

Phoenix Sky Harbor International Airport
PHX SKY TRAIN Stage 2
PROJECT AV10000011

PACKAGE B04

SPECIFICATIONS

**VOLUME 1 OF 2
PART ONE – DIVISIONS 01 THRU 08**

ISSUED FOR CONSTRUCTION

July 13, 2018

**SECTION 00010****TABLE OF CONTENTS**

Section Number	Section Title Package	Date
Division 1 – General Requirements		
01180	Project Utility Sources	12/28/2017
01200	Price & Payment Procedures	05/21/2018
01315	Project Coordination	05/21/2018
01316	Project Meetings	05/21/2018
01321	Photographic Documentation	03/02/2018
01325	Progress Schedules & Reports	10/06/2017
01330	Submittal Procedures	05/21/2018
01352	Special Project Procedures for Airport Facilities	12/26/2017
01360	Sustainable Design Requirements	03/12/2018
01400	Quality Requirements	01/17/2018
01410	Regulatory Requirements	12/27/2017
01425	Definitions & Reference Standards	10/06/2017
01454	Mock-Up Requirements	10/06/2017
01500	Temporary Facilities & Controls	10/06/2017
01555	Traffic Control	10/06/2017
01568	Temporary Tree & Plant Protection	10/06/2017
01571	Temporary Erosion & Sediment Control	10/06/2017
01723	Pre-Construction Video	10/06/2017
01725	Field Engineering	10/06/2017
01732	Cutting & Patching	10/06/2017
01736	Selective Demolition	12/20/2017
01770	Closeout Procedures	10/06/2017

Section Number	Section Title Package	Date
01780	Closeout Submittals	10/06/2017
01810	Commissioning	12/20/2017
Division 2 – Site Construction		
02072	Geocomposite In-Place Wall Drain	03/02/2018
02220	Site Demolition	10/06/2017
02223	Removal of Pavement Markings & Markers	11/03/2017
02224	Paving Removal	10/06/2017
02231	Clearing & Grubbing	10/06/2017
02237	Plant Salvage	12/01/2017
02300	Earthwork	10/13/2017
02316	Trenching & Backfilling	10/06/2017
02339	Subgrade Preparation	12/26/2017
02361	Termite Control	12/01/2017
02373	Riprap & Rock Lining	10/13/2017
02473	Drilled Concrete Shafts	03/02/2018
02582	Underground Ducts and Manholes	12/01/2017
02591	Phoenix Sky Train System Grounding	10/06/2017
02630	Storm Drainage	10/13/2017
02637	Utility Trench Drains	12/01/2017
02702	Concrete Curb, Gutter, Driveway, Sidewalk, & Alley Entrance	10/13/2017
02721	Aggregate Base Course	10/06/2017
02741	Bituminous Concrete Pavement	10/06/2017
02749	Colored Asphalt and Concrete Paving	12/01/2017
02751	Plain Cement Concrete Pavement	10/06/2017
02761	Plastic Pavement Markings	11/03/2017
02763	Painted Pavement Markings	10/13/2017

Section Number	Section Title Package	Date
02766	Raised Pavement Markers	11/03/2017
02769	Tactile Warning Surfaces	12/20/2017
02786	Tack Coat	10/13/2017
02789	Asphaltic Rubber Seal Coats	10/13/2017
02805	Pet Water Fountain	03/27/2018
02810	Irrigation System	07/09/2018
02821	Chain Link Fences & Gates	12/01/2017
02823	Ornamental Metal Fences & Gates (Coated)	04/19/2018
02823	Ornamental Metal Fences & Gates (Stainless-Steel)	04/19/2018
02825	Wire Rope Security Fence	12/01/2017
02829	Swing Gate Operators	11/03/2017
02891	Post-Mounted Signs	11/03/2017
02892	Structure-Mounted Signs	01/09/2018
02893	Traffic Signal Supports & Equipment	10/13/2017
02900	Planting	07/09/2018
02919	Topsoil	12/01/2017
Division 3 – Concrete		
03100	Concrete Forms & Accessories	03/02/2018
03150	Vertical Restrainers	03/02/2018
03200	Concrete Reinforcement	03/02/2018
03250	Post-Tensioning	11/03/2017
03260	Gabion Retaining Wall	12/01/2017
03300	Cast-In-Place Concrete	03/02/2018
03410	Plant-Precast Structural Concrete	11/03/2017
03434	Prestressed Concrete U-Beams	12/01/2017
03435	Prestressed Concrete Beams	11/03/2017

Section Number	Section Title Package	Date
03600	Grouts	10/06/2017
03935	Fiber-Reinforced Polymer Concrete Rehabilitation	7/13/2018
Division 4 – Masonry		
04810	Unit Masonry Assemblies	12/20/2017
Division 5 – Metals		
05120	Structural Steel	12/20/2017
05210	Steel Joists	12/20/2017
05310	Steel Deck	12/20/2017
05314	Long Span Steel Roof Deck	03/12/2018
05400	Cold-Formed Metal Framing	12/20/2017
05500	Metal Fabrications	12/20/2017
05511	Metal Stairs	03/30/2018
05520	Handrails and Railings	12/01/2017
05521	Pipe and Tube Railings	12/01/2017
05522	Tempered Glass Railing Assemblies	12/01/2017
05530	Gratings	12/01/2017
05580	Formed Metal Fabrications	12/01/2017
05700	Ornamental Metal	12/01/2017
05810	Expansion Joint Cover Assemblies	12/01/2017
05830	Bridge Expansion Joint Assemblies	12/01/2017
05835	Elastomeric Bearing Pads	12/01/2017
Division 6 – Wood & Plastics		
06105	Miscellaneous Carpentry	12/20/2017
06605	Fiberglass Reinforced Plastic Wall Panels	12/20/2017

Section Number	Section Title Package	Date
06690	Solid Surfacing Fabrications	12/01/2017
Division 7 – Thermal & Moisture Protection		
07132	Self-Adhering Sheet Waterproofing	12/01/2017
07142	Cold Fluid Applied Waterproofing	12/01/2017
07161	Metal Oxide Waterproofing	07/13/2018
07180	Traffic Coatings	03/12/2018
07190	Water Repellents	12/20/2017
07210	Building Insulation	12/20/2017
07275	Fluid-Applied Membrane Air Barriers	12/01/2017
07412	Metal Wall Panels	12/01/2017
07430	Composite Panels	12/01/2017
07485	Exterior Wall Assembly Testing Requirements	12/01/2017
07542	Polyvinyl-Chloride (PVC) Roofing	12/20/2017
07551	APP-Modified Bituminous Membrane Roofing	12/01/2017
07610	Sheet Metal Roofing	12/20/2017
07620	Sheet Metal Flashing and Trim	12/20/2017
07720	Roof Accessories	12/01/2017
07810	Applied Fireproofing	12/01/2017
07842	Fire-Resistive Joint Systems	12/20/2017
07850	Through Penetration Firestopping Systems	12/01/2017
07920	Joint Sealants	12/20/2017
Division 8 – Doors & Windows		
08110	Steel Doors and Frames	12/20/2017
08311	Access Doors and Frames	12/01/2017
08331	Overhead Coiling Doors	12/01/2017

END OF SECTION

SECTION 02072

GEOCOMPOSITE IN-PLACE WALL DRAIN

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for geocomposite drainage panels installed behind abutments and retaining or other walls as indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. MARV: Minimum Average Roll Value.
- B. Reference Standards:
 - 1. ASTM International (ASTM):
 - a. ASTM D 1621-16, Standard Test Method for Compressive Properties of Rigid Cellular Plastics.
 - b. ASTM D 2729-17, Standard Specification for Polyvinyl Chloride (PVC) Sewer Pipe and Fittings.
 - c. ASTM D 4491/D4491M-17, Standard Test Methods for Water Permeability of Geotextiles by Permittivity.
 - d. ASTM D 4632/D4632M-15a, Standard Test Method for Grab Breaking Load and Elongation of Geotextiles.
 - e. ASTM D 4716/D4632M-15a, Standard Test Method for Determining the (In-plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head.
 - f. ASTM D 4751-16, Standard Test Method for Determining Apparent Opening Size of a Geotextile.
 - g. ASTM D 4833/D4833M-07(2013)e1, Standard Test Method for Index Puncture Resistance of Geotextiles, Geomembranes, and Related Products.
 - h. ASTM D 4873/D4873M-17, Standard Guide for Identification, Storage, and Handling of Geosynthetic Rolls and Samples.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Scheduling:
 - 1. Schedule installation of the geocomposite in-place drains to follow installation of the retaining or other wall to receive the drain.

2. To minimize potential damage and deterioration between the time geocomposite drain material is placed and the time it is covered by backfill, allow the material to be exposed to the elements a maximum of 5 days.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Adhesive.
 - 2) Drainage pipe.
 - b. Certificates:
 - 1) Geocomposite Drain Flow Rate Certificate of Compliance.
 - 2) Geocomposite Drain Materials Certificate of Compliance.
 - c. Qualification Statements:
 - 1) Qualifications and certifications of the proposed Material Testing Laboratories.

B. Informational Submittals:

1. Submit the following to the Construction Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Drain manufacturer's adhesive recommendations.

1.05 QUALITY ASSURANCE

A. Qualifications:

1. Material Testing Laboratories:
 - a. To perform testing of the materials to be incorporated into the Work, and to control testing and inspections of the Work this Section, employ the services of one or more independent certified material testing laboratories having the following qualifications:
 - 1) Each Material Testing Laboratory must be independent, certified, and comply with the quality standards for testing laboratories of the nationally recognized associations and agencies that promulgate the test standards specified and with the basic requirements of ASTM E 329-14a and other standards specified in individual Specification Sections.
 - 2) Each Material Testing Laboratory must be capable of performing the reviews, inspections, and testing required of them by this Contract; including but not limited to the following:

- a) Inspecting, sampling, and testing proposed materials and production as required by the Program/Project Manager for compliance with the Contract Documents.
- b) Capable of securing production samples of materials at plants or stockpiles during the course of the work, and testing the samples for compliance with the Contract Documents.
- 3) The Material Testing Laboratory must be approved by the Program/Project Manager, and must also be accepted by the local jurisdictions responsible for building inspection.
- b. Dismissal and replacement of any of these independent certified Material Testing Laboratories by the Contractor requires written notice to and the approval from the Program/Project Manager.
- c. Submit the qualifications and certifications of the proposed Material Testing Laboratories to the Program/Project Manager for approval.

B. Certifications:

- 1. Geocomposite Drain Flow Rate Certificate of Compliance:
 - a. Submit a Geocomposite Flow Rate Certificate of Compliance for the geocomposite drain certifying that the drain produces the required flow rate.
 - 1) With the Certificate of Compliance, provide a flow capability graph for the geocomposite drain showing flow rates and externally applied pressures and hydraulic gradients; and stamped with the verification of an independent testing laboratory.
 - b. Submit a Geocomposite Drain Materials Certificate of Compliance with each shipment of materials attesting that the material conforms to the specified material requirements.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

- 1. Verify that a Geocomposite Drain Materials Certificate of Compliance is included with each shipment of materials.

B. Storage and Handling Requirements:

- 1. To protect rolls of geocomposite material against moisture and ultra-violet exposure prior to placement, wrap the material using a suitable protective wrapping.
- 2. Identify, store, and handle each roll in compliance with the requirements of ASTM D4873.
 - a. If the rolls are stored outdoors, elevate the rolls, and protect them with a waterproof cover.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Performance:
1. Flow Rate:
 - a. Provide geocomposite drain that at a hydraulic gradient of 1.0 produces a flow rate of at least 15 gallons per minute per foot of width.
 2. Environmental Resistance:
 - a. Provide geocomposite material resistant to chemical attack, mildew, and rot.
- B. Design Criteria
1. Provide geocomposite drain mats consisting of a manufactured core having a layer of filter fabric integrally bonded to one or both sides, and capable of maintaining a drainage void the entire height of the geocomposite drain.
 2. One side of the geocomposite drain mat must be impermeable.
 3. Provide a manufactured core consisting of one of the following:
 - a. A preformed grid of embossed plastic.
 - b. A mat of random shapes of plastic fibers.
 - c. A drainage net consisting of a uniform pattern of polymeric strands forming 2 sets of continuous flow channels.
 - d. A system of plastic pillars and interconnections forming a semigrd mat.
- C. Geocomposite Manufactured Core:
1. Thickness:
 - a. Provide a manufactured core for the geocomposite drain not less than 0.25 inch thick or more than 2 inches thick.
 2. Core Properties:
 - a. Provide a manufactured core for the geocomposite drain complying with the Minimum Average Roll Values (MARV) requirements specified in Table 02072-1.

Table 02072-1 Geocomposite Drain Manufactured Core Properties (Minimum Average Roll Values [MARV])		
Property	Test Procedure	Requirement
Minimum Compressive Strength (psi)	ASTM D1621	40
Flow rate (gallons per minute per foot of width) at 14.5 psi, hydraulic gradient 1.0,	ASTM D4716	15

**D. Geocomposite Filter Fabric:****1. Fabric Properties:**

- a. Provide filter fabric complying for the geocomposite drain with the Minimum Average Roll Values (MARV) requirements specified in Table 02072-2.

Table 02072-1 Geocomposite Drain Filter Fabric Properties (Minimum Average Roll Values [MARV])		
Property	Test Procedure	Requirement
Minimum Tensile Strength, either direction, (pounds)	ASTM D4632	110
Maximum Elongation, either direction (percent)	ASTM D4632	70
Minimum Puncture Resistance (pounds)	ASTM D4833	70
Apparent Opening Size (US Standard Sieve) ⁽¹⁾	ASTM D4751	70 - 120
1. Apparent Opening Size (AOS) requirement may be adjusted by the Program/Project Manager when less than 50% of the soil particles by weight pass a US No, 200 Sieve or when permeability (ASTM D4491) of the geotextile is equal to or less than permeability of the soil.		

2.02 ACCESSORIES**A. Adhesive:**

1. Provide an approved mastic, adhesive, or other material complying with the geocomposite drain manufacturer's recommendations.
2. Submit the geocomposite drain manufacturer's adhesive recommendations and Product Data for the adhesive to the Program/Project Manager for approval.

B. Drainage Pipe:

1. Provide perforated plastic pipe conforming to the requirements specified in ASTM D2729.
2. Submit Product Data for the drainage pipe to the Program/Project Manager for approval.

PART 3 EXECUTION**3.01 EXAMINATION****A. Verification of Conditions:**

1. Verify that there are no sharp objects which could puncture the geocomposite drain on the wall.
2. Verify that the surface of the wall is clean and dry in order that the adhesive will properly adhere.

3.02 INSTALLATION

- A. Unroll the geocomposite material, and place the material on the back of the retaining or other wall for the full length of the wall.
 1. Place the permeable fabric side facing away from the wall.
 2. For geocomposite material having core material manufactured from impermeable plastic sheeting with non-connecting corrugations, place the corrugations approximately perpendicular to the drainage collection system piping.
- B. Attach the geocomposite drain to the back of the retaining or other wall with adhesive in accordance with the manufacturer's recommendations.
- C. Geocomposite Drain Joints and Ends:
 1. At geocomposite drain joints, peel back the filter fabric from the core material, and provide a minimum fabric overlap of 3 inches.
 2. At the ends of the drainage panel, provide a 3 inch lap over the edge of the core material.
 3. If additional fabric is needed to provide overlap at joints and wraparound at edges, overlap the fabric on the geocomposite drain at least 6 inches and attach it to the geocomposite drain.
- D. Drain Pipe:
 1. To connect to the perforated pipe to the geocomposite drain, peel back fabric from the manufactured core a sufficient distance to encircle the perforated pipe between the fabric and core materials with a minimum of 3 inch fabric lap over the core material.
 2. Place the perforated pipe with the perforations down.
 3. Join the pipe sections securely with appropriate couplings and/or bands.
- E. Special Techniques:

3.03 REPAIR

- A. Filter Fabric Damage:
 1. Should the filter fabric on the geocomposite drain be torn or punctured, completely replace the damaged section; or repair the damage by covering the damaged area with a piece of filter fabric large enough to cover the damage and provide a 6-inch overlap.

3.04 PROTECTION

A. Compaction of Retaining Wall Backfill:

1. To minimize the risk of damage to the geocomposite drains, use hand operated compaction equipment to compact the backfill at retaining walls no closer than 1 foot from the geocomposite material.

SECTION 02220

SITE DEMOLITION

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Demolition requirements for buildings and vacant lots.
2. Restoration requirements for demolition Sites.

B. Related Requirements:

1. Section 01316 - Project Meetings.
2. Section 01325 - Progress Schedules and Reports.
3. Section 01330 - Submittal Procedures.
4. Section 01500 - Temporary Facilities and Controls.
5. Section 01571 - Temporary Erosion and Sediment Control.
6. Section 01780 - Closeout Submittals.
7. Section 02231 - Clearing and Grubbing.
8. Section 02300 – Earthwork.

1.02 REFERENCES

A. Definitions:

1. Debris: All materials generated as part of demolition activities or designated for removal as part of Site cleanup activities.
2. Combustible Gas Indicator (CGI): A device having sensors calibrated to measure the amount of a combustible gas or vapor in a given atmosphere, and used to test atmospheres for sufficient oxygen content for life support and/or the presence of combustible gases or vapors posing a potential flammability/explosion hazard.
3. Lower Explosive Limit (LEL): A lower limiting concentration of a gas or vapor in air at normal ambient temperatures that is needed for the gas or vapor to ignite and explode, expressed as a percentage of the gas or vapor in the air by volume; at gas or vapor concentrations below the LEL in air, there is not enough fuel to continue an explosion.
 - a. The concentration of the gas or vapor in air is usually given as a percentage of the LEL.
4. Underground Storage Tank (UST): As defined by the United States Environmental Protection Agency, any one or combination of tanks, including underground pipes connected thereto, which is used to contain an accumulation of regulated substances, and the volume of which

including the volume of the underground pipes connected thereto is 10 per centum or more beneath the surface of the ground.

 - a) Clean Air Act, as amended by Public Law 101-549, 104 Stat. 2399.95-95.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

- 1. Ensure minimum interference with roads, streets, walks, and other adjacent occupied or used facilities by demolition operations.
 - a. Do not close or obstruct streets, walks, or other occupied or used facilities without permission from the authorities having jurisdiction.
 - 1) Coordinate street and sidewalk closings and traffic control with the City of Phoenix Street Transportation Department Traffic Operations Division, the City of Phoenix Right-of-Way Management program, and with other appropriate government agencies.
 - 2) Obtain all permits required by the City of Phoenix, and pay necessary fees.
 - 3) Prepare traffic control and walkway plans required by the City of Phoenix Special Traffic Regulations.
 - b. Provide alternate routes around closed or obstructed traffic ways if required by governing regulations.
 - 1) Ensure safe passage of persons around the area of demolition.
- 2. Obtain the approval of serving utilities and/or the Phoenix Sky Harbor International Airport as applicable to schedule shut downs of utilities and services
- 3. Obtain the approval of serving utilities and/or the Phoenix Sky Harbor International Airport as applicable to disconnect, relocate, and/or provide temporary utility service connections and lines as needed if these have not been previously completed.
 - a. Coordinate all utility related work during construction activities to avoid tapping into established Aviation Facilities and Services utilities at Phoenix Sky Harbor International Airport.

- b. Forward all utility information to the Design and Construction Services Division (DCS) of the Phoenix Sky Harbor International Airport.

B. Meetings:

1. Pre-Demolition Meeting:

- a. Prior to beginning demolition operations, attend a mandatory pre-demolition meeting with the Program/Project Manager held in accordance with the requirements specified in Section 01316, Project Meetings.

2. Safety Meetings:

- a. Conduct daily safety meetings with the demolition staff.

C. Sequencing:

1. Coordinate and sequence the demolition work with the work of other trades whose activities are mutually affected to avoid conflicts, mistakes, omissions, disputes, and delays.

2. Unfinished Work:

- a. Sequence and schedule work with consideration for the stability of the areas of the structure not intended for removal or are intended for removal at a later time.
- b. Provide and secure bracing, shoring, or lateral supports to shore unstable areas created as a result of any cutting, removal, or demolition work.

D. Scheduling:

1. Show all phases of the demolition work on the Project Schedule required under Section 01325, Progress Schedules and Reports, including dates that each phase of the work will begin and end.

- a. Show the shut-off, capping, and continuation of utility services.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:

a. Product Data:

- 1) Tank cleaning agent.

b. Certificates:

- 1) Certificates of Destruction.

c. Special Procedure Submittals:

- 1) Underground Storage Tank Removal Work Plan (USTWP).

d. Qualification Statements:

- 1) Demolition licenses.

- 2) Resumes, licenses, or other qualifications of the personnel intended for performing tank removal operations.
- 3) Licenses, certifications, and other qualifications of the firm intended for performing utility location operations.
- 4) Name and location, licenses, certifications, and other qualifications of the firms intended for use as waste disposal or recycling facilities.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:

a. Test and Evaluation Reports:

- 1) Documentation of the sampling and analysis of materials to be removed and transported.
- 2) Records of inspections and tests required to comply with the requirements of each disposal facility.
- 3) Records of the backfill compaction.

C. Closeout Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:

a. Record Documentation:

1) Pre-Disposal Records:

- a) Names and locations of the disposal areas and facilities to be used for disposing and recycling the materials.
- b) Copies of the licenses, certifications, permits, and agreements required or issued for the disposal of materials.
- c) Equipment and methods to be used for removal and disposal operations.

2) Records of Waste Disposal Operations:

- a) Records of the disposal operation.
- b) Manifests of shipments of contaminated materials.
- c) Records of corrective actions taken to address any problems encountered during disposal operations.

1.05 QUALITY ASSURANCE

A. Qualifications:

1. The Contractor and all Subcontractors who perform demolition activities must be properly licensed to perform the demolition work of this Contract.
 - a. Submit copies of the required licenses to the Program/Project Manager.

2. During all times that the Work is performed, the Contractor is responsible to have at least one fully competent and experienced general Superintendent at the Site to represent the Contractor in all matters.
 - a. Instructions and information given to the Contractor's general Superintendent by the Program/Project Manager is considered to have been given to the Contractor.
 - b. Whenever emergencies from whatever cause arise during the Contract, be prepared to perform all necessary work promptly to address the emergency conditions, including special efforts or adding extra work shifts to continue work beyond normal working hours.

1.06 SITE CONDITIONS

- A. Ambient Conditions:
 1. The use of explosives at the Site is prohibited.
 2. Do not use water to limit dust and dirt when it may create hazardous or objectionable conditions such as flooding and pollution.
- B. Existing Conditions:
 1. Structures to be demolished will be vacated prior to the start of the Work of this Section.
 - a. The Phoenix Sky Harbor International Airport assumes no legal responsibility for the actual condition of the structures to be demolished.
 - b. The conditions of the structures to be demolished that existed at the time of inspection for bidding purposes will be maintained by the Phoenix Sky Harbor International Airport.
 - c. Keys to the structures to be demolished will be available from the Program/Project Manager when they exist so the Contractor can review the structures.
 2. All existing underground and aboveground utilities, services, and improvements, if any, are indicated in the Contract Documents to the best of the Phoenix Sky Harbor International Airport's knowledge and belief; however, the Phoenix Sky Harbor International Airport has not verified this information by on-site verification of available as-built documentation, and the Contractor shall notify the Phoenix Sky Harbor International Airport of discrepancies discovered in the information provided in accordance with the notification and change procedures of the Contract.

