tripoly phosphate and sodium molybdate.
2. Algaecide; chlorine release agents such as sodium hypochlorite or calcium hypochlorite, or microbiocides such as quarternary ammonia compounds, tributyl tin oxide, methylene bis (thiocyanate), or isothiazolones.
3. Or equal.

2.3 CHEMICAL FEEDING EQUIPMENT

A. Bypass Feeders: Cast iron or steel, for introducing chemicals into system; with funnel shutoff valve on top, air-release valve on top, drain valve on bottom, and recirculating shutoff valves on sides, as manufactured by Wingert, Nalco, Neptune, or equal.

1. Capacity: 1.8 gal.
2. Working Pressure: 125 psig.

B. Chemical Feed Tanks:

1. Chemical pot feeders shall be provided at each secondary heating system for buildings with HTW heat exchangers, and in stand-alone buildings for chilled water cooling systems and heating water systems.
2. Chemical feeders are not necessary when connecting to the campus chilled water or high temperature water systems.
3. Provide a minimum of a two-gallon by-pass chemical feed tank. Tank shall be piped on discharge piping to pump, across the pump shut-off valve. This location is to eliminate chemical slugging of pump seals. Chemicals shall be circulated throughout the total system before reaching pump seals.

C. Automatic Feedwater System:

1. Feedwater systems shall have totaling water meters on the inlet line.

2. Verify water pressure at the feedwater system. Feed pressure at the inlet shall exceed the manufacturer's recommended pressure by 20%.
3. Automatic blow down and chemical feed systems shall maintain a desired level of dissolved solids concentration in the water of the shell side of HTW steam generators with the use of a Lakewood conductivity controller or equal.
4. Provide a Lakewood model 250 conductivity controller or equal by Moore Controls with a Worchester motorized ball valve and orifice union.
5. The chemical feed system shall include a LMI model chemical feed pump and tank assembly, complete with foot valve, check valve, pressure relief valve, and strainer. The system shall be mounted over a non-metallic 5-gallon chemical mixing tank, complete with agitator, low level switch, hinged tank cover, and suction assembly. The chemical feed tank shall have soft water for mixing.
6. Both the solenoid valve (located on the airline controlling the regulator valve) and the chemical feed pump shall be wired into the steam generator's level controller. When the steam generator calls for water, the chemical feed pump and blow down system will begin operation (only upon activation of the make-up feed system). This system shall stop operation when the make-up valve serving the steam generator is closed. Blow down system shall periodically operate to sample the solids level.
7. Condenser water chemical treatment shall utilize a controller designed to continuously protect the condenser water system from the harmful affects of scaling, corrosion, and microbiological growth. The controller shall operate via microprocessor technology and shall be Pulsa Feeder PULSAtrol or prior approved equal. Fully isolated differential inputs for circuits to prevent ground loops. Keyboard activated hand/off/auto control of relays. The controller shall include:

    a. High resolution 10 bit A/D converter with adjustable analog sample sensitivity for accurate sensor inputs.
    b. Control of conductivity (user selectable scales 0-500, 0-2000, 0-500, 0-10000, and 0-20000 michrohms).
    c. Modular hardware and software for easy access and service.
    d. Pre-wired NEMA 4X enclosure, 120 volt/1 phase/60 hertz power requirement
    e. Hi-Lo alarm indicator.
    f. Mounted flow assembly.
    g. Selectable chemical feed timer: "percent", "limit", or "pulse".
    h. 28-day dual biocide feed.
    i. Serial line with communications software.
    j. 4-20 mA isolated programmable proportional output for remote monitoring of system conductivity.

2.4 CHEMICALS FOR CLOSED SYSTEMS

A. The University will supply chemicals as used on campus for system start-up water treatment. Coordinate quantities required with the University's representative. Treatment will occur after piping has been cleaned and tested. If because of the contractor's error, additional chemicals are needed, the University will provide chemicals at contractor's cost.

B. Provide 48 hours notice when chemical treatment is needed. Piping system must have been tested and approved and completely cleaned and flushed prior to this request. Provide an appropriate chemical for cleaning piping system. Discharge is required to be indirectly into sanitary sewer. The University has no preference for pipe cleaning chemicals, except Trisodium Phosphate (TSP) shall not be used.

C. Provide automatic feed water conditioning equipment for steam boilers, hot water boiler systems, and steam and hotwater heating systems connected to HTW generators and converters. Include water conditioning of make up and feedwater to steam boilers and HTW steam generators.

D. Coupon racks are not required at buildings unless directed by the University.

E. Clean Steam Generators: As recommend by the chemical treatment company and for use with sterilizers, and food service. FDA approved for use on sterilization, food service (direct contact), and humidification.

PART 3 - .EXECUTION

3.1 PREPARATION

A. Systems shall be operational, filled, started, and vented prior to cleaning. Place terminal control valves in open position during cleaning.

3.2 CLEANING SEQUENCE

A. Add cleaner to closed systems at concentration as recommended by manufacturer but not less than one pound per 100 gallons of water.

B. Use neutralizer agents on recommendation of system cleaner supplier.

C. Flush open systems with clean water for one-hour minimum. Drain completely and refill.

D. Remove, clean and replace strainer screens.

E. Inspect, remove sludge, and flush low points with clean water after cleaning process is completed. Include disassembly of components as required.

3.3 CLOSED SYSTEM TREATMENT

A. Provide one bypass feeder on each system. Install isolating and drain valves and necessary piping. Install around globe valve downstream of circulating pumps unless indicated otherwise.

B. Introduce closed system treatment through bypass feeder when required or indicated by test.

END OF SECTION 23 2500

SECTION 23 3113 - METAL DUCTS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes metal ducts for supply, return, outside, and exhaust air-distribution systems in pressure classes from minus 2- to plus 10-inch wg. Metal ducts include the following:

1. Rectangular ducts and fittings.
2. Single-wall, round, and flat-oval spiral-seam ducts and formed fittings.
3. Double-wall, round, and flat-oval spiral-seam ducts and formed fittings.
4. Duct liner. Use of fibrous glass duct liners shall be prohibited unless recommended by the sound consultant and approved by the University.

B. Related Sections include the following:

1. Division 23 Section "Air Duct Accessories" for dampers, sound-control devices, duct mounting access doors and panels, turning vanes, and flexible ducts.
2. Division 23 Section “Vibration and Seismic Controls for HVAC” for vibration isolation and seismic bracing requirements.
3. Division 23 Section “HVAC Insulation” for insulation and jacketing requirements.

1.2 PERFORMANCE REQUIREMENTS

A. Delegated Duct Design: Duct construction, including sheet metal thicknesses, seam and joint construction, reinforcements, and hangers and supports, shall comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and performance requirements and design criteria indicated in "Duct Schedule" Article.

1. Duct system design shall be used to select size and type of air-moving and -distribution equipment and other air system components. Design of the layout and configuration of duct system shall be approved in writing by the University’s Representative.

B. Structural Performance: Refer to Section 23 0548 “Vibration and Seismic Controls for HVAC.”

C. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.

1.3 SUBMITTALS

A. Shop Drawings: CAD-generated and drawn to 1/4 inch equals 1foot scale for the occupied floor plans. Mechanical rooms and rooftop plan shop drawings shall be ½” equals 1’-0” scale. Show fabrication and installation details for metal ducts.

1. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
2. Equipment service clearance and access panels and door swings.
3. Duct layout indicating sizes and pressure classes.
4. Elevations of top and bottom of ducts.
5. Dimensions of main duct runs from building grid lines.
6. Fittings.
7. Reinforcement and spacing.
8. Seam and joint construction.
9. Penetrations through fire-rated and other partitions.
10. Equipment installation based on equipment being used on Project.
11. Duct accessories, including access doors and panels.
12. Hangers and supports, including methods for duct and building attachment, vibration isolation, and seismic restraints.
13. Fabrication details and materials may be a separate submittal from ductwork shop drawings.
14. Seismic bracing calculations, details, products, and plans.

B. Coordination Drawings: Refer to 01 for requirements of "Coordination Detailing Activity". Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Ceiling suspension assembly members.
2. Other systems installed in same space as ducts.
3. Ceiling- and wall-mounting access doors and panels required providing access to dampers and other operating devices.
4. Ceiling-mounting items, including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

C. Welding certificates.

D. Field quality-control test reports.

E. LEED Submittals:

1. Product Data for LEED-NC Prerequisite EQ 1: Documentation indicating that duct systems comply with ASHRAE 62.1-2004, Section 5 - "Systems and Equipment."
2. Product Data for LEED-NC Prerequisite EA 2: Documentation indicating that duct systems comply with ASHRAE/IESNA 90.1-2004, Section 6.4.4 - "HVAC System Construction and Insulation."

3. Leakage Test Report for LEED-NC Prerequisite EA 2: Documentation of work performed for compliance with ASHRAE/IESNA 90.1-2004, Section 6.4.4.2.2 - "Duct Leakage Tests."

4. Duct-Cleaning Test Report for LEED-NC Prerequisite EQ 1: Documentation of work performed for compliance with ASHRAE 62.1-2004, Section 7.2.4 - "Ventilation System Start-Up."
5. Product Data for LEED-NC Credit EQ 4.1: For adhesives and sealants, including printed statement of VOC content.

F. Product Data: For each type of the following products:

1. Liners and adhesives.
2. Sealants and gaskets.
3. Seismic-restraint devices.

1.4 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel," for hangers and supports AWS D1.2, "Structural Welding Code--Aluminum," for aluminum supporting members and AWS D9.1, "Sheet Metal Welding Code," for duct joint and seam welding.

B. Mackups

a Mockup will be done in place and if approved will become part of the completed work.

C. Seismic Engineering: Seismic bracing and support design, product installation, equipment, and systems shall conform to the CBC requirements for Seismic Zone 4. Submit calculations, plans, and documents stamped by a qualified California registered engineer.

D. Structural Review: Seismic engineering submittal documents, seismic loads, anchorage loads, and all vertical loads applied to the building structure shall be approved by the project structural engineer of record.

E. ASHRAE and LEED-NC Prerequisite EQ 1 Compliance: Applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-Up."

F. ASHRAE/IESNA and LEED-NC Prerequisite EA 2 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6.4.4 - "HVAC System Construction and Insulation."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 SHEET METAL MATERIALS

A. Comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods, unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Galvanized Sheet Steel: Lock-forming quality; complying with ASTM A 653/A 653M and having G90 coating designation. Ducts shall have mill-phosphatized finish for surfaces exposed to public view and that are specified to be painted.

C. Stainless Steel: ASTM A 480/A 480M, Type 316L or 304. Minimum 20 gage. All welded construction.

D. Aluminum Sheets: ASTM B 209, alloy 3003, temper H14; with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.

E. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts.

F. Tie Rods: Tie rods complying with SMACNA may be used on ductwork more than 52-inches wide

2.3 DUCT LINER

A. Fibrous-Glass Liner: Shall not be used without University’s Representatives written approval.

1. Manufacturers:

    a. Certain Teed Corp.; Insulation Group.
    b. Johns Manville International, Inc.
    c. Knauf Fiber Glass GmbH.
    d. Owens Corning.
    e. Or equal.

2. Materials: ASTM C 1071; surfaces exposed to airstream shall be coated to prevent erosion of glass fibers.

    a. Thickness: 1 inch.

b. Thermal Conductivity (k-Value): 0.26 at 75 deg F mean temperature.
c. Fire-Hazard Classification: Maximum flame-spread index of 25 and smoke developed index of 50 when tested according to ASTM E 84.
d. Liner Adhesive: Comply with ASTM C 916.
e. Mechanical Fasteners: Galvanized steel suitable for adhesive attachment, mechanical attachment, or welding attachment to duct without damaging liner when applied as recommended by manufacturer and without causing leakage in duct.

1) Tensile Strength: Indefinitely sustain a 50-lb- tensile, dead-load test perpendicular to duct wall.
2) Fastener Pin Length: As required for thickness of insulation and without projecting more than 1/8 inch into airstream.
3) Adhesive for Attaching Mechanical Fasteners: Comply with fire-hazard classification of duct liner system.

f. For indoor applications and to comply with LEED-NC Credit EQ 4.1, use adhesive that has a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

B. Flexible Elastomeric Duct Liner: Comply with NFPA 90A. Shall not be used without University's Representatives written approval.

1. Manufacturers:

a. Armstrong World Industries, Inc.
b. Or equal.

2. Materials: Unicellular polyethylene thermal plastic, preformed sheet insulation complying with ASTM C 534, Type II, except for density, for applications less than 220 Deg F.

a. Thickness: 1 inch.
b. Thermal Conductivity (k-Value): 0.24 at 75 deg F mean temperature.
c. Fire-Hazard Classification: Maximum flame-spread index of 25 and smoke developed index of 50 when tested according to ASTM C 411.
d. Liner Adhesive: As recommended by insulation manufacturer and complying with NFPA 90A.
e. For indoor applications and to comply with LEED-NC Credit EQ 4.1, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.4 SEALANT AND GASKETS

A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.

B. Two-Part Tape Sealing System:

1. Tape: Woven cotton fiber impregnated with mineral gypsum and modified acrylic/silicone activator to react exothermically with tape to form hard, durable, airtight seal.
2. Tape Width: 3 inches minimum.
3. Sealant: Modified styrene acrylic.
4. Water resistant.
5. Mold and mildew resistant.
6. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
7. Service: Indoor and outdoor.
8. Service Temperature: Minus 40 to plus 200 deg F.
9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum.
10. For indoor applications and to comply with LEED-NC Credit EQ 4.1, use sealant that has a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. Water-Based Joint and Seam Sealant:

1. Application Method: Brush on.
2. Solids Content: Minimum 65 percent.
3. Shore A Hardness: Minimum 20.
4. Water resistant.
5. Mold and mildew resistant.
6. VOC: Maximum 75 g/L (less water).
7. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
8. Service: Indoor or outdoor.
9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

D. Flanged Joint Sealant: Comply with ASTM C 920.

1. General: Single-component, acid-curing, silicone, elastomeric.
2. Type: S.
3. Grade: NS.
4. Class: 25.
5. Use: O.
6. For indoor applications and to comply with LEED-NC Credit EQ 4.1, use sealant that has a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

E. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

2.5 HANGERS AND SUPPORTS

A. Building Attachments: Concrete inserts, drilled in fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.

1. Concrete Inserts: Carbon steel, electro-galvanized, except exterior or corrosive environments shall be stainless steel, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used. UL listed for use in metal deck formed concrete and formed slabs for pre-positioning and attaching hanger rods in poured concrete decks. Suitable for seismic loads and brace attachments.

a. Manufacturers:

1) B-Line Systems, Inc.; a division of Cooper Industries.
2) ISAT (Blue Banger Hanger).
3) Simpson Strong-Tie Company (Blue Banger Hanger).
4) NIBCO Inc.; Tolco.
5) Or equal.

2. Use drilled in concrete fasteners for standard-weight aggregate concretes or for slabs more than 5 inches thick.
3. Shot pins may be installed using Ramset © gas driven fastening system. Do not use powder-actuated fasteners.

B. Hanger Materials: Galvanized sheet steel or threaded steel rod.

1. Hangers Installed in Corrosive Atmospheres: Electro-galvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.
2. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards-Metal and Flexible" for steel sheet width and thickness and for steel rod diameters.
3. Galvanized-steel straps attached to aluminum ducts shall have contact surfaces painted with zinc-chromate primer.

C. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

D. Trapeze and Riser Supports: Steel shapes complying with ASTM A 36/A 36M.

1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.
2. Supports for Stainless-Steel Ducts: Galvanized-steel or stainless steel shapes and plates.
3. Supports for Aluminum Ducts: Aluminum support materials unless materials are electrolytically separated from ducts.

2.6 RECTANGULAR DUCT FABRICATION

A. Fabricate ducts, elbows, transitions, offsets, branch connections, and other construction according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" and complying with requirements for metal thickness, reinforcing types and intervals, tie-rod applications, and joint types and intervals except as modified by this specification.

1. Lengths: Fabricate rectangular ducts in lengths appropriate to reinforcement and rigidity class required for pressure class.
2. Deflection: Duct systems shall not exceed deflection limits according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible."

B. Elbows shall be radius or short radius with vanes, type RE 1 and RE 3 in the SMACNA manual. Mitered elbows with turning vanes and other types shall not be used, use short radius elbows with vanes where space is limited. Construct vanes per pages A.41 and A.43 of the SMACNA manual.

C. Divided flow branches shall be per SMACNA manual figure 2-5, type 1 or type 4A or 4B only.

D. Branch connections per SMACNA manual figure 2-6; 45-degree entry shall only be used where airflow in branch is less than 25% of total airflow in main duct.

E. Offsets shall be SMACNA manual figure 2-7, type 3 only.

F. Transverse Joints: Prefabricated slide-on joints and components constructed using manufacturer's guidelines for material thickness, reinforcement size and spacing, and joint reinforcement.

1. Manufacturers:

a. Ductmate Industries, Inc.
b. Nexus Inc.
c. Ward Industries, Inc.
d. Or equal.

G. Longitudinal Seams: Pittsburgh lock sealed with non-curing polymer sealant. Button punch snap lock seams are not acceptable to the University and shall not be used.

H. Provide drive slip or equivalent flat seams for ducts exposed in the conditioned space or where necessary due to space limitations.

I. Cross Breaking or Cross Beading: Cross break or cross bead duct sides 19 inches and larger and 0.0359inch thick or less, with more than 10 sq. ft. of non-braced panel area unless ducts are lined.

2.7 APPLICATION OF LINER IN RECTANGULAR DUCTS

A. Adhere a single layer of indicated thickness of duct liner with at least 100 percent adhesive coverage at liner contact surface area. Attaining indicated thickness with multiple layers of duct liner is prohibited.

B. Apply adhesive to transverse edges of liner facing upstream that do not receive metal nosing.

C. Butt transverse joints without gaps and coat joint with adhesive.

D. Fold and compress liner in corners of rectangular ducts or cut and fit to ensure butted-edge overlapping.

E. Do not apply liner in rectangular ducts with longitudinal joints, except at corners of ducts, unless duct size and standard liner product dimensions make longitudinal joints necessary.

F. Apply adhesive coating on longitudinal seams.

G. Secure liner with mechanical fasteners 4 inches from corners and at intervals not exceeding 12 inches transversely; at 3 inches from transverse joints and at intervals not exceeding 18 inches longitudinally.

H. Secure transversely oriented liner edges facing the airstream with metal nosings that have either channel or "Z" profiles or are integrally formed from duct wall. Fabricate edge facings at the following locations:

1. Fan discharges.
2. Intervals of lined duct preceding unlined duct.
3. Upstream edges of transverse joints in ducts where air velocities are greater than 2500 fpm or where indicated.

I. If duct velocities are greater than 4000 fpm, secure insulation between perforated sheet metal inner duct of same thickness as specified for outer shell. Use mechanical fasteners that maintain inner duct at uniform distance from outer shell without compressing insulation.

1. Sheet Metal Inner Duct Perforations: 3/32-inch diameter, with an overall open area of 23 percent. Use solid metal (non-perforated) inner ducts for material handling exhaust systems.

J. Terminate inner ducts with buildouts attached to fire-damper sleeves, dampers, turning vane assemblies, or other devices. Fabricated buildouts (metal hat sections) or other buildout means are optional; when used, secure buildouts to duct walls with bolts, screws, rivets, or welds.

2.8 ROUND AND FLAT-OVAL DUCT AND FITTING FABRICATION

A. Diameter as applied to flat-oval ducts in this Article is the diameter of a round duct with a circumference equal to the perimeter of a given size of flat-oval duct.

B. Round, Spiral Lock-Seam Ducts: Fabricate supply ducts of galvanized steel according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible."

C. Flat-Oval, Spiral Lock-Seam Ducts: Fabricate supply ducts according to SMACNA's "HVAC Duct Construction Standards--Metal and Flexible." Fabricate ducts larger than 72 inches in diameter with butt-welded longitudinal seams.

1. Manufacturers:

a. McGill AirFlow Corporation.
b. SEMCO Incorporated.
c. Contractors Fabrication shop
d. Or equal.

D. Duct Joints:

2. Ducts up to 20 Inches in Diameter: Interior, center-beaded slip coupling, sealed before and after fastening, attached with sheet metal screws.
3. Ducts 21 to 72 Inches in Diameter: Three-piece, gasketed, flanged joint consisting of two internal flanges with sealant and one external closure band with gasket.
4. Ducts Larger than 72 Inches in Diameter: Companion angle flanged joints per SMACNA "HVAC Duct Construction Standards--Metal and Flexible," Figure 3-2.

E. 90-Degree Tees and Laterals and Conical Tees: Fabricate to comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," with metal thicknesses specified for longitudinal-seam straight ducts.

F. Diverging-Flow Fittings: Fabricate with reduced entrance to branch taps and with no excess material projecting from fitting onto branch tap entrance.

G. Fabricate elbows using die-formed, gored, pleated, or mitered construction. Bend radius of dieformed, gored, and pleated elbows shall be 1-1/2 times duct diameter. Unless elbow construction type is indicated, fabricate elbows as follows:

1. Mitered-Elbow Radius and Number of Pieces: Welded construction complying with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible," unless otherwise indicated.

2. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from minus 2- to plus 2-inch wg:

a. Ducts 3 to 36 Inches in Diameter: 0.034 inch.
b. Ducts 37 to 50 Inches in Diameter: 0.040 inch.
c. Ducts 52 to 60 Inches in Diameter: 0.052 inch.
d. Ducts 62 to 84 Inches in Diameter: 0.064 inch.

3. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from 2- to 10-inch wg:

a. Ducts 3 to 26 Inches in Diameter: 0.034 inch.
b. Ducts 27 to 50 Inches in Diameter: 0.040 inch.
c. Ducts 52 to 60 Inches in Diameter: 0.052 inch.
d. Ducts 62 to 84 Inches in Diameter: 0.064 inch.

4. Flat-Oval Mitered Elbows: Welded construction with same metal thickness as longitudinal-seam flat-oval duct.
5. 90-Degree, 2-Piece, Mitered Elbows: Use only for supply systems or for material handling Class A or B exhaust systems and only where space restrictions do not permit using radius elbows. Fabricate with single-thickness turning vanes.
6. Round Elbows 14 Inches and Less in Diameter: Adjustable elbows for 30, 45, 60, and 90 degrees only. After installation screw segments in place and seal all segment joints. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.
7. Round Elbows14 Inches and above in Diameter: Fabricate gored or pleated elbows for 30, 45, 60, and 90 degrees unless space restrictions require mitered elbows. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction. Fabricate 90 degrees elbows with minimum of 5 pieces.
8. Round Elbows Larger than 14 Inches in Diameter and All Flat-Oval Elbows: Fabricate gored elbows unless space restrictions require mitered elbows.
9. Die-Formed Elbows for Sizes through 8 Inches in Diameter and All Pressures 0.040 inch thick with 2-piece welded construction.
10. Round Gored-Elbow or adjustable elbows Metal Thickness: Same as non-elbow fittings specified above.
11. Flat-Oval Elbow Metal Thickness: Same as longitudinal-seam flat-oval duct specified above.
12. Pleated Elbows for Sizes through 14 Inches in Diameter and Pressures through 10-Inch wg: 0.022 inch.

2.9 DOUBLE-WALL DUCT AND FITTING FABRICATION

A. Manufacturers:

1. Lindab Inc.
2. McGill AirFlow Corporation.
3. SEMCO Incorporated.
4. Or equal.

B. Ducts: Fabricate double-wall (insulated) ducts with an outer shell and an inner duct. Dimensions indicated are for inner ducts.

1. Outer Shell: Base metal thickness on outer-shell dimensions. Fabricate outer-shell lengths 2 inches longer than inner duct and insulation and in metal thickness specified for single-wall duct.

2. Insulation: 3-inch- thick fibrous glass. Terminate insulation where double-wall duct connects to single-wall duct or uninsulated components, and reduce outer shell diameter to inner duct diameter.

    a. Thermal Conductivity (k-Value): 0.26 at 75 deg F mean temperature.

3. Solid Inner Ducts: Use the following sheet metal thicknesses and seam construction:

    a. Ducts 3 to 8 Inches in Diameter: 0.019 inch with standard spiral-seam construction.
    b. Ducts 9 to 42 Inches in Diameter: 0.019 inch with single-rib spiral-seam construction.
    c. Ducts 44 to 60 Inches in Diameter: 0.022 inch with single-rib spiral-seam construction.
    d. Ducts 62 to 88 Inches in Diameter: 0.034 inch with standard spiral-seam construction.

4. Perforated Inner Ducts: Fabricate with 0.028-inch- thick sheet metal having 3/32-inchdiameter perforations, with overall open area of 23 percent.
5. Maintain concentricity of inner duct to outer shell by mechanical means. Prevent dislocation of insulation by mechanical means.

C. Fittings (from minus 2- to plus 10-inch wg): Fabricate double-wall (insulated) fittings with an outer shell and an inner duct.

1. Solid Inner Ducts: Use the following sheet metal thicknesses:

    a. Ducts 3 to 34 Inches in Diameter: 0.028 inch.
    b. Ducts 35 to 58 Inches in Diameter: 0.034 inch.
    c. Ducts 60 to 88 Inches in Diameter: 0.040 inch.

2. Perforated Inner Ducts: Fabricate with 0.028-inch- thick sheet metal having 3/32-inchdiameter perforations, with overall open area of 23 percent.

PART 3 - EXECUTION

3.1 DUCT APPLICATIONS

A. Static-Pressure Classes: Unless approved by the University's Representative, construct ducts according to the following:

1. Supply Ducts (exterior installation): 4-inch wg.
2. Supply Ducts before (upstream) Air Terminal Units (VAV boxes or air valves): 4-inch wg.
3. Supply Ducts after (downstream) Air Terminal Units (VAV boxes or air valves): 2-inch wg.

4. Supply Ducts (in Mechanical Equipment Rooms): 4-inch wg.
5. Return ducts (negative pressure) after (downstream) Air Terminal Units (VAV boxes, air valves, or filters): 2-inch wg.
6. Return Ducts (negative pressure) before (upstream) Air Terminal Units (VAV boxes, air valves, or filters): 2-inch wg.
7. General exhaust (negative pressure) after (downstream) Air Terminal Units (VAV boxes, air valves, or filters): 4-inch wg.
8. General Exhaust Ducts (negative pressure) before (upstream) Air Terminal Units (VAV boxes, air valves, or filters:): 2-inch wg
9. Laboratory or vivarium Exhaust Ducts (negative pressure): 4-inch wg.
10. Laboratory or vivarium Exhaust Ducts exterior on roof (negative pressure): 4-inch wg.
11. Vertical risers shall be constructed to a minimum of 4-inch wg, regardless of type.

B. All ducts shall be galvanized steel except as follows:

1. Dishwasher ducts, pot sink hood, cart wash hood, Sterilizers and glass wash steam hood should be as followed:
    a. Concealed: 1st 20ft 316L or 304 Stainless Steel or back to duct main connection.
    b. Exposed: 1st 20ft 316L or 304 Stainless Steel
    c. Weld and flange seams and joints.

2. Laboratory or vivarium (Fume-Handling) Ducts, exhaust (except biosafety cabinets): Type 316L, or 304 to main stainless-steel sheet, welded construction.
3. Vivarium Cage Washer and Rack Washer Exhaust Duct: Type 316L or 304, stainless-steel sheet, welded construction.
4. Shower exhaust duct: First 20 feet from register, Aluminum or 304
5. Duct mounted humidifier: Type 304 stainless steel, minimum of 8’-0” length, or 1.5 times the absorption distance, whichever is greater. Type 304 stainless steel.
6. Ductwork installed within 50 feet of cooling tower or similar evaporative device: Type 316L.
7. Ductwork exposed on roof: Galvanized Duct
8. Wet Process Exhaust: Type 304 stainless steel.
9. Outside Air / Air Make-up Ducts: Galvanized Duct

10. Floor trench with no access shall be Type 316L stainless with welded joints and flexible elastomeric insulation (not fiberglass).

C. Round ducts shall be used to the maximum extent possible. Rectangular ducts shall be limited to areas of space restriction with a maximum aspect ratio of 3:1. If due to a structural clearance constraint, duct aspect ratio can be increased and/or duct cross section reduced if upstream transition has included angles of 60 degrees or less and downstream transition has included angles of 30 degrees or less.

D. Ducts exposed outside to elements shall only be of round construction to shed rainwater. If conditions do not allow round ducts, provisions shall be provided to slope the flat top of rectangular ductwork so rainwater will not stand on top of duct.

E. Except for connection of terminal discharge duct to air outlets, 90 degree taps shall not be used. Takeoff feeding terminals shall be conical branch; 45 wye, conical branch; low loss tee; bell mouth, or branch with a loss coefficient equivalent to that for the conical branch. The slopes of transitions shall be approximately one to five, and no abrupt changes or offsets of any kind in the duct system shall be permitted.

F. Fume Hood Duct System

1. Hood collar connections shall be made with concentric transitions having minimum round duct dimensions as follows:

NOMINAL BENCH TYPE HOOD SIZE, FEET	MINIMUM ROUND DUCT SIZE, INCHES
4	10
5	12
6	12
8	14

2. Branch to main fittings shall be wye, 30 or 45-degree converging type where the increase in main occurs at the fitting. Ductwork shall take the straightest route to the roof, minimizing bends and horizontal runs. Increased distances and bends create resistance to airflow and require larger exhaust motors.

3.2 DUCT INSTALLATION

A. Construct and install ducts according to SMACNA's "HVAC Duct Construction Standards-Metal and Flexible," unless otherwise indicated.

B. Install round and flat-oval ducts in lengths not less than 10 feet unless interrupted by fittings.

C. Install ducts with fewest possible joints.

D. Install fabricated fittings for changes in directions, size, and shape and for connections.

E. Install couplings tight to duct wall surface with a minimum of projections into duct. Secure couplings with sheet metal screws. Install screws at intervals of 12 inches, with a minimum of 3 screws in each coupling.

F. Install ducts vertically and horizontally and parallel and perpendicular to building lines; avoid diagonal runs in ducts that would be over 12 feet in length.

G. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.

H. If space permits, install ducts with a clearance of 2 inch on each side, plus allowance for insulation thickness.

I. Conceal ducts from view in finished spaces. Do not encase horizontal runs in solid partitions unless specifically indicated.

J. Coordinate layout with suspended ceiling, fire- and smoke-control dampers, lighting layouts, and similar finished work.

K. Seal all joints and seams. Apply sealant to male end connectors before insertion, and afterward to cover entire joint and sheet metal screws.

L. Stainless steel ducts connected to air valves and fume hoods shall be flanged.

M. Electrical Equipment Spaces: Route ducts to avoid passing through transformer vaults and electrical equipment spaces and enclosures and telephone equipment rooms.

N. Non-Fire-Rated Partition Penetrations: Where ducts pass through interior partitions and exterior walls and are exposed to view, conceal spaces between construction openings and ducts or duct insulation with sheet metal flanges of same metal thickness as ducts. Overlap openings on 4 sides by at least 1-1/2 inches.

O. Fire-Rated Partition Penetrations: Where ducts pass through interior partitions and exterior walls, install appropriately rated fire dampers or combination fire/smoke dampers, sleeves, and firestopping sealant. Fire and smoke dampers are specified in Division 23 Section "Air Duct Accessories." Firestopping materials and installation methods are specified in Division 07 Section "Penetration Firestopping."

P. Install ducts with hangers and braces designed to withstand, without damage to equipment, seismic force required by California building codes.

Q. Protect duct interiors from the elements and foreign materials until building is enclosed. Follow SMACNA's "Duct Cleanliness for New Construction."

R. Do not paint interiors of metal ducts except for air distribution metal cans as required.

S. Protect duct openings from damage and prevent entrance of foreign materials.

T. Sealants shall not take the place of welding of metal ducts, where required.

3.4 SEAM AND JOINT SEALING

A. Seal all duct seams and transverse and longitudinal joints regardless of pressure classification.

B. Seal ducts before external insulation is applied.

C. Provide airtight seal on seams around fan and coil housings.

D. Do not use permanent sealants on duct mounted equipment. Sealant at equipment, or other induct maintenance component, shall be sealed with a code approved sealant that may be easily removed and replaced upon repair and replacement of the device connected to the ductwork.

3.5 HANGING AND SUPPORTING

A. Attachment method, hanger device selection, loads, and spacing shall be coordinated and approved with the structural engineer.

B. Support horizontal ducts within 24 inches of each elbow and within 48 inches of each branch intersection.

C. Support vertical ducts at maximum intervals of 16 feet and at each floor.

D. Install upper attachments to structures with an allowable load not exceeding one-fourth of failure (proof-test) load. Wire and friction clamps shall not be used.

E. Install concrete inserts before placing concrete.

F. Install drilled in concrete anchors after concrete is placed and completely cured.

G. Do not use powder-actuated concrete fasteners. Gas driven fasteners may be used.

H. Wet, or High Moisture Areas: Provide stainless steel supports, brackets, and mounting hardware for spaces that have wet process, wash-down, or high humidity.

I. Outdoor Applications: All outdoor support assemblies shall be of “stainless steel material”, or “hot-dip galvanized carbon steel.

1. Stainless steel: Mounting hardware such as bolts, nuts, washers, straps, brackets, fastening hardware etc., shall be stainless steel.
2. Coated galvanized steel: Carbon steel support assemblies, including all metal fabrications for use outdoors shall comply with each paragraph listed below:

    a. Assemblies must be shop-fabricated and hot-dip galvanized coating process
    b. Touch-up and repair per manufacturer’s recommendations after field installation.

J. Ducts and equipment shall be supported high enough above roofing surfaces to allow roofing access for maintenance and repair. Install ducts and equipment at a minimum height as shown in Table 4-1 of SMACNA Architectural Sheet Metal Manual – 5th Edition.

3.6 CONNECTIONS

A. Make connections to equipment with flexible connectors according to Division 23 Section "Air Duct Accessories" unless equipment is internally isolated.

B. Comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

C. Make connections to grilles, registers or diffusers the same size as the flange outer perimeter or neck size of the grille, register, or diffuser.

3.7 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections according to SMACNA's "HVAC Air Duct Leakage Test Manual" and prepare test reports:

1. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
2. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If pressure classes are not indicated, test entire system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure. Give seven days' advance notice for testing.
3. Maximum Allowable Leakage: Comply with requirements for Leakage Class 3 for round and flat-oval ducts, Leakage Class 12 for rectangular ducts in pressure classes lower than and equal to 2-inch wg (both positive and negative pressures), and Leakage Class 6 for pressure classes from 2- to 10-inch wg.
4. Remake leaking joints and retest until leakage is equal to or less than maximum allowable.

B. Supply, return and exhaust ducts shall be sealed to minimize leakage. Ducts in concealed spaces such as chases or shafts and above wallboard ceilings shall be pressure-tested prior to concealment. Seams and joints of ducts shall be sealed with mastic or mastic plus tape or gasketing as appropriate to limit the air leakage.

C. Laboratory exhaust shall not have any leakage. Pressure test at 95% of duct pressure rating, checking every joint by spraying with bubbles to verify seal.

D. Materials such as duct, stiffeners, gaskets, bolting, etc., intended as part of the final installation, which are damaged during testing shall be replaced.

E. Ductwork may be tested in sections. The section of the ductwork to be tested shall be prepared by blanking off duct outlets, etc.

F. Dampers in the tested ductwork shall be left in the open position. Testing shall be satisfactorily completed before insulation or enclosure of the ductwork and before terminal units are installed.

G. Ductwork downstream of terminal units and air valves need not be leak tested.

3.8 CLEANING NEW SYSTEMS

A. SMACNA Intermediate Cleanliness level shall be followed as outlined in "SMACNA Duct Cleanliness for New Construction Guidelines". If the ductwork system is maintained in a clean state during the installation the following is not required. If in the opinion of the University's Representative the ductwork system becomes dirty during installation the following shall be complied with:

B. Mark position of dampers and air-directional mechanical devices before cleaning, and perform cleaning before air balancing.

C. Use service openings, as required, for physical and mechanical entry and for inspection.

1. Create other openings to comply with duct standards.
2. Disconnect flexible ducts as needed for cleaning and inspection.
3. Remove and reinstall ceiling sections to gain access during the cleaning process.

D. Vent vacuuming system to the outside. Include filtration to contain debris removed from HVAC systems, and locate exhaust down wind and away from air intakes and other points of entry into building.

E. Clean the following metal duct systems by removing surface contaminants and deposits:

1. Air outlets and inlets (registers, grilles, and diffusers).
2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
4. Coils and related components.
5. Return-air ducts, dampers, and actuators except in ceiling plenums and mechanical equipment rooms.
6. Supply-air ducts, dampers, actuators, and turning vanes.

G. Cleanliness Verification:

1. Visually inspect metal ducts for contaminants.
2. Where contaminants are discovered, re-clean and reinspect ducts.

END OF SECTION 23 3113

SECTION 23 3300 - AIR DUCT ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Backdraft dampers.
2. Volume dampers.
3. Motorized control dampers.
4. Fire dampers.
5. Smoke dampers.
6. Combination fire and smoke dampers.
7. Duct silencers.
8. Duct-mounting access doors.
9. Flexible connectors.
10. Flexible ducts.
11. Duct accessory hardware.

B. Related Sections include the following:

1. Division 28 Section "Digital Addressable Fire Alarm System" for duct-mounted fire and smoke detectors.
2. Division 23 Section "Instrumentation and Controls" for electric and pneumatic damper actuators.
3. Division 23 Section “Custom Air-Handling Units.”
4. Division 23 Section “Metal Ducts.”

1.2 SUBMITTALS

A. Product Data: For the duct accessories to be used on this project.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Special fittings.
2. Manual-volume damper installations.
3. Motorized-control damper installations.
4. Fire-damper, smoke-damper, and combination fire and smoke-damper installations, including sleeves and duct-mounting access doors.
5. Wiring Diagrams: Power, signal, and control wiring.

C. Submittal shall include published leakage, pressure drop and maximum pressure data for a full range of damper sizes based on AMCA Standard 500 testing. Data from one size sample test is not acceptable.

D. LEED Submittal:

1. Product data: Documentation indicating that units comply with ASHRAE 62.1-2004, Section 5 – “Systems and Equipment.”

1.3 QUALITY ASSURANCE

A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems," and with NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."

B. Comply with AMCA 500-D testing for damper rating.

C. Flexible ducts shall be listed by Underwriters Laboratories, Inc., complying with UL 181.

D. Fire, Smoke, and Combination Fire-Smoke dampers shall conform to the California State Fire Marshall Listing for Fire Damper and Smoke Damper.

E. Fire dampers shall be listed by Underwriters Laboratories, Inc., complying with UL 555, Smoke, and Combination Fire-Smoke dampers shall be listed by Underwriters Laboratories, Inc., complying with UL 555S.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.
2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 SHEET METAL MATERIALS

A. Comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods, unless otherwise indicated.

B. Galvanized Sheet Steel: Lock-forming quality; complying with ASTM A 653/A 653M and having G90 coating designation; exposed ducts shall have mill-phosphatized finish for paint adhesion.

C. Stainless Steel: ASTM A 480/A 480M, type 304, and having a No. 2 finish for concealed ducts and exposed ducts.

D. Aluminum Sheets: ASTM B 209, alloy 3003, temper H14; with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.

E. Extruded Aluminum: ASTM B 221, alloy 6063, temper T6.

F. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.

G. Tie Rods, for ducts 52-inches or more in width: Galvanized steel, or stainless steel, 3/8-inch minimum diameter.

2.3 BACKDRAFT DAMPERS

A. Manufacturers:

1. Duro Dyne Inc.
2. Greenheck Fan Corporation.
3. Pottorff; a division of PCI Industries, Inc.
4. Ruskin Company.
5. Or equal

B. Description: Multiple-blade, parallel action gravity balanced, factory fabricated with center pivoted blades of maximum 6-inch width, with sealed edges, assembled in rattle-free manner with 90-degree stop, steel ball bearings, and axles; adjustment device to permit setting for varying differential static pressure. The damper shall be limited to 500 fpm velocity.

C. Frame: 0.063-inch- thick extruded aluminum, with welded corners and mounting flange.

D. Blades: 0.025-inch- thick, roll-formed aluminum.

E. Blade Seals: Neoprene.

F. Blade Axles: Galvanized steel.

G. Tie Bars and Brackets: Galvanized steel.

H. Return Spring: Adjustable tension.

I. Outside-Air: For outside air applications, provide stainless steel frame, axle, hardware, and damper blades.

2.4 VOLUME DAMPERS

A. Manufacturers:

1. McGill AirFlow LLC.

2. Pottorff; a division of PCI Industries, Inc.
3. Ruskin Company.
4. Contractor Fabricator per SMACNA Duct Construction Standards
5. Or equal.

B. General Description: Factory and shop fabricated, with required hardware and accessories. Stiffen damper blades for stability. Include locking device to hold single-blade dampers in a fixed position without vibration. Close duct penetrations for damper components to seal duct consistent with pressure class.

C. Standard Volume Dampers: Multiple-opposed-blade design, standard leakage rating, with linkage outside airstream, and suitable for horizontal or vertical applications. Single blade design may be Contractor shop-fabricated per SMACNA guidelines.

1. Steel Frames: Hat-shaped, galvanized (provide stainless in outside air system) sheet steel channels, minimum of 0.064 inch thick, with mitered and welded corners; frames with flanges where indicated for attaching to walls and flangeless frames where indicated for installing in ducts.
2. Roll-Formed Steel Blades: 0.064-inch- thick, galvanized (provide stainless in outside air system) sheet steel.
3. Blade Axles: Galvanized steel, or stainless steel.
4. Bearings: Oil impregnated bronze sleeve, or stainless-steel sleeve.
5. Tie Bars and Brackets: not allowed.

D. Low-Leakage Volume Dampers for fume hoods and similar installations: Multiple- or single blade, parallel- or opposed-blade design low-leakage rating, with linkage outside airstream, and suitable for horizontal or vertical applications.

1. Steel Frames: stainless sheet steel channels, minimum of 0.064 inch thick, with mitered and welded corners; frames with flanges for attaching to walls and flangeless frames for installing in ducts.
2. Roll-Formed Steel Blades: 0.064-inch- thick, stainless sheet steel.
3. Blade Axles: Stainless steel.
4. Bearings: Stainless-steel sleeve thrust or ball.
5. Blade Seals: Neoprene.
6. Jamb Seals: Cambered stainless steel.

E. Jackshaft: ½ -inch minimum- diameter, galvanized-steel pipe rotating within pipe-bearing assembly mounted on supports at each mullion and at each end of multiple-damper assemblies.

1. Length and Number of Mountings: Appropriate to connect linkage of each damper in multiple-damper assembly.

F. Damper Hardware: Zinc-plated, die-cast core with dial and handle made of 3/32-inch- thick zinc-plated steel, and a 3/4-inch hexagon locking nut. Include center hole to suit damper operating-rod size. Include elevated platform for insulated duct mounting.

2.5 MOTORIZED CONTROL DAMPERS

A. Manufacturers:

1. Greenheck Fan Corporation.
2. McGill AirFlow LLC.
3. Nailor Industries Inc.
4. Ruskin Company.
5. Or equal.

B. General Duty Control Dampers: AMCA-rated, opposed-blade design, double-skin air foil shape; minimum of 0.1084-inch- thick, galvanized-steel frames with holes for duct mounting; minimum of 0.0635-inch- thick, galvanized-steel damper blades with maximum blade width of 8 inches and stainless steel jamb seals.

1. Secure blades to 1/2-inch- diameter, zinc-plated axles using zinc-plated hardware, with externally mounted regreaseable stainless steel ball type bearings (Oil impregnated bronze, stainless sleeve or synthetic bearings are not acceptable), out of airstream blade linkage hardware of zinc-plated steel and brass, end seals, and thrust bearings at each end of every blade.
2. Operating Temperature Range: From minus 40 to plus 200 deg F.
3. Provide opposed-blade design with inflatable seal blade edging, or replaceable EPDM blade seals, rated for leakage at less than 10 cfm per sq. ft. of damper area, at differential pressure of 4-inch wg when damper is being held by torque of 50 in. x lbf; when tested according to AMCA 500D.
4. Maximum pressure drop shall be 0.07 inches WG for a 24-inch by 24-inch duct-mounted damper handling 8,000 cfm.
5. Outside-Air/Relief-Air: For outside air applications, provide stainless steel frame, axle, hardware, and damper blades.

2.7 SMOKE, OR COMBINATION FIRE AND SMOKE DAMPERS

A. Manufacturers:

1. Greenheck.
2. Pottorff.
3. Ruskin Company.
4. Or equal.

B. General Description: Labeled according to UL 555S. Combination fire and smoke dampers shall be labeled according to UL 555 for 1-1/2-hour rating.

C. Fusible Links: Replaceable, 165 deg F. or, and 212 deg F. rated as applicable.

D. Frame and Blades: 0.064-inch- thick, galvanized sheet steel, or stainless steel.

E. Mounting Sleeve: Factory-installed, 0.052-inch- thick, galvanized sheet steel; length to suit wall or floor application.

F. Damper Motors: Provide for modulating or two-position action.

1. Permanent-Split-Capacitor or Shaded-Pole Motors: With oil-immersed and sealed gear trains.
2. Spring-Return Motors: Equip with an integral spiral-spring mechanism where indicated. Enclose entire spring mechanism in a removable housing designed for service or adjustments. Size for running torque rating of 150 in. x lbf and breakaway torque rating of 150 in. x lbf.
3. Outdoor Motors and Motors in Outside-Air Intakes: Equip with O-ring gaskets designed to make motors weatherproof. Equip motors with internal heaters to permit normal operation at minus 40 deg F.
4. Nonspring-Return Motors: For dampers larger than 25 sq. ft., size motor for running torque rating of 150 in. x lbf and breakaway torque rating of 300 in. x lbf.
5. Electrical Connection: 115 V, single phase, 60 Hz.

G. Access doors shall be provided for the dampers.

H. Dampers shall be duct size or sized to limit loss coefficient to 0.05" w.g., whichever is greater. Small ducts may need to be increased in size to limit pressure loss.

I. Multi-leaf dampers shall have airfoil blades. Damper design shall have maximum pressure drop of 007 inches w.g. corresponding to a 24-inch by 24-inch damper handling 8,000 cfm.