1.07 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:

1. Remove each septic tank or UST and its associated surface and subsurface piping and equipment according to applicable Federal, State, and Local requirements.
 - a. Comply with the Clean Air Act, Clean Water Act, Resource Conservation and Recovery Act (RCRA), and other Federal laws and regulations listed in Article 1.02 or applicable, and with State and Local laws and regulations, applicable to septic tank and underground storage tank removal.
 - b. Furnish spill prevention countermeasure materials and control products, including plastic sheeting and absorbent materials
2. Package or containerize, label, manifest, transport, and dispose of hazardous liquid and solid wastes in accordance with the provisions of applicable Local, State and Federal laws and regulations.
 - a. Transport hazardous and non-hazardous waste in vehicles appropriately licensed, placarded, and operated by appropriately trained personnel.

B. Qualifications:

1. Tank Removal Personnel:
 - a. Only employ personnel qualified to perform underground storage tank removal operations that can demonstrate at least 5 years of experience performing removals similar to those required as the Work of this Section.
 - 1) Persons responsible for testing tank atmospheres using a combustible gas indicator (CGI) must be completely familiar with the use of the instrument and the interpretation of the instrument's readings.
 - b. Submit the resumes, licenses, and other qualifications of the personnel intended for performing tank removal operations to the Program/Project Manager for approval.
 - 1) Attach evidence that the persons responsible for CGI testing have been trained to use and read the CGI employed at the Site.
2. Off-Site Disposal Facility:
 - a. Use only properly licensed disposal facilities to handle the types of waste materials generated by the UST removals, and listed in the approved Underground Storage Tank Removal Work Plan (USTWP).
 - b. Off-Site disposal facilities must be approved by the Program/Project Manager prior to being used to receive waste materials from this Contract.
 - c. Submit the name and location, licenses, certifications, and other qualifications of disposal and recycling facility(s) intended for use for the disposal or recycling of tanks, piping, tank supports, liquid waste,

solid waste and appurtenances to the Program/Project Manager for approval.

C. Certifications:

1. Certificate of Destruction:

- a. For each tank decommissioned, and within 15 days of the tank's removal from the Site, submit a signed Certificate of Destruction to the Program/Project Manager.

D. Site Samples:

1. Waste Characterization Sampling and Analysis:

- a. To the extent required by the approved off-site disposal facility intended to receive the material from demolition of septic tanks and USTs being removed, have the Testing and Inspection Agency perform waste characterization sampling and analysis of the contaminated materials removed prior to transporting them off-site.
- b. Perform additional sampling and analysis required by others prior to transporting the potentially contaminated material.
- c. Conduct chemical sampling and analysis of the material being removed throughout the duration of removal activities.
 - 1) Sample and test the materials to determine if non-hazardous or hazardous contaminated materials disposal is required.
- d. Prepare, maintain, and submit to the Program/Project Manager documentation of the sampling and analysis, such as sample locations, rationale, chain-of-custody, test results, and similar information prior to removing tank contents.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Provide the equipment, personnel, and facilities necessary and suitable to remove, load, transport, unload, and dispose of or recycle the excavated soil materials, USTs and hydraulic lifts, associated piping, cylinders, tank contents, and other items demolished under this Section.
 - a. If similar liquid wastes are compatible, they may be bulked for cost effective disposal.
2. Transport and manifest the liquids, residues, and rinsate removed to an approved disposal facility.
 - a. Have the Program/Project Manager sign the manifest prior to transporting waste rinsate to an approved disposal facility.
 - b. Secure the tanks on trucks for transportation to a storage or disposal facility with all accessible holes being plugged or capped.
 - 1) Provide one plug with a 1/8-inch vent hole, and locate this plug at the uppermost point on the tank to prevent the tank from being

subject to excessive differential pressure caused by temperature changes.

- a) Position the tank so the vent plug is on the top of the tank during subsequent transport and storage of the tank, or until the tank is punctured preparatory to disposal.

B. Storage and Handling Requirements:

1. Rinsate:

- a. Contain and label rinsate generated by septic tank, UST, pipe, and appurtenance cleaning operations.
 - 1) At a minimum, label the rinsate with the date it was generated, the location of the tank it was removed from, and the type of liquid or residue,
- b. Locate rinsate in above ground containers temporarily stored on-site away from traffic patterns as designated by the Program/Project Manager.
- c. Keep rinsate from cleaning operations separate from contaminated and uncontaminated surface runoffs, and from the tank contents.

PART 2 PRODUCTS

2.01 MATERIALS:

A. Backfill:

1. Provide backfill material that conforms to the requirements specified in Section 02300, Earthwork.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Prior to performance of the actual work, carefully inspect the entire site and locate those objects and structures designated for demolition and removal.
 - a. Field verify the dimensions, quantity, type, material, location, means of anchorages and support, interconnection with other facilities, and other pertinent characteristics of facilities which must be removed or demolished to accommodate new facilities.
2. Locate existing exposed and buried active utilities, and determine the requirements for their protection, or their disposition with respect to the demolition work.

- a. Prior to performing excavation operations, contact Arizona 811 (formerly Arizona Blue Stake, Inc.) to verify the location or existence of buried utilities and avoid damage to the utilities.
 - 1) Arizona 811 may be contacted by telephone at (602) 659-7500.
 3. Inspect the properties identified for demolition to identify items of value which the Contractor intends to salvage or retain.
 - a. Notify the Program/Project Manager of the intent to retain or salvage items.
 - b. The Phoenix Sky Harbor International Airport reserves the right to renegotiate the Contract Price to reflect proposed salvaged or retained items.
- B. Evaluation and Assessment:
 1. Verify with the Program/Project Manager the objects to be removed and preserved.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 1. Conduct demolition operations in a manner that prevents injury to adjacent buildings, structures, other facilities, and persons.
 - a. If public safety could be endangered during the progress of the demolition work, provide adequate protective measures to protect public pedestrian and vehicular traffic on streets and walkways.
 - 1) Provide warning signs, signals, and barricades conforming to requirements of Federal, State and local laws, rules, regulations, precautions, orders, and decrees.
 - b. Leave all sidewalks, curbs, pavement, and shoring of these and similar items in place and properly braced except as otherwise indicated in the Contract Drawings.
 - c. If buildings are designated to remain vacant on the Site, secure the doors, windows, and attic access at carports of those buildings in accordance with the requirements specified in Section 01500, Temporary Facilities and Controls.
 2. Maintain existing utilities indicated to remain, and protect them against damage.
 - a. Electrical:
 - 1) Disconnect or de-energize on-site electrical wiring close to or entering structures to be demolished.
 - 2) Coordinate with the local electrical utility company for necessary relocation of utilities.
 - b. Water:
 - 1) Disconnect or cap on-site water lines close to or entering structures to be demolished.

- 2) Protect existing fire control hydrants and repair damaged hydrants.
 - 3) Coordinate with the local municipality for necessary relocation of utilities.
 - c. Natural Gas:
 - 1) Disconnect or cap on-site gas lines and mains close to or entering structures to be demolished.
 - 2) Coordinate with the local gas utility company for necessary relocation of utilities.
 - d. Sanitary and Storm Sewers:
 - 1) Disconnect or cap sanitary sewers and storm drains close to or exiting structures to be demolished.
 3. Keep all active utilities in service.
 - a. Protect active utilities, improvements, and services from damage.
 - b. Take precautions to work safely around the utility corridors identified, or have the utility services temporarily disconnected.
 - c. Do not interrupt existing utilities serving occupied or used facilities, except when authorized in writing by the authorities having jurisdiction.
 - d. During interruptions to existing utilities, provide temporary services acceptable to governing authorities.
- B. Surface Preparation:
1. Control fugitive dust by applying an adequate dust palliative, such as water, to the ground and debris in an amount sufficient to maintain dust as incidental to demolition and lot clearing operations in accordance with the requirements of the Maricopa County Air Pollution Regulations and with the requirements of other authorities having jurisdiction.
 - a. Sprinkle water, use temporary enclosures, and employ other suitable methods to limit dust and dirt rising and scattering into the air to the lowest practical level.
 2. Before beginning to excavate, place temporary erosion and sediment controls around proposed excavations in accordance with Section 01571, Temporary Erosion and Sediment Control, to eliminate erosion and sedimentation problems caused by the Work of this Section.
 3. Excavate around the septic tanks, USTs, and piping to be removed, and uncover them to facilitate their removal.
 - a. Excavate the tanks and their appurtenances in accordance with Section 02300, Earthwork.
 - 1) If the Program/Project Manager deems it necessary to do so, perform the excavation activities in phases, and complete all of the phases prior to the pre-final inspection.
 - b. Manage surface water runoff, seepage, and infiltrating groundwater.

4. Provide temporary barriers around open excavations in accordance with Section 01500, Temporary Facilities and Controls, to protect workers and the public from injuries sustained from falling into the excavations.

C. Removal:

1. Unless otherwise indicated in the Contract Documents, entirely remove all trees, palms, shrubs, and other vegetation areas in accordance with the requirements of Section 02231, Clearing and Grubbing.
 - a. When clearing lots, remove and properly dispose of sticks, roots, rubbish, and other material.
2. Remove or relocate active utilities, services, and improvements only as indicated on the Contract Drawings, as specified, or as provide by Change Order.

3.03 DEMOLITION

A. Regulatory Requirements:

1. Comply with the Laws, Codes, and Regulations pertaining to the work being performed.
 - a. All work is governed at all times by the applicable provisions of Federal Laws, including but not limited to, the following:
 - 1) Occupational Safety and Health Administration (OSHA):
 - a) Occupational Health and Safety Standards.
 - b) Safety and Health Regulations for Construction.
 - 2) Environmental Protection Agency (EPA):
 - a) National Emission Standards for Hazardous Air Pollutants.
 - b) Federal Toxic Substances Control Act.
 - c) Water Quality Act of 1987.
 - d) Clean Water Act of 1977.
 - e) Federal Water Pollution Control Act Amendments of 1972.
 - f) Resource Conservation and Recovery Act (RCRA).
 - g) Clean Air Act.
 - b. When performing utility work, observe the governing code authority and utility company rules and regulations as applicable.
 - c. During demolition activities, constructing soil berms, or other earth moving operations, comply with the Maricopa County Air Quality Permit and Dust Control requirements, particularly Rule 310 and Rule 310.01.

B. Inactive or Abandoned Utilities:

1. Coordinate all utility relocations with the Phoenix Sky Harbor International Airport and the utility company.

2. Remove, plug, or cap inactive and abandoned utilities encountered during the work and as indicated in the Contract Documents.
 - a. Cap all utilities in a location approved by the Phoenix Sky Harbor International Airport.
 - b. Use approved cap materials.
 - c. If no specific setbacks are indicated, plug or cap inactive and abandoned utilities at least 5 feet outside of new building walls or as required by local regulations.
- C. Building and Structure Demolition:
 1. Demolish buildings and structures to the extent indicated on the Contract Drawings.
 2. Unless it is indicated to remain, demolish concrete and masonry in small sections.
 - a. Break up concrete slabs on grade.
 3. Do not impose excessive loads on supporting walls, floors, or framing.
 - a. Distribute demolition equipment throughout the structure, and remove demolished materials promptly.
 4. Use hoists, derricks, cranes, or other suitable equipment to remove and lower structural framing members.
 5. Security Board-Up of Buildings:
 - a. On vacant buildings designated to remain, secure the doors, windows, and attic access at carports in accordance with the board-up requirements specified in Section 01500, Temporary Facilities and Controls.
- D. Demolition of Below-Grade Construction:
 1. Except as indicated by the Contract Documents, remove all below-grade construction and on-grade concrete slabs to 4 feet below existing grade.
 - a. Remove all below-grade underground storage tanks (USTs) and septic tanks in their entirety.
 - 1) Underground Storage Tank Removal Work Plan (USTWP):
 - a) Prepare and submit to the Program/Project Manager an Underground Storage Tank Removal Work Plan (USTWP) that describes in detail the proposed procedures for removing and properly disposing of existing underground storage tanks and contaminated soil and liquids to be removed.
 - (1) Provide a detailed sequence of operations, and a description of the methods and equipment to be used for each operation.
 - (2) Include procedures for carefully removing, testing, and disposing of solid materials and liquid wastes; and for safely conducting the Work.

- (a) Describe the proposed method for product removal from the tanks, pipelines, and ancillary equipment.
 - (b) Ensure that the procedures include health, safety, and emergency response procedures, and off-site transportation and disposal procedures.
- (3) Include the names and locations of appropriately licensed disposal facilities intended to be used for the disposal or recycling of removed tanks, piping, tank supports, liquid waste, solid waste, and appurtenances.
- (4) Base the USTWP on previous work experience and the guidance provided in this Specification Section.
- 2) Except as otherwise specified or indicated on the Contract Drawings, comply with the requirements of the API standards listed in Article 1.02.
- 3) Remove any existing water, fuel, or other fluids and residues in existing pipelines and appurtenances in a safe and proper way so that flammable, hazardous, toxic, or deleterious substance are not released into or on the land surface, waterways, or any other portion of the environment.
 - a) Furnish only explosion-proof or air-driven pumps for removing liquids and residues from existing piping and equipment.
 - (1) Bond the pump motors and suction hoses to pipe or otherwise ground these items to prevent electrostatic ignition hazards.
 - b) If vacuum trucks are furnished to remove liquids or residues from existing piping and equipment, comply with the requirements of API 2219.
 - (1) Ensure that the area the vacuum trucks operate in is free of flammable vapors.
 - (a) Locate the vacuum trucks upwind from the tanks and outside the path of probable vapor travel.
 - (2) Discharge vacuum pump exhaust gases through a hose of adequate size and length downwind of the truck and tank area.
 - c) Remove the residue on the interior of piping to the degree of cleanliness required by applicable regulations and by the requirements of the tank and piping disposal or recycling facilities.
 - (1) Steam and/or detergent solvent solutions may be used to aid in removing the residue provided they are disposed of the same as the pipe and equipment contents and they do not introduce hazardous substances.

- 4) Perform inspections to ensure that the contents of existing pipelines and appurtenances are thoroughly drained into suitable containers having the capacity and integrity to contain them for storage until their proper disposal can take place.
 - a) Take care to drain all depressions, pockets, lines, and pumps.
- 5) Disconnect system lines from compartments and equipment.
 - a) Disconnect pumps, tightly seal their outlets, and remove the pumps.
 - b) Remove meters, air eliminators, and manifold valves from the tanks and piping to be removed.
- 6) Tank Degassing:
 - a) Degas the tanks prior to and during cleaning operations, and before initiating tank demolition to temporarily free the tank atmosphere of vapor, and to reduce the flammable and/or combustible tank atmosphere to a safe working level.
 - (1) Remove flammable vapors using a method described in API 1604, except as follows:
 - (a) Do not fill tanks with water.
 - (b) If dry ice is employed, use a minimum of 1.5 pounds of dry ice per 100 gallons of tank volume.
 - (2) Vent vapors from tanks at a minimum of 12 feet above grade to avoid creating a flammable and/or combustible hazard.
 - (a) Existing vent pipes may be used for this purpose provided they are 12 feet above grade.
 - (b) If an existing vent pipe is not 12 feet above grade or above the building roof line, attach an extension pipe.
 - b) Obtain and maintain atmospheric readings of 10 percent or less of the lower explosive limit (LEL) prior to and during the tank cleaning process.
 - (1) Recognize that tanks can still become a source of flammable vapors even after the degassing procedures are followed.
 - (2) Test the tank and pipeline atmosphere regularly for flammable or combustible vapor concentrations according to API 1604 until tank demolition is complete.
 - (a) Use a properly calibrated combustible gas indicator (CGI) to determine the combustible atmosphere within the tank.
 - i. Properly calibrate combustible gas indicators according to the Manufacturer's instructions, and thoroughly check and maintain the calibration in

accordance with the Manufacturer's Specifications.

- (b) If another approved method as described in API 1604 is proposed in lieu of CGI testing, it must be in accordance with State and Local fire codes.

- 7) Tank Cleaning and Liquid Residue Removal:
 - a) Disconnect the tank and its associated piping.
 - b) Immediately following the tank degassing operation, clean the tank in accordance with the procedures in API 2015, and rinse it with a cleaning agent approved by the Program/Project Manager.
 - (1) Ensure that residues in the tanks and piping remain in the tanks and piping during removal operations.
 - (2) Submit Product Data for the cleaning agent to the Program/Project Manager for approval.
 - c) For removing liquids and residues from existing tanks, furnish only explosion-proof or air-driven pumps.
 - (1) Bond the pump motors and suction hoses to pipe or otherwise ground these items to prevent electrostatic ignition hazards.
- 8) Tank Demolition:
 - a) Demolish tanks and their associated lines in accordance with API 2202 and API 2207.
 - (1) Cap or plug all accessible holes.
 - (a) Provide a 1/8-inch vent hole in one plug to prevent the tank from being subjected to excessive differential pressure caused by temperature changes.
 - i. Keep the tank positioned with this vent plug on the top of the tank during subsequent transport and storage, or until they are punctured preparatory to disposal.
 - b) Label the tanks after demolition but prior to removal of the tank from the Site.
 - (1) Regardless of the condition of the tank, provide a warning label containing a warning against using the tank for storing certain types of refuse.
 - (2) Indicate each tank's former contents and the present vapor state, including vapor-freeing treatment.
 - (3) Provide a legend on the label similar to the following in lettering at least 2 inches high and legible:

1. Tank Has Contained [Fuel Oil] Not Vapor Free.
2. Not Suitable for Storage of Food or Liquids Intended for Human or Animal Consumption.

- c) Remove the tanks from the Site as promptly as possible, preferably on the day of tank demolition.
 - (1) If the tanks remain at the Site overnight, test them with a CGI in accordance with State and Local regulations prior to removing them.
 - (a) If the testing indicates an atmosphere in excess of 10 percent of the LEL, evacuate the Program/Project Manager's and Contractor's personnel to a safe area, except those directly engaged in reducing the combustible atmosphere.
 - i. Do not perform Work on or around the tanks until the combustible atmosphere in each tank is less than 10 percent of the LEL.
 - ii. Provide appropriate ventilation, degassing, or other safety measures to reduce the combustible atmosphere in each tank to less than 10 percent of the LEL prior to resuming Work.
- d) Reduce the tanks to scrap at a Site specifically designated for this activity, and sell or dispose of the demolished tanks as scrap.
 - (1) Do not reuse the tanks or sell the tanks for reuse.
 - (2) If it is not possible or feasible to reduce the tanks to scrap, render the tanks unfit for further use.
 - (a) Introduce a sufficient number of holes in the tanks to make their reuse impossible.
 - (b) Check the tanks with a CGI before and during this operation to prevent fire or explosive hazards.
- b. Contaminated Soil Excavation
 - 1) If during the UST removal activities, the Program/Project Manager determines that contaminated soil has been encountered, excavate the contaminated soil as specified in Section 02300, Earthwork, and as directed by the Program/Project Manager.
 - a) If the Program/Project Manager determines that excavation work must be phased, complete all phases of the excavation prior to the pre-final inspection.
- c. Contaminated Water Removal

- 1) If during UST removal activities the Program/Project Manager determines that contaminated water has been encountered in the excavations, remove the contaminated water from the excavation as directed by the Program/Project Manager
 - a) Arrange to dispose of the contaminated water off-site.
 - (1) Collect water characterization samples in accordance with the disposal or recycling facility's requirements and as directed by the Program/Project Manager.
 - b) If approved by the Program/Project Manager and Owner, arrange to treat the water at the Site prior to discharging it to the ground water or surface water as directed by the Program/Project Manager.
 - (1) Prior to discharging the treated water, perform the testing required by Local, State, and Federal regulations.
2. Backfill and compact all voids created by demolition operations.
 - a. Backfill and compact basements, footings, basement walls, and the total volume within substructures in their entirety.
 - b. Compact backfill in accordance with the requirements specified in Section 02300, Earthwork.
 - 1) The last 12 inches of backfill may not contain material larger than 3 inches in diameter.

E. Excavation and Grading:

1. Uniformly grade the final compacted surfaces so that they are primarily flat.
 - a. On Sites that are to be scraped to form soil berms around their perimeter, compact the soil at the Site, including the soil in the berms.
 - b. If formation of an 18-inch berm is required adjacent to a remaining building, provide the same gradient to ensure that no "free" water migrates to or collects at the wall faces.
2. After completing fine grading, treat the lot with water, and compact the soil to permanently stabilize the lot in accordance with Maricopa County Rule 310, Appendix C.
 - a. Alternative dust palliatives may only be used with the written approval of the City of Phoenix Office of Environmental Programs.
3. Level all parcels to finish grade to facilitate future weed cutting.

F. Salvage:

1. Except for items indicated to remain the property of the Phoenix Sky Harbor International Airport, other salvaged and demolished materials not indicated for reuse become the property of the Contractor.
 - a. The disposition of the other salvaged and demolished materials not indicated for reuse is at the Contractor's option.

2. Items salvaged by the Contractor may be removed from structures as the demolition work progresses.
 - a. Transport salvaged items away from the Site as they are removed.
 - 1) Storage or sale of the salvaged or removed items on-site is not permitted.
3. Salvaging items is not cause for claiming delay in the completion time agreed upon for completion of the Contract

G. Special Techniques:

1. Environmental Protection:
 - a. Comply with the regulations governing pollution controls.
 - b. If potentially dangerous materials, such as asbestos, lead, refrigerant, batteries, fluorescent light bulbs, storage drums, storage tanks, sumps, grease interceptors, or similar items are unexpectedly encountered, discontinue work in that immediate area, and report the conditions to the Program/Project Manager as soon as practicable.
 - 1) If on-site materials are found to contain hazardous contaminant concentrations above the Resource Conservation and Recovery Act (RCRA) disposal limit, remove and dispose of them in accordance with the RCRA and its amendments.

3.04 REPAIR / RESTORATION

- A. Restore adjacent areas to the conditions existing prior to the start of the demolition work.
- B. Use the same trade which originally constructed items that have been damaged to patch or repair these items at no increase in the Contract Price.
- C. Repair all damage to existing underground and overhead utilities, services, and improvements caused by demolition or other operations; whether or not such utilities, services, and improvements are indicated on the Contract Drawings.
 1. Commence and complete the work to repair damaged utilities as soon as practicable.

3.05 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. Compaction Test:
 - a. Test Procedure:
 - 1) Have the Testing and Inspection Agency use a nuclear density gauge or other approved method to measure the compaction of backfill and Site grading.