J. Dampers shall bear the UL and CSFM listed labels.

2.8 DUCT SILENCERS

A. Manufacturers:

1. Metal Form Manufacturing Inc.; Commercial Acoustics.
2. Industrial Noise Control, Inc.
3. McGill AirFlow LLC.
4. Ruskin Company.
5. Vibro-Acoustics.
6. Or equal

B. General Description: Factory-fabricated and -tested, round or rectangular silencers with performance characteristics and physical requirements as indicated.

C. Fire Performance: Adhesives, sealants, packing materials, and accessory materials shall have fire ratings not exceeding 25 for flame-spread index and 50 for smoke-developed index when tested according to ASTM E 84.

D. Rectangular Units: Fabricate casings with a minimum of 0.034-inch- thick, solid galvanized sheet metal for outer casing and 0.022-inch- thick, ASTM A 653/A 653M, G90, perforated galvanized sheet metal for inner casing. Attenuators in 100% outside air or fume hood exhaust system shall have a solid stainless steel internal lining.

E. Round Units:

1. Outer Casings:

    a. ASTM A 653/A 653M, G90, galvanized sheet steel.
    b. Up to 24 Inches in Diameter: 0.034 inch thick.
    c. 26 through 40 Inches in Diameter: 0.040 inch thick.
    d. 42 through 52 Inches in Diameter: 0.052 inch thick.
    e. 54 through 60 Inches in Diameter: 0.064 inch thick.
    f. Casings fabricated of spiral lock-seam duct may be one size thinner than that indicated.

2. Interior Casing, Partitions, and Baffles:

    a. ASTM A 653/A 653M, G90, galvanized sheet steel.
    b. At least 0.034 inch thick and designed for minimum aerodynamic losses.
    c. Attenuators in 100% outside air or fume exhaust system shall have a solid stainless steel internal lining.

F. Sheet Metal Perforations: 1/8-inch diameter for inner casing and baffle sheet metal.

G. Fill Material: Inert and vermin-proof fibrous material, packed under not less than 5 percent compression.

1. Erosion Barrier: Polymer bag enclosing fill and heat-sealed before assembly.

H. Fabricate silencers to form rigid units that will not pulsate, vibrate, rattle, or otherwise react to system pressure variations.

1. Do not use nuts, bolts, or sheet metal screws for unit assemblies.
2. Lock form and seal or continuously weld joints.
3. Suspended Units: Factory-installed suspension hooks or lugs attached to frame in quantities and spaced to prevent deflection or distortion.
4. Reinforcement: Cross or trapeze angles for rigid suspension.

I. Source Quality Control:

1. Acoustic Performance: Test according to ASTM E 477.
2. Record acoustic ratings, including dynamic insertion loss and self-noise power levels with an airflow of at least 2000-fpm face velocity.
3. Leak Test: Test units for air tightness at 200 percent of associated fan static pressure or 6-inch wg static pressure, whichever is greater.

2.9 TURNING VANES

A. Not to be used. Provide short radius elbows with vanes per SMACNA details in appendix.

2.10 DUCT-MOUNTING ACCESS DOORS

A. General Description: Fabricate doors airtight and suitable for duct pressure class. Include vision panel where indicated.

B. Access Door: Double wall, duct mounting, and rectangular; fabricated of galvanized sheet metal, or stainless steel, with insulation fill and thickness as indicated for duct pressure class. Include piano hinge and cam latches.

1. Manufacturers:

    a. Ductmate Industries, Inc.
    b. Flexmaster U.S.A., Inc.
    c. Greenheck Fan Corporation.
    d. McGill AirFlow LLC.
    e. Pottorff; a division of PCI Industries, Inc.
    f. Ruskin Company.
    g. Or equal.

2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
3. Hinges: Continuous piano hinges.
4. Low Pressure Rating: Low pressure applications, rated between negative 2-inches and positive 2-inches static pressure.

C. Access Door: Double wall, duct mounting, for round or rectangular ducts; fabricated of galvanized sheet metal, or stainless steel, with insulation fill and 1-inch thickness, closed cell neoprene gasket, closure knobs with zinc plated springs and bolts. Provide accessory safety chain.

1. Manufacturers:

    a. Ductmate Industries, Inc.
    b. Flexmaster U.S.A., Inc.
    c. Greenheck Fan Corporation.
    d. Pottorff; a division of PCI Industries, Inc.
    e. Ruskin Company.
    f. Or equal.

2. Frame: None. Sandwich type configuration with outer door galvanized sheet steel. notched frame.
3. Hinge: None.
4. Gasket location: shall be interchangeable for positive and negative pressure applications, per manufacturer's guidelines.
5. Pressure Rating: Ultra low leakage for positive or negative 8-inch w.c.

D. Pressure Relief Access Door: Double wall and duct mounting; fabricated of galvanized sheet metal, or stainless steel, with insulation fill and thickness as indicated for duct pressure class. Include vision panel where indicated, latches, and retaining chain.

1. Manufacturers:

    a. Ductmate Industries, Inc.

b. Greenheck Fan Corporation.
c. Ruskin Company.
d. Or equal.

2. Frame: Galvanized sheet steel, with bend-over tabs and neoprene gaskets.
3. Provide negative pressure and positive pressure relief doors design to open automatically to prevent exploding or imploding ductwork in the event dampers close or some other event may occur while the fan is still operating. The door shall automatically close and reset when the pressure is equalized or the system shuts down. Ruskin models PRD18, NRD18 or ADHP-3. Provide insulated doors in supply air systems, stainless steel construction for hazardous air exhaust systems and construction shall be appropriate for the pressure class.
4. Seal around frame attachment to duct and door to frame with neoprene rubber.
5. Insulation: 1-inch- thick, fibrous-glass or polystyrene-foam board.

2.11 FLEXIBLE CONNECTORS

A. Manufacturers:

1. Duro Dyne Inc.
2. Ventfabrics, Inc.
3. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
4. Or equal.

B. Metal-Edged Connectors: Factory fabricated with a fabric strip 5-3/4 inches wide attached to two strips of 2-3/4-inch- wide, 0.028-inch- thick, galvanized sheet steel or 0.032-inch- thick aluminum sheets. Select metal compatible with ducts.

C. Indoor System, Flexible Connector Fabric: Woven nylon and polyester blend with binyl coating.

1. Minimum Weight: 22 oz./sq. yd.
2. Tensile Strength: 240 lbf/in wrap and 220 lbf/in filling.
3. Service Temperature: -40 to 180 deg F.

E. Outdoor System, Flexible Connector Fabric: Glass fabric insulated double coated with weatherproof, Hypalon synthetic rubber resistant to UV rays and ozone.

1. Minimum Weight: 23 oz./sq. yd.
2. Insulation: Fiberglass.
3. Tensile Strength: 225lbf/in wrap.
4. Service Temperature: Zero to plus 240 deg F.

F. High-Temperature System, Flexible Connectors: Glass fabric coated with silicone rubber.

1. Minimum Weight: 16 oz./sq. yd..
2. Tensile Strength: 200 lbf/inch in the warp and 185 lbf/inch in the filling.
3. Service Temperature: Zero to plus 500 deg F.

G. High-Corrosive-Environment System, Flexible Connectors: Glass fabric with Teflon chemicalresistant coating including gasoline grease and acetone, UL 214 listed.

1. Minimum Weight: 14 oz./sq. yd..
2. Pressure Rating: 8-inch wg positive and 5-inch wg negative.
3. Tensile Strength: 300 lbf/inch in the warp and 275 lbf/inch in the filling.
4. Service Temperature: Zero to plus 500 deg F.

2.12 DRAWBAND CONNECTORS

A. Manufacturers:

1. Phoenix Controls Corp.
2. Flexmaster U.S.A., Inc.
3. Or equal.

B. General Description: Formed galvanized steel cylindrical sleeve with internal gasket and external drawband bolts. Flame-retardant or noncombustible gaskets and adhesives complying with UL 181, Class 1.

1. Pressure Rating: 10-inch wg positive and 5-inch wg negative.
2. Maximum Air Velocity: 4000 fpm.
3. Temperature Range: Minus 20 to plus 200 deg F.
4. Fume Hood or Corrosive Application: Chemically resistant gasket material. Galvanized metal shall not contact airstream.

2.13 FLEXIBLE DUCTS

A. Manufacturers:
1. Buckley Associates, Inc.
2. CASCO; Cal-Flex
3. Flexmaster U.S.A., Inc.
4. Quietflex Manufacturing Co.
5. Or equal.

B. Non-insulated, Non-Metallic Flexible Duct: UL 181, Class 1, black polymer reinforced sheeting or coated fiberglass cloth fabric supported by helically wound, spring-steel wire.

1. Pressure Rating: 4-inch wg positive and 0.5-inch wg negative.
2. Maximum Air Velocity: 4000 fpm.
3. Temperature Range: Minus 20 to plus 175 deg F.

C. Non-insulated, Non-Metallic Flexible Duct: UL 181, Class 0, interlocking spiral of aluminum foil, or coated heavy fiberglass cloth fabric.

1. Pressure Rating: 8-inch wg positive and 5.0-inch wg negative.
2. Maximum Air Velocity: 5000 fpm.
3. Temperature Range: Minus 100 to plus 435 deg F.

D. Insulated, Non-Metallic Flexible Duct: UL 181, Class 1, black polymer film or coated fiberglass cloth fabric supported by helically wound, spring-steel wire; fibrous-glass insulation; polyethylene fire retardant vapor-barrier film.

1. Pressure Rating: 4-inch wg positive and 0.5-inch wg negative.
2. Maximum Air Velocity: 4000 fpm.
3. Minimum Installed R-Value: R-4.2
4. Temperature Range: Minus 20 to plus 175 deg F.

E. Insulated, Non-Metallic Flexible Duct: UL 181, Class 0, interlocking spiral of aluminum foil or coated fiberglass cloth fabric; fibrous-glass insulation; polyethylene fire retardant vapor-barrier film.

1. Pressure Rating: 8-inch wg positive and 5.0-inch wg negative.
2. Maximum Air Velocity: 5000 fpm.
3. Minimum Installed R-Value: R-4.2
4. Temperature Range: Minus 20 to plus 250 deg F.

F. Flexible Duct Connectors:

1. Clamps: Stainless-steel band clamps with cadmium-plated hex screw to tighten band with a worm-gear action in sizes 3 through 18 inches, to suit duct size.
2. Sheet Metal Screws: For flexible duct connectors with metal collars, use minimum (3) sheet metal screws and duct sealer.

PART 3 - EXECUTION

3.1 APPLICATION AND INSTALLATION

A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for metal ducts.

B. Provide duct accessories and components of materials suited to duct materials; use galvanized steel accessories in galvanized-steel ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.

C. Install backdraft dampers on general low volume (less than 2,500 cfm) exhaust fans or exhaust ducts nearest to outside.

D. Install volume dampers in ducts with liner; avoid damage to and erosion of duct liner.

E. Provide balancing volume dampers at points on supply, return, and exhaust systems where branches lead from larger ducts as required for air balancing. Install at a minimum of two duct widths from branch takeoff. Provide exterior insulated ducts with 12” long flags hanging from damper handle for locating dampers.

F. Provide instrument test holes in ductwork at fan inlets and outlets and elsewhere as required by Testing, Adjusting and Balancing contractor for testing and balancing purposes. Factory install test holes for air handling units.

G. Install fire and smoke dampers, with fusible links, according to manufacturer's UL-approved written instructions.

H. When approved by the University's representative in writing, install duct silencers rigidly to ducts and provide supports.

I. Install duct access doors suitably sized and locate so as to allow for safe inspecting, testing, adjusting, and maintaining accessories and terminal units as approved by University Representatives and as follows:

1. Adjacent to fire or smoke dampers, providing access to reset or reinstall fusible links.
2. To interior of ducts for cleaning; at base of risers or bottom of multi-story drops.
3. On sides of ducts where adequate clearance is available.

J. Install the following minimum sizes for rectangular duct-mounting, rectangular access doors:

1. 8 by 5 inches for 6-inch duct size and smaller.
2. 12 by 6 inches for 8-inch to 10-inch duct sizes.
3. 12 by 8 inches for 11 to 13 duct sizes.
4. 12 by 12 inches for 14-inch to 24-inch duct sizes by maximum of 18-inches wide.
5. 20 by 12 inches for 14-inch to 24-inch duct sizes by 19" and wider.
6. 24 by 24 inches for larger duct sizes than listed above.

K. Install the following minimum sizes for round duct-mounting, round access doors:

1. 8 inches in diameter for up to 12-inch diameter duct size.
2. 12 inches in diameter for 13-inch to 19 inch duct sizes.
3. 18 inches in diameter for 20-inch to 25 inch duct sizes.
4. 24 inches in diameter for larger duct sizes than listed above.

L. Label access doors according to Division 23 Section "Identification for HVAC."

M. Install flexible connectors immediately adjacent to equipment in ducts associated with fans and motorized equipment supported by vibration isolators.

N. For fans developing static pressures of 5-inch wg and higher, cover flexible connectors with loaded vinyl sheet held in place with metal straps.

O. For air systems with fire or smoke dampers in the mains provide pressure relief dampers when fan static exceeds pressure class of ductwork.

P. Connect terminal units to supply ducts directly.

Q. Connect diffusers, registers and grilles with lengths of flexible duct clamped or strapped in place without kinks and not exceeding an angular layout sum of 135 degrees. Do not use flexible ductwork above hard lid gypsum or similar inaccessible ceilings. Do not use flexible ducts to change directions more than 135 degrees, with 90 degrees the turn down from horizontal duct to diffuser, register or grille in ceiling.

R. Connect flexible ducts to metal ducts with adhesive and band clamps. Flexible ducts with galvanized sheet metal collars shall be connected with duct sealant and sheet metal screws. S.

3.2 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Operate dampers to verify full range of movement.
2. Inspect locations of access doors and verify that purpose of access door can be performed. Location and operation of access doors shall be witnessed and approved by Campus Fire Marshal prior to concealment.
3. Operate fire, smoke, and combination fire and smoke dampers to verify full range of movement and verify that proper heat-response device is installed. Test shall be witnessed by Campus Fire Marshal prior to concealment.
4. Operate remote damper operators to verify full range of movement of operator and damper.

B. Adjusting:

1. Adjust duct accessories for proper settings.
2. Adjust fire and smoke dampers for proper action.
3. Final positioning of manual-volume dampers is specified in Division 23 Section "Testing,
Adjusting, and Balancing for HVAC."

END OF SECTION 23 3300

SECTION 23 3400 – FANS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Utility set fans.
2. Centrifugal roof ventilators.
3. Vaneaxial fans.
4. Upblast propeller roof exhaust fans.
5. Ceiling-mounting ventilators.
6. High-Plume Dilution Laboratory Exhaust Fans
7. Mixed Flow Fans
8. Manufacturer’s Roof Curbs

B. Related Sections include the following:

1. Division 23 Section “Common Motor Requirements for HVAC equipment”.
2. Division 23 Section “Hangers and Supports for HVAC Piping and Equipment”.
3. Division 23 Section "Seismic Restraint for HVAC".
4. Division 23 Section “Vibration Controls for HVAC”.

1.3 PERFORMANCE REQUIREMENTS

A. Project Altitude: Base fan-performance ratings on sea level unless otherwise indicated.

B. Operating Limits: Classify according to AMCA 99.

C. Wind Loads: Exterior fans, curb mounting assemblies and attachment to structure shall meet the wind structural loading requirements of the local Building Codes and Authorities Having Jurisdiction.

1. Wind Design Pressures: As determined from wind speed, building category, wind exposure indicated on the structural drawings for specific equipment location calculated per the structural wind loading requirements of the Building Code.
2. Structural Attachment Forces: As determined from wind design pressures using actual equipment dimensions calculated per the structural wind loading requirements of the Building Code.

D. Wind and Impact Loads: Exterior fans, curb mounting assemblies and attachments to structure shall meet the wind and impact structural loading requirements of the Florida Building Code and Authorities Having Jurisdiction. Provide fans and assemblies with current wind and impact certification by Florida Product Approval, Miami-Dade "Notice of Acceptance" (NOA) Product Approval or other approved testing agency.

1. Wind Design Pressures: As determined from wind speed, building category, wind exposure indicated on the structural drawings for specific equipment location calculated per the structural wind loading requirements of the Building Code.
2. Structural Attachment Forces: As determined from wind design pressures using actual equipment dimensions calculated per the structural wind loading requirements of the Building Code.
3. Windborne-Debris-Impact-Resistance-Test Performance: Provide equipment that pass large and small missile-impact tests and cyclic-pressure tests according to Section 1626 of the Florida Building Code.

E. Seismic: Fans and curb mounting assemblies shall withstand the effects of seismic forces in accordance with project Seismic specifications.

1.4 ACTION SUBMITTALS

A. Product Data:

1. Include rated capacities, furnished specialties, dimensions, weights and accessories for each fan.
2. Certified fan performance curves with system operating conditions indicated. Fan curves shall include a series of curves indicating the relationship of CFM and static pressure for various RPM. Brake horsepower curves shall also be included. Indicate the design operating point clearly on the fan curves. Indicate fan brake horsepower requirement at the design operating point.
3. Certified octave band fan sound-power ratings.
4. Motor ratings and electrical characteristics, plus motor and electrical accessories.
5. Material thickness and finishes, including color charts.
6. Dampers, including housings, linkages, and operators.
7. Diagrams for power, signal, and control wiring

1.5 INFORMATIONAL SUBMITTALS

A. Wind compliance: Contractor's certification of compliance with wind structural loading requirements of the Building Code, wind loads identified in "Performance Requirement" article and Authority Having Jurisdiction. Submit as applicable:

1. Product Approval: Equipment specific documentation indicating compliance.
2. Delegated Design: Signed and sealed documents by registered engineer.
3. Dimensioned Outline Drawings of Equipment: Identify maximum rated wind force in pounds per square foot, mounting and anchorage provisions.
4. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Wind and Impact Additional Qualifications: Manufacturer's certification that equipment will withstand both wind and impact loads identified in "Performance Requirement" Article.

C. Seismic Qualification: Manufacturer's certification of seismic qualification according to ASCE 7. Submit ASCE 7 special seismic certification as required. Include method used to determine compliance with requirements.

1. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
2. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements

D. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For centrifugal fans to include in emergency, operation, and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Belts: One extra set for each belt-driven unit.

1.8 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70 by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. AMCA Compliance: Products shall comply with performance requirements and shall be licensed to use the AMCA-Certified Ratings Seal.

C. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.

1.9 COORDINATION

A. Coordinate size and location of structural-steel support members and concrete bases where applicable.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations, where applicable.

1.10 DESIGN CRITERIA

A. All fans shall be tested as complete units in accordance with the applicable test code of AMCA and shall be certified by AMCA.

B. All fans with belt drives shall be provided with variable pitch V-belt sheaves for purpose of system balancing. After system is balanced, fixed pitch sheaves shall replace the variable pitch sheaves for all motors using multiple belt drives.

C. Each fan and motor combination shall be capable of meeting the following conditions while maintaining stable fan performance: deliver plus or minus 10% of the air quantity scheduled at the scheduled static pressure; deliver the air quantity scheduled at 125% of the scheduled static pressure. Provide Class I, II or III fan construction as required. The motor furnished with the fan shall not operate into the motor service factor in any of these cases. Drive efficiency shall be considered in motor selection according to manufacturer's published recommendations, or according to AMCA.

D. Where inlet and outlet ductwork at any fan is changed from that shown on the drawings, Contractor shall submit a scaled layout of the change and system effect factor calculations, indicating increased static pressure requirements as described in AMCA. This Contractor shall be responsible for any motor, drive and/or wiring changes required as a result of duct configuration changes at fan.

E. Where fan drives are exposed use OSHA approved belt guards that totally enclose the entire drive. Construct guards of expanded metal to allow for ventilation. Provisions shall be made so that tachometer may be used to verify fan speed without removing the guard assembly.

F. All internal insulation and other components exposed to the airstream are to meet the flame spread and smoke ratings contained in NFPA 90A.

G. Statically and dynamically balance all fans so they operate without objectionable noise or vibration.

H. Fan size, fan class, wheel type, inlet type, capacity, arrangement operating characteristics and any other special requirements shall be as indicated on the plans and/or as scheduled.

I. All fans serving a “fume” application (i.e., fume hoods) shall be completely coated internally with a baked phenolic coating, minimum 4 mils thick.

J. Fan bearings shall be heavy duty grease lubricated, ball or roller type selected for a Basic Rating Life (L_{10}) of at least 80,000 hours unless otherwise indicated in the fan product section. All bearings shall be factory lubricated and equipped with standard hydraulic grease fittings and lube lines extended to the motor side of the fan.

K. All belt-driven drive assemblies shall be factory mounted, with final alignment and belt adjustment made after installation. Fan shafts shall be turned, ground and polished steel and keyed to wheel hub. Fan Pulleys shall be Cast iron with split, tapered bushing and dynamically balanced at factory. Motor Pulleys shall be adjustable pitch. Select motor pulley so pitch adjustment is at the middle of adjustment range at fan design conditions. Belts shall be oil resistant, nonsparking, and nonstatic with matched sets for multiple belt drives. Motor mounts shall have an adjustable base. Fan and motor shall be isolated from the exhaust air stream unless otherwise indicated.

L. All V-belt drives shall be designed for 150% of motor rating.

M. For direct drive fans with VFDs and bypass starter, select fan to operate at or above the fan's motor speed to allow fan operation in bypass mode.

N. Provide stainless steel fasteners to secure fan to curb.

O. Provide electrically commutated motors (ECM) for all direct drive fans with single phase motors.

P. Provide backdraft or motorized dampers for fans where required by the plans and/or schedules. Counterbalanced, parallel-blade, backdraft dampers mounted in wall sleeve or roof curb; factory set to close when fan stops. Motorized dampers shall be parallel-blade dampers mounted in curb base with electric actuator; wired to close when fan stops.

Q. Exhaust fans and attachments to structure shall be designed to conform with the wind and seismic structural loading requirements identified in "Performance Requirement".

R. Forward curved fans may be provided when scheduled and when static pressure differential at fan is 1.5" W.G. or less.

S. Elevated Temperature Rating: Exhaust fans part of smoke control systems shall be UL listed as "Power Ventilators for Smoke Control Systems" for operational temperatures as approved by the AHJ for 500 F maximum temperature for a minimum of 4 hours or operation.

PART 2 - PRODUCTS

2.1 UTILITY SET FANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Greenheck Fan Corporation
2. Loren Cook Company
3. Peerless
4. Twin City Fan

B. Description: Single-width, single inlet direct- or belt-driven centrifugal fans consisting of rotatable housing, wheel, fan shaft, bearings, motor, starter and disconnect switch, drive assembly, and accessories. [Comply with wind and impact load Performance Requirements for exterior fans.]

C. Housing: Fabricated of steel coated with electrostatically applied baked polyester urethane with side sheets fastened with air tight lock formed seams or welded to scroll sheets with inlet cone. Belt guards or weather hood for exterior applications.

1. Housing Discharge Arrangement: Adjustable to eight standard positions.

D. Fan Wheels: Single-width, single inlet non overloading aluminum or steel air foil or backward inclined blades secured to backplate.

E. Accessories:

1. Inlet and Outlet: Flanged.
2. Companion Flanges: Rolled flanges for duct connections of same material as housing.
3. Access Door: Gasketed door in scroll with latch-type handles.
4. Inlet Screens: Where applicable provide removable wire mesh.
5. Drain Connections: NPS 3/4 threaded coupling drain connection installed at lowest point of housing.
6. Weather Hoods: Weather resistant with stamped vents over motor and drive compartment for exterior applications.
7. Dampers: Counterbalanced or motor operated as scheduled, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stop.