- b. Acceptance Criteria:
 - 1) Compaction achieving the minimum density specified is acceptable.
- 2. UST Testing:
 - a. Prior to proceeding with the final disposal of the tanks and other waste materials, have the Testing and Inspection Agency perform the testing required, including the following:
 - 1) Chemical sampling and analysis of contaminated materials removed during UST removal activities prior to transporting these contaminated materials off-site.
 - 2) Tests performed to comply with the requirements of each disposal facility.
 - b. Have the Testing and Inspection Agency test the compaction of the backfill placed, as specified in Section 02300, Earthwork, and submit the testing records to the Program/Project Manager for approval.
 - c. The Program/Project Manager will perform the confirmation sampling required at the completion of the UST and contaminated soil removals and Site remediation activities.
 - 1) Provide assistance to the Program/Project Manager to collect these verification samples for testing.
- B. Inspections:
 - 1. The Program/Project Manager will inspect all finished work and notify the Contractor of discrepancies and omitted work.
 - 2. Have the Testing and Inspection Agency perform the inspections required by regulatory agencies, the disposal facilities, and API standards.
- C. Non-Conforming Work
 - 1. Within 2 days of notification by the Program/Project Manager of discrepancies and/or omitted work, correct the discrepancies and perform the omitted work.

3.06 CLEANING

- A. Clean dust, dirt, and debris resulting from demolition operations from adjacent structures and improvements as directed by the Program/Project Manager.
- B. Promptly remove the tools, equipment, materials, and debris used during demolition activities from the Site upon completion of the Work of this Section.
- C. Waste Management:
 - 1. Leave the area in which the demolition work was performed clean and free of all rubbish and debris.
 - a. Do not leave debris inside substructure areas.

2. Remove debris, rubbish, and the debris from building demolition, and legally dispose of them off-site.
 - a. Transport demolition materials from demolished structures away from the Site.
3. Burning materials removed from demolished structures on the Site is not permitted.
4. Underground Storage Tank Disposal:
 - a. Follow the applicable regulatory requirements for disposing of removed underground storage tanks.
 - 1) In accordance with the Federal Resource Conservation and Recovery Act (RCRA) as amended, and local laws and regulations, manage liquid and solid wastes that have been determined to be hazardous according to the criteria set forth in those laws and regulations.
 - b. Pre-Disposal Documentation:
 - 1) Submit the following documentation for materials to be removed and disposed of to the Program/Project Manager prior to removing the materials from the Site:
 - a) The names and locations of the disposal areas and facilities to be used for disposing and recycling the materials.
 - b) Copies of the licenses, certifications, permits, and agreements required or issued for the disposal of materials.
 - c) The equipment and methods to be used for removal and disposal operations.
 - c. Dispose of or recycle the tanks, piping, tank supports, liquid waste, solid waste, and appurtenances removed only at the disposal facilities listed in the approved Underground Storage Tank Removal Work Plan (USTWP).
 - 1) Dispose of removed underground storage tanks at an approved facility immediately after demolition.
 - 2) Reduce removed tanks to scrap at a site specifically designated for this activity, and sell or otherwise dispose of the tanks as scrap.
 - a) Check the tanks with a combustible gas indicator (CGI) before and during this operation in order to prevent fire and explosive hazards.
 - 3) Under no circumstances allow the tanks to be reused or sold for reuse.
 - 4) If it is not possible or feasible to reduce the tanks to scrap, render the tanks unfit for further use by introducing a sufficient number of holes in the tanks to make their reuse impossible.
 - d. Disposal Operation Records:

- 1) Maintain records of the inspections and tests performed to comply with the requirements of each disposal facility.
- 2) Maintain detailed records of the entire disposal operation, including at a minimum the following information:
 - a) Date of disposal operation.
 - b) Tank number or identifier.
 - c) Tank capacity.
 - d) Tank dimensions.
 - e) Product stored.
 - f) Vapor purge method used.
 - g) Amounts of product and other liquid removed, including rinsate.
 - h) Disposal/recycling site of the tank and its appurtenances.
 - i) Detailed log of contact with regulatory agencies and all personnel involved in the operation.
 - j) Method used to render the tank unfit for the further use.
- 3) Following shipment of contaminated materials to a disposal facility, submit to the Program/Project Manager a copy of each manifest evidencing the delivery of removed material to an approved licensed disposal facility, chain of custody records, weigh tickets, meter recordings, delivery tickets, and receipts required or issued for the disposal of materials:
 - a) Prepare each manifest in accordance with the requirements of the applicable Federal, State, and local laws and regulations.
 - b) Each manifest must list, but is not limited to, the following information:
 - (1) Surface runoff.
 - (2) Tank contents.
 - (3) Expended cleaning liquids and rinsate.
 - (4) Structural components.
 - (5) Tanks and piping.
 - c) Maintain and submit to the Design Professional proper documentation for scrap metals recycling.
- 4) Maintain records of corrective actions taken to address any problems encountered during disposal operations.
- 5) Except as follows, within 15 calendar days of the final disposal of each tank submit the detailed records as described in Subparagraphs 3.06.C.4.a through 3.06.C.4.d for the entire disposal operation to the Program/Project Manager for information.
 - a) Submit appropriate manifests and related documents for hazardous liquid and solid wastes to the Design Professional within 2 working days of disposal.

3.07 PROTECTION

- A. Where excavation work is required during demolition operations and is incomplete, provide temporary chain link fencing as specified in Section 01500, Temporary Facilities and Controls, around the excavated areas.

SECTION 02223

REMOVAL OF PAVEMENT MARKINGS AND MARKERS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for removing existing pavement markings and markers from pavement, including:
 - a. Permanent preformed plastic pavement marking tape.
 - b. Raised pavement markers.
 - c. Thermoplastic markings.
 - d. Traffic paint.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01555 - Traffic Control.
 - 3. Section 02786 - Tack Coat.
 - 4. Section 02741 - Bituminous Concrete Pavement.

1.02 REFERENCES

- A. Definitions:
 - 1. Asphalt Concrete Overlay: Plant mix asphalt concrete placed over existing asphalt concrete paving and compacted.
 - 2. Turboblasting: A blast cleaning method using high velocity steel shot directed at a surface to be cleaned in order to abrade the surface.
 - 3. Type I Preformed Plastic Pavement Marking Tape: General-purpose pavement markings intended for finished permanent striping and markings.
- B. Reference Standards:
 - 1. City of Phoenix (COP):
 - a. City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - 1) Section 321 – Placement and Construction of Asphalt Concrete Pavement.
 - 2) Section 710 - Asphalt Concrete.
 - 2. Maricopa Association of Governments (MAG):
 - a. Uniform Standard Specifications for Public Works Construction:
 - 1) Section 330 – Asphalt Chip Seal.
 - 3. U. S. Government:
 - a. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 - Occupational Health and Safety Standards.
 - 2) 29 CFR 1926 - Safety and Health Regulations for Construction.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Depending on where the pavement markings and markers removal operation is to occur and the owner of the Right-of-Way, coordinate with and obtain the required approvals from the appropriate State and municipal departments, including but not limited to, the following:
 - a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Street Transportation Department.
 - c. Phoenix Sky Harbor International Airport.
 - 2. If the owner of the right-of- way is other than the Phoenix Sky Harbor International Airport, the owner of the right-of- way will be provided on the Contract Drawings.
- B. Sequencing:
 - 1. Include provisions for traffic control during pavement markings and markers removal operations in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the workers and the public during removal operations.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Asphalt overlay material.
 - b. Delegated Design Submittals:
 - 1) Lead Exposure Plan, if removal of lead-based striping is required.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Required approvals depend on where the removal of pavement markings and markers is to be performed and who owns the right-of- way, but must be obtained before construction activities begin from the appropriate State and municipal departments, which may include but are not limited to, the following:
 - a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Streets Department.
 - c. Phoenix Sky Harbor International Airport Design and Construction Services.
 - 2. The special removal techniques specified in this Section are approved methods for the removal of traffic paint, thermoplastic markings, Type 1

(permanent) performed plastic tape, and raised pavement markers as indicated.

3. If removal of lead-based paint striping is required, use methods complying with the requirements of 29 CFR 1910 and 29 CFR 1926.
 - a. Notify employees of the Contractor, the Program/Project Manager, the Phoenix Sky Harbor International Airport, and others on the construction Site, of the lead abatement activities and precautions necessary to avoid contamination by lead compounds.
 - b. Submit a Lead Exposure Plan to the Program/Project Manager for approval at least 48 hours prior to the start of lead-based paint striping obliteration activities.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 1. Deliver asphalt mixtures to the Site in accordance with the requirements of Section 02741, Bituminous Concrete Pavement.
- B. Storage and Handling Requirements:
 1. Stockpile, store, and handle aggregate in accordance with the requirements of Section 02741, Bituminous Concrete Pavement.

PART 2 PRODUCTS

2.01 MATERIALS:

- A. Bituminous Concrete Overlay:
 1. Provide asphalt overlay complying with the requirements of Section 02741, Bituminous Concrete Pavement.
 - a. Provide "Type D-1/2" asphalt concrete mix as specified in Section 710, Asphalt Concrete, of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 2. Submit Product Data for the asphalt overlay material to the Program/Project Manager for approval.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Verify the striping removal limits of the Contract with the Program/Project Manager before commencing the Work.
 - a. In order to match and tie into the existing striping, the striping removal limits may exceed the Contract construction limits, or new striping limits.
- B. Pre-Installation Testing:

1. If the type of paint in painted pavement markings to be removed is unknown, verify whether or not the striping paint is lead-based paint by testing samples.

C. Evaluation and Assessment:

1. The type of pavement markings existing will determine the appropriate removal methods required.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Maintain and protect traffic on active streets and roads in accordance with the requirements specified in Section 01555, Traffic Control.

B. Surface Preparation:

1. If a bituminous concrete overlay is required for obliterating existing pavement markers, 48 hours prior to applying the overlay prepare the surface as follows:
 - a. Cut out and patch severely raveled and cracked areas that are depressed more than 3/4 inches from the adjoining pavement.
 - b. Fill large shrinkage cracks with asphalt sealing compound acceptable to the Program/Project Manager.
 - c. Clean the surface using a power broom.
 - d. Apply a tack coat complying with the requirements of Section 02786, Tack Coat, to the surfaces to receive the bituminous concrete overlay, and do not permit traffic to travel on the coated surface.

3.03 PAVEMENT MARKING OBLITERATIONS

A. Perform pavement marking obliterations or removals as shown on the Contract Drawings or as indicated by the Program/Project Manager.

1. Remove existing pavement markings and markers from pavement to the fullest extent possible by using one of the special techniques specified in this Article unless another method is approved by the Program/Project Manager.
 - a. Do not use a method for removing existing pavement markings that materially damages the surface or texture of the useable pavement.
 - b. Do not cover over existing pavement markings with slurry seal, black paint, or stain of any kind.
 - c. Do not use sandblasting or turboblasting within 12 feet of a lane occupied by traffic.
 - d. Do not use sandblasting, turboblasting, or bituminous concrete overlay for airside applications.

B. Special Techniques:

1. Techniques Approved for Removing or Obliterating Traffic Paint:

- a. High Pressure Water Jet:
 - 1) Use a high-pressure water jet with the proper spray nozzle and pressure to remove the pavement markings.
- b. Sandblasting:
 - 1) Sandblast the pavement to remove the pavement markings, taking care not to damage the pavement surface.
- c. Turboblasting (Steel Shot):
 - 1) Blast the pavement with steel shot to remove the pavement markings, taking care not to damage the pavement surface.
- d. Bituminous Concrete Overlay:
 - 1) Cover the pavement markings with a bituminous concrete overlay so the markings are no longer visible.
- e. Solvent Cleaning:
 - 1) Employ chemical agents to remove the pavement markings, taking care to comply with environmental regulations and to properly clean up residue.
- 2. Techniques Approved for Removing Raised Pavement Markers:
 - a. When removing raised pavement markers, remove both the marker and the adhesive pad, or the adhesive pad alone if the marker is missing.
 - b. Hammer and chisel:
 - 1) Manually remove the raised pavement markers with a hammer and chisel.
 - c. Blade:
 - 1) Use the blade on heavy equipment to dislodge and remove raised pavement markers.

3.04 REPAIR/RESTORATION

- A. Repair damage to the pavement caused by pavement marking removal by using methods acceptable to the Program/Project Manager.
 - 1. If asphalt slurry is used to repair damage caused by pavement marking removal methods, place the asphalt slurry parallel to the new direction of travel and not less than 2 feet in width.

3.05 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 - 1. Inspections:
 - a. The Program/Project Manager will inspect the Site to verify that required removals have been adequately performed in a timely manner, and whether incomplete obliteration of markings that could confuse motorists exists.
- B. Non-Conforming Work

1. If the Program/Project Manager discovers incomplete obliteration of pavement markings that may result in confusing travelers, remove them immediately.

3.06 CLEANING

- A. Remove sand or other material that is deposited on the pavement as a result of removing pavement markings and markers as the Work progresses.
 1. If blast cleaning is used as a method to remove pavement markings or objectionable material; immediately remove the residue, including dust, after contact between the sand and the surface being treated.
 - a. To remove the residue, use a vacuum attachment operating concurrently with the blast cleaning operation or other methods approved by the Program/Project Manager.
 - b. Do not allow sand or other material that might interfere with drainage or might constitute adverse safety conditions to traffic to accumulate.

SECTION 02224

PAVING REMOVAL

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for demolition, removal, and disposal of existing paving.
- B. Related Requirements:
 - 1. Section 01555 - Traffic Control.

1.02 REFERENCE STANDARDS:

- A. City of Phoenix (COP):
 - 1. Phoenix Supplemental Standard Details for Public Works:
- B. Maricopa Association of Governments (MAG):
 - 1. MAG Uniform Standard Details for Public Works Construction:
- C. Maricopa County:
 - 1. Air Quality Department (MCAQD):
 - a. Guidance for Dust Control Permit for Application.
 - b. Application for Dust Control Permit.
 - c. Dust Control Logs.
 - 2. Maricopa County Air Pollution Control Regulations:
 - a. Regulation II – Permits and Fees:
 - 1) Rule 200 – Permit Requirements, Section 306 – Dust Control Permit, <https://www.maricopa.gov/DocumentCenter/View/5341>.
- D. State of Arizona:
 - 1. Arizona Revised Statutes (ARS):
 - a. ARS 40-360.41 through 45 - Chapter 2 Public Service Corporations Generally, Article 6.4, High Voltage Power Lines and Safety Restrictions.
- E. U. S. Government:
 - 1. Occupational Safety and Health Administration (OSHA):
 - a. 29 CFR 1926 Safety and Health Regulations for Construction.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Depending on where the paving removal operation is to occur and the owner of the right-of- way, coordinate with and obtain the required

approvals from the appropriate State and municipal departments, including but not limited to, the following:

- a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Streets Department.
 - c. Phoenix Sky Harbor International Airport.
2. Adhere to each owner's specifications and/or permits, and comply with additional requirements of the owners, regarding the Work of this Section.
 3. If the owner of the right-of-way is other than the Phoenix Sky Harbor International Airport, the owner of the right-of-way will be provided on the Contract Drawings.
 4. Demolition Safety:
 - a. Comply with applicable Arizona Revised Statutes (ARS), especially those regarding high voltage power lines and safety restrictions.
 - b. Sole responsibility for performing paving demolition in a safe manner is the Contractor's.
 - c. Provide suitable protection against bodily injury.

B. Sequencing:

1. Include provisions for traffic control during paving removal operations in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the pavement from traffic.

1.04 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Protect the demolition excavations, and the safety of workers and the public, in conformance with the requirements of Occupational Safety and Health Administration (OSHA), particularly "Subpart P – Excavations" of 29 CFR 1926, and the following:
 - a. Incomplete Street Crossings:
 - 1) At street crossings where backfill and temporary patches have not been completed during regular working hours, provide substantial steel plates to bridge across the demolished areas and accommodate traffic.
 - b. Dust Control Permit:
 - 1) In accordance with Rule 200 of the Maricopa County Air Pollution Control Regulations, a Dust Control Permit issued by the Maricopa County Air Quality Department is required for Sites where more than 0.1 acre (4356 square feet) of soil will be disturbed.
 - a) If a Dust Control Permit is required for this Contract, follow the instructions in the Maricopa County Air Quality Department's "Guidance for Dust Control Permit for Application" and file the "Application for Dust Control Permit", which requires including a Dust Control Plan with the Application, and pay the permit

fees in accordance with Maricopa County Air Pollution Control Regulation Rule 280.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

3.01 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Maintain and protect traffic on active streets and roads in accordance with the requirements specified in Section 01555, Traffic Control.
 - 2. Take measures adequate to protect existing utilities and other existing items and structures to remain.

3.02 DEMOLITION/REMOVAL

- A. Sidewalks:
 - 1. Demolish and remove sidewalks indicated for removal on the Contract Drawings as indicated on the Contract Drawings and to the distance required to maintain a 1 inch per foot maximum slope for the replaced portion of sidewalk.
- B. Driveways:
 - 1. Demolish and remove driveways indicated for removal on the Contract Drawings as indicated on the Contract Drawings and in the Standard Details appearing in the MAG Uniform Standard Details for Public Works Construction and Phoenix Supplemental Standard Details for Public Works.
 - 2. Demolish and remove existing concrete driveway curbs and gutters to the right-of way line and the new end of curb faced.
- C. Portland Cement Concrete Driveways, Curbs, Gutters, and Sidewalks:
 - 1. Demolish and remove existing Portland cement concrete driveway, curbs, gutters, and sidewalks indicated for removal on the Contract Drawings after saw cutting the paving at match lines.
 - a. Saw cut the paving to neat, vertical, true lines without damaging the adjoining surface not to be removed.
 - b. Minimum Depth of Cut: 1-1/2 inches, or 1/4 of the paving thickness, whichever is greater.
- D. Bituminous Concrete Driveways, Curbs, Gutters, and Sidewalks:
 - 1. Demolish and remove existing bituminous concrete driveways, curbs, gutters, and sidewalks indicated for removal on the Contract Drawings after cutting the paving using a device capable of making a neat, straight

and smooth cut without damaging the adjoining surface not to be removed.

- a. If only saw cutting is to be used, it will be indicated on the Contract Drawings.
- E. Remove pavements and aggregate base outside the roadway prism if indicated on the Contract Drawings.
- F. Special Techniques:
 1. Precast Safety Curbs Inside the Right-of-Way;
 - a. Unless otherwise indicated on the Contract Drawings, reset safety curbs currently existing inside the right-of-way approximately parallel to the new curb line directly opposite their existing location with their back edge on the right-of-way line.
 - 1) Salvage and stockpile other safety curbs existing inside the right-of-way on the adjacent property at a location agreeable to the property owner.

3.03 CLEANING

- A. At the completion of the paving removal operation, remove all paving removal equipment and traffic control devices furnished under this Section from the Site.
- B. Waste Management:
 1. Remove demolished paving materials from the Site to a legal disposal site unless otherwise specified, indicated on the Contract Drawings, or approved by the Program/Project Manager.

END OF SECTION

0	10/06/2016	N/A	All	First edition.

SECTION 02231

CLEARING AND GRUBBING

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for selective clearing and grubbing operations, and the disposal of spoil materials.
- B. Related Requirements:
 - 1. Section 01316 - Project Meetings.
 - 2. Section 01330 - Submittal Procedures.
 - 3. Section 01568 - Temporary Tree and Plant Protection.
 - 4. Section 01571 - Temporary Erosion and Sediment Control.
 - 5. Section 01725 - Field Engineering.
 - 6. Section 02300 - Earthwork.

1.02 REFERENCES

- A. Definitions:
 - 1. Clearing and Grubbing: Operations consisting of removing trees, shrubs, stumps, roots, fences not indicated to remain, and similar items indicated to be removed from the ground surface to clear designated areas within the Limits of Disturbance that are defined in the Contract Documents.
- B. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO M 43, Standard Specification for Size of Aggregate for Road and Bridge Construction.
 - b. AASHTO T 85, Standard Method of Test for Specific Gravity and Absorption of Coarse Aggregate.
 - c. AASHTO T 104, Standard Method of Test for Soundness of Aggregate by Use of Sodium Sulfate or Magnesium Sulfate.
 - 2. ASTM International (ASTM):
 - a. ASTM D 698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft·lbf/ft³ (600 kN·m/m³)).
 - 3. Maricopa County:
 - a. Maricopa County Air Pollution Regulations:
 - 1) Regulation III – Control of Air Contaminants:
 - a) Rule 310 – Fugitive Dust from Dust-Generating Operations.
 - b) Rule 310.01 - Fugitive Dust from Open Areas, Vacant Lots, Unpaved Parking Lots, and Unpaved Roadways.

4. U. S. Government:
 - a. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 Occupational Health and Safety Standards.
 - 2) 29 CFR 1926 Safety and Health Regulations for Construction.
 - b. Environmental Protection Agency (EPA):
 - 1) 40 CFR 61 National Emission Standards for Hazardous Air Pollutants.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 1. Coordinate all utility related work during clearing and grubbing activities with Aviation Facilities and Services at Phoenix Sky Harbor International Airport to avoid tapping into established utilities.
 2. Forward all utility information to the Design and Construction Services Division (DCS) of the Phoenix Sky Harbor International Airport.
- B. Pre-Construction Meeting:
 1. Prior to beginning clearing and grubbing operations, attend a mandatory pre-construction meeting with the Program/Project Manager held in accordance with the requirements specified in Section 01316, Project Meetings.

1.04 SUBMITTALS

- A. Action Submittals:
 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Post-emergent herbicide per Subparagraph 2.01.B.1.b.

1.05 QUALITY ASSURANCE

- A. Qualifications:
 1. Surveyor Qualifications:
 - a. Employ the services of a Professional Surveyor registered in the State of Arizona, and having the additional qualifications as specified in Section 01725, Field Engineering.

1.06 SITE CONDITIONS

- A. Ambient Conditions:
 1. Explosives and Blasting:
 - a. Explosives and blasting are not allowed in the performance of the Work of this Section.
 2. Project Environmental Requirements:

- a. Comply with regulations governing pollution controls.
- b. Erosion Control:
 - 1) During the performance of the Work of this Section, implement erosion control measures as specified in Section 01571, Temporary Erosion and Sediment Control.
- c. Dust Control:
 - 1) Using the necessary means and methods, control dust on the Site during performance of the Work of this Section.
 - a) To prevent unnecessary spread of dust during the performance of the Work of this Section, thoroughly moisten surfaces and debris as required to prevent dust being a nuisance to the public, neighbors, and other concurrent work on the Site.
 - b) The Contractor is responsible for providing the water used for controlling dust.
 - 2) During earth moving operations, comply with the Maricopa County Air Quality Permit and Dust Control requirements, particularly Maricopa County Rule 310 and Rule 310.01.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Fill Material:
 - 1. On-Site Fill Material:
 - a. Provide clean, uncontaminated fill material excavated on-site and consisting of soil or soil-gravel-cobble mixed materials that are free of topsoil, vegetation, lumber, metal, and refuse; and that are free of rock or similar hard objects larger than 6 inches in any dimension in non-structural fill areas, and 4 inches in any dimension in structural fill areas.
 - 1) Excavate material from the areas on the Site where extensive excavation will be required, and place and compact backfill in accordance with the requirements of Section 02300, Earthwork.
- B. Herbicides:
 - 1. Post-emergent herbicide:
 - a. Provide post-emergent herbicide designed for aquatic use with no restrictions on water use, specifically domestic use, after application.
 - b. Submit Product Data to the Program/Project Manager for approval.
 - c. Manufacturers:
 - 1) Dow AgroSciences LLC, Rodeo®, www.dowagro.com.
 - 2) Approved equal.

2.02 REGULATORY REQUIREMENTS

- A. Comply with the Laws, Codes, and Regulations pertaining to the work being performed.
 - 1. All work is governed at all times by the applicable provisions of Federal Laws, including but not limited to, the following:
 - a. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 Occupational Health and Safety Standards.
 - 2) 29 CFR 1926 Safety and Health Regulations for Construction.
 - b. Environmental Protection Agency (EPA):
 - 1) 40 CFR 61 National Emission Standards for Hazardous Air Pollutants.
 - 2. During clearing and grubbing activities, comply with the Maricopa County Air Quality Permit and Dust Control requirements, particularly Rule 310 and Rule 310.01.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Prior to starting the actual clearing and grubbing work, carefully inspect the entire Site to locate the above and below grade structures, physical objects, and utilities designated to be protected or preserved as indicated in the Contract Documents.
 - 2. Locate existing exposed and buried active utilities, and determine the requirements for their protection, or their disposition with respect to the demolition work.
 - a. Prior to performing excavation operations, contact Arizona Blue Stake to verify the location or existence of buried utilities and avoid damage to the utilities.
 - 1) Arizona Blue Stake may be contacted by telephone at (602) 263-1100.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. In order to define trees and other items to be protected or preserved during clearing and grubbing activities, direct the Surveyor to stakeout the Limits of Disturbance as indicated in the approved Erosion and Sediment Control Plan specified in Section 01571, Temporary Erosion and Sediment Control, and as indicated in the Contract Documents.
 - 2. Provide temporary protection as specified in Section 01568, Temporary Tree and Plant Protection, for trees and other items to be protected or preserved during clearing and grubbing activities.

3. Minimize interference with roads, streets, walks, and other adjacent occupied or used facilities when conducting Site clearing operations.

B. Demolition/Removal:

1. Fence Removal:

- a. When a fence is partly or wholly within the Limits of Disturbance as indicated in the approved Erosion and Sediment Control Plan specified in Section 01571, Temporary Erosion and Sediment Control, is indicated to be removed in the Contract Documents, or is within the right-of-way; notify the property owner of the fence 30 days in advance of clearing and grubbing operations to remove the fence so that the fence's owner has the opportunity to make the necessary arrangements to relocate or rebuild the fence to maintain the security of the space enclosed or protected by the existing fence.
- b. If the owner of the fence fails to take the necessary steps to maintain the security of the fenced area within a reasonable amount of time, carefully remove the fence within the Limits of Disturbance or within the right-of-way, and neatly store this material on the fence owner's property adjacent to the Project area.

3.03 CLEARING AND GRUBBING

- A. In areas where embankment is to be placed, clear and grub the areas to a depth not less than 6 inches below the existing ground level.
- B. In areas that will be finish graded, clear and grub the areas to a depth not less than 8 inches below existing ground level.
- C. In areas that will be excavated, clear and grub the areas to the following depths:
 1. In areas of excavation for sidewalks: 6 inches.
 2. In areas of excavation for roadway: 18 inches.
 3. In areas of excavation for riprap and rock lining: 6 inches below the bottom of the riprap structure.
- D. Remove stumps, downed timber, logs, snags, and trees which are not designated to remain.
 1. In order to minimize damage to trees that are to remain standing, fell trees toward the center of the area being cleared.
 2. In order to avoid damage to overhead utilities and existing structures, fell trees located in close proximity to these items in sections.
 3. Remove stumps and roots, matted roots, and similar subsurface debris to the depths as specified except as follows.
 - a. In areas to be excavated and where embankment will be placed, dig out and remove stumps and roots completely.

- b. In areas other than areas to be excavated and where embankment will be placed, treat stumps which are over four inches in diameter with herbicide to prevent re-growth and leave them in place.
- 4. Backfill stump holes and other depressions caused by clearing and grubbing operations with the specified fill material in horizontal layers not exceeding 8 inches loose depth, and thoroughly compact each layer to a density of 95 percent of the maximum dry density in accordance with ASTM D 698 under building, slab, walkway, and pavement footprints, but do not compact the backfill in planting areas.
- E. When grubbing inside the drip line of trees indicated to remain, use only manual methods.
 - 1. Perform selective tree trimming and scar repair as required to preserve trees indicated to remain and protect them from damage or loss.
- F. Remove brush, undergrowth, and heavy growths of grass and weeds.
- G. Grubb or otherwise remove the natural obstructions in the soil; and remove such surface material which, in the opinion of the Program/Project Manager, is unsuitable for topsoil or backfill material.
- H. Remove surface debris and rubbish of any nature.

3.04 RE-INSTALLATION

- A. Re-install any items indicated to remain that were removed to facilitate clearing and grubbing operations.

3.05 CLEANING

- A. Waste Management:
 - 1. Debris Removal:
 - a. Remove clearing and grubbing debris accumulations generated by clearing and grubbing activities from the Site on a daily basis.
 - 1) Should the Contractor elect to continue work beyond normal working hours, do not allow clearing and grubbing debris to accumulate for more than 48 hours.
 - 2) Debris to be removed includes sawn timber, wood, brush, branches, and similar items.
 - 3) Do not bury stumps on the Site, but provide for their disposal as specified hereinafter.
 - b. Debris Disposal:
 - 1) Dispose of the debris from clearing and grubbing operations off-site in a lawful manner and at a site having current approval to conduct solid waste disposal activities.
 - 2) Burning of Spoil Materials:
 - a) On-site burning of spoil materials is not allowed.

END OF SECTION

SECTION 02237

PLANT SALVAGE

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for complete salvage of plant materials.
 - 2. Requirements for the relocation, storage, and maintenance of salvaged plant materials.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. AMQ: Acceptable Mortality Quantity.
- B. Definitions:
 - 1. Bottoming: Affixing the bottom material to the side boxing applied to the root ball of plant materials to minimize the loss of soil from the bottom of the root ball.
 - 2. Callus: The tissue that forms over the wounds of plants, protecting the inner tissues and causing healing.
 - 3. Landscape Establishment Period: The time required for a species of plant to acclimate itself to its transplanted location.
 - 4. Topwood: Material affixed to the top of the side boxing applied to the root ball of plant materials to minimize movement of the plant and its root system, and to reduce loss of soil, during transportation and handling.
- C. Related Requirements:
 - 1. Section 01568 - Tree and Plant Protection.
 - 2. Section 01780 - Closeout Submittals.
 - 3. Section 02900 - Planting.

1.03 REFERENCES

- A. Reference Standards:
 - 1. Maricopa County:
 - a. Air Quality Department (MCAQD):
 - 1) Guidance for Dust Control Permit for Application.
 - 2) Application for Dust Control Permit,
 - 3) Dust Control Logs.
 - b. Maricopa County Air Pollution Control Regulations:
 - 1) Regulation II – Permits and Fees:

- a) Rule 200 – Permit Requirements, Section 305 – Dust Control Permit,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/200-0803.pdf.
 - b) Rule 280 – Fees,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/280-0803.pdf.
- 2) Regulation III – Control of Air Contaminants:
 - a) Rule 300 – Visible Emissions,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/300-0803.pdf.
 - b) Rule 310 – Fugitive Dust from Dust-Generating Operations,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/310-0803.pdf.
 - c) Rule 310.01 - Fugitive Dust from Non-Traditional Sources of Fugitive Dust,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/310.01-0803.pdf.
- 2. Tree Care Industry Association (TCIA)/American National Standards Institute (ANSI):
 - a. ANSI Z133.1, Safety Requirements for Arboriculture.

1.04 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. The Construction Manager at Risk is responsible for the safety of the public, other contractors, and his/her crew members during the relocation operations.
- B. Sequencing:
 - 1. Coordinate the salvage and replanting of the salvaged materials with anticipated phasing and sequencing of other construction activities.
 - a. Submit methods for coordinating the plant salvage operations with other construction activities to the Program/Project Manager for approval.
 - 2. If the Phoenix Sky Harbor International Airport landscape staff cannot immediately identify the exact areas where plants are to be relocated, develop a temporary nursery or nurseries in the interim for storing the plants.
 - a. Submit methods for developing the temporary nursery or nurseries to the Program/Project Manager for approval.

1.05 SUBMITTALS

- A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) List of pesticide materials proposed for use, and their application methods and documentation.
 - 2) Fertilizer/nutrients.
 - b. Shop Drawings:
 - 1) Boxes for plants.
 - c. Delegated Design Submittals:
 - 1) Location of the temporary holding yard for storing salvaged plants.
 - 2) Equipment proposed for removing and transporting salvaged plants.
 - 3) Methods for coordinating the plant salvage operations with other construction activities.
 - 4) Methods for developing the temporary nursery or nurseries.
 - 5) List of mechanical and hand equipment to be used to accomplish salvage and replanting operations.
 - d. Special Procedure Submittals:
 - 1) Saguaro Cacti Photo Log.
 - 2) Proposed method of measuring Saguaro cacti.
 - 3) Proposed form for the Saguaro Calibrated Measurement Log.
 - e. Qualification Statements:
 - 1) Plant Nursery Qualification Statement.
 - 2) Landscape subcontractor qualifications.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Written record of plant salvageability discussion and decisions.
 - b. Site Quality Control Submittals:
 - 1) Daily Plant Salvage Log.
 - 2) Current Saguaro Calibrated Measurement Logs upon completion of the initial measurements and after other required measurements thereafter.
 - 3) Salvaged Plant Watering Log.

1.06 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Dust Control Permit:
 - a. In accordance with Rule 200 of the Maricopa County Air Pollution Control Regulations, a Dust Control Permit issued by the Maricopa

County Air Quality Department is required for Sites where more than 0.1 acre (4356 square feet) of soil will be disturbed.

- b. If a Dust Control Permit is required for this Contract, follow the instructions in the Maricopa County Air Quality Department's "Guidance for Dust Control Permit for Application" and Section 01410, Regulatory Requirements, and file the "Application for Dust Control Permit and Dust Control Plan, and pay the permit fees in accordance with Maricopa County Air Pollution Control Regulation Rule 280.
 - 1) Comply with the requirements of the Maricopa County Dust Control Permit and air pollution control requirements, particularly Maricopa County Air Pollution Control Regulation Rules 310 and 310.01.
 - a) Rule 310 requires maintaining daily logs recording the actual implementation of control measures identified in the Dust Control Permit.
- c. Conspicuously post a copy of the Maricopa County Air Quality Department Dust Control Permits in a weather resistant location at the Site where it can be read by the workers.

B. Qualifications:

1. Offsite Plant Nursery Qualifications:

- a. Provide the services of an offsite plant nursery that specializes in, and has proven success in, transplanting the type of plant materials as required by the Contract Drawings and Specifications.
- b. Submit a Qualification Statement for the offsite plant nursery that includes the following information:
 - 1) Project list indicating past plant relocation projects.
 - 2) Clients for whom the relocation was performed.
 - 3) The types and quantities of plant materials moved.
 - 4) The mortality rate for the project.
 - 5) The time of year the work was performed.
 - 6) A narrative describing the daily operations of the job
 - 7) Include any deviations from the tree boxing method specified that may be proposed for incorporation into this Contract.
- c. The Program/Project Manager reserves the right to approve or disapprove of the offsite plant nursery based on review of the qualification statement.

2. Landscape Subcontractor Qualifications:

- a. Employ a landscape subcontractor licensed as a landscape contractor in the State of Arizona and in good standing.
- b. The licensed landscape subcontractor must have a minimum of 10 years' experience relocating native plants, palm trees and cacti similar to those shown in the Contract Drawings, and must have a proven record of successful palm, tree and saguaro transplanting and survival rate of at least 80 percent for 3 years after transplanting.

- c. Submit the landscape subcontractor qualifications to the Program/Project Manager for approval prior to initiation of any salvage operations, and include the following-written documentation:
 - 1) A list of a minimum of 5 native tree, palm tree, shrub, and saguaro salvaging projects the landscape subcontractor has satisfactorily completed, each of which involved the relocation of a minimum of 100 native trees, 25 date palms and 100 saguaros having sizes ranging from 3 to 25 feet in height.
 - a) Include the dates of the project work; the type of equipment used; a description of the project and work performed; and the name and phone number of a contact person representing the agency, company, or owner for which the work was completed.
 - 2) A written record of successful tree and saguaro transplanting demonstrating a survival rate of at least 80 percent for 3 years after transplanting.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Transport the materials for the Work of this Section in compliance with all State and local requirements.
 - a. Obtain all necessary permits and tags for transporting plant materials on public roadways.
 - b. Make permits and tags available to the Program/Project Manager upon request.
- B. Storage and Handling Requirements:
 - 1. Temporary Holding Yard:
 - a. Prior to commencing plant salvage work, submit the location of a temporary holding yard and the proposed equipment for removing and transporting the salvaged plants to the Program/Project Manager for approval.
 - 1) Provide a fenced and secure temporary holding yard.
 - 2) Prevent damage to the salvaged vegetation boxes by grading the temporary holding yard to prevent ponding, to promote positive drainage away from the salvaged plant materials, and to control offsite runoff.
 - a) Grade the nursery site to be level, with a slope no greater than 1 percent in any direction, and to safely retain all water within the established boundaries of the holding area.
 - 3) Use hand equipment and labor to keep the holding yard weed free.
 - a) Using chemicals or herbicides within a 6 foot radius of salvaged plant material to combat weeds is not allowed.
 - b. Temporary Irrigation System

- 1) Provide a temporary irrigation system in the salvage plant holding yard constructed using methods and materials that prevent rodents, insects, and pests from damaging and/or impeding the intent of the system's operation.
 - 2) Provide the temporary holding yard with a pressurized water source for watering plant material.
 - a) Provide a water source capable of delivering the necessary water to the salvaged plant materials that occupy the nursery and require irrigation.
 - b) Provide the water source for the life of the holding yard.
 - c) If a storage tank is provided for the purpose, it must be capable of providing sufficient water during a 24-hour period for the required irrigation without refilling based on the nursery being filled to capacity with salvaged plant materials.
 - 3) Use an automatic controller or automatic controllers to insure a regular watering schedule.
 - 4) Emitters:
 - a) Distribute emitters evenly across the surfaces of the rootballs.
 - b) If a drip irrigation system is proposed, design the system so no emitter point is capable of emitting water flows greater than 2 gallons per hour.
 - c) Large boxes may need additional emitters.
 - 5) Record the date, time, and frequency of watering for each plant in a Salvaged Plant Watering Log, and submit this log to the Program/Project Manager on a weekly basis for information.
2. Store and maintain salvaged material at the approved holding yard until it can be planted in its new location.
 - a. Provide optimum conditions for salvaged plants to overcome transplant shock and maintain viability throughout boxing and the storage period.
 - b. Plant Placement:
 - 1) In order to avoid sunburn damage, take care when plant material is placed in the holding area that the plant is placed facing the direction in which it originally grew.
 - 2) Properly orient the specified mark to the north side of the plant during placement.
 3. Do not allow lifting or replanting activities to damage or deform tree branches and canopies of salvaged trees.

1.08 SITE CONDITIONS

A. Ambient Conditions:

1. Salvage Season:

a. Trees and Shrubs:

- 1) Salvage and transport salvaged trees and shrubs to a temporary holding yard as specified between the **dates of April 1 through**

- September 30.** Salvage dates outside of this window will require Program/Project Manager prior approval.
- b. Cacti:
 - 1) Salvage and transport salvaged cacti to a temporary holding yard as specified between the dates of **April 1 through September 30.** Salvage dates outside of this window will require Program/Project Manager prior approval.
 - c. Date Palms:
 - 1) Salvage and transport salvaged cacti to a temporary holding yard as specified between the dates of April 1 through September 30. Salvage dates outside of this window will require Program/Project Manager prior approval.
2. Cactus Salvage Weather Constraints:
- a. Do not be excavate, transport, or remove cactus of any species during rainy weather conditions as determined by the Program/Project Manager.
 - b. Cactus salvage operations may resume after rain with the written approval by Program/Project Manager.
- B. Existing Conditions:
- 1. An Existing Plant Inventory and Salvage Summary appears in the Contract Drawings.
 - 2. Saguaro Cacti Photo Log:
 - a. Produce and submit a photo log of each saguaro cacti in its current location, capturing its orientation and notable scarring and/or blemishes.
 - 1) Include a caliper measurement of each saguaro taken 4 feet above finish grade with the photo log.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Boxes:
- 1. The following material specifications for construction of box sides are based on storage and transportation requirements.
 - 2. The following guidelines are for plants that are to be lifted upright as opposed to being tipped.
 - a. If plants are to be tipped, modify the materials used to withstand the additional stress of being tipped.
 - b. Box Member Standards
 - 1) One inch members: Standard 1 by 12 Number 5 pine minimum.
 - 2) Two inch members: Standard 2 by 6, or 2 by 12, economy grade minimum.
 - c. Provide Horizontal box members as follows:

- 1) Up to a 60-inch box: 1 inch members.
 - 2) Over a 60-inch box: 2 inch members.
 - d. Provide Vertical box members as follows:
 - 1) Up to a 48-inch box: 1 inch members.
 - 2) Over a 60-inch box: 2 inch members.
 3. Submit Shop Drawings of boxes to the Program/Project Manager for approval.
- B. Pesticide:
1. Provide materials approved by the governing regulatory agencies that are suitable for the identified needs.
 2. Submit a list of pesticide materials proposed for use, and their application methods and documentation.
- C. Soil Sulfur:
1. Provide agricultural dusting type of soil sulfur.
- D. Fertilizer/Nutrients:
1. Provide the following types of fertilizer/nutrients:
 - a. Slow release fertilizer:
 - 1) Provide 19/3/10 slow release fertilizer.
 - b. Nutrient replacement for salvage trees:
 - 1) Manufacturers:
 - a) PHC BioPak (Artistic Arborist 602-2638889).
 - b) Approved equal.
 - c. Organic Compost: Organic compost.
 - 1) Manufacturers:
 - a) Western Organics (602-269-5756).
 - b) Approved equal.
 2. Submit Product Data for the fertilizer/nutrients to the Program/Project Manager for approval.
- E. Plant Identification Tags:
1. Provide heavy duty vinyl identification tags or plastic tape, color coded as specified.
 2. Provide tags and/or tape that does not damage or deface the plant materials being tagged and identified.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
1. Confine Work performed to within the Contract limits as defined by the Contract Drawings and Specifications and field verified by the Program/Project Manager.

B. Evaluation and Assessment:

1. Identification of Plants

- a. Protected plants within the Contract have been identified in the Native Plant Inventory and on the Existing Plant Inventory and Salvage Summary on the Contract Drawings.
- b. Flag all inventoried plants with plastic tape or vinyl tags to correspond to the determinations made in the plant Inventory in the following manner:
 - 1) White tape or vinyl tag – Plants to remain in place.
 - 2) Red tape or vinyl tag – Plants to be moved to another location.
 - 3) Blue tape or vinyl tag – Plants to be destroyed.
- c. Maintain the identification tags or tape for the duration of the Contract and landscape establishment period.
- d. All Date Palms to be salvaged shall be tagged in the field by the contractor with 1" plastic (vinyl) yellow colored tape. The tape shall be tied around each palm tree at a height of 5 feet from existing finish grade. Contractor shall tie the tape around the palm trunk no staples or other penetrating device will be allowed to secure the tape to the palm trunk. The Engineer shall review all tagged materials and approve of the palms slated for salvaging and relocating.

2. Investigation of Plant Salvageability:

- a. Use accepted methods and equipment to investigate conditions in the area surrounding each plant, including all utility, soil, and rock conditions.
- b. If upon this investigation a plant is found to have a decreased chance of being successfully boxed and relocated, contact the Program/Project Manager and any other parties the Owner requires, to come out and review the field conditions.
 - 1) A decision will then be made as to whether the plant will be relocated.
 - 2) Individual decisions will be made for each plant in question.
 - 3) Substitution or other possible alternatives will be discussed at this time.
 - 4) Prepare and submit a written record of plant salvageability discussion and decisions.

3. Marking Orientation:

- a. Mark all plants to be salvaged on their north side to provide proper orientation during storage and planting.
 - 1) Apply a mark and use an installation process that does not damage or deface the salvaged plant materials.
 - 2) Apply a mark that is capable of withstanding poor weather and expected working conditions without the possibility of erasure or detachment for the duration of the Contract, including the plant establishment period.

4. Shaded Plant Material:

- a. Properly document all salvaged plant material originally growing in a shaded condition and subsequently transplanted to a nursery as “shaded plant material”.
- b. Place the “shaded plant material” in a shaded area or areas in the nursery created by using screening or other methods approved by the Program/Project Manager and sized to adequately store these materials.
- c. Gradually expose salvaged material documented as shaded plant material to continual sunlight during its period in the nursery and prior to being transplanted to its final location as approved by the Program/Project Manager.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Protect-In-Place Limits:

- a. The Program/Project Manager may direct that areas or features on or adjacent to the Site are to be protected by fencing, flagging, or staking in accordance with Section 01568, Tree and Plant Protection.
- b. Provide the equipment, labor, and materials to define and protect such areas and features at no increase in Contract Price.
- c. Replace plant material to be salvaged that has been damaged or destroyed during pre-construction and construction activities with like-kind and size plant material as approved in advance by the Program/Project Manager and at no increase in Contract Price.
- d. The acceptable mortality quantity (AMQ) for each species as indicated in Subparagraph 3.06.A.2.c.1 for replacements applies to all plant materials identified as salvageable.

B. Surface Preparation:

1. The Construction Manager at Risk is responsible for safety considerations of the public, the Program/Project Manager’s personnel, and the Construction Manager at Risk’s crew during relocation operations.
 - a. Provide barricades as necessary during salvage operations to insure the safety of the public, other trades, and the salvage crew.
 - b. Follow the safety requirements of ANSI Z133.1.

3.03 SALVAGE OPERATIONS

- A. Prior to commencement of the plant salvage Work, submit a list of mechanical and hand equipment to be used to accomplish removing, transporting, and replanting salvaged plants to the Program/Project Manager for approval.
- B. Calibrated Measurements of Saguaro Cacti:
 1. Saguaro Cacti to be transplanted must have several calibrated measurements performed, the first measurement performed shall be taken

before the cactus is dug with the location of the measurement recorded and marked so that subsequent measurements can be taken at the exact same location. The next measurement performed on the saguaro cacti shall be one (1) week after the cactus is planted or moved into the temporary nursery location, and additional measurements on the saguaro shall be performed every four (4) weeks during Saguaro storage in the nursery. A measurement shall be taken at time of replanting the Saguaro in its final location and then every 4 months after that point during the remainder of the Contract Time.