F. Coatings: Epoxy

2.2 CENTRIFUGAL ROOF VENTILATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Greenheck Fan Corporation
2. Loren Cook Company
3. Twin City Fan

B. Description: Roof mounted direct- or belt-driven centrifugal fans with motor out of air stream consisting of housing, wheel, fan shaft, bearings, motor, starter and disconnect switch, drive assembly, curb cap, and accessories. [Comply with wind and impact load Performance Requirements for exterior fans.]

C. Housing: Aluminum along with curb cap, windband and ventilated motor compartment with removable housing. Curb cap with integral venturi inlet cone.

1. Upblast Units: If listed on the plans, provide design of wind band to direct discharge air upward, with rain and snow drains and welded curb cap for waterproof construction.
2. Wireways: Integral internal wiring conduits for all power and control wiring for fan and curb.
3. Bird Screens: Where applicable provide removable, 1/2-inch mesh, aluminum or brass wire.
4. Vibration Isolation: factory installed vibration isolators for drive assembly.

D. Fan Wheels: Aluminum hub and wheel with non-overloading backward-inclined blades.

E. Accessories:

1. Dampers: Counterbalanced or motor operated as scheduled, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
2. Direct Drive Speed Controller

F. Roof Curbs: Straight sided curb of heavy gauge galvanized steel; mitered and welded corners with 4” minimum bottom flange, structural curb for positive attachment of fan to structure; 1-1/2-inch- thick, rigid, fiberglass insulation adhered to inside walls; curb seal. Size as required to suit roof opening and fan base.

1. Coordinate curb height with roof insulation thickness, and with other criteria such as snow. Minimum curb height is 18" to provide a minimum of eight (8) inches above finished roof.
2. Pitch Mounting: Manufacture curb for roof slope.
3. Damper holding tray: For fans scheduled with dampers.

2.3 VANEAXIAL FANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Greenheck Fan Corporation
   2. Loren Cook Company
   3. Twin City Fan

B. Description: Direct or belt drive, vaneaxial fan wheel and housing, straightening vane section**,** fan shaft, bearings, motor, starter and disconnect switch, drive assembly, , an inlet cone section, and accessories.

   1. Variable-Pitch Fans: Internally mounted electronic actuator, externally mounted positive positioner, and mechanical-blade-pitch indicator.

C. Housings: Fabricated of steel coated with electrostatically applied baked polyester urethene.

   1. Inlet and Outlet Connections: Flanges.
   2. Guide Vane Section: Integral guide vanes downstream from fan wheel designed to straighten airflow.

D. Fan wheel Assemblies: Aluminum air foil blades adjustable pitch with in cast aluminum hub.

E. Accessories:

   1. Companion Flanges: Rolled flanges of same material as housing.
   2. Inspection Door: Bolted door allowing limited access to internal parts of fan, of same material as housing.
   3. Propeller Access Section Door: Short duct section bolted to fan inlet and/or outlet allowing access to internal parts of fan for inspection and cleaning, of same material as housing.
   4. Mounting Clips: Horizontal or Vertical mounting clips welded to fan housing, of same material as housing.
   5. Horizontal Support: Pair of supports bolted to fan housing, of same material as housing.
   6. Vertical Support: Short duct section with welded brackets bolted to fan housing, of same material as housing.
   7. Inlet and Outlet Screens: Wire-mesh screen on fans not connected to ductwork of same material as housing.
   8. Inlet Bell: Curved inlet for when fan is not attached to duct, of same material as housing.
   9. Inlet Cones: Round-to-round transition of same material as housing.
   10. Outlet Cones: Round-to-round transition of same material as housing.

F. Factory Finishes:

1. Sheet Metal Parts: Prime coat before final assembly.
2. Exterior Surfaces: Baked-enamel finish coat after assembly.

2.4 UPBLAST PROPELLER ROOF EXHAUST FANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Greenheck Fan Corporation
   2. Loren Cook Company
   3. Twin City Fan

B. Description: Direct- or belt-driven propeller fans consisting of housing, wheel, butterfly-type discharge damper, fan shaft, bearings, motor, starter and disconnect switch, drive assembly, curb cap, and accessories. Comply with wind and impact load Performance Requirements for exterior fans.

C. Housing: Reinforced and braced galvanized steel or aluminum, containing butterfly dampers, wind band, curb cap and rain trough:

   1. Wireways: Integral internal wiring conduits for all power and control wiring for fan and curb.
   2. Bird Screens: Removable, 1/2-inch mesh, aluminum or brass wire.
   3. Vibration Isolation: factory installed vibration isolators for drive assembly.
   4. Damper Rods: Steel with bronze or nylon bearings.
   5. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.

D. Fan Wheel: Replaceable, -aluminum, airfoil blades fastened to cast-aluminum hub; factory set pitch angle of blades.

E. Accessories:

   1. Dampers: Counterbalanced or motor operated as scheduled, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
   2. Direct Drive Speed Controller.

F. Roof Curbs: Straight sided curb of heavy gauge galvanized steel; mitered and welded corners with 4” minimum bottom flange, structural curb for positive attachment of fan to structure; 1-1/2-inch- thick, rigid, fiberglass insulation adhered to inside walls; curb seal. Size as required to suit roof opening and fan base.

   1. Coordinate curb height with roof insulation thickness, and with other criteria such as snow. Minimum curb height is 18” to provide a minimum of eight (8) inches above finished roof.
   2. Pitch Mounting: Manufacture curb for roof slope.
   3. Damper holding tray: For fans scheduled with dampers.

G. Stack Cap: Vertical discharge assembly with backdraft dampers, of same material as housing.

2.5 CEILING-MOUNTING VENTILATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Greenheck Fan Corporation
   2. Loren Cook Company
   3. Twin City Fan

B. Description: Centrifugal direct drive or belt drive fans designed for installing in ceiling or wall or for concealed in-line applications.

C. Housing: Steel, galvanized or aluminum.

D. Fan Wheel: Backward inclined aluminum wheel. Fan shrouds, motor, and fan wheel shall be removable for service.

E. Grille: Plastic or Aluminum, louvered grille with flange on intake and thumbscrew attachment to fan housing.

F. Electrical Requirements: Junction box for electrical connection on housing and receptacle for motor plug-in.

G. Accessories:

   1. Manual Starter Switch: Single-pole rocker switch assembly with cover and pilot light.
   2. Isolation: Rubber-in-shear vibration isolators.
   3. Manufacturer's standard roof jack or wall cap, and transition fittings.
   4. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in fan discharge; factory set to close when fan stops.

2.6 HIGH-PLUME DILUTION LABORATORY EXHAUST FANS

A. Basis-of-Design Product: Subject to compliance with requirements, provide products by Strobic Air Tri-Stack or comparable product by one of the following:

   1. Greenheck Vektor MD
   2. M.K. Plastics

B. Description: Laboratory or industrial process fume exhaust system, producing a high discharge plume through inducing airflow at the fan outlet. Multiple fans may be configured with a common plenum, and bypass control dampers to maintain internal variable volume air flow, and constant volume exhaust. [Comply with wind and impact load Performance Requirements for exterior fans.]

C. Fan Housing: Housing and guide vane section shall be a minimum of 10 gauge hot rolled steel. The roof base shall be 7 gauge. The 7 gauge guide vane section shall be designed to straighten leaving air and direct it into twin, high velocity, discharge nozzles

D. Discharge Nozzles:

1. Nozzles shall be manufactured of chemical resistant fiberglass or steel having coatings equal to fan to reduce roof line mass and prevent caustic erosion. The nozzles shall be suitable for outlet velocities 4,000 to 7,000 FPM without vibration and shall be engineered to provide a passive third central stack over the motor with entrainment capabilities.

E. Radial Entrainment Windband: Windband shall be located at the discharge to prevent cross flow contamination and to improve overall entrained performance by volume up to 270% of design flow

F. Fan Wheels: The fan wheel shall be a radial mixed flow or backward-curved airfoil blade centrifugal configuration manufactured of welded steel. Radial mixed flow fan wheels shall be part backward curve centrifugal to avoid axial stall characteristics, and part axial to minimize mass and provide straight through flow. The mixed flow wheel shall be capable of handling system effects without stall. Direct-driven fans' balance shall not exceed 0.5 mil, peak to peak at the roof line.

G. Fan Isolation Dampers: Provide each fan with a motorized fan isolation control damper.

1. Dampers & Damper Operators: Two-position (Open-Close), airfoil type opposed blade (OBD), automatic control damper(s) of aluminum 6" w.c. service, with polyurethane edge seals, stainless steel bearings or silicone.
2. Electronic Damper Operators: Dampers are to open when the fan is energized and close via spring return when de-energized.
3. Damper operators shall be mounted outside of the exhaust air stream and protected from the weather.

H. Fan(s) Plenum: Provide a bypass (mixing = outdoor air +system air) plenum for the fans, where indicated on drawings. The plenum shall have a hinged and gasketed steel access door(s) and outside air bypass inlet(s) with airfoil type opposed blade, automatic control damper(s), electronic damper operator(s) and rain hood(s) with galvanized steel birdscreen.

1. Construction: Continuously welded, heavy gauge steel for single fans; double-wall, continuously welded heavy gauge steel with structural stiffeners for multiple-fans.
2. Exterior finish as specified herein. Interior finish to match that of the fan itself.
3. Primary Air Inlets: Bottom or side inlets as shown on drawings. Openings sized for air velocity less than or equal to 1,500 FPM.
4. Outside Air Bypass Damper(s): Modulating automatic control damper(s) of aluminum construction to 6" w.c. service, with polyurethane edge seals, stainless steel bearings and electronic damper operator(s). Damper operators shall be mounted outside of the outside air stream and protected from the weather.

I. Vibration: Each fan shall be vibration tested before shipping. Each fan shall be test run at the factory at the specified fan RPM, and vibration signatures shall be taken. The maximum allowable fan vibration shall be less than 0.10 in./sec. peak velocity.

J. Accessories:
1. Disconnect Switches: Furnish NEMA 3R non-fused disconnect switch, factory-mounted and wired.

2. Jib Crane Pedestal (Direct-Driven Top Plenum-Mounted Fans only): Provide a pedestal for a portable jib crane, one for every two fans, for motor removal. Weld pedestal to the fan's base on the plenum roof.
3. Lifting lugs of 0.25 inch plate minimum shall be provided for fans 5.0 horsepower and above.
4. Provide an aluminum fan inlet bell to prevent sparking should bearing failure occur.
5. Corrosion-Resistant Finish: Coat all parts of the fan in contact with the moving air stream.
6. All threaded devices in the airstream and exposed to outside air shall be a combination of Monel and 316 stainless steel to prevent seizure, erosion and/or embrittlement.
7. All non-welded joints and seams shall be gasketed with PTFE for air leakage tightness under maximum fan design operating pressure.
8. A drain system shall be provided, out of the airstream, to eliminate the possibility of duct contamination.
9. When fan(s) ship(s) separately from the plenum, all wiring and conduit shall be factory-supplied for field connection.
10. Finish dampers in a corrosion-resistant finish to match that of the fan.
11. Fan Access Door: A bolted and gasketed access door shall be provided in the fan shroud for inspection of the wheel.
12. Vortex breakers shall be provided on all side inlets and multiple fan plenums

K. Roof Curbs: Galvanized steel; mitered and welded corners; 1-1/2-inch- thick, rigid, fiberglass insulation adhered to inside walls. Size as required to suit roof opening and fan base.

1. Coordinate curb height with roof insulation thickness, and with other criteria such as snow. Minimum curb height is 18" to provide a minimum of eight (8) inches above finished roof.
2. Design curb to provide positive connection between curb and fan base and curb and building structure.
3. Provide seismic and wind rated curbs when required by seismic and wind loading requirements of this project.
4. Pitch Mounting: Manufacture curb for roof slope.
5. Damper holding tray: For Fans scheduled with dampers.

2.7 MIXED-FLOW FANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Greenheck Fan Corporation
2. Howden Fan Co
3. Loren Cook Company
4. Twin City Fan

B. Description: Direct or belt drive in line mixed flow fan wheel and housing, straightening vane section, fan shaft, bearings, motor, starter and disconnect switch, drive assembly and accessories.

C. Housings: Fabricated of steel coated with electrostatically applied baked polyester urethane.

1. Inlet and Outlet Connections: Outer mounting frame and companion flanges.
2. Guide Vane Section: Integral guide vanes downstream from fan wheel designed to straighten airflow.
3. Mixed-Flow Outlet Connection: flanged discharge perpendicular to fan inlet.

D. Fan wheels: Steel with mixed flow airfoil-shaped blades.

E. Accessories:

1. Mounting Clips: Horizontal or Vertical mounting clips welded to fan housing, of same material as housing.
2. Inlet and Outlet Screens: Wire-mesh screen on fans not connected to ductwork of same material as housing.
3. Inlet Bell: Curved inlet for when fan is not attached to duct, of same material as housing.
4. Inlet Cones: Round-to-round transition of same material as housing.
5. Outlet Cones: Round-to-round transition of same material as housing.

F. Factory Finishes:

1. Sheet Metal Parts: Prime coat before final assembly.
2. Exterior Surfaces: Baked-enamel finish coat after assembly.

2.8 ELECTRICAL

A. Fans shall be supplied with NEMA motor controllers in accordance with mechanical, control and electrical specifications.

B. Disconnect Switch: Nonfusible type, with thermal-overload protection factory mounted. Locate within motor compartment for exterior applications, factory wired to motor.

C. Starter: Single phase motor contactor or three phase combination motor starter/fused disconnect switch with overcurrent protection. Locate remotely in an enclosed location for exterior applications.

D. Direct Drive Speed Controller – Manually adjustable type for constant volume operation and automatic modulating or two speed type for automatic control suitable for PSC or ECM single phase motors.

2.9 SOURCE QUALITY CONTROL

A. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

B. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210, "Laboratory Methods of Testing Fans for Rating."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Compliance: In accordance with approved submittals and manufacturer's written installation instructions.

B. Comply with mounting and anchoring requirements for seismic and/or wind installations.

C. Secure fan and curb mounting assemblies to structure with positive attachments in accordance project's seismic loading requirements.

D. Secure exterior fans and curb mounting assemblies to structure with positive attachments in accordance with project's seismic and/or wind loading requirements.

E. Wind and impact certified fans and mounting assemblies additionally shall comply with requirements of current certification. All power wiring, control wiring, controllers, motor starters and unit disconnects shall be concealed and protected from wind and impact by equipment and curb assemblies.

F. Suspended Units: Suspend and brace units from structural-steel support frame using threaded steel rods and spring hanger

G. Install floor-mounting units on concrete bases with vibration isolation per specifications.

H. Secure roof-mounting fans to roof curbs with stainless or cadmium-plated hardware. Install units with clearances for service and maintenance. In no case, shall the access and service space around and over fans less than that recommended by manufacturer.

I. Install work readily accessible for normal operation, reading of instruments (in vertical position), adjustment, service, inspection and repair. Provide access panels where indicated and required. Access panels shall be the responsibility of the respective subcontractor.

3.2 CONNECTIONS

A. Duct installation and connection requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Install ducts adjacent to fans to allow service and maintenance.

B. For fans with drain, install a drain valve with screwed cap.

C. Provide internal wiring conduits so that all electrical and control wiring penetrates the building envelope within the interior of the roof curb to eliminate exposed wiring and conduit.

3.3 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Verify that cleaning and adjusting are complete.
4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Adjust belt tension.
6. Adjust damper linkages for proper damper operation.
7. Verify lubrication for bearings and other moving parts.
8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
9. Disable automatic temperature-control operators, energize motor and adjust fan to indicated rpm, and measure and record motor voltage and amperage.
10. Shut unit down and reconnect automatic temperature-control operators.
11. Remove and replace malfunctioning units and retest as specified above.

B. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.4 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain fans.

3.5 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Replace fan and motor pulleys as required to achieve design airflow. After system is balanced, replace the variable pitch sheaves with fixed pitch sheaves.

D. Lubricate bearings.

END OF SECTION 23 3400

SECTION 23 3600 - AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Single-duct air terminal units.

1.2 SUBMITTALS

A. Product Data: For each type of product indicated, include rated capacities, pressure loss, furnished specialties, liner/insulation, sound-power ratings, and accessories.

B. LEED Submittal:

1. Product Data for Prerequisite EQ 1: Documentation indicating that units comply with ASHRAE 62.1-2004, Section 5 - "Systems and Equipment."

C. Shop Drawings: Detail equipment assemblies and indicate dimensions, required clearances, method of field assembly, components, and location and size of each field connection.

1. Include a schedule showing unique model designation, room location, model number, size, and accessories furnished.

2. Wiring Diagrams: Power, signal, and control wiring.

D. Operation and Maintenance Data: For air terminal units to include in emergency, operation, and maintenance manuals.

1.3 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of air terminal units and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

B. Sound Performance: Air Terminal Unit sizing and selection shall include sound performance characteristics. Entire installation shall conform to project Acoustic and Vibration Control requirements of Division 01 Specifications.

C. UL Listing: Meeting UL 181 requirements flame spread, smoke developed, and erosion.

D. NFPA Compliance: NFPA 90A, "Installation of Air Conditioning and Ventilating Systems."

E. Performance: Rate air terminal unit performance characteristic data according to ARI 880.

1.4 COORDINATION

A. Coordinate layout and installation of air terminal units and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

B. Coordinate control wiring, transformer requirements, electrical wiring and electrical disconnect installation.

C. Coordinate DDC controller, automatic temperature controls and instrumentation installation.

D. Coordinate CBC equipment anchorage and seismic bracing requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

1. Manufacturers:

a. Price Industries
b. Siemens
c. Titus.
d. Or equal.

B. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 SINGLE-DUCT AIR TERMINAL UNITS

A. Configuration: Volume-damper assembly inside unit casing with control components located inside a protective metal shroud.

B. Casing: Minimum 22-gage galvanized steel.
1. Air Inlet: Round stub connection or S-slip and drive connections for duct attachment.
2. Air Outlet: S-slip and drive connections.

C. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.

1. Maximum Damper Leakage: ARI 410 rated, 2 percent of nominal airflow at 6-inch wg inlet static pressure.
2. Damper Position: Normally closed.

2.3 REQUIRED ACCESSORIES

A. DDC Controls: Single-package unitary controller and actuator specified in Division 23 Section "Instrumentation and Controls."

B. Control Transformer: For control voltage on electronic control units.

C. Hot-Water Heating Coil: 0.0075" copper, 0.0095" phenolic coated aluminum, or 0.0095" aluminum fins, and 0.017" copper tube, mechanically expanded into copper -plate fins; and factory installed with galvanized casings. Coils shall be factory tested at 350 psi prior to shipment.

D. Attenuator Section: Similar to terminal casing, as specified above. For multi-outlet attenuator section: provide collars; each with locking butterfly balancing damper.

E. Identification: Label each air terminal unit with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.

2.4 SOURCE QUALITY CONTROL

A. Identification: Label each air terminal unit with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.

B. Verification of Performance: Rate air terminal units according to ASHRAE Standard 130 - 1996.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install air terminal units level and plumb. Maintain sufficient clearance for normal service and maintenance.

B. Install air terminal units with seismic bracing where required by code.

C. Reheat coil fins on 100% outside air systems shall be copper, or phenolic coated with stainless steel coil casings.

D. Reheat coil fins on office and lecture hall air systems shall be aluminum.

3.2 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Shop drawings shall show specific installation locations.

B. Install piping adjacent to air terminal units to allow service and maintenance.

C. Hot-Water Piping: In addition to requirements in Division 23 Section "Hydronic Piping and Valves," connect heating coils to supply with shutoff valve, strainer, and union or flange; and to return with control valve, automatic flow balancing valve, shutoff valve and union or flange, in accordance with UCI Campus Standard detail drawing.

D. Connect ducts to air terminal units according to Division 23 Section "Metal Ducts."

E. Connect DDC control wiring and control devices according to Division 23 "Instrumentation and Controls."

F. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

G. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

3.3 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:

1. After installing air terminal units and after electrical circuitry has been energized, test for compliance with requirements.
2. Leak Test: After installation, fill water coils and test for leaks. Repair leaks and retest until no leaks exist.
3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Remove and replace malfunctioning units and retest as specified above.

END OF SECTION 23 3600

SECTION 23 3610 - LABORATORY AIRFLOW CONTROLS

PART 1 – GENERAL

1.1 SUMMARY

A. This Section specifies requirements for laboratory and vivarium airflow and pressure control system.

B. Related Sections include the following:

1. Division 26 Section "Digital Addressable-Fire Alarm Systems" for fire and smoke detectors mounted in HVAC systems and equipment.
2. Division 23 Section “Metal Ducts” for installation requirements.
3. Division 23 Section “Terminal Air Units” for reheat coil, access door, and attenuator requirements.
4. Division 23 Section "Instrumentation and Controls.”
5. Division 26 Section "Common Work Results for Electrical."

1.2 SYSTEM DESCRIPTION

A. A laboratory airflow control system shall be furnished and installed to control the airflow into and out of laboratory rooms. The exhaust flow rate of a laboratory fume hood shall be controlled precisely to maintain a constant average face velocity into the fume hood at either a standard/inuse or standby level based on an operator’s presence in front of the fume hood. The laboratory control system shall vary the amount of make-up/supply air into the room to operate the laboratories at the lowest possible airflow rates necessary to maintain temperature control, achieve minimum ventilation rates and maintain laboratory pressurization in relation to adjacent spaces (positive or negative). The laboratory airflow control system shall be capable of operating as a standalone system or as a system integrated with the Building Management System (BMS). An optional locally mounted user interface terminal shall be available to allow room-level control variables to be displayed, and where appropriate, edited to adjust control operation.

1.3 SUBMITTALS

A. Product Data: Include manufacturer's technical literature for each device noting configuration, assembly and materials of construction. Indicate product performance characteristics including airflow, static pressure, and noise criteria rating for each valve.

1. Installation and startup instructions for each type of product indicated.
2. Manufacturer’s descriptive literature including operating, maintenance, and repair instructions, and parts list.
3. Each control device labeled with setting or adjustable range of control.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. System Communication Diagram: Indicate configuration showing: control devices, power supplies, communications cabling diagrams, interconnections, and system interfaces
2. Control Diagrams: Power, signal, and control wiring.
3. Sequence of Operation: Describe operation of each device, annunciation of each alarm, alarm notification, and interconnects/interfaces with BMS. .
4. Room Schedule indicating equipment specific Tag number and model, valves minimum and maximum airflows, and room offset.

C. Field Startup Reports: Indicate and interpret test results for compliance with performance requirements.

D. Project Record Documents: Record actual locations of air valves, control components, and sensors.

1.4 QUALITY ASSURANCE

A. The laboratory airflow system provider shall be an entity that designs, develops, manufactures and sells products and services to control the environment and airflow of critical spaces using a Quality Management System registered to ISO 9001:2000.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC (NFPA 70), Article 100, by a testing agency acceptable to University's Representative, and marked for intended use.

C. Sound Performance: Control Valve unit sizing and selection shall include consideration of sound performance characteristics. Entire installation shall conform to project acoustic and vibration control requirements.