- a. No additional calibration of trees will be required by the Construction Manager at Risk's landscape subcontractor.
2. Perform calibrated measurements of Saguaro cacti using methods and tools approved by the Program/Project Manager.
 - a. Use a method that allows the original points of measurement to be located easily and with pinpoint accuracy when future measurements are to be made throughout the duration of the Contract.
 - b. The minimum acceptable measurable distance of displacement between the original points of measurement and all future measurements is 1/8 inch.
 - c. Submit the proposed method of measuring Saguaro cacti to the Program/Project Manager for approval.
3. Saguaro Calibrated Measurement Log:
 - a. Keep a record of the Saguaro calibrated measurements, dates, saguaro identification number, corresponding photograph(s), final transplanted location by station and offset, and a remarks column in a written Saguaro Calibrated Measurement Log kept on file at the Site.
 - b. Submit the proposed form for recording the information in the Saguaro Calibrated Measurement Log to the Program/Project Manager for approval prior to beginning salvage of the Saguaro cacti.
 - c. Submit copies of the current Saguaro Calibrated Measurement Log to the Program/Project Manager upon completion of the initial measurements, and monthly thereafter throughout the duration of the Work of this Section and the landscape establishment period to document the other required measurements.

C. Watering:

1. Provide adequate water to each plant during digging operations to maintain its optimum health.
2. Saguaro cactus shall **NOT** be watered for a period of fourteen (14) days following their initial removal to allow the rooting system to heal.

D. Pruning:

1. Prune plants as needed; and hand dig, box, and relocate them to a temporary holding yard as specified.

2. Prune plants to be relocated in a way that removes an amount of foliage proportionate to the root system that will be eliminated by the salvage operations.
 - a. Prune plants so that an aesthetic framework of branches is left which preserves the size and best features of the plant so the plant will fill in for a balanced appearance.
 - b. Use current standards for arboriculture.
3. Remove dead and diseased branches at the direction of the Program/Project Manager.
4. For cacti, apply a one-time application of soil sulfur to all areas where branches/arms are removed.
 - a. Treat the wounds and/or cuts made to the roots and salvaged plant materials with powdered sulfur and bactericide on the same day that the cut and/or wound is made.
 - b. Make cuts so damage to the cambium layer of the tree and exposed weakness are minimized.
5. Carefully plan the excavation and root selection process for salvaged materials to ensure that the remaining roots will supply a structurally sound foundation.
 - a. Saguaro Roots:
 - 1) To achieve the proper Saguaro root length, do not commence excavation closer than three (3) feet from the trunk of each plant.
 - 2) When making the final cuts to Saguaro roots less than 1 inch in diameter, ensure each attached root has a minimum length of 12-14 inches from the buttress of the trunk or lateral support root.
 - 3) When making the final cuts to Saguaro roots greater than 1 inch but less than 3 inches in diameter, ensure each attached root has a minimum length of 16-18 inches from the buttress of the trunk or lateral support root.
 - 4) When making the final cuts to Saguaro roots greater than 3 inches in diameter, ensure each attached root has a minimum length of 24 inches from the buttress of the trunk or lateral support root.
 - b. Root length requirements stated herein are the minimum requirements and additional root length will increase survivability.
6. After pruning, employ a Certified Pesticide Applicator to apply an approved dusting of a fungicide (soil sulfur), an antibiotic (streptomycin) to the root cuts to prevent damage by wood borers and to increase moisture retention of the foliage.
 - a. Reapply granular soil sulfur and pesticide treatment 3 weeks after the initial application around the base of each saguaro.
7. Palm Tree Preparation:
 - a. After tagging of the palms, contractor shall remove all thatch and older fronds and cut back all resulting stems to within 2 inches of the base of the palm trunk. The use of chain type saws for pruning of fronds and or the removal of thatch is not allowed. The crown of the palm

shall be reduced in size per standard nursery practice with enough live fronds remaining to wrap and protect the palm crown bud.

- b. After thatch removal, the contractor shall use soft sisal rope (organic twine) to tie up all remaining fronds to protect the interior crown bud. Do not permit fronds to become damaged by means of restraint.
- c. All trunks shall be "shovel cut" for uniform appearance.
- d. Contractor shall exercise extreme caution while pruning palms to prevent the spread of vascular diseases. Contractor shall dip pruning tools in a sterilizing agent that has been approved in advance by the Engineer before beginning pruning and before moving from one palm to another.

E. Excavating Plant Materials:

1. Use only non-mechanized methods for the excavation of plants to be salvaged.
2. Saw roots off at the edge of the rootball with a sharp pruning saw and immediately treat each cut with a dusting of soil sulfur.
3. Excavate the rootball to be rectilinear, widest at the top and tapering toward the bottom in accordance with the industry standard.
4. The size of the palm tree root ball taken shall be a minimum of 3 feet by 3 feet by 4 feet, unless otherwise directed by the Engineer.

F. Boxing Plant Materials:

1. Hand dig and box plants as necessary, as indicated by Contract Drawings and Specifications, and as directed by the Program/Project Manager.
2. Water plants as needed depending on the season or as otherwise instructed by the Program/Project Manager.
3. Box/Root Ball Size:
 - a. Determine the box size as follows:
 - 1) Choose box sizes that will maximize the chances of survival for the roots but that are within economic constraints.
 - 2) Base box sizes for trees/shrubs on Table 02237-1.

Table 02237-1 Box Sizes for Trees/Shrubs	
Trunk Caliper (Inches)	Box Size (Inches)
0 to 2-1/2	24
2 to 3-1/2	30
3 to 5	36
5 to 7	42
6-1/2 to 9-1/2	48
8-1/2 - 11	54

Table 02237-1 Box Sizes for Trees/Shrubs	
Trunk Caliper (Inches)	Box Size (Inches)
11 to 13	60
12 to 15	66
14 to 17	72
16 to 20	78

- b. Indicate the box size on flagging tape attached to the plant.
 - 1) Label the caliper of the tree and the identification (ID) number corresponding to the tag on the tree on the box itself.
- c. Side Boxing:
 - 1) Provide side boxing consisting of 4 tapered box sides that enclose and preserve a rectilinear root ball, while exposing the top and bottom of the root ball with minimum damage to the root system.
 - 2) Secure the box sides with horizontal banding.
 - a) Provide 3/4-inch wide steel strip banding with a minimum thickness of 0.025 inch.
 - 3) Pack dirt tightly into any space between the box sides and the root ball.
 - 4) Water thoroughly and repack dirt as needed.
- d. Topwood:
 - 1) Place topwood so it minimizes the movement of the plant and its root system, and reduces loss of soil.
 - 2) Securely anchor topwood to the box.
- e. Bottoming:
 - 1) Leave plants side boxed for a minimum of 2 weeks and a maximum of 3 weeks, prior to bottoming.
 - 2) Bottom each plant after cutting the remaining roots, minimizing the loss of soil from the bottom of the root ball.
4. Special Protection for Saguaros:
 - a. Saguaros 7 feet in height and taller require bracing and protection capable of reasonably eliminating harmful twisting and bending of the Saguaro's trunk and/or arms during each removal and transportation.
 - 1) Use methods and/or materials that do not damage and/or mar the surface or internal structure of each saguaro.
 - 2) Use Styrofoam and/or similar materials to support saguaro arms 3 feet or longer.
 - b. Submit to the Program/Project Manager the materials and methods required to appropriately brace, protect, remove, and transport salvaged saguaros for approval.

G. Removing and Transporting Salvaged Plants:

1. Before salvaged plants can be transplanting to the indicated new locations or locations designated by the Program/Project Manager, the condition of the plant materials must be reviewed by the Program/Project Manager.
 - a. In order for the condition of the salvaged plants can be reviewed, notify the Program/Project Manager prior to transplanting each salvaged plant to the indicated new locations.
2. Remove and transport salvaged plants to the approved temporary holding yard without damaging the plant or box.
 - a. Take care so that branches are not broken or otherwise damaged by equipment or while transporting the plant materials.

H. Palm Tree Loading & Unloading:

1. A lattice type crane, or telescoping type crane or a specially designed tree crane will be acceptable for lifting and off-loading palm trees.
2. For transporting the palms from their original site to the designated and approved holding yard, the trailer used shall be long enough to avoid damage to the heart of the palm that would be caused by lack of support.
3. Loading and unloading of palms must be accomplished with the aid of nylon or fabric sling/straps with a minimum width of 4 inches. Palms should be carefully lifted off the truck setting the choker to the outside so to turn the palm to the inside as it is lifted. Extreme caution must be used to ensure that the heads are not caught, pulled on banged into or shaken; which can damage the bud.
4. Excessive scarring or trunk damage will not be permitted and will be cause for rejection of the palms.

I. Palm Tree Protection

1. Palms should be stored for no more than 48 hours in a shaded area until planting or prior to placement in a temporary planting area until such time as the ultimate area for these palms is prepared and ready for planting. During storage when laying stored the total palm surface and root ball shall be misted every three hours. When planted in a temporary holding pit or trench palms shall be watered to maintain a healthy vigorous palm.
2. Contractor is totally responsible for the palm tree's health and survivability from the initiation of the contract until the end of the landscape establishment period.
3. Palms will not be allowed to be stored on any asphalt surface.
4. The Palm trees shall be stored under a temporary shade cloth or shade structure. The materials used to create the shade must allow for air movement so that heat does not build up under the covering. The use of plastic or rubberized tarpons will not be allowed.
5. Palm tree stacking shall not be allowed the contractor shall lay palms in a single layer on a flat surface. If the palm trees are stored for more than a day, the root balls must be covered with a burlap tarp and kept moist.

6. Prolonged palm planting delays may result in rejection of the palm and replacement of like kind and size by the contractor shall be required if the delay results in rejected palm trees. The replacement shall be at no cost to the department.
7. Contractor shall apply the fungicide chemical treatment "Subdue" or approved equal as often as is recommended by the manufacturer instructions until the end of the landscape establishment phase of work.

3.04 REPAIR/RESTORATION

- A. Replace and/or repair, in kind, any plant material, geological, natural or manmade features disturbed or destroyed within or outside the limits of the Contract which were to be protected during transplanting operations.
- B. Repair damaged areas to their previous condition to the satisfaction of the Program/Project Manager.
- C. Fill-in and compact all pits left from removal of salvaged plants or as directed by the Program/Project Manager.
- D. Temporary Holding Yard:
 1. At the completion of salvage and replanting efforts and activities, remove the temporary holding yard and the associated equipment as directed by the Program/Project Manager.
 - a. Remove temporary fences, tanks, and other equipment used during the holding yard operation.
 - b. Re-grade the temporary holding yard site to return it to its pre-construction conditions, including replacing ground plane treatment provided to be in compliance with Maricopa County Dust Control measures.
 - 1) Contractor shall provide one of the following to the area occupied and considered part of the temporary holding yard as directed by the Program/Project Manager:
 - a) Two (2) inch layer of decomposed granite
 - b) Preapproved soil stabilization product
 - c) The re-establishment of native seed or ground cover to the area
 2. Prior to restoring the temporary holding yard to its pre-construction conditions, submit the proposed methods for performing this work to the Program/Project Manager for approval.

3.05 REPLANTING

- A. For replanting, follow the requirements set out in the relevant specification for each plant type in accordance with the requirements specified in Section 02900, Planting.
- B. Replant salvaged materials approximately at their original growing depth, but not more than 2 inches deeper than their original growing depth. Note this depth variation does NOT apply to Saguaro cactus that must be planted at their original planting depth.
- C. For salvaged materials transplanted deeper than their original growing depth, the root collars must be in a callused condition, and replanting will require advanced approval from the Program/Project Manager. This does not apply to Saguaro cactus.
- D. Replant saguaro and barrel cacti in the same solar orientation, at the exact same depth marked prior to excavation, and as near as possible to their vertical growth habit, found prior to their initial removal and transport.
- E. Apply a thorough application of agricultural streptomycin bactericide and powdered sulfur to the roots of each salvaged plant prior to planting.
 - 1. Plant salvaged plant materials treated with both soil sulfur and streptomycin bactericide in dry site soil at its temporary and final locations.
 - 2. Keep the surrounding soil dry for a minimum period of fourteen (14) days after application of the bactericide or powdered sulfur.
 - 3. To increase the stability of the installed plants, the Program/Project Manager may allow the plants (with the exception being the Saguaro cacti) to be watered within a few days of planting to compact the backfill.

3.06 SITE QUALITY CONTROL

- A. Inspections:
 - 1. Daily Plant Salvage Log:
 - a. Keep a daily log of all plant salvage related activities on the Contract.
 - b. The daily log must contain a record of the number of trees that are dug and side boxed per day, and when bottoming and moving takes place.
 - c. Refer to the plant inventory provided by the Program/Project Manager listing all plants to be boxed.
 - d. Pre-printed log sheets will be available to record the necessary information.
 - e. Submit the Daily Plant Salvage Log to the Program/Project Manager for approval weekly.

2. The Program/Project Manager will observe salvage, transportation, and storage operations periodically to review overall conditions including compliance with accepted maintenance standards.
 - a. The Work and equipment will be observed by the Program/Project Manager, and must be approved by him.
 - b. The recorded Saguaro Cacti calibrated measurements, photographs, and visual inspections will be used as tools by the Program/Project Manager to determine if the health and/or vigor of the Saguaro cacti are in reasonably close conformity to the appearance each displayed prior to its initial removal and transplant.
 - c. The Program/Project Manager will review transplanted material every month for overall condition.
 - 1) The Program/Project Manager and the Construction Manager at Risk will together calculate the acceptable mortality quantity (AMQ) of each species.
 - 2) The acceptable mortality quantity (AMQ) for each species is determined by multiplying the assigned acceptable mortality quantity percent (AMQP) as indicated in Table 02237-2 by the total species amount, and rounding the result down to the nearest whole number.

Table 02237-2 Acceptable Mortality Quantity Percent (AMQP)		
Species	Common Name	AMQP
Carnegiea gigantea	Saguaro cactus	10
Fouquieria splendens	Ocotillo	25
Ferocactus wislizenii	Fishhook barrel	25
Olneya tesota	Ironwood tree	10
Cercidium microphyllum	Foothills palo verde	10
Cercidium floridum	Blue palo verde	10
Prosopis velutina	Velvet mesquite	10
Opuntia species	Prickly Pear	25
Cactus species	Other cactus	25
Ebenopsis ebano	Texas Ebony	10
Phoenix dacylifera	Date Palm	20

B. Non-Conforming Work

1. If the material inspected is deemed by the Program/Project Manager to be in unsatisfactory condition prior to completion of the Contract, replace the material with like kind and size at no increase in Contract Price.
 - a. If the acceptable mortality quantity (AMQ) is exceeded for any species, obtain replacement trees or saguaros of the same species and of equal size, quality, and caliper and/or height (saguaro) from other approved sources for the unacceptable plant materials.
 - b. Replacement plant materials will likewise be observed by the Program/Project Manager, and are subject to the same inspection and acceptance requirements as salvaged plants.
2. Remove salvaged and replacement plant materials determined to be unacceptable by the Program/Project Manager from the nursery and/or temporary holding yard within 15 working days from notification.

3.07 CLEANING

- A.** Clean up the debris from salvage operations, and remove it offsite in a legal manner.

- B.** Waste Management:

1. Gather and dispose of spoils and vegetative waste, including dead and damaged plants and the trimmings accumulated from the operations.
2. Dispose of spoils and vegetative waste offsite in conformance with the regulations imposed by the local authorities, and in an area approved for such disposal by the local authorities.

3.08 MAINTENANCE

A. Watering Stored Salvaged Plants:

1. Watering is the responsibility of the Construction Manager at Risk.
2. Salvaged Plant Watering Schedule:
 - a. Water the plants as needed, depending on the season, to keep the stored plants healthy.
 - b. Water plants 3 times a week from May through October.
 - c. Water plants 2 times a week from November to April.
 - d. Cacti/Bare Root Material:
 - 1) No water shall be provided to Saguaro Cactus for a period of fourteen (14) days following excavation.
 - 2) Water cacti/bare root material 2 times per month from May to October.
 - 3) Water cacti/bare root material 1 time per month from November to April.
3. Boxed Material:
 - a. Water boxed material until water runs from the bottom of the box to insure the soil is totally saturated.
 - b. Typically, the entire rootball should be saturated in 4 hours.
4. Bare Root Material:
 - a. Water *fouquieria splendens* (Ocotillo) using overhead spray heads to insure the branches will be wet down during watering.
 - b. Water cacti using a drip irrigation line in a well around the base and insuring that water does not come in direct contact with the cactus base.
5. Periodically check rootballs for excessive runoff caused by cavities in the soil and holes in box sides.
6. Repack soil and repair boxes as necessary, causing minimal damage to the rootball.

B. Weeding and trimming:

1. Maintain the boxed plants in a weed free condition and trim all suckers at the base of the plants.

C. Pest Control:

1. Spray trees with appropriate pesticides as directed by Program/Project Manager.

D. Disease Control:

1. Use soil sulfur for disease control on cacti.

E. Irrigation:

1. Check the irrigation system and delivery to each plant for proper function and distribution of appropriate water quantities.

F. Fertilization:

1. Slow Release Fertilizer:

- a. Fertilize trees with 19/3/10 slow release fertilizer in late February and early July per Table 02237-3.

Table 02237-3 Slow Release Fertilizer Application	
Box Size (Inches)	Number of Cups
24	1
30	1.5
36	2
42	2.5
48	3
54	4
60	5

2. Nutrient Replacement

- a. Apply nutrient replacement to all trees and shrubs.
 - 1) Use one-half pound per 25 gallons of water for 2 applications at 30 Day intervals.
 - 2) For additional monthly applications use one-fourth pound per 25 gallons of water.
- b. Apply nutrient replacement to boxes per Table 02237-4.

Table 02237-4 Nutrient Replacement	
Box Size (Inches)	Number of Gallons
24 - 30	5
36 - 42	10
48 - 54	15
60 - 72	20

Table 02237-4 Nutrient Replacement	
Box Size (Inches)	Number of Gallons
84 and greater	25

G. Mulching

1. Cover the top of the rootball of boxed plants with 4 inches of organic compost.

SECTION 02300

EARTHWORK

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for earth moving activities, including but not limited to the following:
 - a. Removing unsuitable onsite fill material.
 - b. Screening and selecting suitable onsite fill material.
 - c. Excavating, filling, backfilling, and compacting material to attain the required grades and densities.
 - d. Rough and finish grading.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01568 - Temporary Tree and Plant Protection.
 - 3. Section 02316 - Trenching and Backfilling.
 - 4. Section 02339 - Subgrade Preparation.
 - 5. Section 02721 - Aggregate Base Course.

1.02 REFERENCES

- A. Definitions:
 - 1. Contractor: The Contractor.
 - 2. Completed Course: A course or layer that is ready for the next layer or next phase of the work.
 - 3. Imported Material: Material obtained from sources off the Site that are suitable for a specified use.
 - 4. Lift: A layer of fill material.
 - 5. Miscellaneous Unclassified Excavation: Unclassified excavation required by the Program/Project Manager and not included in other items for payment.
 - 6. MSE Wall: A mechanically stabilized earth retaining wall which is a wall having a reinforced fill zone.
 - 7. Optimum Moisture Content: The water content at which a soil can be compacted to a maximum dry unit weight by a given compactive effort.
 - a. Determine Optimum Moisture Content in accordance with ASTM D 2216 for the maximum dry density for relative compaction.
 - 8. Prepared Ground Surface: The ground surface after clearing, grubbing, stripping, excavation, and scarification and/or compaction.
 - 9. Project Limits: Areas, as shown on the Contract Drawings or specified, within which the Work is to be performed.

10. Proof Rolling: Subgrade testing to identify areas that will not support future loading without excessive deflection or deformation that is performed by observing passes of a suitably heavy rubber-tired construction vehicle.
11. Relative Compaction: The ratio, in percent, of the as-compacted field dry density to the laboratory maximum dry density as determined by the Standard Proctor test specified in ASTM D 698.
 - a. For oversize material, corrections are applied to either the as-compacted field dry density or the maximum dry density as determined by the Program/Project Manager and as specified in ASTM D 4718.
12. Select Offsite Borrow Material: Materials from designated borrow areas located off site.
13. Select Onsite Fill Material: Materials available onsite that the Program/Project Manager determines to be suitable for a specific use.
14. Structural Fill: Materials obtained from select offsite borrow material and/or select onsite fill material and used for support of pavement, building slabs, exterior slabs, structure foundations, and within a 10-foot lateral distance of building edges and building appurtenances.
15. Subgrade: The areas upon which rest the planned bottoms of foundations or slabs, and the surfaces upon which aggregate layers are placed below slabs and pavements.
16. Unclassified Excavation: Removal of materials of whatsoever nature in the excavation, including both earth and rock excavation, and other consolidated mineral mass, and existing structure foundations as may be encountered in the excavation.
17. Unclassified Excavation Below Subgrade: Same as unclassified excavation except such excavation is performed below elevations given as subgrade.

B. Reference Standards:

- 5. U. S. Government:
 - a. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 Occupational Health and Safety Standards.
 - 2) 29 CFR 1926 Safety and Health Regulations for Construction.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Excavation Safety:
 - a. At least 3 days prior to the start of digging or excavation Work, contact Arizona Blue Stake at (602) 263-1100 to arrange for utility owners to locate and mark their underground utilities.
 - 1) Comply with applicable Arizona Revised Statutes (ARS), especially those regarding Underground Utilities and the Overhead Powerline Safety Law.
 - 2) If unexpected active underground facilities are encountered during the performance of the Work, notify the Program/Project Manager immediately.
 - b. Sole responsibility for making all excavations in a safe manner is the Contractor's.
 - c. Provide suitable protection against bodily injury.
 - 2. Do not interfere with persons, firms, corporations, or utilities, removing, changing, replacing, or employing protective measures at their property or structures.

- a. Allow these persons, firms, corporations, or utilities to take such measures as they may consider necessary or advisable under the circumstances.
- b. Measures employed or not employed by these entities do not relieve the Contractor of his responsibilities.

1.04 SUBMITTALS

A. Action Submittals:

- 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Samples:
 - 1) Representative samples of proposed select onsite fill.
 - 2) Representative samples of proposed imported material.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

- 1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency may be necessary to obtain approval of portions of the Work of this Section.

B. Qualifications:

- 1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ an independent Approved Agency having the qualifications specified in Section 01400, Quality Requirements, to perform Special Inspections.
- 2. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections not considered Special Inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ an independent Testing and Inspection Agency having the qualifications specified in Section 01400, Quality Requirements

C. Site Samples:

- 1. Submit representative samples of proposed select onsite fill.
- 2. Submit representative samples of proposed imported material.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Do not deliver imported materials to the Site until the proposed source and materials tests have been tentatively accepted in writing by the Program/Project Manager.
 2. If it is necessary to haul wet soil material over roadways, use suitably tight vehicles to prevent spillage.
 - a. Clear away spilled material resulting from hauling operations from roadways.
- B. Storage and Handling Requirements:
1. Storage of Approved Materials:
 - a. If approved materials are not used immediately, store or stockpile the various approved materials.
 - b. Do not mix various approved materials together or mix approved materials with unapproved materials unless approved by the Program/Project Manager.

1.07 SITE CONDITIONS

- A. Ambient Conditions:
1. Do not perform excavating, backfilling, or compacting operations when either weather conditions or the condition of the materials are such, in the opinion of the Program/Project Manager, that the work cannot be performed satisfactorily.
 2. Provide effective dust control measures on the Site to prevent the spread of dust during earth moving operations.
 - a. Thoroughly moisten excavation areas by dampening the soil, or employ other similar methods as approved by the Program/Project Manager.
- B. Existing Conditions:
1. Assume the risks attending to the presence or proximity, if any, of overhead or underground public utility and private lines, pipes, conduits and their associated support work, and other structures and property of every kind and description, in or over the excavation, or in the vicinity of the work, whether above or below the surface of the ground.

PART 2 PRODUCTS

2.01 MATERIALS:

- A. Granular Fill:
1. Provide approved material conforming to the requirements specified in MAG Uniform Standard Specifications for Public Works Construction Section 206, Structure Excavation and Backfill, and to Section 02316, Trenching and Backfilling, except as modified by this Section.

2. Provide granular fill that meets the requirements specified in Table 02300-1.

Table 02300-1 Granular Fill Requirements	
Characteristic / Item	Value
Maximum particle size	3 inches
Percent passing 3/4-inch sieve	50 to 100
Percent passing No. 8 sieve	30 to 80
Percent passing No. 200 sieve	0 to 12
Maximum plasticity index (PI)	5

B. MSE Wall Fill:

1. Provide approved material conforming to the requirements specified in MAG Uniform Standard Specifications for Public Works Construction Section 206, Structure Excavation and Backfill, and to Section 02316, Trenching and Backfilling, except as modified by this Section.
2. Provide MSE wall fill that meets the requirements specified in Table 02300-2.

Table 02300-2 MSE Wall Fill Requirements	
Characteristic / Item	Value
Maximum particle size	3 inches
Percent passing 3/4-inch sieve	50 to 100
Percent passing No. 8 sieve	30 to 80
Percent passing No. 200 sieve	0 to 12
Maximum plasticity index (PI)	5
Resistivity	> 3,000 ohm-cm
pH	5 < pH < 10
Chlorides	< 100 ppm
Sulfates	< 200 ppm
Organic Content, Maximum	1 percent

C. Non-Structural Fill:

1. Provide non-structural fill material conforming to the requirements specified in MAG Uniform Standard Specifications for Public Works Construction Section 211, Fill Construction, except as noted in this Section.

2. The non-structural fill may contain broken concrete, asphaltic concrete, cobbles, and/or boulders if the following limitations are adhered to:
 - a. The maximum dimension of these materials does not exceed 6 inches.
 - b. Pieces of these materials larger than 4 inches are not placed within 12 inches of a structure.
 - c. Pieces of these materials larger than 2-1/2 inches are not placed within 12 inches of the subgrade for paving.
 - d. Nesting of pieces of these materials is not permitted; and interstices must be filled with finer material.
 - e. Remove wire mesh and reinforcing steel from broken concrete.
3. Obtain approval of the material from the Program/Project Manager prior to using the material in performance of the Work.

D. Select Onsite Fill:

1. Classification of Excavated Materials:
 - a. Consideration will be given to the nature of materials encountered in onsite excavating operations for their later use as fill.
2. Provide onsite as-excavated material that is free of topsoil, roots, organic matter, vegetation, lumber, metal, refuse, concrete, asphaltic concrete rubble, boulders or similar hard objects larger than 6 inches, and other deleterious materials.

E. Structural Fill:

1. Provide approved material conforming to the requirements specified in MAG Uniform Standard Specifications for Public Works Construction Section 206, Structure Excavation and Backfill, and to Section 02316, Trenching and Backfilling, except as modified by this Section.
2. Provide structural fill that meets the requirements specified in Table 02300-3.

Table 02300-3 Structural Fill Requirements	
Characteristic / Item	Value
Maximum particle size	4 inches
Percent passing 3/4-inch sieve	50 to 100
Percent passing No. 8 sieve	30 to 80
Percent passing No. 200 sieve	0 to 30
Maximum plasticity index (PI)	15

F. Pipe Bedding:

1. Provide crushed aggregate pipe bedding materials complying with the requirements for either Select Material Type B or Aggregate Base as specified Table 02721-1 Crushed Aggregate Gradation in Section 02721, Aggregate Base Course.
2. Do not use open graded rock without the written approval of the Program/Project Manager.

G. Unsuitable Material:

1. Unsuitable material consists of organic material, oil, alkali, chemical compounds, rubble, rubbish, wood, and other substances subject to decomposition.

H. Water:

1. Provide water for compaction as required that is free of toxic contaminants and contaminants deleterious to proper compaction.

2.02 SOURCE QUALITY CONTROL

A. Tests and Inspections:

1. Imported Material Acceptance Test:

a. Test Procedure:

- 1) Notify the Program/Project Manager at least 24 hours prior to the required sampling of the imported material.
 - a) The Program/Project Manager's Testing and Inspection Agency will perform the sampling procedures by taking representative samples of the material at the source in accordance with ASTM D 75.
 - b) The samples will be clearly marked to show the source of the material and the intended use of the material on the Project.
- 2) Each material will be tested in accordance with the requirements specified for the material in Article 2.01.

b. Acceptance Criteria:

- 1) Tentative acceptance of the material source is at the Program/Project Manager's discretion, and will be based on observation of the source by the Program/Project Manager and/or the certified test results.
- 2) Before the material may be used, copies of the test results indicating that the materials comply with specified requirements must be received from the Testing and Inspection Agency.
- 3) Final acceptance of the material will be based on tests made on field samples of material taken from the completed and compacted course.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Notify the Program/Project Manager of unexpected subsurface conditions, and discontinue working in the affected area until notified to resume work.
- B. Pre-Installation Testing:
 - 1. Select Onsite Fill:
 - a. Only certain onsite materials may meet the requirements of select onsite fill material.
 - b. To obtain approval of each type of soil encountered and proposed to be used as select onsite fill, submit the following items to the Program/Project Manager for testing and evaluation:
 - 1) Representative sample of the material in a 5-gallon container or appropriately sized cloth sample bags.
 - 2) Information that identifies the location, extent, and quantity of material represented by the sample.
- C. Evaluation and Assessment:
 - 1. Select Onsite Fill:
 - a. Regardless of the source, written approval from the Program/Project Manager is required prior to using any material as select onsite fill.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Provide and maintain protection to retain earth banks and to protect adjoining grades and structures from caving, sliding, sloughing, erosion, or other damage.
 - 2. Protect trees, shrubs, and other features remaining as a portion of final landscaping in accordance with Section 01568, Temporary Tree and Plant Protection.
 - 3. Protect benchmarks, utilities, paving, and curbs from equipment and vehicular traffic.
 - 4. Protect any above-grade and below-grade utilities which are to remain.
 - 5. Protect installed piping and other work against damage from uplift or heave due to high ground water levels.
 - 6. Do not obstruct fire hydrants.
- B. Surface Preparation:
 - 1. Provide suitable structure supports where excavations are in the vicinity of buildings or structures which by their construction or position might exert detrimental pressure on the excavations.

2. Prior to the final disposition of obstructions, uncover and sustain the obstructions.
 - a. If existing sewers, storm drains, or conduits that do not require removal, realignment, or complete reconstruction are encountered, and in the judgment of the Program/Project Manager it is necessary to break through and reconstruct the invert or arch of the obstruction, perform this work.
 3. Plan the Work so adequate protection during storms is provided and materials are available for preventing flood damage.
 - a. Maintain storm sewers, drains, and ditches free of debris to facilitate surface drainage.
 - b. Do not direct the flow of water across or over pavements except through approved pipes or properly constructed troughs of adequate size and length to carry flows.
 - c. Do not allow damming or ponding of water in gutters or other waterways to occur.
- C. Demolition/Removal:
1. Remove, realign, or change the direction of above-ground or below-ground utilities and their appurtenant supports if required by the Program/Project Manager.

3.03 EXCAVATION

- A. Limits of Excavation:
1. Excavate to the finished grade elevations shown on the Contract Drawings.
 2. Excavate to the widths necessary to perform the Work allowing for the working space and/or aggregate base as shown on the Contract Drawings or as required.
 3. Replace excavation carried below the grade lines shown as follows:
 - a. If the overlying area is to receive fill or backfill, backfill the over-excavated volume with the same fill material specified for the overlying fill or backfill, and compact it as specified for the overlying fill or backfill.
 - b. If the overlying area is not to receive fill or backfill, replace the over-excavated material, and compact it to a relative compaction not less than that specified for structural fill.
- B. Excavation Equipment:
1. Perform excavation using machinery, except employ hand excavation where necessary to protect existing structures, buried utilities, or private or public properties.
- C. Excavation to Subgrade:

1. The method of excavation is at the Contractor's option; however, do not operate equipment within 5 feet of new structures or newly completed construction without prior approval of the Program/Project Manager.
 - a. Perform excavation that cannot be accomplished without endangering newly completed construction with hand tools.
2. Perform excavation of every description and of whatever substances encountered to the lines and grades or depths indicated by the Contract Drawings and as specified herein.
3. Remove subsurface materials of whatever nature, including boulders, rock, concrete, and construction debris, down to subgrade elevation.
 - a. Properly separate and store removed subsurface materials as suitable for use as fill.
4. Where work space is limited, remove excavated material from the limited area and replace the material after the structure has been installed.

D. Excavation Below Subgrade:

1. If through the fault of the Contractor excavations extend below the design depths or below the depths required by the Program/Project Manager, restore the excavation to the required depth with structural fill.

3.04 DEWATERING

A. Dewatering Excavations:

1. Remove all water during periods when concrete is being deposited, when pipe is being laid, during the placing of backfill, and at such other times as required for efficient and safe execution of the work.
2. Keep excavations free from water during the performance of the work.
3. Furnish and operate dewatering equipment having sufficient capacity for dewatering the excavations.
4. Control groundwater and surface water during construction in order to maintain soil stability.

B. Water Disposal:

1. Dispose of the water removed from excavations so that it does not cause injury to the public health, to public or private property, to the work of others, or to portions of the work completed or in progress, and does not cause an impediment to the use of streets, roads, and highways.

3.05 SHORING, SHEETING, BRACING, AND SLOPING

- A. Install and maintain shoring, sheeting, bracing, and sloping as necessary to support the sides of the excavation; to keep and to prevent any movement which may damage adjacent pavements, utilities, or structures; damage or delay the work; or endanger life and health.

- B. Install and maintain shoring, sheeting, bracing, and sloping as required by the Occupational Safety and Health Administration (OSHA) and other applicable governmental regulations and agencies

3.06 SUBGRADE PREPARATION

- A. After completion of excavations other than utility excavations, prepare the subgrade in accordance with the requirements of Section 02339, Subgrade Preparation.

3.07 FILLING AND BACKFILLING

- A. Borrow Material:
 - 1. The required quantity of fill may exceed the quantity of suitable onsite material.
 - 2. If borrow excavation is needed for fill material, notify the Program/Project Manager sufficiently in advance of borrow excavation work to permit the Program/Project Manager to verify the need for the borrow excavation, and to view the proposed borrow pit to determine the suitability of the material.
 - a. Borrow material from outside sources must be suitable in every respect, meeting specified requirements for the type of material, and will be subject to the Program/Project Manager's approval.
 - b. Prior to using borrow material from outside sources, obtain the Program/Project Manager's written consent.
- B. Fill Restrictions:
 - 1. Prior to placing fill, clean the excavation so it is free of trash and debris.
 - 2. Do not place backfill material adjacent to concrete structures until the concrete has attained at least 2/3 of its specified compressive strength.
 - 3. Do not place fill material on areas of ponded water or on surfaces that are muddy.
 - 4. Do not operate heavy equipment within 3 feet of walls.
 - 5. Do not operate earth-moving equipment within 5 feet of the walls of concrete structures to deposit or compact backfill material without prior approval by the Program/Project Manager.
 - a. Only small walk-behind compactors are allowed to operate within this zone unless otherwise indicated by the Program/Project Manager.
 - 6. Do not use wet materials containing moisture in excess of the amount necessary for satisfactory compaction as backfill.
 - 7. For walls to receive fill on both sides of the wall, backfill by alternately placing backfill material so the material heights on each side of the wall do not differ by more than 18 inches.
- C. Fill Placement:

1. Use machinery to place and compact fill, except where necessary to prevent damaging or displacing walls, foundations, or buried utilities fill or backfill by hand.
2. Prior to placing dry fill or backfill material not having sufficient moisture to obtain satisfactory placement or compaction, moisten the fill or backfill material.
3. Aggregate Base:
 - a. Place aggregate base courses directly on excavation bottoms and, where required, on completed structural fills.
 - b. Place aggregate base in loose lifts not exceeding 8 inches in thickness.
4. Granular Fill:
 - a. Place granular fill as backfill for retaining walls.
5. MSE Wall Fill:
 - a. Place MSE wall fill in the reinforced fill zone of mechanically stabilized earth walls.
6. Non-structural Fill:
 - a. Place non-structural fill in uniform horizontal layers not exceeding 8 inches in compacted thickness.
7. Structural Fill:
 - a. Place structural fill in uniform horizontal layers not exceeding 8 inches in compacted thickness.

RFI

0655

Retaining Wall Backfill

3.08 COMPACTION

- A. Compaction Equipment:
 1. Perform compaction using compaction equipment suitable for the material being placed.
 - a. Furnish compaction equipment of a type suitable and adequate to obtain the relative compaction specified, and that satisfactorily breaks down materials to form dense fill.
 - b. If inadequate relative compactions are obtained, furnish larger and/or different types of equipment.
 - c. If hand-operated equipment is furnished, furnish equipment capable of achieving the specified relative compaction.
 2. Operate compaction equipment in strict accordance with the manufacturer's instructions and recommendations.
 3. Maintain compaction equipment in a condition capable of delivering the manufacturer's rated compactive effort.
- B. Compacting Fill and Backfill:
 1. Compact the fill and backfill with vibratory compaction equipment as indicated in the Construction Documents to the satisfaction of the Program/Project Manager.
 - a. Compact all fill and backfill materials by mechanical means to the densities and moisture content specified.

2. Aggregate Base:
 - a. Compact each layer of the aggregate base course with vibratory compaction equipment to at least 98 percent of the maximum dry density as specified in ASTM D 698.
 3. Structural Fill, MSE Wall Fill, and Granular Fill:
 - a. Maintain the moisture content of structural fill, MSE wall fill, and granular fill at compaction within 2 percentage points of optimum moisture content as determined in accordance with the requirements of ASTM D 698.
 - b. Compact structural fill, MSE wall fill, and granular fill to at least 95 percent of the maximum dry density as determined in accordance with the requirements of ASTM D 698.
 - c. Compact the upper 2 feet of structural fill and granular fill in utility trenches below pavement and slab areas to at least 98 percent of the maximum dry density as determined in accordance with the requirements of ASTM D 698.
 4. Non-structural Fill:
 - a. Do not nest larger particles.
 - b. Maintain the moisture content of non-structural fill at compaction within 3 percentage points of optimum moisture content as determined in accordance with the requirements of ASTM D 698.
 - c. Compact non-structural fill to at least 90 percent of the maximum dry density as determined in accordance with the requirements of ASTM D 698.
- C. Moisture Control:
1. During compacting operations, maintain the optimum practicable moisture content in each lift of fill required for compaction purposes.
 - a. At the time of compaction, maintain the water content of the material at the optimum moisture content, plus or minus 2 or 3 percentage points as indicated in Paragraph 3.08.B.
 2. Maintain uniform moisture content throughout the lift.
 - a. Add water to the material at the excavation site insofar as practicable.
 - b. If required, supplement the moisture content by sprinkling the fill.
 3. Do not attempt to compact fill material that contains excessive moisture.
 4. Moisture Control Equipment:
 - a. Furnish equipment for applying water that is of a type and quality adequate for the work, that does not leak, and that is equipped with a distributor bar or other approved device to assure uniform application of the water.
- D. Other Materials and Equipment:
1. Furnish equipment for mixing and drying out material that consists of blades, discs, or other approved components.
 2. Furnish all other materials and equipment not specifically described but required for a complete and proper installation.

- a. All such Contractor-selected equipment is subject to review by the Program/Project Manager prior to use.

3.09 FINISH GRADING

- A. Finish grade all areas to the elevations and grades indicated in the Construction Documents.
- B. Perform grading in the vicinity of excavations so the ground surface is properly pitched to prevent water running into excavated areas.
 1. Grade the top perimeter of excavations to prevent surface water runoff from flowing into excavations.

3.10 REPAIR / RESTORATION

- A. Responsibility for damages and expenses arising out of the Work, for direct or indirect injury to such structures or to any persons or property by reason of them, or by reason of injury to them, whether such structures are or are not indicated on the Contract Drawings, rests solely with the Contractor.

3.11 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. The approved independent Testing and Inspection Agency will perform the testing specified in this Paragraph 3.11.A, and submit the test results to the Program/Project Manager and Contractor for information.
 - a. The Program/Project Manager may require additional tests whenever necessary to ensure that the specified density is being obtained.
 - b. If it appears that material, whether it is in stockpiles or is being placed, differs from that which has previously been approved for use, the Program/Project Manager may require retesting the material.
 - 1) Differences that may result in retesting include, but are not limited to, differences in grain size, color, texture, plasticity, or workability.
 - 2) Placing material represented by material requiring retesting during the interim period between taking a retest sample and receiving the test results is at the Contractor's risk.
 2. Laboratory Moisture-Density Tests:
 - a. Test Procedure:
 - 1) At least one laboratory moisture density determination test will be performed for each different soil being placed.
 - 2) The laboratory moisture-density tests will be performed in accordance with the methods specified in ASTM D 698.
 - b. Acceptance Criteria:
 - 1) Test results conforming to the requirements specified in Article 3.08 for the type of material are acceptable.
 3. In-Place Field Density Tests:

- a. Test Procedure:
 - 1) In-place field density tests will be performed in accordance with the methods specified in ASTM D 1556 or ASTM D 2922.
 - a) If the methods of ASTM D 2922 are used for in-place field density testing, the moisture content will be determined as specified in ASTM D 3017.
 - 2) For structural fills, at least one field moisture-density determination test will be performed for each 5,000 square feet below building areas and 10,000 square feet below parking areas.
 - a) The field moisture-density determination test will be performed for each compacted fill and backfill layer, not to exceed 8 inches compacted thickness.
 - 3) For granular and MSE wall fills, at least one field moisture-density determination test will be performed for each 100 feet of wall below slab and pavement areas and for each 150 feet of wall below landscaping areas.
 - a) The field moisture-density determination test will be performed for each compacted fill and backfill layer, not to exceed 8 inches compacted thickness.
 - 4) For non-structural fills, at least one field moisture-density determination test will be performed for each area of 10,000 square feet.
 - a) The field moisture-density determination test will be performed for each compacted fill and backfill layer, not to exceed 8 inches compacted thickness.
- b. Acceptance Criteria:
 - 1) Test results conforming to the requirements specified in Article 3.08 for the type of material are acceptable.

B. Non-Conforming Work

- 1. If testing indicates that a material does not meet the specified requirements, terminate placement of that material until corrective measures have been taken.
 - a. Whenever tests indicate that the field moisture or density does not meet specified requirements, take corrective action as approved by the Program/Project Manager.
 - 1) Corrective measures may include loosening the soil and wetting or drying it prior to re-compaction, additional compaction, or removing and replacing the material.
 - 2) Retest material that did not meet the moisture and density requirements after corrective measures have been performed.
 - b. For disapproved material, either submit samples for retesting for the sieve analysis, maximum dry density, optimum moisture content, liquid limit and plastic limit for approval of new borrow material, or procedures and materials proposed to render the disapproved material suitable for use.

2. Remove material which does not conform to the specified requirements but was placed in the Work, and replace the removed material with the specified material.
 - a. In the event that material that was previously approved for use is retested, and the retesting indicates that the material does not meet the specified requirements, moisture-condition and recompact the material in accordance with the specified requirements, or remove the material represented by the retest from the Work, and replace it with approved material.

3.12 CLEANING

- A. Cleanup:
 1. Remove excess excavated material that cannot be used at the Site, and dispose of it offsite in a lawful manner.
- B. Waste Management:
 1. No right of property for excavated materials is granted to the Contractor prior to filling.
 - a. The Contractor is not relieved of responsibility for removing and disposing of surplus excavated material or excavated materials not suitable for use as fill.

3.13 MAINTENANCE

- A. Maintain cut slopes as required for stability and safety during the duration of the Contract.

SECTION 02316

TRENCHING AND BACKFILLING

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Excavating, backfilling, and compacting trenches for inline structures and pipelines within the limits and to the depths indicated on the Contract Drawings or as specified.
 - a. Excavation for appurtenant structures, such as manholes, inlets, transition structures, junctions, vaults, valve boxes, catch basins, and similar structures are included in trenching.
 - b. Unless otherwise shown on the Contract Drawings or approved by the Program/Project Manager, perform open cut excavation for trenches.
 - 2. Requirements for pavement replacement where trenches are opened in paved areas.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01555 - Traffic Control.
 - 3. Section 02721 - Aggregate Base Course.
 - 4. Section 02741 - Bituminous Concrete Pavement.
 - 5. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCES

- A. Definitions:
 - 1. Bedding: Material to be placed in pipe trenches filling the volume from the bottom of the trench to 1 foot above the top of the buried pipe or conduit, excluding the pipe and its interior.
 - 2. Springline or Springing Line: In a transverse cross section of pipe, the line of maximum horizontal dimension.
 - 3. Unsuitable Material: Material consisting of organic material, oil, alkali, chemical compounds, rubble, rubbish, wood, and other substances subject to decomposition.
- B. Reference Standards:
 - 1. American Association of State Highway Transportation Officials (AASHTO):
 - a. AASHTO M 82 – Standard Specification for Cutback Asphalt (Medium-Curing Type).
 - b. AASHTO M 226 - Standard Specification for Viscosity-Graded Asphalt Cement.