D. NFPA Compliance: NFPA 90A, "Installation of Air Conditioning and Ventilating Systems."

E. Performance: Rate air terminal unit performance characteristic data according to ASHRAE Standard 130- 1996. Control Valve unit selection shall be based on maximum pressure drop of 0.6-inches of water column.

F. Identification: Label each Control Valve unit with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.

1.5 COMPLIANCE SCHEDULE

A. Any alternate laboratory airflow control system supplier shall provide a separate compliance schedule, which shall include the section, paragraph and subparagraph of these specifications, and a direct statement to indicate compliance or noncompliance with the requirements. For all areas of noncompliance, the supplier shall describe what specific and alternative approach or approaches

has been taken and document the impact this will have on the sizing of the air delivery systems, the required cooling and heating capacities, energy costs and maintenance of the building.

B. The alternate laboratory airflow control system supplier shall furnish a letter of compliance to the engineer, signed by a corporate officer of the laboratory system manufacturer, certifying the compliance and noncompliance items as stated above 10 days prior to the bid.

1.6 TECHNICAL PROPOSAL

A. Any alternate laboratory airflow control system supplier shall submit a detailed technical proposal for the University's evaluation at the time of submitting the compliance schedule described in section 1.4. The proposal shall describe the manner of compliance with this minimum performance specification, with particular emphasis on the following areas: diversity and energy analysis, proposed equipment, experience and performance verification. This proposal shall be separate from any BMS proposal(s), and it shall include the scope of information and services detailed in paragraphs B through E of this subsection.

B. Diversity and Energy Analysis:

1. Diversity analysis of the sizing of the ductwork, fans, air handlers, chillers, and boilers for the laboratory spaces. The analysis shall be based upon:

Number of Hoods	=	See plans
Occupied Hours	=	*
User Presence Hours	=	*
Sash Position–User Present	=	100%
Sash Position (a)–User Absent	=	100%
Sash Position (b)–User Absent	=	50%
CFM/Ton Cooling	=	175 or *

The analysis shall provide:

Required Exhaust Capacity per Manifold (in CFM)	w/user absent sash position (a) w/user absent sash position (b)
Required Supply Capacity per Manifold (in CFM)	w/user absent sash position (a) w/user absent sash position (b)
Required Cooling Capacity (in tons)	w/user absent sash position (a) w/user absent sash position (b)

2. Energy analysis for the laboratory spaces. The analysis shall be based upon:

Number of hoods	=	See plans
Occupied Hours	=	*
User Presence Hours	=	*
Sash Position–User Present	=	100%
Sash Position (a)–User Absent	=	100%
Sash Position (b)–User Absent	=	50%

$/CFM = *

The analysis shall provide:

Energy Costs w/user absent sash position (a)

w/user absent sash position (b)

* *Actual project parameters as defined by the University*

C. Proposed Equipment:

1. The laboratory airflow control system supplier shall provide a detailed proposal describing all elements of the laboratory control system. A schematic laboratory layout shall be provided, showing relations of these elements and a description of how they interact.
2. Technical specification data sheets shall be provided for all proposed system components and devices.
3. All proposed airflow control devices shall include discharge, exhaust and radiated sound power level performance obtained from testing in accordance with ASHRAE Standard 130-1996.

D. Experience:

1. The laboratory airflow control system supplier shall provide a list of at least three similar laboratory airflow control systems installed in California as part of this proposal.
2. The laboratory airflow control system supplier shall provide the names, addresses and telephone numbers of the consulting engineer and the University's representative for each of these installations. It is understood that these individuals may be contacted regarding timely delivery, the quality of installation, the operation and performance of the equipment and the service requirements for each installation. Unsatisfactory performance or inability to provide references shall be grounds for rejection.

E. Performance Verification: The laboratory airflow control system supplier shall demonstrate a typical laboratory space that includes multiple fume hoods, a general exhaust and a supply airflow control device for the purpose of verifying the laboratory airflow control system's ability to meet the performance requirements indicated in this specification. All travel and lodging costs to witness the performance verification shall be the responsibility of the laboratory airflow control system supplier.

1.7 SYSTEM PERFORMANCE REQUIREMENTS

A. Airflow Control System Description:

1. Each laboratory shall have a dedicated laboratory airflow control system. Each dedicated laboratory airflow control system shall support a minimum of 20 network controlled airflow devices.

2. The laboratory airflow control system shall employ individual average face velocity controllers that directly measure the area of the fume hood sash opening and proportionally control the hood's exhaust airflow to maintain a constant face velocity over a minimum range of 20% to 100% of sash travel. The corresponding minimum hood exhaust flow turndown ratio shall be 5 to 1.
3. The hood exhaust airflow control device shall respond to the fume hood sash opening by achieving 90% of its commanded value within one second of the sash reaching 90% of its final position (with no more than 5% overshoot/undershoot) of required airflow. Rate of sash movement shall be from one to one and one-half feet per second.
4. The hood exhaust airflow control device shall be switched automatically between in-use and standby levels based on the operator's presence immediately in front of the hood. A presence and motion sensor shall activate the switching. The airflow control device shall achieve the required in-use commanded value in less than one second from the moment of detection with no more than a 5% overshoot or undershoot.
5. The laboratory airflow control system shall maintain specific airflow (±5% of signal within one second of a change in duct static pressure) regardless of the magnitude of the pressure change, airflow change or quantity of airflow control devices on the manifold (within 0.6" to 3.0" wc).
6. The laboratory airflow control system shall use volumetric offset control to maintain room pressurization. The system shall maintain proper room pressurization polarity (negative or positive) regardless of any change in room/system conditions, such as the raising and lowering of any or all fume hood sashes or rapid changes in duct static pressure. Systems using differential pressure measurement or velocity measurement to control room pressurization are unacceptable.
7. The laboratory airflow control system shall maintain specific airflow (±5% of signal) with a minimum 16 to 1 turndown to ensure accurate pressurization at low airflow and guarantee the maximum system diversity and energy efficiency.

1.8 SOUND SPECIFICATION

A. Refer to Division 01 for project sound performance criteria. Select valve assemblies and attenuators to meet project requirements.

B. Unless otherwise specified, the airflow control device shall meet the NC levels specified for each space.

C. If the airflow control device cannot meet the sound power level specification, a properly sized silencer or sound attenuator must be used.

D. All proposed airflow control devices shall include discharge, exhaust and radiated sound power level performance.

1.9 COORDINATION

A. Coordinate power requirements with Division 26. Division 26 shall provide 120 VAC power to each laboratory airflow control panel. The power circuits shall be dedicated to the laboratory airflow control system and connected to the emergency system.

B. Coordinate equipment installation ensuring unit maintenance space and clearance requirements are provided.

1.10 PREVENTIVE MAINTENANCE

A. The laboratory airflow control system supplier shall provide at no additional cost to the University during and after the warranty period five years of required preventive maintenance on all airflow sensors (e.g., pitot tube, flow cross, orifice ring, air bar, hot wire, vortex shedder, side wall sensors, etc.) and flow transducers provided under this section. Airflow sensors shall be removed, inspected, and cleaned annually during the five-year period to prevent inaccuracies due to long-term buildup from corrosion, lab tissues, wet or sticky particles, or other materials that foul the sensor. If impractical to remove the airflow sensors, the laboratory airflow control system supplier shall include in the proposal the cost of supplying and installing duct access doors, one for each sensor. The transducer shall be checked and recalibrated annually to ensure long-term accuracy. Note that auto-zero recalibration of transducers is not acceptable as a substitute for annual recalibration.

1.11 WARRANTY

A. Warranty shall commence upon the date of Substantial Completion and extend for a period of 36 months, whereupon any defects in materials or laboratory airflow control system performance shall be repaired by the supplier at no cost to the University.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Phoenix Control Corporation.
2. Siemens.
3. Tek-Air
4. CEL

2.2 USAGE BASED CONTROL EQUIPMENT

A. For variable air volume (VAV) systems, a sash sensor shall be provided to measure the height of each vertically moving fume hood sash. A sash sensor shall also be provided for horizontal overlapping sashes. Control systems employing sidewall-mounted velocity sensors shall be unacceptable. Coordinate vertical/horizontal sash sensor requirements with lab drawings.

B. A presence and motion sensor shall be provided to determine an operator's presence in front of a hood by detecting the presence and/or motion of an operator, and to command the laboratory airflow control system from an in-use operating face velocity (e.g., 100 fpm) to a standby face velocity (e.g., 60 fpm) and vice versa. When the sensor detects the presence and/or motion of an operator within the detection zone, it shall command the system to the in-use face velocity within 1.0 second. Wide area motion detectors (on the hood or room level) shall be unacceptable

C. The airflow at the fume hood shall vary in a linear manner between two adjustable minimum and maximum flow set points to maintain a constant face velocity throughout this range. A minimum volume flow shall be set to assure flow through the fume hood even with the sash totally closed.

D. A fume hood monitor shall be provided to receive the sash sensor output and presence and/or motion signal. The same monitor shall generate an exhaust airflow control signal for the appropriate airflow control device in order to provide a constant average face velocity. Audible and separate visual alarms shall be provided for both flow alarm and emergency exhaust conditions. A push button switch shall be provided to mute the audible alarm. Muting of the alarm shall only silence the audible portion, while the visual alarm shall be maintained until the low flow condition has returned to normal. The mute mode is automatically reset when the alarm condition ceases.

2.3 AIRFLOW CONTROL DEVICE

A. The airflow control device shall be a single blade damper or VAV terminal or venturi valve.

B. The valve assembly manufacturer's Quality Management System shall be registered to ISO 9001:2000.

C. The airflow control device shall be pressure independent over its specified differential static pressure operating range. An integral pressure independent assembly shall respond and maintain specific airflow within one second of a change in duct static pressure irrespective of the magnitude of pressure and/or flow change or quantity of airflow controllers on a manifolded system.

D. The airflow control device shall maintain accuracy within ±5% of signal over an airflow turndown range of no less than 16 to 1.

E. No minimum entrance or exit duct diameters shall be required to ensure accuracy and/or pressure independence.

F. The airflow control device shall be constructed of one of the following three types:

1. Class A—The airflow control device for non-corrosive airstreams, such as supply and general exhaust, shall be constructed of 16-gauge aluminum. The device's shaft and shaft support brackets shall be made of 316 stainless steel. The pivot arm and internal mounting

   link shall be made of aluminum. The pressure independent springs shall be a spring-grade stainless steel. All shaft bearing surfaces shall be made of a Teflon, polyester or PPS (polyphenylene sulfide) composite. Sound attenuating devices used in conjunction with general exhaust or supply airflow control devices shall be constructed using 24 gauge

galvanized steel or other suitable material used in standard duct construction. No sound absorptive materials of any kind shall be used.

2. Class B—The airflow control device for corrosive airstreams, such as fume hoods and biosafety cabinets, shall have a baked-on, corrosion-resistant phenolic coating. The device's shaft shall be made of 316 stainless steel with a Teflon coating. The shaft support brackets shall be made of 316 stainless steel. The pivot arm and internal mounting link shall be made of 316 or 303 stainless steel. The pressure independent springs shall be a spring-grade stainless steel. The internal nuts, bolts and rivets shall be stainless steel. All shaft bearing surfaces shall be made of a Teflon or PPS (polyphenylene sulfide) composite.
3. Class C—The airflow control device for highly corrosive airstreams shall be constructed as defined in Paragraph F.2. In addition, these devices shall have no exposed aluminum or stainless steel components. Shaft support brackets, pivot arm, internal mounting link, and pressure independent springs shall have a baked-on, corrosion-resistant phenolic coating in addition to the materials defined in paragraph F.2. The internal nuts, bolts, and rivets shall be titanium or phenolic coated stainless steel. Only devices for highly corrosive environment applications, and those clearly defined as “high corrosion resistant” on project drawings will require this construction.

G. Actuation:

1. For electrically actuated VAV operation, a UL 916 listed electronic actuator shall be factory mounted to the valve. Loss of main power shall cause the valve to position itself in an appropriate failsafe state. Options for these failsafe states include: normally open maximum position, normally closed-minimum position and last position. This position shall be maintained constantly without external influence, regardless of external conditions on the valve (within product specifications).
2. Constant volume valves do not require actuators.

H. The controller for the airflow control devices shall be microprocessor based and operate using peer-to-peer control architecture. The room-level airflow control devices shall function as a standalone network.

I. There shall be no reliance on external or building-level control devices to perform room-level control functions. Each laboratory control system shall have the capability of performing fume hood control, pressurization control, temperature control, humidity control, and implement occupancy and emergency mode control schemes.

J. The laboratory airflow control systems shall have the option of digital integration with the BMS.

K. Certification:

1. Each airflow control device shall be factory calibrated to the job specific airflows as detailed on the plans and specifications using NIST traceable air stations and instrumentation having a combined accuracy of no more than ±1% of signal over the entire range of measurement. Electronic airflow control devices shall be further calibrated

and their accuracy verified to ±5% of signal at a minimum of 48 different airflows across the full operating range of the device.

2. Each airflow control devices shall be marked with device-specific factory calibration data. At a minimum, it should include the tag number, serial number, model number, eight point characterization information (for electronic devices), and quality control inspection numbers. All information shall be stored by the manufacturer for use with as-built documentation.

L. Airflow control devices that are not venturi valves and airflow measuring devices (e.g., pitot tube, flow cross, air bar, orifice ring, vortex shedder, etc.) shall only be acceptable, provided these meet all the performance and construction characteristics as stated throughout this specification and:

1. The airflow control device employs transducers manufactured by Rosemount, Bailey, Bristol, or Foxboro. Accuracy shall be no less than ±0.15% of span (to equal ±5% of signal with a 15 to one turndown) over the appropriate full-scale range, including the combined effects of nonlinearity, hysteresis, repeatability, drift over a one-year period, and temperature effect.
2. Airflow sensors shall be of a multi-point averaging type, 304 stainless steel for all supply and general exhaust applications, 316L stainless steel for all fume hood, canopy, snorkel, and biosafety cabinet applications. Single point sensors are not acceptable.
3. Suppliers of airflow control devices or airflow measuring devices requiring minimum duct diameters shall provide revised duct layouts showing the required straight duct runs upstream and downstream of these devices. Coordination drawings reflecting these changes shall be submitted by the supplier of the laboratory airflow control system. In addition, suppliers shall include static pressure loss calculations as part of their submittals. All costs to modify the ductwork, increase fan sizes and horsepower and all associated electrical changes shall be borne by the laboratory airflow control supplier.

2.4 EXHAUST AND SUPPLY AIRFLOW DEVICE CONTROLLER

A. The airflow control device shall be a microprocessor-based design and shall use closed loop control to linearly regulate airflow based on a digital control signal. The device shall generate a digital feedback signal that represents its airflow.

B. The airflow control device shall store its control algorithms in non-volatile, re-writeable memory. The device shall be able to stand alone or be networked with other room-level digital airflow control devices using an industry standard protocol. The controller shall operate using peer-topeer control architecture. The room-level airflow control devices shall function as a standalone network.

C. There shall be no reliance on external or building-level control devices to perform room-level control functions. Each laboratory control system shall have the capability of performing fume hood control, pressurization control, temperature control, humidity control, and implement occupancy and emergency mode control schemes

D. The airflow control device shall use industry standard 24 Vac power.

E. The airflow control device shall have provisions to connect a notebook PC commissioning tool and every node on the network shall be accessible from any point in the system.

F. The airflow control device shall have built-in integral input/output connections that address fume hood control, temperature control, humidity control occupancy control, emergency control, and non-network sensors switches and control devices. At a minimum, the airflow controller shall have:

1. 3 universal inputs capable of accepting 0 to 10 Vdc, 4 to 20 mA, 0 to 65 K ohms, or Type 2 or Type 3 10 K ohm @ 25 degree C thermistor temperature sensors.
2. 1 digital input capable of accepting a dry contact or logic level signal input.
3. 2 analog outputs capable of developing either a 0 to 10 Vdc or 4 to 20 mA linear control signal.
4. 1 Form C (SPDT) relay output capable of driving up to 1 A @ 24 Vac/Vdc.

G. The airflow control device shall meet FCC Part 15 Subpart J Class A and be UL916 listed.

2.5 VIVARIUM AND OFFICE AIRFLOW CONTROL DEVICE

A. The airflow control device shall maintain a temperature set point by controlling the airflow and the reheat valve in response to a room temperature sensor. If the airflow supply device is not required for make-up airflow control for fume hoods, then the one-second speed of response, and fail-safe conditions required of the laboratory airflow control system shall not apply.

2.6 CONSTANT VOLUME AIRFLOW CONTROL DEVICE

A. The airflow control device shall maintain a constant airflow setpoint. It shall be factory calibrated and set for the desired airflow. It shall also be capable of field adjustment for future changes in desired airflow.

2.7 LOCAL DISPLAY UNIT

A. The control system shall have an optional local display option that allows control and system variables to be displayed on a user interface terminal device. The Local Display Unit shall connect to the room-level network and provide access to all room-level control data.

B. The display unit shall be powered by 24 Vac or 24 Vdc.

C. The Local Display Unit shall have the provisions of being flush mounted or surface mounted either directly to a standard electrical enclosure or DIN rail. Electrical conductors shall terminate inside the display module housing to a pluggable terminal block.

D. The display unit shall utilize an LCD display with variable contrast adjustment and backlighting to adapt the display to various lighting conditions.

E. The display unit shall provide a means of entering and displaying a unique location descriptor that may be used to identify the location and/or function of the display unit. The descriptor shall allow up to two lines of at least 13 alphanumeric characters to be entered in the description field.

F. The display unit shall allow access to pertinent flow, temperature, humidity, pressure data, as well as occupancy and emergency mode control status, and current device or system alarm status. Data shall be viewable in units of measure appropriate for users of the system.

G. The display unit shall have the ability to display up to 250 parameters, organized into display screens of up to five parameters per screen. Each screen shall have the ability to have a descriptive name of up to 16 alphanumeric characters for ease of navigation. Each parameter being displayed shall have the ability to include such information as:

1. Descriptive tag (up to 13 alphanumeric characters).
2. Present value, which may be read directly off the network, or conditioned with a fixed multiplier and/or offset to scale the value for the desired units of measure.
3. Units of measure, which are configurable based on local user conventions.

H. Set points and editable control parameters shall be viewable on the Local Display Unit. The user shall have the ability to enable a pass code to prevent unauthorized changes to set points and editable control parameters.

2.8 CONTROL FUNCTIONS

A. The airflow control devices shall utilize a peer-to-peer, distributed control architecture to perform room-level control functions. Master/Slave control schemes shall not be acceptable. Control functions shall at a minimum include, pressurization, temperature, humidity control and respond to occupancy and emergency control commands.

B. Pressurization Control

1. The control system shall control supply and auxiliary exhaust airflow devices in order to maintain a volumetric offset (either positive or negative). Offset shall be maintained regardless of any change in flow or static pressure. This offset shall be field adjustable and represents the volume of air, which will enter (or exit) the room from the corridor or adjacent spaces.
2. The pressurization control algorithm shall sum the flow values of all Supply and Exhaust airflow devices and command appropriate controlled devices to new set points to maintain the desired offset. The offset shall be adjustable.
3. The pressurization control algorithm shall consider both networked devices, as well as:

    a. Up to three (3) non-networked devices providing a linear analog flow signal.
    b. Any number of Constant Volume devices where the total of supply devices and the total of exhaust devices may be factored into the pressurization control algorithm.

4. Volumetric offset shall be the only acceptable means of controlling room pressurization. Systems that rely on differential pressure as a means of control shall provide documentation to demonstrate that space pressurization can be maintained if fume hood sashes are changed at the same time a door to the space is opened.

5. The Pressurization control algorithm shall support the ability to regulate the distribution of total supply flow across multiple supply airflow control devices in order to optimize air distribution in the space.

C. Temperature Control:

1. The laboratory control system shall regulate the space temperature through a combination of volumetric thermal override and control of reheat coils and/or auxiliary temperature control devices. The critical control system shall support up to four separate temperature zones for each pressurization zone. Each zone shall have provisions for monitoring up to five (5) temperature inputs and calculating a straight-line average to be used for control purposes. Separate cooling and heating set points shall be writable from the BMS, with the option of a local offset adjustment.
2. Temperature control shall be implemented through the use of independent primary cooling and heating control functions, as well as an auxiliary temperature control function, which may be used for either supplemental cooling or heating. Cooling shall be provided as a function of thermal override of conditioned air with both supply and exhaust airflow devices responding simultaneously so as to maintain the desired offset. Heating shall be provided through modulating control of a properly sized reheat coil.
3. The auxiliary temperature control function shall offer the option of either heating or cooling mode and to operate as either a stand-alone temperature control loop, or staged to supplement the corresponding primary temperature control loop.

D. Humidity Control:

1. The laboratory control system shall have an embedded humidity control function, which allows the monitoring and control of the relative humidity level in the pressurized zone. Using peer-to-peer control, the airflow devices shall have the ability to monitor the relative humidity level of the space and, based on a BMS writable set point, develop a control signal to drive one or the other humidification or dehumidification control circuits.
2. The humidity control loop(s) shall share a common set point, with a configurable dead band adjustment to prevent the humidification and dehumidification control functions to operate at the same time.

E. Occupancy Control:

1. The control system shall have the ability to change the minimum air change rate, based on the occupied state, in order to reduce energy consumption when the space is not occupied. The occupancy state may be set by either the BMS as a scheduled event or through the use of local occupancy or switch. The laboratory control system shall support a local occupancy override button that allows a user to override the occupancy mode and set the space to occupied for a predetermined interval. The local occupancy sensor/switch or bypass button shall be given priority over a BMS command.

F. Emergency Mode Control:

1. The laboratory control system shall provide a means of overriding temperature and pressurization control in response to a command indicating an emergency condition exists, and airflow control devices are to be driven to a specific flow set point. The system shall support up to four emergency control modes. The emergency control modes may be initiated either by a local contact input or BMS command.
2. Once an emergency mode is invoked, pressurization and temperature control are overridden for the period that the mode is active. Emergency modes shall have a priority scheme allowing a more critical mode to override a previously set condition.

G. Local Alarm Control:

1. The laboratory control system shall provide the means of summing selective alarm activity at the room-level network and generating a local alarm signal. The local alarm signal may be directed to any available output, as well as to the BMS. The alarm mask may be configured differently for each room-level system.

H. Diversity Alarm:

1. The laboratory control system shall have the ability of monitoring the airflow values for the pressurized space and generating an alarm signal in the event the total exhaust flow exceeds a predetermined threshold. The diversity alarm is intended to allow the user to take diversity in the design and generate an alarm condition in the event the diversity threshold is compromised. This function must be available in either an integrated or standalone system.

I. Fume Hood Control:

1. Airflow devices intended to control the face velocity of a fume hood shall have the ability to interface directly with the fume hood monitoring device. The airflow control device shall:

    a. Accept command inputs to regulate the flow accordingly and make this command value available to the BMS
    b. Accept a sash position signal and make this value available to the BMS.
    c. Accept a Usage Based Control signal to indicate user presence and make this signal available to the BMS
    d. Provide a flow feedback signal to the fume hood monitor, which may be used for calculating face velocity or to confirm the airflow device has achieved the proper flow rate and make this value available to the BMS.
    e. Provide alarm signals to the fume hood monitor in the event the airflow device is unable to achieve the proper flow rate, there is a loss of static pressure indicating improper fan operation, or there is a loss of power to the airflow control device, in order to provide a local alarm indication. The fume hood airflow control device shall respond to changes in sash position and user presence within 1 second, in order to provide a constant 100-feet-per-minute face velocity when the fume hood is in use.

J. The laboratory control system shall be segregated into subnets to isolate network communications to ensure room-level control functions and BMS communications are carried out reliably. Each

laboratory space or pressurization zone shall be its own subnet. Commercially available routers shall be used to provide this isolation.

K. The laboratory airflow control system shall support at least 20 networked devices in each pressurized zone.

L. All points shall be available through the interface to the BMS for trending, archiving, graphics, alarm notification and status reports. Laboratory airflow control system performance (speed, stability and accuracy) shall be unaffected by the quantity of points being monitored, processed or controlled.

M. Refer to the BMS specification for the required input/output summary for the necessary points to be monitored and/or controlled.

2.9 INTERFACE TO BUILDING DDC SYSTEM

A. The laboratory airflow control system network shall have the capability of digitally interfacing with the BMS using BACnet communication protocol. The required software interface drivers shall be developed and housed in a dedicated interface device (gateway) furnished by the critical airflow control system supplier.

B. All room-level points shall be available to the BMS for monitoring or trending. The gateway shall maintain a cache of all points to be monitored by the BMS. The room-level airflow control devices shall update this cache continually.

C. The building-level network shall be a high-speed (1.25 mbps) communications protocol. The building-level network shall support up to one hundred (100) sub nets, or pressurization zones, or six thousand (6,000) data points.

D. A commercially available interface card shall be provided with the gateway in order to connect to the building-level network.

E. A commercially available network interface card shall be provided with the gateway to interface with the BMS.

PART 3 – EXECUTION

3.1 INSTALLATION

A. The automatic temperature controls (ATC) contractor shall install the sash sensors, interface boxes, presence and motion sensor, and fume hood monitor on the fume hood. Reel-type sash sensors and their stainless steel cables shall be hidden from view. Bar-type sash sensors shall be affixed to the individual sash panels. Sash interface boxes with interface cards shall be mounted in an accessible location.

B. Fume hood manufacturer shall provide cutout for the fume hood monitors.

C. The ATC contractor shall install all routers and repeaters in an accessible location in or around the designated laboratory room.

D. The ATC contractor shall install an appropriately sized and fused 24 VAC transformer suitable for NEC Class II wiring.

E. All cable shall be furnished and installed by the ATC contractor. The ATC contractor shall terminate and connect all cables as required. The ATC shall utilize cables specifically recommended by the laboratory airflow controls supplier.

F. The mechanical contractor shall install all airflow control devices in the ductwork and shall connect all airflow control valve linkages.

G. The mechanical contractor shall provide and install all reheat coils and transitions.

H. Each pressurization zone shall have either a dedicated, single-phase primary circuit or a secondary circuit disconnect.

I. Install labels and nameplates to identify control components according to Division 23 Section "Identification for HVAC."

3.2 SYSTEM STARTUP AND TRAINING

A. System start-up shall be provided by a factory-authorized representative of the laboratory airflow control system manufacturer. Start-up shall include calibrating the fume hood monitor and any combination sash sensing equipment as required. Start-up shall also provide electronic verification of airflow (fume hood exhaust, supply, make-up, general exhaust or return), system programming and integration to BMS.

B. The balancing contractor shall be responsible for final verification and reporting of all airflows.

C. The laboratory airflow control system supplier shall furnish a minimum of eight hours of University personnel training by factory trained and certified personnel. The training will provide an overview of the job specific airflow control components, verification of initial fume hood monitor calibration, general procedures for verifying airflows of air valves and general troubleshooting procedures.

D. Operation and maintenance manuals, including as-built wiring diagrams and component lists, shall be provided for each training attendee.

3.3 ON-SITE ASSISTANCE

A. Occupancy Adjustments: Within one year of date of Substantial Completion, provide up to three Project site visits, when requested by University’s Representative, to adjust and calibrate components and to assist University's personnel in making program changes and in adjusting sensors and controls to suit actual conditions.

END OF SECTION 23 3610

SECTION 23 3713 - DIFFUSERS, REGISTERS, AND GRILLES

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes ceiling- and wall-mounted diffusers, registers, and grilles some of which may not be applicable to this project.

B. Related Sections include the following:

1. Division 08 Section "Louvers and Vents" for fixed and adjustable louvers and wall vents, whether or not they are connected to ducts.
2. Division 23 Section "Air Duct Accessories" for fire and smoke dampers and volume control dampers not integral to diffusers, registers, and grilles.

1.2 SUBMITTALS

A. Product Data: For each product indicated, include the following:

1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.
2. Diffuser, Register, and Grille Schedule: Indicate Drawing designation, room location, quantity, model number, size, and accessories furnished.

B. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Ceiling suspension assembly members.
2. Method of attaching hangers to building structure.
3. Size and location of initial access modules for acoustical tile.
4. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
5. Duct access panels.

C. Samples for Verification: For diffusers, registers, and grilles to be provided in other than baked white enamel the University’s Representative may request a sample in the manufacturer's standard sizes to select and verify alternate color.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following.

    a. Price Industries.
    b. Titus.
    c. Or equal.

2. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section “Product Requirements”, Part 2 “Product Substitutions” Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 SUPPLY AIR OUTLETS

A. Louver Face Diffuser - CD:

1. Titus model MCD.
2. Material: Steel.
3. Finish: Baked enamel, white.
4. Panel Size: 24” x 24”.
5. Mounting: Lay-in T-bar.
6. Pattern: modular core, field adjustable.
7. Dampers: None.
8. Accessories: Square to round neck adaptor, if needed.
9. Adjust modules in field to provide air pattern required.
10. For hard ceilings, provide surface mount beveled drop face border type 6. Panel size not required.

B. Ceiling Diffuser – optional type to CD specified above:

1. Titus model OMNI.
2. Material: Steel.
3. Finish: Baked enamel, white.
4. Panel Size: 24” x 24”.
5. Mounting: Lay-in T-bar.
6. Pattern: horizontal air with directional blow clip.
7. Dampers: None.
8. Accessories: Direction blow clips..
9. Provide blow clips in field to provide air pattern required.
10. For hard ceilings, provide surface mount full face border type 1. Panel size not required.

C. Sidewall Supply Register – SWR (if needed on project):

1. Titus model 300RL.
2. Material: Steel.
3. Finish: Baked enamel, white.
4. Face Blade Arrangement: Adjustable horizontal or vertical to suit installation and air flow with blades spaced at 3/4 inch apart unless otherwise required.

5. Rear Blade Arrangement: alternate of face blade with same blade spacing. .
6. Frame: 1-1/4 inches wide.
7. Mounting: Wall with concealed screws.
8. Damper Type: None.
9. Accessories: Front-blade gang operator.

2.3 RETURN, TRANSFER AND EXHAUST AIR INLETS

A. Perforated Face Ceiling Grille - CR:

1. Titus model PAR.
2. Material: Steel.
3. Finish: Baked enamel, white.
4. Face Arrangement: Perforated core.
5. Panel Size: 24" x 24".
6. Mounting: Lay-in T-bar.
7. Damper: None.
8. Accessories: Square to round neck adaptor, if needed.
9. For hard ceilings, provide surface mounting face border type 1. Panel size not required.

B. Fixed Face Wall Grille or Register – TG & SWE (if needed on project):

1. Titus model 350RL.
2. Material: Steel, or Stainless steel.
3. Finish: Baked enamel, white. Or Stainless steel, mill.
4. Face Blade Arrangement: Fixed horizontal or vertical to suit installation at 3/4 inch apart at 35° angle.
5. Rear Blade Arrangement: alternate of face blade with same blade spacing. .
6. Frame: 1-1/4 inches wide.
7. Mounting: Wall with concealed screws.
8. Damper Type: Adjustable opposed-blade assembly for registers only.

C. Eggcrate Ceiling Grille - TG & EG (if needed on project):

1. Titus model 50F.
2. Material: Aluminum.
3. Finish: Natural anodized.
4. Face: ½" x ½" x ½" grid.
5. Panel Size: 24" x 24".
6. Mounting: Lay-in T-bar.
7. Damper: none. Ceiling registers shall be type ER and have opposed blade damper.
8. Accessories: Square to round neck adaptor, if needed.
9. For hard ceilings, provide plaster frame with concealed screws. Panel size not required.

D. Adjustable Bar Register

1. Material: Steel, Aluminum or Stainless steel.
2. Finish: Baked enamel, white.

3. Face Blade Arrangement: Adjustable horizontal Adjustable vertical spaced 3/4 inch apart.

4. Rear Blade Arrangement: Adjustable horizontal Adjustable vertical spaced 3/4 inch apart.

5. Mounting: Concealed.

2.5

2.6 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate diffusers, registers, and grilles according to ASHRAE 70, “Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas where diffusers, registers, and grilles are to be installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install diffusers, registers, and grilles level and plumb.

B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practicable. For units installed in lay-in ceiling panels, units shall be furnished with metal panel. Where architectural features or other items conflict with installation, notify the University’s Representative for a determination of final location.

C. Install diffusers, registers, and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

D. Provide stainless steel exhaust grilles in showers, dark rooms, sterilizer area, glass wash areas, and other moisture areas.

E. Provide outlets with gaskets and install so that there will be no streaking of the walls or ceilings due to leakage.

F. Grilles and diffusers shall match all qualities, including appearance, throw, noise level, adjustability, etc.

G. Locations of diffusers, registers and grilles shall be coordinated as not to interfere with light fixtures and sprinkler heads and also be located in accordance with the following:

1. Supply and return grilles shall create efficient cross ventilation in the room.
2. Exhaust grilles in restrooms shall be located near water closets.
3. Transfer air inlets in restrooms shall be located as farthest from exhaust grille.
4. Airflow within the room shall minimize the effects of door operation.
5. Return grilles shall be located near windows to offset heat gain/loss.

H. Air Distribution within the laboratories is critical. Supply diffusers shall be positioned such that air discharge does not affect the operation of the fume hoods. The terminal velocity shall be 50 fpm at 2 feet from the face of any fume hood and 50 fpm at 6 feet above the floor. Provide a laminar flow ceiling panel if these requirements can be meet with design layout. J. Exhaust grilles shall be 45° angled blades type only.

K. Opposed blade dampers in necks of ceiling diffusers are a source for noise generation and shall not be provided. Volume damper shall be provided in upstream ductwork to balance airflow.

L. Air throw from supply air diffusers shall not be directed towards the face of laboratory hoods.
L. Grilles, registers and diffusers shall be selected to perform without distracting noise. Throw, drop, and NC values shall be analyzed during design layout.

M. Painting inside of ducts behind grilles is not allowed in order to avoid any IAQ issues.

N. Install regular style diffusers and grilles in regular type lay-in acoustic tile ceilings.

3.3 ADJUSTING

A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before starting air balancing.

END OF SECTION 23 3713

SECTION 23 4100 – PARTICULATE AIR FILTRATION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes factory-fabricated air-filter devices and media used to remove particulate matter from air for HVAC applications.

B. Related Section includes the following:

1. Division 23 Section “Custom Air-Handling Units”.
2. Division 23 Section “Air Duct Accessories”.

1.2 DEFINITIONS

A. DOP: Dioctyl phthalate or bis-(2-ethylhexyl) phthalate.

1.3 SUBMITTALS

A. Product Data: Include dimensions; operating characteristics; required clearances and access; rated flow capacity, including initial and final pressure drop at rated airflow; efficiency and test method; fire classification; furnished specialties; and accessories for each model indicated.

B. LEED Submittals:

1. Product Data for Prerequisite EQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
2. Product Data for Credit EQ 4.1: For adhesives and sealants, including printed statement of VOC content.

C. Shop Drawings: Include plans, elevations, sections, and details to illustrate component assemblies and attachments.

1. Show filter rack assembly, dimensions, materials, and methods of assembly of components.
2. Include setting drawings, templates, and requirements for installing anchor bolts and anchorages.

D. Operation and Maintenance Data: For each type of filter and rack to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of air filters and are based on the specific system indicated. Refer to Division 01 Section "Product Requirements."

B. Comply with ARI 850.

C. Filters shall conform to UL 900, Class 2.

D. Comply with ASHRAE 52.2 Appendix J for method of establishing MERV-A performance rating.

E. Replaceable filter face velocity shall correspond to cooling coil face velocity within ± 5 percent.

F. Gaskets shall be provided to prevent infiltration of air around filters.

G. Filter frames shall be constructed of corrosion-resistant material.

H. Provide sealant, or gasket, around edges of High Efficiency filter frames.

I. Provide filters for outside air and/or return air. Provide replaceable (throwaway) and/or high efficiency type.

J. High efficiency filter assembly shall include holding frame and fastener assembly, filter cartridge/housing, mounting frame, and retainer assembly. Filters shall be high flow capacity type with low-pressure drop.

1.5 COORDINATION

A. Coordinate filter array size with AHU manufacturer using 24” x 24” filters only.

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Provide one complete set of pre-filters.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Air Filters and Filter-Holding Systems:

a. Aerostar
b. Burk Enviromnmeital
c. Califilter
d. Camfil/Farr Co.
e. Flanders Filters, Inc.

f. Luwa

2. Filter Gages:

a. Airguard Industries, Inc.
b. Dwyer Instruments, Inc.

2.2 DISPOSABLE PANEL FILTERS

A. Manufacturer: Camfil Farr 30/30, Flanders Pre Pleat HV, Aerostar

B. Description: MERV 8, factory-fabricated, viscous-coated, flat-panel-type, disposable air filters with holding frames.

C. Media: Interlaced glass fibers sprayed with nonflammable adhesive and anti-microbial agent. Filter shall be UL Class 1.

D. Frame: Cardboard/beverage board frame with perforated metal retainer. Chemically bonded to the filter pack.

1 PRE-FILTERS/MOISTURE ELIMINATOR

a Manufacturer: Califilter Califog, medium efficiency type or Burke Aero-Mist 40.

b The Pre-filter/Moisture Eliminator shall be a medium efficiency, extended area, disposable type of the quantity and size indicated on the drawings.

c The filter media shall have a Minimum Efficiency Reporting Value of MERV 8 when evaluated under the guidelines of ASHRAE Standard 52.2-1999. It shall have an average atmospheric dust spot efficiency of 30 % on ASHRAE Test Standard 52-.1-92. It shall have an average synthetic dust arrestance of 90% in accordance with that test standard.

d Media shall be antimicrobial treated.

e The filter shall be listed by Underwriters' Laboratories as UL 900 Class 2.

2.5 V-BANK CELL FILTERS

A. Manufacturer: Aerostar FP Mini-Pleat, Camfil Farr Durafil ES, Flanders Super Flow V or Luwa FP.

B. Description: 12" thick MERV 14A (95%) Factory-fabricated, disposable, packaged air filters with media packs angled to airflow, and with holding frames.

C. Filter Unit Class: UL 900, Class 2.

D. Media: Water resistant micro-fine fibrous material constructed so individual pleats are maintained in tapered form under rated-airflow conditions by flexible internal supports.
E. Initial resistance at 500 fpm approach velocity shall not exceed .36" w.g.
F. The filter shall be capable of withstanding 10" w.g. without failure of the media pack

G. Filter-Media Frames: Galvanized steel, Polypropylene, or impact-resistant plastic.

H. Face Gasket: Neoprene expanded rubber.

2.7 FRONT- ACCESS FILTER FRAMES

A. Duct-Mounting Frames: Welded galvanized steel with gaskets and fasteners suitable for bolting together into built-up filter banks.

B. Framing System: Galvanized steel framing members with access for upstream (front) filter servicing, cut to size and pre-punched for assembly into modules.

1. 16-gauge welded galvanized steel construction, a 3/4" filter sealing flange and filter centering dimples for ease of installation.
2. Vertically support filters with heavy gage galvanized steel stiffeners to prevent deflection of horizontal members without interfering with either filter installation or operation.
3. Polyurethane gasketing on the frame to filter sealing surface to assure leak free performance in the most demanding of applications.
4. Pre-drilled holes for bolt-together installation of built-up banks.
5. Multiple lances for the application of varying fasteners to install a wide variety of standard size air filter.
6. Four galvanized fasteners per filter.

C. Prefilters: Incorporate a separate track, removable from front on duct mounted assemblies, and if required.

D. Sealing: Factory-installed, positive-sealing device for each row of filters to ensure seal between gasketed filter elements to prevent bypass of unfiltered air.

2.8 FILTER GAGES

A. Description: Diaphragm type with dial and pointer in metal case, vent valves, black figures on white background, and front recalibration adjustment.

1. Diameter: 4-1/2 inches similar to Dwyer 2000 Series.
2. Range: 0- to 2.0-inch wg, except HEPA filters shall be 0-3.0-inch wg.

B. Accessories: Static-pressure tips, tubing, gage connections, and mounting bracket.

PART 3 - EXECUTION

3.1 INSTALLATION

A. For filter efficiencies greater than 65%, V-Bank type filters shall be provided.

B. Install filter holding frames according to manufacturer's written instructions.

C. Position each filter unit with clearance for normal service and maintenance. Anchor filter holding frames to substrate.

D. Install filters in position to prevent passage of unfiltered air.

E. Install filter gage for each filter bank.

F. Install filter gage static-pressure tips upstream and downstream from filters to measure pressure drop through filter. Mount filter gages on outside of filter housing or filter plenum in an accessible position.

G. Coordinate filter installations with duct and air-handling unit installations.

3.3 CLEANING

A. After completing system installation and testing, adjusting, and balancing air-handling and air distribution systems, clean filter housings and install new filter media.

3.4 CONSTRUCTION PHASE

A. Provide temporary 30% pre-filters for adjacent buildings at air intakes within 150 feet of construction zone. Provide weekly filter changes if necessary for the duration of the construction cycle.

END OF SECTION 23 4100

SECTION 23 5100 - BREECHINGS, CHIMNEYS, AND STACKS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Listed double-wall boiler breeching or chimney stack.

B. Related Sections include the following:

1. Division 23 Section "Water Tube Boilers" for induced-draft and mechanical fans, and for motorized and barometric dampers.

1.2 SUBMITTALS

A. Shop Drawings: For vents, breechings, chimneys, and stacks. Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, methods of field assembly, components, hangers and seismic restraints, and location and size of each field connection.
2. For installed products indicated to comply with design loads, include calculations required for selecting seismic restraints and structural analysis data.

B. Warranty: Special warranty specified in this Section.

1.3 QUALITY ASSURANCE

A. Source Limitations: Obtain listed system components through one source from a single manufacturer.

B. Certified Sizing Calculations: Manufacturer shall certify venting system sizing calculations.

C. Seismic Engineering: Seismic bracing and support design, mounting hardware and equipment, support systems, restraint systems, anchorage systems, and installation shall conform to the

CBC requirements for Seismic Zone 4. Submit calculations, plans, and documents stamped by a qualified California registered engineer.

D. Structural Review: Seismic engineering submittal documents, seismic loads, wind loads, anchorage and support loads, and vertical loads applied to building structures and structural components shall be reviewed, analyzed, and approved by the project structural engineer of record.

E. Flues, vents, chimneys, and breeching materials, designs, and installation shall be UL approved, and shall conform to the requirements of the California Mechanical Code.

F. Flues, vents, and chimney termination locations shall be designed with project Wind Study analysis and results, and shall be subject to review and approval of the University's Representative. Termination location points shall be optimized to minimize impact to building being served as well as adjacent buildings, and surrounding campus environment.

1.4 COORDINATION

A. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."

1.5 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of venting system that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, structural failures caused by expansion and contraction.

1. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 FOR LISTED VENTS

A. Manufacturers: Subject to compliance with requirements, provide products from one of listed companies.

1. Or Equal: Where products are specified by manufacturers name and accompanied by the term "or equal", comply with provisions in Division 01 Section "Product Requirements", Part 2 "Product Substitutions" Article. Specific procedures must be followed before use of an unnamed product or manufacturer.

2.2 LISTED TYPE B AND BW VENTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. American Metal Products; MASCO Corporation.
2. Heat-Fab, Inc.
3. Industrial Chimney Company.
4. Metal-Fab, Inc.
5. Selkirk Inc.; Selkirk Metalbestos and Air Mate.

6. Simpson Dura-Vent Co., Inc.; Subsidiary of Simpson Manufacturing Co.
7. Van-Packer Company, Inc.
8. Or equal.

B. Description: Double-wall metal vents tested according to UL 103 for continuous operation at 1400° F and intermittent operation at 1800° F.

C. Construction: Inner shell and outer jacket separated by at least a 1/4-inch airspace.

D. Inner Shell: Type 304 stainless steel. E. Outer Jacket: Galvanized or Aluminized steel.

F. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

1. Termination: Round chimney top designed to exclude minimum 98 percent of rainfall.

2.3 LISTED SPECIAL GAS VENTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Heat-Fab, Inc.
2. Metal-Fab, Inc.
3. Selkirk Inc.; Selkirk Metalbestos and Air Mate.
4. Or equal.

B. Description: Double-wall metal vents tested according to UL 1738 and rated for 480 deg F continuously, with positive or negative flue pressure complying with NFPA 211.

C. Construction: Inner shell and outer jacket separated by at least a 1/2-inch airspace.

D. Inner Shell: ASTM A 959, Type 29-4C stainless steel.

E. Outer Jacket: Stainless steel.

F. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

1. Termination: Round chimney top designed to exclude minimum 98 percent of rainfall.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of work.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATION

A. Listed Type B and BW Vents: Vents for certified gas appliances.

B. Listed Special Gas Vent: Boilers.

3.3 INSTALLATION OF LISTED VENTS AND CHIMNEYS

A. Locate to comply with minimum clearances from combustibles and minimum termination heights according to product listing or NFPA 211, whichever is most stringent.

B. Seal between sections of positive-pressure vents according to manufacturer's written installation instructions, using sealants recommended by manufacturer.

C. Support vents at intervals recommended by manufacturer to support weight of vents and all accessories, without exceeding appliance loading.

D. Slope breechings down in direction of appliance, with condensate drain connection at lowest point piped to nearest drain.

E. Lap joints in the direction of flow.

3.4 CLEANING

A. After completing system installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.

B. Clean breechings internally, during and after installation, to remove dust and debris. Clean external surfaces to remove welding slag and mill film. Grind welds smooth and apply touchup finish to match factory or shop finish.

C. Provide temporary closures at ends of breechings, chimneys, and stacks that are not completed or connected to equipment.

END OF SECTION 23 5100

SECTION 23 5239 - FIRE-TUBE BOILER SKID PACKAGE

PART 1 - GENERAL

1.1 DESCRIPTION

1. This section specifies a steam skid assembly complete with two (2) boilers, a common return system, chemical treatment systems, and blowdown separator. Skid will be manufactured and assembled with single point connections for steam make-up water, condensate return, natural gas, drain, and electrical power.

1.2 RELATED WORK

A. Section 01 33 23, Shop Drawings, Product Data, and Samples.

B. Section 09 91 00, painting.
   1. Section 23 05 11, Common Work Results for HVAC

C. Section 23 08 00, Commissioning of HVAC Systems.

1.3 QUALITY ASSURANCE

A. Coordinate all new and existing equipment and conditions. This includes, but is not limited to: boiler, boiler trim, burner, fuel valve and piping trains, gas pressure regulators and available gas pressure, required fuel oil train pressures and fuel oil header back pressure regulator on house oil pump set, compressed air system for oil atomization, control systems, economizer (if provided), breeching and stacks.