- c. AASHTO T 90 - Standard Method of Test for Determining the Plastic Limit and Plasticity Index of Soils.
- d. AASHTO T 99 - Standard Method of Test for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop.
- e. AASHTO T 191 - Standard Method of Test for Density of Soil In-Place by the Sand-Cone Method.
- f. AASHTO T 224 – Standard Method of Test for Correction for Coarse Particles in the Soil Compaction Test
- 2. ASTM International (ASTM):
 - a. ASTM C 33 - Standard Specification for Concrete Aggregates.
 - b. ASTM C 143/C 143M - Standard Test Method for Slump of Hydraulic-Cement Concrete.
 - c. ASTM D 2922 - Standard Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).
 - d. ASTM D 3017 - Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth).
 - e. ASTM D 4832 - Standard Test Method for Preparation and Testing of Controlled Low Strength Material (CLSM) Test Cylinders.
 - f. ASTM D 5084 - Standard Test Methods for Measurement of Hydraulic conductivity of saturated Porous Materials Using a flexible Wall Permeameter.
 - g. ASTM D 5982 - Standard Test Method for Determining Cement Content of Fresh Soil-Cement (Heat of Neutralization Method).
 - h. ASTM D 6103 - Standard Test Method for Flow Consistency of Controlled Low Strength Material (CLSM).
- 3. City of Phoenix (COP):
 - a. City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - b. Phoenix Supplemental Standard Details for Public Works - Construction:
 - 1) Detail No. P1200 Trench Backfill & Surface Replacement.
 - 2) Detail No. P1270 Frame and Cover Installation and Grade Adjustment.
 - 3) Detail No. P1343 Waterline – Cut & Plug for 12” Dia. Main and Smaller.
 - 4) Detail No. P1344 Waterline Cut Out (Tees & Crosses) for 12” Dia. Main and Smaller.
 - 5) Detail No. P1391 Valve Box Installation.
- 4. Maricopa Association of Governments (MAG):

- 4) Detail No. 380 Thrust Blocks for Water Lines.
- 5) Detail No. 381 Anchor Blocks for Vertical Bends.
- 6) Detail No. 403-1 Pipe Supports Across Trenches.
- 7) Detail No. 403-2 Pipe Supports Across Trenches.
- 8) Detail No. 403-3 Alternate to Pipe Support.
- 9) Detail No. 404-1 Water and Sanitary Sewer Separation/Protection.
- 10) Detail No. 404-2 Water and Sanitary Sewer Separation/Protection.
- 11) Detail No. 404-3 Water and Sanitary Sewer Separation/Protection
- 12) Detail No. 405 Broken Sewer Line Replacement.
- 13) Detail No. 422 Manhole and Cover Frame Adjustment.
5. Maricopa County:
 - a. Air Quality Department (MCAQD):
 - 1) Guidance for Dust Control Permit for Application.
 - 2) Application for Dust Control Permit.
 - 3) Dust Control Logs.
 - b. Maricopa County Air Pollution Control Regulations:
 - 1) Regulation II – Permits and Fees:
 - a) Rule 200 – Permit Requirements, Section 305 – Dust Control Permit,
http://www.maricopa.gov/qa/divisions/planning_analysis/rules/docs/200-0803.pdf.
6. State of Arizona:
 - a. Arizona Revised Statutes (ARS):
 - 1) ARS 40-360.21 through 32 - Chapter 2 Public Service Corporations Generally, Article 6.3, Underground Utilities,
 - 2) ARS 40-360.41 through 45 - Chapter 2 Public Service Corporations Generally, Article 6.4, High Voltage Power Lines and Safety Restrictions.
7. U. S. Government:
 - a. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 Occupational Health and Safety Standards.
 - 2) 29 CFR 1926 Safety and Health Regulations for Construction.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Property Owner:

- a. Depending on where the trenching operation is to occur and the owner of the property or right-of- way, coordinate with and obtain the required approvals from the appropriate State and municipal departments, including but not limited to, the following:
 - 1) Phoenix Sky Harbor International Airport.
 - 2) City of Phoenix Streets Department.

- 3) Maricopa County.
 - 4) Arizona Department of Transportation (ADOT).
 - b. Adhere to each owner's specifications and/or permits, and comply with additional requirements of the owners, regarding the Work of this Section.
 - c. If the owner of the property or right-of-way is other than the Phoenix Sky Harbor International Airport, the name of the owner of the property or right-of-way will be provided on the Contract Drawings.
2. Excavation Safety:
 - a. At least 3 days prior to the start of digging or excavation Work, contact Arizona Blue Stake at (602) 263-1100 to arrange for utility owners to locate and mark their underground utilities.
 - 1) Comply with applicable Arizona Revised Statutes (ARS), especially those regarding Underground Utilities and the Overhead Powerline Safety Law.
 - 2) If unexpected active underground facilities are encountered during the performance of the Work, notify the Program/Project Manager immediately.
 - b. Sole responsibility for making all excavations in a safe manner is the Contractor's.
 - c. Provide suitable protection against bodily injury.
3. Utility Owners:
 - a. Coordinate with the various utility companies regarding the adjustment and inspection of their facilities.
 - 1) Adhere to each utility's specifications during adjustments.
 - 2) Comply with additional requirements of the utilities.
 - b. Conflicting Waterlines:
 - 1) If a trenching operation exposes 4 feet or more of an existing 12-inch or smaller water line, excluding service lines, then notify the City of Phoenix Water Distribution Division of the Water Services Department to isolate the conflicting waterline undercrossed by the excavation either by operating existing valves or cutting in new valves.
 - a) Request a shut-down at least 1 week in advance by contacting the City of Phoenix Water Distribution Division at either (602) 262-4711 or (602) 262-4712.
 - b) City forces will perform the shutdown or cut-in work.
 - c) If the unanticipated conflict can be resolved using offset pipe joints, coordinate with the City of Phoenix Water Distribution Division to obtain the offset pipe joints from the City's Water Stores Warehouse, and notify the City Inspector at least 24 hours prior to performing the work to schedule picking up the materials, and install the offset joints.
 - 2) After the existing undercrossed waterline has been isolated, remove a portion of the waterline sufficient to allow the new

- mainline pipe or structure to be installed under it as indicated on the Contract Drawings.
- 3) Once the new mainline pipe or structure has been installed, replace the portion of the waterline previously removed with same size and type of pipe that was removed, and extend the replacement pipe at least 5 feet into undisturbed ground beyond the trench wall.
 4. Irrigation Facilities:
 - a. Prior to trenching in the vicinity of irrigation facilities, including ditches, pipes, and structures, contact the owners of the irrigation facilities to arrange for construction clearances and/or dry-up periods.
 - b. Perform backfill and compaction for irrigation lines of the Salt River Valley Water User's Association and Roosevelt Irrigation Districts in compliance with each entity's specifications and/or permits.
 5. Do not interfere with persons, firms, corporations, or utilities, removing, changing, replacing, or employing protective measures at their property or structures.
 - a. Allow these persons, firms, corporations, or utilities to take such measures as they may consider necessary or advisable under the circumstances.
 - b. Measures employed or not employed by these entities do not relieve the Contractor of his responsibilities.

1.04 SUBMITTALS

- A. Action Submittals:
 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Proposed source of imported materials.
 - b. Samples:
 - 1) Imported materials.
 - c. Certificates:
 - 1) Microseal Mix Certification.
 - d. Delegated Design Submittals:
 - 1) Mix design for the controlled low strength material (CLSM).

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 1. Protect the excavations, and the safety of workers and the public, in conformance with the requirements of Occupational Safety and Health Administration (OSHA), particularly "Subpart P – Excavations" of 29 CFR 1926, and the following:
 - a. Shoring and Sheet piling:

- 1) Install bracing, sheathing, and/or shoring as necessary to excavations protect the excavations and safeguard the workers, the public, and the Program/Project Manager's representatives.
 - 2) To prevent overloading pipes and other structures in trenches during backfilling operations, do not remove the bracing, sheathing, and/or shoring in one operation, but remove it in successive stages as approved by the Program/Project Manager.
 - b. Open Trench Limits:
 - 1) Except where otherwise allowed or approved in writing by the Program/Project Manager, the maximum aggregate length of open trench at one location may not exceed 1320 feet.
 - a) The aggregate length of open trench is the sum of the lengths of concurrent excavation, pipe-laying, and backfilling operations at the location.
 - b) Excavated areas are considerate to be open trench until they are completely backfilled, compacted, and the surface is restored, including completion of pavement replacement where required. If approved by the Program/Project Manager, trench excavations may be opened at more than one separate location.
 - c. Incomplete Street Crossings:
 - 1) At street crossings where trench backfill and temporary patches have not been completed during regular working hours, provide substantial steel plates with adequate trench bracing to bridge across the trenches and accommodate traffic.
 - d. Dust Control Permit:
 - 1) In accordance with Rule 200 of the Maricopa County Air Pollution Control Regulations, a Dust Control Permit issued by the Maricopa County Air Quality Department is required for Sites where more than 0.1 acre (4356 square feet) of soil will be disturbed.
 - a) If a Dust Control Permit is required for this Contract, follow the instructions in the Maricopa County Air Quality Department's "Guidance for Dust Control Permit for Application" and file the "Application for Dust Control Permit", which requires including a Dust Control Plan with the Application, and pay the permit fees in accordance with Maricopa County Air Pollution Control Regulation Rule 280.
- B. Certifications:
1. Microseal Mix Certification:
 - a. Submit the microseal job mix formula and certified test results for it from an approved laboratory to the Program/Project Manager for approval.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Do not deliver imported materials to the Site until the proposed source and materials tests have been tentatively accepted in writing by the Program/Project Manager.
 - a. Submit the proposed source of imported materials and materials Samples for testing to the Program/Project Manager for approval.
 - 2. If it is necessary to haul wet soil material over roadways, use suitably tight vehicles to prevent spillage.
 - a. Clear away spilled material resulting from hauling operations from roadways.
- B. Storage and Handling Requirements:
 - 1. Storage of Approved Materials:
 - a. If approved materials are not used immediately, store or stockpile the various approved materials.
 - b. Do not mix various approved materials together or mix approved materials with unapproved materials unless approved by the Program/Project Manager.
 - 2. Storage of Excavated Material:
 - a. Pile excavated material that is suitable for use as backfill in an orderly manner, and a sufficient distance away from the edges of trenches so the trench walls are not overloaded and slides and/or cave-ins are avoided.
 - b. If the Contract Documents require the topsoil to be segregated from the underlying material, separate the 2 materials where they are stockpiled so they do not become mixed together.

1.07 SITE CONDITIONS

- A. Ambient Conditions:
 - 1. Do not perform trench excavating, backfilling, or compacting operations when either weather conditions or the condition of the materials are such, in the opinion of the Program/Project Manager, that the work cannot be performed satisfactorily.
 - 2. Provide effective dust control measures on the Site to prevent the spread of dust during trenching operations.
 - a. Thoroughly moisten excavation areas by dampening the soil, or employ other similar methods as approved by the Program/Project Manager.
- B. Existing Conditions:
 - 1. Boring logs shown on the Contract Drawings or included in the Specifications are included for the Contractor's convenience only, and do not constitute a part of the Contract.

- a. It is not intended to imply that the character of the material is the same as shown on the logs at points other than where each boring was made.
 - b. It is the Contractor's responsibility to satisfy itself regarding the actual soil moisture content, and the amount of rock, gravel, sand, silt, clay, and water, to be encountered during the Work of this Section.
2. Assume the risks attending to the presence or proximity, if any, of overhead or underground public utility and private lines, pipes, conduits and their associated support work, and other structures and property of every kind and description, in or over the excavation, or in the vicinity of the work, whether above or below the surface of the ground.

PART 2 PRODUCTS

2.01 MATERIALS:

- A. Asphalt Emulsion:
 1. Provide modified asphalt emulsion materials complying with the requirements for emulsified asphalt as specified in Section 02686, Tack Coat.
- B. Bedding Materials:
 1. Crushed Aggregate:
 - a. Provide crushed aggregate bedding materials complying with the requirements either for Select Material Type B or Aggregate Base as specified in Section 02721, Aggregate Base Course, with gradations according to Table 02721-1 Crushed Aggregate Gradation.
 - 1) Provide granular material having the sum of the plasticity index, measured in accordance with the methods specified in AASHTO T 90, plus the percent of material passing a Number 200 sieve less than 23.
 - b. Do not use open graded rock without the written approval of the Program/Project Manager.
 2. Sand:
 - a. Provide sand complying with the grading requirements of ASTM C 33 for fine aggregate.
- C. Backfill Materials:
 1. Provide aggregate base course, granular backfill, or native backfill as indicated on the Contract Drawings and/or on the applicable Standard Drawings from the City of Phoenix and the Maricopa County Association of Governments.
 - a. Provide sound material free from broken concrete, broken pavement, wood, and other deleterious material.
 - b. Under pavement, sidewalk, or similar construction, backfill for the 12 inches directly below the subgrade may not be larger than 3 inches.

2. Aggregate Base:
 - a. Provide crushed aggregate complying with the requirements specified in Section 02721, Aggregate Base Course.
3. Granular Backfill:
 - a. Provide granular material having the sum of its plasticity index, measured in accordance with the methods specified in AASHTO T 90, plus the percent of the material passing a Number 200 sieve, equaling less than 23.
4. Excavated "Native" Backfill:
 - a. Excavated "native" material with pieces less than 4 inches is suitable for use as backfill for backfilling trench excavations.
 - 1) Excavated material having either excessive or inadequate moisture content is considered unsuitable, since it cannot be properly compacted; however, the following options may be elected:
 - a) At no increase in Contract Price, add or remove water to the unsuitable excavated material to bring it within the range of plus 2 percent to minus 4 percent of the optimum moisture content in order that the material can be properly compacted to the values specified in Table 02316-1.
 - b) In lieu of adding or removing water to the unsuitable excavated material to make it suitable for backfill as specified in Subparagraph 2.01.C.4.a.2.a, haul excessively dry or wet material offsite and legally dispose of it, and provide other material complying with the requirements specified for suitable backfill material to replace the material removed.
5. Controlled Low Strength Material (CLSM):
 - a. Provide controlled low strength material (CLSM) consisting of a cement-enriched aggregate base course slurry having the following properties:
 - 1) Cement Content:
 - a) Provide controlled low strength material (CLSM) having a cement content of 47 pounds per cubic yard plus or minus 5 percent when tested in accordance with the methods specified in ASTM D 5982.
 - 2) Slump or Flow Consistency:
 - a) Provide controlled low strength material (CLSM) having a slump of 7 inches plus or minus 1 inch when tested in accordance with the methods specified in ASTM C 143/C 143M, or flow consistency of 8 inches when tested in accordance with the methods specified in ASTM D 6103.
 - 3) Compressive Strength:

- a) Provide controlled low strength material (CLSM) having a compressive strength of 100 psi at 28 days when tested in accordance with the methods specified in ASTM D 4832.
- 4) Permeability Coefficient:
 - a) If the controlled low strength material (CLSM) is used as backfill around gas pipelines, it must totally encapsulate the pipeline, and have a minimum permeability coefficient, k , of 1×10^{-5} centimeters per second when tested in accordance with the methods specified in ASTM D 5084.
 - b. Submit a mix design for the controlled low strength material (CLSM) to the Program/Project Manager for approval prior to placing the controlled low strength material.
6. Decomposed Granite:
 - a. Provide decomposed granite as specified in Section 02721, Aggregate Base Course.
- D. Bituminous Concrete:
 1. Provide bituminous concrete materials and mixes in accordance with the requirements of Section 02741, Bituminous Concrete Pavement, and complying with the requirements specified in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications for the type of asphalt paving required.
- E. Cold Mix Bituminous Concrete:
 1. Provide cold mix bituminous concrete consisting of natural crude or refined asphalt petroleum, or a residual product thereof, combined with aggregate having the gradation shown in Table 02316-1.
 - a. For the asphalt petroleum, or residual product thereof, provide 6 percent plus or minus 0.4 percent medium curing type cutback asphalt complying with the requirements for either Grade MC-70 or MC-250 medium curing type cutback asphalt as specified in Table 1 in AASHTO M 82, or 5.5 percent of AC-2.5 viscosity-graded asphalt cement complying with the requirements of Table 1 in AASHTO M 226.
 - 1) The AC-2.5 asphalt binder must be heated for mixing.

Table 02316-1 Temporary Pavement Aggregate Gradation

Sieve Size	Percent Passing	Tolerance
3/4 inch	97 to 100	Plus or minus 7 percent
1/2 inch	88	Plus or minus 7 percent
3/8 inch	78	Plus or minus 7 percent
Number 4	60	Plus or minus 7 percent

Table 02316-1 Temporary Pavement Aggregate Gradation		
Sieve Size	Percent Passing	Tolerance
Number 8	47	Plus or minus 5 percent
Number 30	25	Plus or minus 5 percent
Number 200	5	Plus or minus 2 percent

F. Microseal Mix:

1. Provide a Grade CSS-1h polymerized cationic asphalt emulsion, modifier, aggregate, mineral filler, water, and additives complying with the requirements specified in Section 761, Microseal Specifications, of the Maricopa Association of Governments Uniform Standard Specifications for Public Works Construction.

G. Slurry Seal:

1. Provide slurry seal materials complying with the requirements of Section 715, Slurry Seal Materials, of the Maricopa Association of Governments Uniform Standard Specifications for Public Works Construction.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Determine actual soil conditions, which may differ from those anticipated or indicated by available soil logs and/or reports.
2. Notify the Program/Project Manager of unexpected subsurface conditions, and discontinue working in the affected area until notified to resume work.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Maintain and protect traffic on active streets and roads in accordance with the requirements specified in Section 01555, Traffic Control.
2. Protect buildings, foundations, bridges, and other structures located adjacent to trenching operations from damage due to the trenching.
 - a. Unless authorized in writing by the Program/Project Manager, do not use water to settle backfill material in trenches adjacent to structures.
3. Safeguard and maintain conflicting utilities shown on the Contract Drawings, including overhead wires and cables and their supporting poles, whether or not they are inside or outside the trench.

- a. If a conflicting utility not shown on the Contract Drawings is discovered during the course of the Work, notify the Program/Project Manager as soon as possible.
 - 1) The Program/Project Manager will negotiate to have the owner of the conflicting utility relocate it, have others relocate the utility, change the alignment or grade of the trench to avoid the conflict, or declare the work to resolve the conflict as extra work.
 - b. Provide permanent pipe supports for sewer, water, and other utility lines where shown on the Contract Drawings and at other locations as deemed necessary by the Program/Project Manager.
 - 1) Provide permanent pipe supports in accordance with the details shown on the Contract Drawings, the MAG Uniform Standard Details for Public Works Construction, and the Phoenix Supplemental Standard Details for Public Works – Construction.
 - c. Adequately support electronic, telephonic, telegraphic, electrical, oil, and gas lines encountered; and avoid damaging plastic pipe, pipe-way, and conduits during foundation preparation, bedding placement and backfilling operations.
 - 1) Support plastic pipe and electrical conduit continuously along the bottom of the pipe or conduit.
 - 2) Support metal pipe and electrical conduit either continuously or suspend the pipe or conduit from nylon webbing spaced at intervals not more than 10 feet apart.
4. Unless otherwise indicated in the Contract Documents, maintain all underground and overhead utilities in continuous service throughout the duration of the Contract, and take responsibility and accept liability for damages or interruptions of service caused by the construction.
- a. If a utility or appurtenance is to be temporarily or permanently relocated or shut down, the Contractor is responsible for making the necessary arrangements and agreements with the owner of the utility and its reconstruction at no increase in the Contract Price.
 - 1) Reconstruct the utility or appurtenance and the property to its previous condition or better as soon as possible.
 - 2) The relocation or shutdown and restoration cycle is subject to inspection and approval by both the Program/Project Manager and the owner of the utility.
- B. Surface Preparation:
- 1. Furnish alignment and elevation stakes marking the trench grade at intervals and offsets agreed upon with the Program/Project Manager.
 - a. On Contracts that include water distribution Work, only furnish elevation stakes if required by the Program/Project Manager.
 - b. The Program/Project Manager will furnish cut sheets for Contracts requiring elevation stakes.

C. Demolition/Removal:

1. Pavement and Concrete Cutting and Removal:
 - a. Where trenches lie within paved streets, alleys, driveways, and/or sidewalks, cut the pavement as follows:
 - 1) Portland Cement Concrete:
 - a) Saw cut the pavement to neat, vertical, true lines without damaging the adjoining surface.
 - b) Cut the pavement to at least 1-1/2 inches or 1/4 of the pavement thickness, whichever is greater.
 - 2) Bituminous Pavement:
 - a) Use approved equipment and methods to clean-cut the bituminous pavement.
 - b. Do not rip or root outside the limits of the cuts.

3.03 TRENCHING

A. Trench Excavation:

1. Unless otherwise indicated on the Contract Drawings, provide pipe trench widths for pipe, other than cast-in-place concrete pipe, as indicated in Table 02316-2.

Table 02316-2 Pipe Trench Widths		
Pipe Size (Inside Diameter)	Maximum Width at Top Greater than Outside Diameter of Barrel	Minimum Width at Springline – Each Side of Pipe
Less than 18 inches	16 inches	6 inches
18 to 24 inches	19 inches	16 inches
27 to 39 inches	28 inches	16 inches
42 to 60 inches	1/2 the outside diameter	16 inches
Over 60 inches	36 inches	16 inches

2. Do not excavate the portion of the trenches below the top of the pipe wider than allowed by Table 02316-2.
 - a. If the maximum trench width specified in Table 02316-2 is exceeded, then provide the additional load bearing capacity necessary by using the following methods or a combination of the methods:
 - 1) Provide bedding with a higher bedding factor than that specified.
 - 2) Provide higher strength pipe.
 - 3) Provide a concrete cradle, cap, or encasement.
 - 4) Other means approved by the Program/Project Manager.

3. Above the top of the pipe, trenches may be excavated as wide as necessary for installing sheeting, shoring, or other wall supports or for slopping the trench walls as required for a safe and proper pipe installation.
4. Do not over-excavate below the elevations indicated in the Contract Documents, except at locations where excavation of rock from the trench is required.
 - a. Refill excavation extending below the indicated grade line or bottom elevation indicated for the foundation of structures with bituminous concrete compacted to a uniform density not less than 95 percent of the maximum density as determined by AASHTO T 99 and AASHTO T 191, or ASTM D 2922 and ASTM D 3017.
 - 1) If Methods A or B of AASHTO T 99 and AASHTO T 191 are used to determine the maximum density, correct the dry density using the rock correction procedure found in Standard Detail 190 in the MAG Uniform Standard Details for Public Works Construction.
 - b. Wherever rock is encountered during trench excavation, over-excavate to a minimum depth of 6 inches below the outside diameter of the pipe, and refill the over-excavated volume by placing granular material with the minimum possible compaction.
 - c. Wherever unsuitable soil, incapable of supporting the pipe, is encountered, notify the Program/Project Manager that a field investigation to determine a course of action is required.
 - 1) If the Program/Project Manager determines that, as a result of the presence of unsuitable material, over-excavation below the normal foundation and bedding depth and backfilling the void is required, this will be considered extra; work and an agreement on the method of payment and construction time extensions must be reached prior to the Contractor starting the work.
5. When excavating trenches for pipes 8 inches or larger in diameter, allow for an initial granular bedding of at least 4 inches or 1/12 the outside diameter of the pipe, whichever is greater.