B. Provide written certification that the entire assembly has been coordinated to achieve the required performance and to provide the required features.

C. The model and size of the proposed burner shall have been applied to at least three fire tube boilers which are similar in size, proportion, number of passes and furnace dimensions to the proposed boiler. In each of the three installations, burner performance shall have conformed to requirements specified in the subparagraph, "performance" under the article, burner, and fuel trains of part 2. Provide list of these installations, and name, address, and telephone number of person familiar with each project who will serve as a reference source.

D. Regardless of fuel input rating, the equipment, installation and operation shall conform to NFPA 85. Where conflicts exist between NFPA 85 and this specification, this specification will govern.

1.4 SUBMITTALS

A. Before executing any work, submit in accordance with section 01 33 23, shop drawings, product data, and samples.

B. Boiler:
   1. Complete catalog information and outline drawings of boiler, burner, and accessories with dimensions including tube removal space and access door opening space.
   2. Catalog cuts showing arrangement and construction of pressure parts, casing, internals, and support frame.
   3. Piping connection sizes, locations, types (threaded or flanged).
   4. Technical data including temperature rating and arrangement of refractory and insulation.
   5. Steam nozzle construction. Capability of steam nozzle and attachment to boiler shell to withstand forces and moments imposed by connecting piping.
   6. Amount of heating surface and combustion volume.
   7. Weight of boiler empty and flooded including burner and boiler and burner accessories.
   8. Design pressures and temperatures.
   9. Loading diagram of support frame. Evidence that boiler support requirements have been coordinated with foundation design.
   10. Recommended anchorage of boiler support frame to foundation.
   11. Furnace viewport construction, locations.
   12. Dimensioned location of normal water line, lowest and highest permissible water level, set points of water level alarms and cutoffs.
   13. Predicted external surface temperature of front, rear and sides of boiler.
   14. Seismic design data on boiler and anchorage of boiler to foundation. Refer to section 13 05 41, seismic restraint requirements for non-structural components.

C. Boiler trim: includes bottom blowoff valves, water level alarm and cutoff devices, water level gage, low water cutoffs, piping, all valves and fittings furnished by boiler manufacturer, feedwater control system, steam safety valves, steam pressure gage, stack thermometer, draft gage, and steam pressure switches.
   1. Design, construction, arrangement on the boiler.
   2. Pressure and temperature limitations.
   3. ASTM numbers and schedule numbers of piping.
   4. Type and pressure ratings of pipe fittings.
   5. Flow and pressure drop data on feedwater regulating valves.
   6. Technical data on water level control system.
   7. Scale ranges of gages, thermometers and pressure switches.
   8. Location of water level sensing and indicating device set points in relation to normal water line and lowest and highest permissible water levels of boiler.
   9. Set pressure and capacity of safety valves.

D. Burner and fuel valve and piping trains:
   1. Catalog data and drawings showing burner assembly and fuel train arrangement.
   2. Outline drawings of flue gas recirculation (fgr) ductwork (if applicable).
   3. Outline drawings of sound attenuators on forced draft fan intake or discharge.
   4. Drawings showing assembly of throat refractory into furnace.
   5. Type and temperature rating of throat refractory.

6. Drawings and catalog data on all equipment in igniter (pilot) train, main fuel trains, and atomizing media train. Include data on pressure and temperature ratings, flow versus pressure drop, performance characteristics. Include complete data on air compressors (for oil atomizing) with sound attenuators and motors.
7. ASTM numbers and schedule numbers on all piping.
8. Type and pressure ratings of pipe fittings.
9. Burner flow and pressure data:
    a. Main burner fuel and atomizing air pressures and flows at maximum required firing rate.
    b. Igniter (pilot) fuel flow and burner pressure.
    c. Natural gas main fuel pressure at inlet and outlet of main burner pressure regulator.
    d. Igniter (pilot) fuel pressures (natural gas and lp gas) at inlet and outlet of burner mounted pressure regulators.
    e. Forced draft fan static pressure, power and air flow at maximum firing rate.
10. Full load efficiency and power factor of all motors.
11. Predicted sound level at maximum firing rate on each main fuel.
12. Weight of burner assembly.

E. Boiler, burner, economizer predicted performance data:
1. At maximum required output: on each fuel at site altitude, with and without economizer (if applicable) in service, at 15 percent excess air. Data must include fuel and steam flow, boiler flue gas outlet temperature, economizer (if provided) flue gas outlet temperature, steam quality, boiler efficiency, windbox and furnace pressures, predicted boiler radiation and unaccounted losses, feedwater and flue gas pressure losses in the economizer (if provided).
2. At low fire, 25%, 50%, 75% of maximum required output. Excess air, CO ppm, NOX ppm on each fuel.

F. ASME “p” forms, manufacturer’s data report, on boiler and economizer construction – submit after boiler and economizer are fabricated.

G. Pretest data - boiler, burner, controls: as required by part 3.

H. Completed system readiness checklists provided by the commissioning agent and completed by the contractor, signed by a qualified technician and dated on the date of completion in accordance with the requirements of section 23 08 00 commissioning of HVAC systems.

1.5 PROJECT CONDITIONS

A. Fuels to be fired, main burner: natural gas

B. Igniter (pilot) fuels: natural gas.

C. Natural gas: high heating value is reported as 1040btu per cubic foot at gas company base pressure and temperature. Pressure provided to the inlet of the boiler-mounted regulators will be (2 psi gage as maintained by main regulator station.

1.6 APPLICABLE PUBLICATIONS

A. The publications listed below form a part of this specification to the extent referenced. The publications are referenced in the text by basic designation only.

B. ASTM international (ASTM):
1. A106/A106M 08 standard specification for seamless carbon steel pipe for high temperature service.
2. A178/178M-02(2007)standard specification for electric-resistance-welded carbon steel and carbon-manganese steel boiler and superheater tubes
3. A269-10standard specification for seamless and austenitic welded stainless steel tubing for general service
4. C612-10standard specification for mineral fiber block and board thermal insulation
5. D396 09A standard specification for fuel oils

C. American society of mechanical engineers (ASME):
1. Boiler and pressure vessel code 2007 edition with amendments.
2. Section I power boilers
3. Section II material
4. Section VII recommended rules for care of power boilers
5. Section IX welding and brazing qualifications
6. Performance test code (ptc):
7. Ptc 4 2008 fired steam generators
8. Code for pressure piping:
9. B31.1-2007 power piping

D. National fire protection association (NFPANFPA):
1. 85-2007 boiler and combustion systems hazards code.

E. Underwriters laboratories (UL):
1. 50 2007 enclosures for electrical equipment.

F. Department of health and human services, food and drug administration (FDA):
1. CFR 21, 173.310, boiler water additives permitted in plants where steam contacts food.

G. Environmental Protection Agency (EPA):

H. CFR 40, part 60, appendix A, method 9, visual determination of the opacity of emissions from stationary sources.

PART 2 - PRODUCTS

2.1 BOILER

A. General boiler design

1. The boiler shall be a cleaver-brooks model cfh 700, single pass horizontal commercial firetube design or approved equal. It shall be mounted on a heavy-duty steel frame with premix forced draft burner and burner controls as a complete package from one manufacturer.
2. Approvals - the complete package including the burner shall be Underwriters Laboratories, inc. Listed and the official UL/CUL label shall be affixed to the package attesting to its certification.
3. If boiler is shipped as a preassembled package, the standard boiler shall be factory fire tested.
4. The complete package as shipped, shall be ready for connections to water, fuel, blowdown, and exhaust venting. Certain items may be shipped loose to prevent their damage such as the safety valves and gauges.

B. Boiler shell
1. The boiler shell must be constructed in accordance with the ASME code, either section i for high-pressure steam or section iv for low- pressure steam. The vessel must be subjected to the required inspections of the code conducted by an independent third party inspector. A signed inspection sheet shall be provided to the purchaser and the appropriate ASME symbol shall be affixed or stamped onto the boiler.
2. Boiler shall be mounted on base rails suitable for transporting by fork lift.
3. Burner housing shall be hinge-mounted to allow tube inspection.
4. Each carbon steel boiler tube shall utilize the alufer heat transfer design technology for high efficiency and reduction in overall size of the vessel and shall be a minimum of 0.105 tube wall thickness.
5. To facilitate waterside inspection, 3 hand holes shall be provided.
6. An observation port for flame inspection shall be provided.
7. Boiler insulation shall consist of 2-inch fiberglass blanket, which shall be covered with a powder coated sheet metal jacket. This jacket and insulation design shall permit field removal and reattachment if necessary for inspection, etc.
8. The entire boiler and base frame shall be factory painted.
9. Exhaust vent shall be located at the rear of the boiler and shall be a slip connection. Stack support shall be by means other than the boiler connection.
10. The following boiler vessel tappings/openings shall be furnished:
    a. Steam supply by npt connection for high-pressure steam or flanged for low pressure steam.
    b. Bottom blowdown.
    c. Feedwater make-up.
    d. Surface blowoff.
    e. Chemical feed.
    f. High water level overflow drain to discharge water in the boiler if water level reaches an unacceptable level.

C. Boiler trim
1. Conform to ASME boiler and pressure vessel code, section i and csd-1
2. A water column shall be furnished complete with gauge glass and water column blowdown valve.

a. Feedwater pump control - shall be integral with the water column via probe control device and electronics for on/off pump operation.
b. Low water cutoff - shall be integral with the water column via probe control device and solid state electronics mounted and wired in the control panel.

3. An auxiliary low water cutoff shall be provided. It shall be located on the top centerline of the boiler using an internal probe and shall be of the manual reset design.
4. For safety steam pressure lockout a high limit pressure control, manual reset shall be provided. The device shall be mercury free.
5. To provide steam demand tracking a steam pressure transmitter shall be provided that provides an input signal for burner positioning in accordance to steam demand.
6. A 3" steam pressure gauge shall be piped onto the trim piping, including an inspectors test cock.
7. In accordance with the a.s.m.e. Code an approved a.s.m.e. Rated and stamped safety valve shall be provided and set at 150#.
8. The factory installed package shall include an economizer coil located in the rear of the boiler, integral to the stack outlet with integral make-up water supply and outlet piping. A vertical stainless steel feedwater tank complete with a continuous running pump shall be provided with integral piping. This piping shall include the feedwater make-up stop valve, check valve, and on/off electric make up valve. The make-up valve shall be factory wired to the on/off pump control. Feedwater piping shall include by-pass piping so that water circulates through the economizer at all times.

D. Burner and burner controls

1. Mode of operation - to minimize short cycling and provide highest efficiency the burner for the specified boiler shall be of the electronic modulation with a turndown ratio of 5:1 for natural gas for sizes of 40 horsepower and greater, and 4:1 for sizes below 40 horsepower. On/off or low/ high burner operation shall not be accepted.
2. The burner shall be enclosed in a NEMA 1 type enclosure. A lift off top cover shall be provided to gain access to the burner and controls.
3. The burner design shall be of the linkage-less premix technology wherein the fuel and air are mixed in the fan housing assembly prior to entering the burner canister. Separately driven linkage or servo motor driven fuel and air valves shall not be permitted.
    a. Fan housing shall utilize non-sparking material and shall be approved for premix operation.
    b. The fan shall be driven by a variable speed motor which shall react to output demand requirements via the demand control motor shall be a high efficiency dc brushless type. Continuous speed synchronous motors will not be acceptable.
4. Ignition of the fuel shall be of the direct spark design; separate pilot gas train is not required. Dual ignition electrodes shall used for the spark generated from the panel mounted ignition transformer.
5. Combustion shall take place on the surface of the burner canister. The canister shall be constructed of fecralloy material and stainless steel and shall be warranted for five years against failure from defects or poor workmanship.
6. Air filter - shall be fitted to the intake air venturi to filter the incoming air supply when using boiler room air. The air filter shall be designed to be easily cleaned and re-used.
7. Fuel - the burner shall be designed for operation with natural gas or lp gas. Gas train, shall be located at the front of the burner and along the left side of the boiler. In

accordance with UL/CUL and ASME csd-1, the following components shall be furnished:

a. Single body dual solenoid safety shutoff valve incorporating the following:
   1) The valve shall be a 1:1 ratio valve with an integral trim regulator and shall operate in relation to the fan speed. An air sensing line shall be connected from the air inlet venturi (mounted to the fan motor) and to the gas valve for control of gas input.
   2) As fan speed increases a negative pressure will be applied to the valve, allowing the valve to open further, permitting more fuel to flow into the venturi for mixing. As fan speed is reduced, fuel input shall be reduced accordingly. Air shall always lead fuel from low to high or high to low.
b. Manual fuel shutoff valve - shall be located downstream of the gas valve and used for csd-1 leak testing.
c. Gas pressure interlocks - one shall be provided for sensing high gas pressure and one provided to sense low gas pressure. Each control shall be of the manual reset type.
d. Gas pressure regulator - shall be provided upstream of the gas valve to provide regulated pressure to the gas train from the gas supply. This regulator shall be suitable for a maximum of 1 psig gas pressure. If gas pressure exceeds 1 psig, a gas pressure relief valve shall be furnished and upstream pressure regulator that is of the full lockup type.
e. Manual shutoff valves - shall be provided upstream of the gas regulator to manually close off the gas supply when servicing the gas train or isolating the boiler. A shutoff valve shall be provided at the burner for tightness checking of the gas valve.
f. Combustion air proving switch shall be provided to prove, prior to modulation that the fan is operating properly.
g. Flame sensing shall be accomplished with a flame rod mounted in the burner mounting plate, designed for easy removal for inspection or replacement.

E. Control panel
   1. A NEMA 1 type enclosure is furnished and located at the front of the boiler to house the following components:
   2. The boiler shall include a computerized boiler burner control which shall be an integrated, solid state digital micro-processor modulating device, complete with sequence indication, fault reset, mode selection, and configurable parameter settings. It shall be mounted at the front of the boiler panel for easy access and viewing. The controller combines flame supervision, burner sequencing, modulating control, and operating limit control.
   3. Controller shall provide for both flame safeguard and boiler control and shall perform the following functions:
      a. Burner sequencing with safe start check, pre-purge, electronic direct spark ignition, and post purge. Flame rod to prove combustion.
      b. lame supervision. The control shall provide pre-purge and post- purge and shall maintain a running history of operating hours, number of cycles, and the most recent 15 faults. The control shall be connected to a touchscreen display interface that will retrieve this information.

c. Safety shutdown with display of error.
d. Modulating control of the variable speed fan for fuel/air input relative to load requirements.
e. Gas pressure supervision, high and low.
f. Combustion air proving supervision.
g. High air pressure (back draft too high) supervision.
h. The active steam pressure and set-point pressure shall be displayed at all times. Output shall be modulating pid set point control via analog signal.
i. Controller shall be capable of Modbus communication to interface with pc or building energy management system.

4. All parameter input control set-points shall be factory pre-configured with jobsite conditions programmed at the time of initial operation.
5. Demand switch.
6. Provide terminals for control interface wiring, customer connections, and connections for incoming power.
7. Install solid state circuit boards for water level controls.
8. Alarm light package to provide indication of low water, flame failure, load demand, fuel valve on, including a horn with silencing for alarm conditions.

F. Performance and emissions:
1. Fuel to steam efficiency shall be guaranteed at 85% with flue gas economizer. Efficiency rating shall account for radiation and convection losses.
2. Nox emissions shall be less than 20 ppm corrected to 3% o2 and less than 10 ppm co over the operating range of the burner turndown. If emissions exceed this level, the boiler manufacturer shall correct at their expense until this level is achieved on a repeatable basis.
3. Noise - sound shall not exceed 70 dba at high fire when measured 3 feet in front of the burner.
4. Radiation losses shall be less than 0.5% of the rated input at maximum firing.
5. Steam quality shall be 99.5% at maximum firing regardless of operating pressure.

2.2 BOILER RETURN SYSTEM

A. Components
1. Boiler Feed Receiver
a. Receiver shall be vertical welded 304 Stainless Steel
b. Head and shell thickness shall be 12 gauge
c. Receiver shall have a networking capacity of not less than that shown on the schedule
d. Receiver shall have an inlet, vent, overflow, drain
e. Receiver shall be furnished with:
1) Gauge Glass Assembly with SS Valves, High Pressure Gauge Glass and Heavy Duty SS Glass Guards
2) Bi-Metal Thermometer
3) Stainless Steel Suction Piping including SS Isolation Valves and SS Suction Strainer

4) Provision for steam preheat – stainless steel steam sparge tube or noiseless educator and feed tank temperature control (optional)
5) Receiver shall have a 20 year warranty against corrosion.

2. Pump(s)
   a. Boiler Feed water pump(s) shall be vertical multi-stage centrifugal pumps with all-wetted components constructed of stainless steel.
   b. Pump capacities and electrical characteristics shall be as shown on the schedule.
   c. Each pump shall be sized for a minimum of 2 times the boiler evaporation rate.
   d. Each pump shall be close coupled to a 3450 RPM C-Face TEFC motor
   e. Mechanical shaft seal shall be rated for 250 degrees F continuous operation
   f. Pump shall have a 5-year warranty against corrosion of the SS components
3. Water make-up assembly
   a. The water make-up assembly shall consist of a float switch mounted at the water make-up level in the tank. A control system will electronically activate a solenoid valve to add softened make-up water to the tank.
   b. A non-siphon filler well (air gap assembly) shall be provided.
4. Control Panel
   a. The control panel shall include a NEMA 1 Steel Enclosure
   b. Motor Starters
   c. Class 10 Solid State Overloads
   d. Pump Circuit Breakers
   e. HOA Selector Switches
   f. Pump Run Indicator Lights
   g. Designed to receive pilot signal from boiler(s)
   h. UL 508 Labeled

2.3 BLOWDOWN SEPARATOR

A. Furnish and install as shown on plans:
   1. Boiler Blow-Down Separator for use with an intermittent bottom blowdown valve.
   2. The separator is to be welded carbon Steel Vessel Designed and "UM" Stamped to ASME Code for 250 psig @ 450 Deg. F. Plate Thickness 5/16”
   3. Connections are threaded type and include a tangential inlet with stainless steel striking plate at point of impingement, a centrally located steam vent for clean quite release of steam to atmosphere, and bottom drain fitted with a stainless steel spiral baffle.
   4. Furnish and install W/3 Angle Legs for Floor Mounting.
   5. Furnish and install as shown on plans for Automatic Control of Drain Water Temperature to 140 Deg. F. A Automatic Aftercooler, a Temperature Regulator Valve sized for cooling water at 50 psig., Strainer, and 2" Dial Bimetal Thermometer.

B. Chemical Treatment system
   1. Chemical Addition Tank
      a. Chemical addition tank shall be a package consisting of chemical metering pump, chemical mix/storage tank, agitator, control panel and accessories as required. The package shall be hydraulically and electrically tested at the factory and shall be preassembled to the fullest extent possible. The package shall be furnished

complete with the required lubricants and installation instructions. Materials of construction are to be specified by the chemical supplier or design engineer.

2. Pump
   a. Solenoid type pump will offer adjustable, manual control from adjustable stroke length, 0-100% throughout the rated capacity of the pump.
   b. Pump shall have circuit protection against voltage and current upsets. Solenoid will be protected against thermal overload with auto-reset.
   c. The pump must be Water Resistant, acceptable for outdoor and indoor applications.
   d. The pump must have ball guided ball check Valve systems to prevent back flow and enhance outstanding priming characteristics.
   e. The liquid end of the pump and the injection quill must be made of PVDF=Polyvinylidene Fluoride.
   f. The balls in ball check design must be made of ceramic material.
   g. Injection nozzles must be capable of handling temperatures of up to 250°F.
   h. Pumps must be equipped with durable leak-free bleed valve assembly to insure safe and easy priming.
3. Tank
   a. Tank must meet or exceed secondary containment regulations set under EPA 49CFR.
   b. Tank must be square and natural colored.
   c. Tank must be designed with pump mounting surface, female threaded connections and twist lid inspection port.
   d. Tank must be constructed of Low Density Polyethylene.
   e. Tank capacity to be determined by the design engineer or chemical supplier.
   f. Standard tank size is 20 gallons, tank – 18” w x 18”l x 24”t.

C. Water Softener
1. The tanks shall be designed for a working pressure of 150 psi, hydrostatically tested at 50% in excess and rated at burst of four (4) times working pressure. A minimum freeboard volume of 50% shall be provided to assure adequate bed expansion during backwash. Tanks shall be manufactured of durable composite resin and reinforced with high-tensile strength filament windings. Tanks are resistant to corrosion, providing years of reliable service. Thermoplastic liners shall be made of high strength polyethylene. A molded plastic base supports the fiberglass tanks. Tanks shall be tested and certified by NSF. Including the base, each vessel shall have nominal dimensions of 9 inches diameter x 48 inches height.
2. Main Control Valve
   a. The control valve shall have 1 inch NPT inlet and outlet connections. It shall be a low lead brass mechanically-actuated, hydraulically balanced, self-cleaning piston six-position type to accomplish the regeneration steps of backwash, brine draw, slow rinse, fast rinse, and refill. Separate rinse and timed refill positions will be provided to reduce regeneration water use. The valve shall contain fixed orifice eductor nozzle and self-adjusting backwash flow control. The bypass body, like the main control valve, shall be actuated by a mechanical drive when used. The valve will be capable of being manually stepped through regeneration without electrical

power. The valve body will be constructed of low lead brass meeting the requirements of NSF 61.

3. Distribution System
   a. The soft water collector and backwash water distributor shall be a single point fine-slotted self-cleaning plastic manifolds with slots no larger than 0.010-inch width.
4. Brine System
   a. 2.4.2.4.1.A combination salt storage tank with cover and brine tank well shall be supplied as part of the system. The tank shall be sufficient size to hold salt for at least 65 regenerations between refills. The tank(s) shall be made of corrosion-free one-piece molded polyethylene or fiberglass reinforced plastic material. The tank(s) shall have a nominal diameter of 18 inches and a height of 40 inches.
5. Ion Exchange Resin and Underbredding
   a. Each softener tank shall be provided with 1.0 cubic feet of high capacity synthetic ion exchange resin having a minimum exchange capacity of 30,000 grains per cubic foot when regenerated with 15 pounds of salt per cubic foot. The resin shall be solid, with uniform particle size, clean and free of dirt and extraneous matter that might interfere with flow of water through the resin or that might interfere with the ion exchange process.
   b. The resin will rest on a bed of quartz at least two inches in depth above the distributor. The quartz shall be washed and dried to remove the debris and fines, and screened not to exceed 16 mesh size by 3/16-inch particle size.
6. Electronic Demand – Twin Alternating
   a. This computer based demand, meter initiated controller operates system from 1 to 2 units in single, parallel or alternating operating configurations. The control will utilize alphanumeric, self-prompting programming for simple start up. EEPROM memory shall store program data eliminating need for battery back-up or configuration input after power loss. It is pre-wired and includes twist lock electrical end connectors for installation ease.
   b. The controller will constantly monitor current operating condition and be capable of displaying instantaneous flow rate through the system. A resettable totalizing flow counter will be included to measure total water processed.
   c. The control shall be self-diagnostic and capable of emitting an audible signal and error specific messages if it detects a system problem. Valve and control operation will be 24V, 60Hz, 1ph A suitably sized UL/CSA listed transformer(s) will be provided to convert 120V, 60Hz, 1ph power for system operation. Control printed wiring assemblies will be conformably coated to MIL specifications suitable for use in humid environments. A watertight enclosure will be used to house the control.
   d. This duplex meter initiated system has one unit(s) on line, and a companion in standby, or regeneration. Regeneration is immediate based a batch count. The standby unit moves to line position. Built in interlock does not allow more than one unit to be in regeneration at a time.
7. Flow Sensors
   a. A turbo flow sensor which is a solid state proximity transducer with a self-lubricated riding on a sapphire bearing. The sensor shall be made with no packing glands or rotating shaft seals. The sensor shall be made in such a way that it can

be installed and removed with simple hand tools. Pipe size of the sensors shall be 1 inches. It shall have a minimum flow of 1 gpm, and a peak flow of 50 gpm.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Refer to section 23 05 11, common work results for HVAC and steam generation.

B. Boiler and burner access openings: arrange all equipment and piping to allow access to openings without disassembly of equipment or piping. Provide space that permits full opening of all boiler and burner doors, panels and other access openings. Provide space for pulling full length of all boiler tubes directly from their installed location.

C. Drainage facilities for boiler water column, gage glass, low water cutoffs, water level alarms:
   1. Locate and orient sight flow indicators so that one person can view the fluid flow while simultaneously operating drain valves and low water cutoff shunt switches.

D. Boiler flue gas outlet location: drawings show a location based on an assumption on the number of passes of the boilers. If the boilers submitted have a different flue gas outlet location, redesign and relocate the stack and breeching systems, at no additional cost to the government.

E. Boiler casing flashing: flash or seal all openings in the casing at the top of the boiler at the piping and the flue penetrations to prevent leakage of water into the boiler insulation.

3.2 CLEANING AND PROTECTION FROM CORROSION

A. Refer to section 23 05 11, common work results for HVAC and steam generation.

B. Boiler cleaning:
   1. Upon completion of installation, the initial firing of the burner shall be performed to boil out, under supervision of boiler manufacturer, all internal surfaces with chemical solution recommended by boiler manufacturer, to remove all mill scale, corrosion products and other foreign material. Following boil out, boiler shall be washed and flushed until water leaving the boiler is clear. Drain boiler, inspect internal surfaces for cleanliness, then refill boiler with softened and treated water.
   2. Refer to the article inspections and tests for requirements for cleaning boiler after operational tests are completed.

C. Protection from corrosion:
   1. Protect the boilers from fire side and water side corrosion at all times.
   2. Dry storage: when the boilers are not filled with water, protect the water sides and fire sides with a dry storage method recommended by either the boiler manufacturer or the ASME code, section vii.

3. Wet storage: if, after water is placed in the boilers, they are not fired for equipment adjustment or testing for more than two weeks, the boilers shall be protected with a wet storage method recommended either by the boiler manufacturer or the ASME code, section vii.
4. Chemical treatment: the quality of the water in the boilers shall be maintained by a professional water treatment organization. This organization shall provide on site supervision to maintain the required water quality during periods of boiler storage, operating, standby and test conditions. Furnish monthly reports by the water treatment organization, to the resident engineer (re). The contractor shall provide all chemicals, labor and professional services until the government has accepted the boilers for operation. All chemicals utilized must conform to FDAguidelines applicable for steam used in food preparation.

3.3 INSPECTIONS AND TESTS

1. The following tests and demonstrations must be witnessed by the resident engineer (re) or his/her representative, and must prove that boilers, economizers, burners, controls, instruments, and accessories comply with requirements. Refer to section 23 08 11, demonstrations and tests for boiler plant for general requirements. When test results are not acceptable, make corrections and repeat tests at no additional cost to the government. Pretests do not require the presence of the re.
2. Condition of boiler and economizer after delivery, rigging, placement: after setting boiler on foundation and placing economizer on supports, and prior to making any connections to boiler and economizer, the contractor and re shall jointly inspect interior and exterior for damage. Correct all damage by repair or replacement to achieve a like new condition.
3. Hydrostatic tests:
    a. Boiler, economizer: contractor shall provide inspector certified by national board of boiler and pressure vessel inspectors to conduct tests after equipment is installed and connected for operation and prior to initial firing. Test pressure shall be 1 1/2 times the design pressure of the boiler for a period required by the inspector. Provide written certification of the satisfactory test, signed by the inspector. Correct any deficiencies discovered during the testing, and retest equipment until satisfactory results are achieved and are accepted by the inspector.
    b. Boiler external piping (as defined by ASME B31.1, power piping):
    c. Refer to section 23 21 11, boiler plant piping systems.
    d. Test may be conducted concurrently with boiler and economizer testing.
4. Identify and remove any connecting equipment which is not rated for the test pressure. Cap the openings left by the disconnected equipment. Reinstall the equipment after tests are completed.

B. Boiler steam safety valves:

1. Test each valve set pressure and blowdown pressure with boiler steam pressure. Perform accumulation test by operating burner at high fire to verify that safety valve flow capacity is sufficient to handle the maximum boiler steaming rate. Tests shall be performed with boiler isolated from the main steam header and all generated steam exhausting through the safety valves.

2. Valve popping tolerance: plus or minus three percent of set pressure for set pressures over 480 kpa (70 psi) gage.
3. Valve blowdown tolerance: reset at not less than 6 percent below set pressure of valve with the lowest set pressure. Minimum blowdown two percent of the set pressure.
4. Accumulation test: with burner at high fire, the boiler pressure shall not rise more than six percent above the set pressure of the safety valve with highest pressure setting and shall remain below the maximum allowable working pressure of the boiler.

C. Burner control system:
1. Demonstrate operation of all control, interlock and indicating functions. Refer to section 23 09 11, instrumentation and control for boiler plant.
2. Prior to scheduling final test submit certification that all control, indicating, and interlock functions have been pretested.
3. Conduct final test immediately prior to boiler burner tests.
4. Experienced personnel representing the manufacturer of the system shall conduct the tests.

D. Performance testing of boiler, burner, economizer, combustion control, boiler plant instrumentation:
1. Perform tests on each boiler on all main burner fuels.
2. If required by local emissions authorities, provide services of testing firm to determine nox and carbon monoxide. Test firm shall be acceptable to emissions authorities.
3. Test no. P 1:
    a. Operate boiler on each fuel, with economizer in service and record data for at least six evenly spaced steam loads from low fire start to 100% of full steam output, and in the same sequence back to low fire. Demonstrate performance and efficiency required by paragraphs under articles, boiler, burner and fuel trains, and economizer and by boiler and economizer equipment lists on drawings.
    b. Demonstrate proper operation of combustion controls, draft control (if provided), feedwater level controls, and instrumentation systems (refer to section 23 09 11, instrumentation and control for boiler plant.
    c. When flue gas oxygen trim is provided, conduct tests with trim control on manual at the zero trim (null) position. Refer to section 23 09 11, instrumentation and control for boiler plant. After completion of tests with trim control on manual control, repeat the tests on one fuel with the trim control on automatic control.
4. Test no. P 2:
    a. Demonstrate sound level of fans and burner systems and atomizing air compressor.
    b. Test point shall be at 100 percent of maximum boiler load.
    c. Refer to sound level requirements in section 23 05 51, noise and vibration control for boiler plant.
5. Test no. P 3:
    a. Check current draw of forced draft fan motor at prepurge and at 100 percent of maximum boiler load.
    b. Current draw shall not exceed full load current stamped on motor nameplate.
    c. This test may be combined with test no. P 1.
6. Test methods:

a. Utilize permanent instrumentation systems for data. All systems shall be operable and in calibration.
b. Utilize portable thermocouple pyrometer furnished and retained by contractor to measure stack temperature as a verification of permanent stack temperature recorder.
c. Use portable electronic flue gas analyzer to determine constituents of flue gas. Analyzer shall be capable of measuring oxygen in per cent with accuracy of plus or minus 0.5 percent oxygen and carbon monoxide in parts per million (ppm) with accuracy of plus or minus 5 percent of reading (range 0 l000 ppm). Obtain oxygen and carbon monoxide readings at each test point. Calibrate instrument with certified test gases within three months prior to use and immediately after analyzer cell replacement.
d. In test no. P 1 retain boiler at each load point for a time period sufficient to permit stabilization of flue gas temperature and other parameters.
e. Steam loads for tests may be furnished by the hospital systems, by operation of the steam silencer vent system, or by a combination of the above. If variable hospital loads interfere with testing, conduct tests at night or on weekends when loads are more stable.
f. Utilize dry bulb and wet bulb thermometers furnished and retained by contractor for checking combustion air.
g. Smoke testing shall be by visual observation of the stack and by smoke density monitor (permanent instrument - if provided). If smoke density monitor is not provided, utilize bacharach model 21-7006 smoke test kit. If there is disagreement with the results of these tests, provide qualified observation person and tests in compliance with EPA reference method 9 (cfr 40, part 60, appendix a).
h. Sound level instruments will be government furnished.
i. Nox emissions shall be tested with electronic analyzer reading in parts per million. Analyzer shall be calibrated with certified test gas within three months prior to use. Analyzer shall be accurate to plus or minus 5% of reading.
    1) 3.3.6.6.9.1.1.An additional efficiency test will be required, conforming to ASME performance test code ptc 4, if the boiler efficiency determined in the test p-1 above, does not comply with requirements. Utilize ASME test forms ptc 4.1.a, 4.1.b, and the abbreviated input-output and heat balance methods.

7. Pretesting:
    a. Perform pretest at the final stage of the burner fine tuning process.
    b. Prior to scheduling final test, submit evidence of pretest. Evidence shall consist of start-up data sheets signed and dated by personnel representing burner manufacturer, combustion controls manufacturer, burner controls manufacturer.
    c. Pretest data sheets shall list the following data for each fuel and at each fuel valve controller position, starting at minimum position, proceeding to the maximum position and returning to the minimum position.
        1) Fuel flow and air flow controller position.
        2) Fuel pressures: at burner and also upstream of fuel flow control valve.
        3) Fuel flow rate.
        4) Boiler feed pressure, upstream of feedwater regulator (at minimum, 50 percent, maximum firing positions only).

5) Boiler feed temperature (at minimum, 50 percent, maximum firing positions only.
6) Stack temperature: boiler outlet, economizer (if provided) outlet.
7) Flue gas oxygen and carbon monoxide (utilize flue gas analyzer which has been calibrated with certified test gases).
8) Steam flow rate (at minimum, 50 percent, maximum firing position only).
9) Steam pressure boiler, header (at minimum, 50 percent, maximum positions only).
10) Opacity of flue gas.
11) Flue gas nox (if limit specified).
12) Combustion air temperature dry bulb and wet bulb.
13) Barometric pressure (one reading).

E. Internal inspection of pressure parts and furnace:
1. After all operational tests are satisfactorily completed, a government retained, licensed boiler inspector will determine if the boiler is free from corrosion, deposits, and any other type of damage or defect.
2. In preparation for the inspection, open all manways, handholes, and access doors or panels at the ends of the boiler. Drain and clean the interior of all pressure parts and clean all soot and debris from furnace and fire tubes.
3. Any corrosion, damage or defect shall be corrected to a like new condition in the judgment of the boiler inspector.
4. After the boiler inspector has approved the boiler, all manways, handholes, and the access doors shall be closed with new gaskets.

F. If burner operation results in deposits of carbonaceous materials in the furnace or tubes clean the furnace and tubes, modify the burners as necessary, and retest the burner performance.

3.4 STARTUP AND TESTING

A. The commissioning agent will observe startup and contractor testing of selected equipment. Coordinate the startup and contractor testing schedules with the resident engineer and commissioning agent. Provide a minimum of 7 days prior notice.

3.5 COMMISSIONING

A. Provide commissioning documentation in accordance with the requirements of section 23 08 00 –Commissioning of HVAC Systems for all inspection, start up, and contractor testing required above and required by the system readiness checklist provided by the commissioning agent.

B. Components provided under this section of the specification will be tested as part of a larger system. Refer to section 23 08 00 – Commissioning of HVAC Systems and related sections for contractor responsibilities for system commissioning.

3.6 DEMONSTRATION AND TRAINING

A. Provide services of manufacturer's technical representative for four hours to instruct each HVAC personnel responsible in the operation and maintenance of units.

B. Submit training plans and instructor qualifications in accordance with the requirements of section 23 08 00 – Commissioning of HVAC Systems.

END OF SECTION 235239

SECTION 23 5700 - HEAT EXCHANGERS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes shell-and-tube and plate heat exchangers.

B. Related Sections include the following:

1. Division 23 Section "Seismic Restraint For HVAC Piping and Equipment" for requirements necessary for compliance with seismic criteria

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include rated capacities, operating characteristics, and furnished specialties and accessories.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Equipment room, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Tube-removal space.
2. Structural members to which heat exchangers will be attached.

A. Seismic Qualification: Manufacturer’s certification of seismic qualification according to ASCE 7-05. Submit ASCE 7-05 special seismic certification as required. Include method used to determine compliance with requirements.

1. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
2. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements

B. Product Certificates: For each type of shell-and-tube heat exchanger. Documentation that shell-and-tube heat exchangers comply with "TEMA Standards."

C. Source quality-control reports.

D. Field quality-control reports.

E. Sample Warranty: For manufacturer's warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For heat exchangers to include in emergency, operation, and maintenance manuals

1.6 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, performance, and dimensional requirements of heat exchangers and are based on the specific equipment indicated. Refer to Division 01 Section "Product Requirements."

B. ASME Compliance: Fabricate and label heat exchangers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," Division 1.

C. Registration: Fabricate and label shell-and-tube heat exchangers to comply with the Tubular Exchanger Manufacturers Association's standards.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 SHELL-AND-TUBE HEAT EXCHANGERS

A. Manufacturers:

1. Alfa Laval
2. API Heat Transfer Inc.
3. Armstrong Pumps, Inc.
4. ITT Industries; Bell & Gossett.
5. Taco, Inc.
6. Thrush Company, Inc.

B. Configuration: Straight tube with removable bundle.

C. Shell Materials: Steel .

D. Head:

1. Materials: Carbon steel.
2. Flanged and bolted to shell.

E. Tube:

1. Seamless copper tubes.
2. Tube diameter is determined by manufacturer based on service.

F. Tubesheet Materials: Type 316 S.S.T.

G. Baffles: Brass.

H. Piping Connections:

1. Shell: Flanged inlet and outlet fluid connections, threaded drain, and vent connections.
2. Head: Flanged inlet and outlet fluid connections.

I. Support Saddles:

1. Fabricated of material similar to shell.
2. Foot mount with provision for anchoring to support.

2.3 Stainless Steel Plate Heat Exchangers

A. Design
1. Preference should be given to single pass designs with all connections located on the frame plate (fixed head) to allow for removal of plates and inspection without dismantling the process piping.
2. For single pass units, all connections should be located on the frame plate (fixed head), allowing the pressure plate (movable head) to slide back and have plates added, removed, or replaced from the plate pack without disturbing the connections or associated piping.
3. The design should allow for the removal of any plate in the plate pack without requiring the removal of any other plates.
4. The unit shall be provided with a stainless steel splash shield covering the sides and top of the plate pack. The bottom should be left open for leak detection.
5. The unit shall be designed, tested, and U stamped in accordance with ASME Section VIII Division 1 and registered with the National Board. A U-1 data report to be furnished upon request.
6. Manufacturer must be certified and registered with ISO 9001:2008. A certificate of registration shall be supplied upon request.
7. Unit must be factory pressure tested with ASME U stamp applied on nameplate prior to leaving the factory.

B. Frame

1. The frame and pressure plates shall be carbon steel SA 516 grade 70.
2. The frame and pressure plates shall be of sufficient thickness to meet the ASME design pressure without the use of stiffeners or other type of reinforcement.
3. Carbon steel frame components, except hardware, shall be painted with gray macro epoxy paint to a minimum of 4 mils dry film thickness.
4. Carbon steel frame and pressure plates shall be steel grit blasted to SSPC-SP6/NACE 3 (Commercial Blast Cleaning) with surface profile of 2 mils on either face. All surfaces and openings must have a recoatable epoxy primer applied within 8 hours of blast or before flash rusting occurs.
5. Frame plates shall have integral lifting eyes in the upper corners. Bolted or welded on lifting lugs not allowed.
6. Units with studded port connections shall have unlined or alloy lined studded ports to mate with a raised face or flat faced ANSI flange where 150# ANSI flanges are acceptable. Rubber liners are not allowed.
7. Units with NPT connections, except 1" port sizes, shall have the frame plate tapped with carbon steel female NPT connections or, if alloy material is required, extended male NPT nozzles.
8. Units with 1" ports shall have carbon steel or 316 stainless steel female tapped NPT or alloy material male NPT connections.
9. For units with studded port type connections, the studs around the ports must be provided by the manufacturer.
10. Units with connections greater than 3" require that the thermal plates be supported by the top carry bar. The bottom guide bar shall only assist in properly aligning the plates.
11. The design for units with 2.5" connections or smaller shall allow the plates to be supported by the bottom guide bar and the top carry bar shall help properly align the plates.
12. The carry and guide bar for 2" port models shall be carbon steel. For models with 2.5" ports and greater, the thermal plate contact surfaces of the carry and guide bar shall be carbon steel. For units with 1" connections, the carry and guide bars shall be zinc plated carbon steel. Provide any rust coating for carbon steel guides
13. For ease of movement during assembly and maintenance, the movable pressure plate shall be supported by a roller assembly over the carry bar for 4" ported models greater than 90" in height and for all 6" and larger ported models. For 4" ported models less than 90" in height, a glide clip made of ultra high molecular weight polyethylene shall be used on the movable pressure plate.
14. Units shall a minimum of two mounting feet at the frame plate and one at the support column, if a support column is used in the design.
15. For units with 300 psig design pressure or less, excluding "wide gap" designs, frames must be designed to withstand full test pressure in one circuit with zero pressure in the opposite circuit.
16. The nominal connection size shall match the nominal thermal plate port hole diameter.

C. Hardware
1. All bolting, including tightening bolts, shall be carbon steel SA193 grade B7 and galvanized via electroplating of zinc coating.
2. All nuts shall be carbon steel SA194 grade 2H and galvanized via electroplating of zinc coating.
3. Mounting feet shall be zinc plated carbon steel.
4. The tightening bolt assemblies on units with 3" and greater connections shall include lock washers at the movable pressure plate such that the unit can be opened and closed with one wrench from the front of the unit.

5. All the tightening bolt assemblies on units with 3" and greater connections shall include bearing washers at the fixed frame plate to reduce friction. Bearing assemblies only on some of the bolts is not allowed.
6. The nuts on the tightening bolt assemblies on units with 3" and greater connections shall be peened on, not welded, at the frame plate.

D. Plates
1. Plates shall be pressed in a one-step stamping process, except for plates 132" and greater in length, where multi step pressing is allowed.
2. Plates shall use an integral rolled edge hanging system to provide a rigid hanger device between the plate and carry bar and guide bar. Welded on hanging brackets or stiffeners are not acceptable.
3. The plate pack shall use a positive plate to plate alignment system to ensure proper plate to gasket seals throughout the plate pack. The positive alignment system shall either be a gasket lug which fits within a plate recess on the proceeding plate (tongue in groove) to align successive plates or an extended rolled edge hanger which nests successive plates through direct contact around the entire plate hanger. Plate designs which only offer alignment through contact with the carry and guide bar are unacceptable.
4. Plates shall have an enclosing groove for the entire gasket designed to contain the gasket while allowing for thermal expansion.
5. Plates shall be permanently marked to indicate plate material and thickness.
6. Double wall plates shall have an air gap with a leak detection path.
7. Stainless steel double wall plates shall be pressed at the same time to ensure a close fit with minimal loss of heat transfer.
8. For units with 300 psig design pressure or less, excluding "wide gap" designs, thermal plates must be designed to withstand full test pressure in one circuit with zero pressure in the opposite circuit.

E. Gaskets
1. All gaskets for single pass designs, except the gasket on the first plate, shall be identical.
2. The gaskets shall be a one-piece construction with a double gasket barrier at the port region. The area isolated by the double gasket shall be vented to the atmosphere, so that a gasket failure is detected by leakage to the exterior prior to any possible cross contamination.
3. Gaskets shall have tapered sides to assure positive seating of the compressed gasket and assist in aligning the thermal plates during compression.
4. When available, glue-free gaskets are preferred to glued-on gaskets. Glue-free gasket attachment methods which break during gasket removal or plate maintenance, thus destroying the gasket, are not allowed.
5. Care should be taken in the selection of gasket materials to insure compatibility with the fluids and operating temperatures.

F. Thermal/Hydraulic Design and Certification
1. The manufacturer shall provide written guarantee to the accuracy of the heat exchanger thermal design.
2. The manufacturer shall be certified with the Air-Conditioning, Heating and Refrigeration Institute's Liquid to Liquid Heat Exchanger Certification program, AHRI Standard 400, for the Model being supplied.
    a. For units within the scope of the program: "This heat exchanger is certified by the AHRI Liquid to Liquid heat exchanger certification program based on AHRI Standard 400. AHRI certified units are subject to rigorous testing, have

performance ratings independently measured and are third party verified. Certified units may be found in the AHRI Directory at www.ahridirectory.org".

b. For units at operating conditions outside the scope of the program: "The operating conditions are outside of the scope of AHRI Standard 400 Liquid to Liquid certification program of 2000 gpm and/or 24,000,000 btu/hr. Model is an AHRI Standard 400 certified model"

3. In accordance with AHRI Standard 400, the manufacturers output/specification sheet shall have the following information:
   a. Model Number;
   b. Volumetric Flow Rate;
   c. Inlet Temperatures on Both Circuits;
   d. Outlet Temperatures on Both Circuits;
   e. Pressure Drops on Both Circuits;
   f. Surface Margin (also known as Excess Surface Area);
   g. Heat Duty (also known as Heat Load);
   h. Overall Heat Transfer Coefficient;
   i. Heat Transfer Area;
   j. Number of Plates;
   k. Channel Arrangements on Both Circuits;
   l. Number of Passes;
   m. Plate Material and Thickness;
4. Should the Heat Exchanger not perform to the specified conditions as defined in AHRI Standard 400, the manufacturer is responsible to replace or repair the exchanger to achieve the stated performance.
5. If the manufacturer is not certified with the Air-Conditioning, Heating and Refrigeration Institute's Liquid to Liquid Heat Exchanger certification program, AHRI Standard 400, a witnessed factory performance test must be completed per the testing specification of AHRI Standard 400.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas for compliance with requirements for installation tolerances and for structural rigidity, strength, anchors, and other conditions affecting performance of heat exchangers.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 HEAT-EXCHANGER INSTALLATION

A. Install shell-and-tube heat exchangers on saddle supports and concrete base. Provide structural steel framework as indicated on the Drawings and as required to adequately support the unit[**s**].

B. Install plate exchangers on concrete base. Concrete base is specified in Division 23 Section "Common Work Results for HVAC," and concrete materials and installation requirements are specified in Division 03.

C. Comply with mounting and anchoring requirements for seismic installations.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Maintain manufacturer's recommended clearances for service and maintenance. Install piping connections to allow service and maintenance of heat exchangers.

C. Install shutoff valves at heat-exchanger inlet and outlet connections.

D. Install relief valves on heat-exchanger heated-fluid connection and install pipe relief valves, full size of valve connection, to floor drain.

E. Install vacuum breaker at heat-exchanger steam inlet connection.

F. Install hose end drain valve to drain shell.

3.4 FIELD QUALITY CONTROL