B. Foundation Preparation:

1. Accurately finish the material upon which the conduit or structure is to be placed to the grade and/or dimensions shown on the Contract Drawings or as directed by the Program/Project Manager.
 - a. Bring the bottom portion of the trench to grade so the conduit or structure will be continuously in contact with the material on which it will be placed.
2. Bedding:
 - a. Place bedding in pipe trenches filling the volume from the bottom of the trench to 1 foot above the top of the buried pipe or conduit, excluding the pipe and its interior.
 - 1) For trenches being excavated for pipes 8 inches or larger in diameter, provide an initial granular material bed to a depth of at

- least 4 inches or $1/12$ the outside diameter of the pipe, whichever is greater, prior to placing the pipe in the trench and completing the backfilling.
- a) Place this bedding material so it has a uniform density with minimum compaction, and fine grade the bedding as specified herein.
 - 2) For electronic, telephonic, telegraphic, electrical, oil, and gas lines, provide native material or sand bedding.
 - a) Provide a 6-inch deep foundation consisting of native material or sand bedding.
 - b) If the backfill material to subsequently be placed in a trench for the electronic, telephonic, telegraphic, electrical, oil, or gas lines consists of aggregate base course, crushed stone, or other stone-containing material, then only sand may be used for the bedding material.
 - b. Where water consolidation will subsequently be used to compact the backfill, place the bedding as follows:
 - 1) Bedding for conduits with an inside diameter of 24 inches or less may be placed in 1 lift.
 - 2) Do not allow the first lift of the bedding for conduits larger than 24 inches to exceed the springline of the pipe.
 - c. Where mechanical consolidation will subsequently be used to compact the backfill, place the bedding as follows:
 - 1) Provide bedding having moisture content within the range of plus 2 to minus 4 percent of the optimum moisture content prior to placement in the trench.
 - 2) Place the first lift to a depth of 8 inches or $2/3$ the distance to the springline, whichever is greater.
 - 3) Do not exceed 1 foot in loose depth when placing succeeding lifts.
 - 4) Prevent the compaction equipment from damaging or moving the conduit.
 3. Fine Grading:
 - a. Unless indicated otherwise on the Contract Drawings, accurately grade the bottom of the trench or the top of the bedding, if it is required, to provide uniform bearing and support for each section of the pipe at every point along its entire length, except for the portion of the pipe where depressions for joint making will be made as follows:
 - 1) After the bedding has been fine graded, dig depressions in the bedding to allow space to accommodate pipe bells, couplings, or other protuberances so the pipe shaft will rest on the prepared top of the bedding and the pipe will not be supported by any portion of the joint.
 - 2) Excavate depressions sufficiently wide to allow ample room for caulking, banding, bolting, or other appurtenances.

- 3) Excavate depressions only as necessary to permit accurate joint making and to ensure the pipe rests on the prepared bottom.
- 4) Excavate depressions in accordance with the recommendations of the joint manufacturer.

C. Dewatering:

1. Remove surface and ground water that accumulates in the trenches by pumping or another approved method at no increase in the Contract Price.

3.04 BACKFILLING

A. Backfill:

1. The type of backfill required is typically indicated on the Contract Drawings or in Phoenix Supplemental Standard Details for Public Works – Construction, particularly Drawing No. P1200.
 - a. If the trenching is in a Portland cement concrete street, provide aggregate base backfill, granular backfill, excavated “native” backfill, or controlled low strength material (CLSM) backfill between the granular bedding material below and the replacement pavement above.
 - 1) Provide permanent Portland cement concrete pavement replacement consisting of at least an 8-inch thick concrete pavement section over the backfill.
 - a) Construct the pavement section from Class A concrete as specified in Section 03300, Cast-In-Place Concrete.
 - b. If the trenching is in a bituminous concrete street that will not be repaved, comply with the following backfill and pavement requirements:
 - 1) For transverse trenches, defined as trenches 45 to 90 degrees from the street centerline, provide aggregate base backfill or controlled low strength material (CLSM) backfill between the granular bedding material below and the replacement pavement above.
 - a) Provide permanent bituminous concrete pavement replacement sections as indicated on the Contract Drawings over the backfill.
 - 2) For trenches parallel or less than 45 degrees from the street centerline, provide aggregate base backfill, granular backfill, excavated “native” backfill, or controlled low strength material (CLSM) backfill between the granular bedding material below and the replacement pavement above.
 - a) Provide permanent bituminous concrete pavement replacement sections as indicated on the Contract Drawings over the backfill.
 - 3) For trenches crossing a major street, collector street, or any other signalized intersection, provide aggregate base backfill, granular

- backfill, excavated “native” backfill, or controlled low strength material (CLSM) backfill between the granular bedding material below and the replacement pavement above.
- a) Provide permanent bituminous concrete pavement replacement sections as indicated on the Contract Drawings over the backfill.
 - c. If the trenching is in a bituminous concrete street that will be repaved, comply with the following backfill and pavement requirements:
 - 1) For transverse trenches, defined as trenches 45 to 90 degrees from the street centerline, provide aggregate base backfill or controlled low strength material (CLSM) backfill between the granular bedding material below and the replacement pavement above.
 - 2) For trenches parallel or less than 45 degrees from the street centerline, provide aggregate base backfill, granular backfill, excavated “native” backfill, or controlled low strength material (CLSM) backfill between the granular bedding material below and the replacement pavement above.
 - 3) For trenches crossing a major street, collector street, or any other signalized intersection, provide aggregate base backfill or controlled low strength material (CLSM) backfill between the granular bedding material below and the replacement pavement above.
 - 4) Provide temporary bituminous concrete pavement replacement for traffic control at intersections, and at existing partially paved areas where the pavement is not scheduled for immediate total removal and replacement.
 - 5) The Program/Project Manager may require temporary bituminous concrete pavement in areas where public safety and welfare warrants it.
 - d. If the trenching is in bituminous concrete pavement having a soil cement base course, concrete treated base course, or bituminous treated base course; either match the existing pavement structure including all courses, or replace the pavement structure with equivalent full depth bituminous concrete pavement.
 - 1) For computing the equivalent full depth bituminous concrete pavement required, assume 1 inch of bituminous concrete is equivalent to 3.25 inches of aggregate base course or 1.4 inches of soil cement, concrete treated base, or bituminous treated base.
 - 2) After computing the equivalent depth, round up the computed number to the next higher 1/2 inch; i.e. 6.15 inches rounds up to 6.5 inches.
 - e. If the trenching is in aggregate base course or decomposed granite, provide excavated “native” backfill compacted as specified and pavement replacement as indicated on the Contract Drawings.

- f. If the condition of existing pavement over an excavation does not justify using the previous backfill methods and pavement replacement, obtain written approval from the Program/Project Manager to provide excavated “native” backfill between the granular bedding material below and the replacement pavement above.
 - 1) Provide bituminous concrete pavement replacement sections as indicated on the Contract Drawings over the backfill.
2. Except when granular backfill material to be water settled is furnished, provide backfill having uniform moisture content throughout the material within the range of plus 2 to minus 4 percent of the optimum moisture content prior to placement in the trench.
 - a. The Program/Project Manager may require backfill placed but not complying with the specified moisture content requirements to be removed in order for the deficiencies to be corrected.
 - 1) Correct the deficiencies by blending excavated material with the backfill, or add or remove moisture prior to replacing it back into the trench, all at no increase in Contract Price
 - b. Controlled Low Strength Material (CLSM):
 - 1) In areas where future excavation into the backfill is anticipated or in areas of low loading such as in streets, in parking areas, behind retaining walls, and similar situations, controlled low strength material (CLSM) may be used to backfill the trench.
3. Backfilling Around Utilities:
 - a. Place backfill around utilities exposed during trench excavation in accordance with the methods specified for bedding.
 - b. If a utility structure is constructed within the open trench limits, backfill the utility structure in accordance with the requirements specified for the adjoining pipe.
 - c. If a utility structure is constructed outside the open trench limits, backfill the utility structure with aggregate base course compacted to 100 percent of the maximum density as determined by AASHTO T 99 and AASHTO T 191, or ASTM D 2922 and ASTM D 3017.
 - 1) If Methods A or B of AASHTO T 99 and AASHTO T 191 are used to determine the maximum density, correct the dry density using the rock correction procedure found in Standard Detail 190 in the MAG Uniform Standard Details for Public Works Construction.
4. As soon as possible after laying pipe in a trench that crosses streets, backfill the trench.
5. Where water consolidation is subsequently to be used, place backfill in lifts in accordance with Table 02316-3, unless the consolidation is accomplished using the jetting method.

**Table 02316-3 Maximum Depth of Backfill Lifts Prior to Settlement**

Trench Width	Depth of Backfill Lifts
18 to 24 inches	4 feet
25 to 36 inches	6 feet
Over 36 inches	8 feet

B. Compaction:

1. Compact the backfill as required for the type indicated on the Contract Drawings as follows:
 - a. If the type of compaction required is not indicated on the Contract Drawings, determine the type from Table 02316-4.
 - b. Unless indicated otherwise in the Contract Documents, thoroughly compact the trench backfill to not less than the densities indicated in Table 02316-4
 - 1) Determine the densities in accordance with the procedures specified in AASHTO T 99 and AASHTO T 191, or ASTM D 2922 and ASTM D 3017.
 - 2) If Methods A or B of AASHTO T 99 and AASHTO T 191 are used to determine the density, correct the dry density using the rock correction procedure found in Standard Detail 190 in the MAG Uniform Standard Details for Public Works Construction.

Table 02316-4 Trench Backfill Compaction Density (Minimum Percent)

Compaction Type⁽¹⁾ [Location]	Zones		
	From the Surface to 2 Feet Below the Surface	From 2 Feet Below the Surface to 1 Foot Above the Top of Pipe	From 1 Foot Above the Top of Pipe to the Bottom of the Trench
<u>Type I</u> – Under existing or proposed pavement, curb, gutter, sidewalk, or similar construction included in the Contract; or where any part of the trench excavation is within 2 feet of foregoing items.	100	95	95

Table 02316-4 Trench Backfill Compaction Density (Minimum Percent)			
Compaction Type ⁽¹⁾ [Location]	Zones		
	From the Surface to 2 Feet Below the Surface	From 2 Feet Below the Surface to 1 Foot Above the Top of Pipe	From 1 Foot Above the Top of Pipe to the Bottom of the Trench
Type II ⁽²⁾ – On utility easements, streets, roads, or alley rights-of-way outside the limits for Type I.	95	95	95
Type III – Around structures or exposed utilities.	95	95	95
<p>1. The Compaction Type indicated on the Contract Drawing will govern, but if no Compaction Type is indicated there, determine the Type for the location as specified in Table 02316-4.</p> <p>2. If Type II Compaction is indicated on the Contract Drawings, but trench widths are increased beyond the widths indicated on the Contract Drawings and fall within the 2-foot limit specified above for Type I Compaction, then the compaction required for that portion of the backfill is Type I.</p>			

2. Mechanical Compaction:
 - a. Where mechanical consolidation is to be used, demonstrate the method and equipment proposed to the Program/Project Manager within a test section, and obtain the approval of the Program/Project Manager before using the method and equipment to perform the Work.
 - 1) Do not change approved methods and equipment without the prior approval of the Program/Project Manager.
 - b. Do not use mechanical consolidation to compact lifts exceeding 1 foot without the written approval of the Program/Project Manager.
 - c. Mechanical consolidation requires hand work and/or mechanical methods using equipment such as rollers, pneumatic tampers, hydro-hammers, or other devices which secure uniform and required density without injuring pipe or other structures in the trench.
3. Water Consolidation:
 - a. If water consolidation, either jetting or flooding, is permitted and used, and the surrounding material does not permit proper drainage, provide a sump and a pump at the downstream end of the trench to remove accumulated water.

- 1) Where Type I compaction is required for non-granular backfill material, water consolidation is not permitted.
 - b. Jetting:
 - 1) Use jetting for consolidating all conduit bedding.
 - a) Establish each lift depth so the conduit being place is not floated.
 - b) For conduit larger than 24 inches in diameter, the first lift may not exceed the springline of the conduit.
 - 2) Provide jets consisting of 1-1/2 inch diameter pipe sufficiently long to reach the bottom of the lift being settled, and having an adequate water supply hose attached.
 - 3) Throughout the length of the trench, insert the jets transversely across the trench at 6-foot intervals, staggering jet locations so they are offset to the jet locations on the other side of the trench.
 - 4) Supply water to the jets at a pressure not less than 30 psi.
 - 5) Working from top to bottom, slowly force the jets down to the bottom of the trench or the top of the previously jetted lift, and level and completely saturate the entire lift.
 - c. Flooding:
 - 1) Unless it is specifically authorized in the Specifications or by Change Order, flooding is unacceptable as a water consolidation method.
 - 2) If flooding is authorized, inundate the entire lift with water and then puddle the lift with poles and bars to ensure the entire lift is saturated.
 - d. If water consolidation is not permitted or results in inadequate compaction, compact the material using mechanical consolidation.
- C. Interface with Other Work:
1. Control grading in the vicinity of trench excavation to prevent surface water from flowing into the trenches.
 2. Earth Forms:
 - a. Concrete placed for cast-in-place utility structures in trenches may be placed directly against the excavated surface, provided that the faces of the excavation are firm and unyielding, and are all at points outside the structure lines shown on the Contract Drawings.
 - 1) If the native material will not stand without sloughing, or if precast structures are to be constructed, over-excavate the trench sufficiently to allow the structure to be properly constructed.

3.05 REPAIR

- A. Repair damage to existing improvements and/or conduits and structures in trenches resulting from water consolidation of bedding and/or backfill at no increase in Contract Price.

3.06 RESTORATION

A. Grading:

1. Grade the area adjacent to backfilled trenches and structures leaving the area neat and in a satisfactory condition as determined by the Program/Project Manager.

B. Pavement Replacement:

1. Resurface the streets, alleys, driveways, sidewalks, curbs, and other similar paved areas where the surface has been broken into or otherwise damaged by the installation of the new Work.
 - a. Resurface the areas in kind, or as otherwise indicated on the Contract Drawings.
2. Prior to the placement of bituminous or Portland cement concrete over trenches, the Program/Project Manager may require the trench or portions of the trench to be load tested for stability using the Contractor's equipment.
 - a. Prior to the placement of bituminous or Portland cement concrete over trenches, correct unstable areas identified by the Program/Project Manager at no increase in Contract Price.
3. Temporary Pavement Replacement:
 - a. Immediately after backfilling and compacting the backfill for trenches that have been cut through existing pavement, install temporary pavement or the first course of permanent pavement replacement so the finished surface of the temporary pavement is flush with the adjacent pavement.
 - 1) In lieu of immediately placing a single course permanent replacement or the first course of 2 course pavement construct temporary pavement during the same shift in which the backfill to be covered is completed.
 - b. Provide cold mix bituminous concrete placed in 2 inch increments, and compacted with a roller having a contact pressure of at least 60 psi.
 - 1) Compact each layer to 96 percent of the laboratory compacted density for like materials.
 - 2) If roller compaction is impractical in an area, small vibrating rollers or vibrating plate compactors may be used provided the specified compaction is obtained.
4. Permanent Pavement Replacement:
 - a. Prior to placing concrete for permanent pavement replacement, compact the trench backfill to the specified density, and place the required aggregate base course.
 - 1) Do not allow placement of bituminous concrete pavement replacement single course or base course to lag more than 600 feet behind placement of its aggregate base course.

- b. For cuts generally parallel to the street centerline and greater than 50 feet long, provide pavement replacement consisting of 2 bituminous concrete courses as specified herein.
- c. For cuts generally parallel to the street centerline and less than 50 feet long, for transverse cuts, for bell holes, and for similar small areas, provide a single course pavement patch.
 - 1) Match the gradation and thickness of the existing pavement.
 - 2) Compact the single course to the same density as for bituminous concrete pavement using a vibratory roller.
- d. For permanent pavement replacement of deep lift asphalt concrete, where the existing pavement consists of both asphalt concrete base and wearing courses, provide the base course replacement in lifts not exceeding 6 inches in compacted thickness to within 1/2 inch of the finish grade.
- e. Placing and Compacting Pavement Replacement:
 - 1) For trenches 6 feet wide or wider, place all permanent pavement replacement courses using self-propelled spreading and compacting equipment.
 - a) If the trenches are from 6 to 8 feet wide, use compacting, spreading equipment not wider than 8 feet.
 - 2) Except for surface courses, compact permanent pavement replacement courses to 1-1/2 inches thick or more.
- f. Single Course:
 - 1) Where providing single course pavement replacement, provide either a Type C-3/4 Surface Course bituminous concrete mix or a Type D-1/2 Surface Course bituminous concrete mix, and finish the course as directed by the Program/Project Manager.
- g. Base Course:
 - 1) Place a bituminous concrete base course consisting of a Type C-3/4 Base Course mix.
 - 2) If the base course is placed with non-compactive equipment, immediately roll the material with a pneumatic-tired roller to provide a thickness of not less than 2 inches.
- h. Surface Course:
 - 1) Over the base course, place a bituminous concrete surface course of sufficient depth to provide the total compacted thickness required of the 2 courses, but not more than 1 inch deep.
 - 2) Place a bituminous concrete surface course complying with the requirements for Type D-1/2 Surface Course to match the existing surface, flush with the existing pavement, using means that result in a surface texture satisfactory to the Program/Project Manager.
 - 3) Except where a trench crosses a signalized intersection, do not place the surface course sooner than 2 weeks after placing the base course.

- 4) Where a trench crosses a signalized intersection, place the surface course within 48 hours after placing the base course, or provide just a single course.
- i. Seal Coat:
 - 1) For cuts greater than 600 feet long, seal coat the entire area from the edge of pavement or lip of the gutter to the centerline of the street with asphalt overlay, slurry seal, microsurfacing, or a modified asphalt emulsion as directed by the Program/Project Manager.
 - a) Slurry seals are not allowed on major and collector streets.
5. Adjust new and existing manholes, valves, survey monuments, clean outs, and similar items to grade as directed by the Program/Project Manager.
 - a. Prior to resetting frames, remove all loose material from the excavation site and the interiors of utility structures.
 - b. Do not allow debris to enter sanitary or storm sewers.
 - c. Adjust manhole frames in accordance with Detail No. 422 in the MAG Uniform Standard Details for Public Works Construction, except extend the concrete color up to the finished grade.
 - d. Adjust water valves, survey markers, and sewer clean out frames for in accordance with Detail No. P1270 and Detail No. P1391 in the Phoenix Supplemental Standard Details for Public Works – Construction.
 - e. Remove asphalt material and aggregate from metal lids and covers encountered using a method approved by the Program/Project Manager.
- C. Irrigation Facilities:
 1. Restore irrigation ditches, dikes, headgates, pipe valves, checks, and similar facilities damaged or removed by the Contractor to their original condition or better at no increase in Contract Price.

3.07 CLEANING

- A. Clean up after trenching so the Site is in a neat condition acceptable to the Program/Project Manager.
- B. Excess Material:
 1. Haul excess excavated material from the Site, and legally dispose of it.
- C. Waste Management:
 1. Immediately following demolition of concrete and pavement surfacing material demolished to allow trenching to commence, haul the demolished material from the Site.
 - a. Haul temporary pavement surfacing material that has been demolished from the Site immediately following the demolition.

2. Properly dispose of demolished concrete and pavement surfacing material at no increase in Contract Price.
 - a. Do not use concrete and pavement surfacing material as backfill.

3.08 MAINTENANCE

- A. Maintain temporary pavement in a safe and reasonably smooth condition until the final compaction and, if required, pavement replacement is performed.

SECTION 02339

SUBGRADE PREPARATION

Roadway Joint Sealant
Sitewide Approval

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for preparation of natural or excavated areas prior to the placement of sub-base material, pavement, curbs and gutters, driveways, sidewalks, or other structures.
- B. Related Requirements:
 - 1. Section 01400 - Quality Requirements.
 - 2. Section 02231 - Clearing and Grubbing.
 - 3. Section 02300 – Earthwork.

1.02 REFERENCES

- A. Definitions:
 - 1. Unsuitable Material: Material that contains organic matter, soft spongy earth, or other matter of similar nature so that compaction to the specified density is unobtainable.
- B. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO T 99 – Standard Method of Test for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop.
 - b. AASHTO T 191 - Standard Method of Test for Density of Soil In-Place by the Sand-Cone Method.
 - c. AASHTO T 224 - Standard Method of Test for Correction for Coarse Particles in the Soil Compaction Test.
 - 2. Arizona Revised Statutes (ARS):
 - a. Chapter 2, Article 6.3, Underground Utilities, ARS 40-360.21 through 32.
 - b. Chapter 2, Article 6.4, Overhead Powerline Safety Law, ARS 40-360.41, 45.
 - 3. ASTM International (ASTM):
 - a. ASTM D 698 - Standard Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN-m/m³)).
 - b. ASTM D 2922 - Standard Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).

- c. ASTM D 3017 - Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth).
- 4. Maricopa Association of Governments (MAG):
 - a. Uniform Standard Specifications for Public Works Construction:
 - 1) MAG Section 211 – Fill Construction.
 - 2) MAG Section 301 – Subgrade Preparation.
 - b. MAG Uniform Standard Details for Public Works Construction.
 - 1) Detail No. 190 Rock Correction Procedure for Maximum Density Determination.
- 5. Maricopa County:
 - a. Air Quality Department:
 - 1) Guidance for Dust Control Permit for Application.
 - 2) Application for Dust Control Permit.
 - 3) Dust Control Logs.
 - b. Maricopa County Air Pollution Control Regulations:
 - 1) Regulation II – Permits and Fees:
 - a) Rule 200 – Permit Requirements, Section 305 – Dust Control Permit,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/200-0803.pdf.
 - b) Rule 280 – Fees,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/280-0803.pdf.
 - 2) Regulation III – Control of Air Contaminants:
 - a) Rule 310 – Fugitive Dust from Dust-Generating Operations,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/310-0803.pdf.
 - b) Rule 310.01 - Fugitive Dust from Non-Traditional Sources of Fugitive Dust,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/310.01-0803.pdf.
- 6. City of Phoenix (COP):
 - a. City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Excavation Safety:
 - a. At least 3 days prior to the start of digging or excavation Work, contact Arizona Blue Stake at (602) 263-1100 to arrange for utility owners to locate and mark their underground utilities.
 - 1) Comply with applicable Arizona Revised Statutes (ARS), especially those regarding Underground Utilities and the Overhead Powerline Safety Law.

- 2) If unexpected active underground facilities are encountered during the performance of the Work, notify the Program/Project Manager immediately.
- b. Sole responsibility for making all excavations in a safe manner is the Contractor's.
 - c. Provide suitable protection against bodily injury.
2. Do not interfere with persons, firms, corporations, or utilities, removing, changing, replacing, or employing protective measures at their property or structures.
 - a. Allow these persons, firms, corporations, or utilities to take such measures as they may consider necessary or advisable under the circumstances.
 - b. Measures employed or not employed by these entities do not relieve the Contractor of his responsibilities.

1.04 QUALITY ASSURANCE

A. Qualifications:

1. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections required by this Section, the Phoenix Sky Harbor International Airport will employ a Testing and Inspection Agency having the qualifications specified in Section 01400, Quality Requirements.

1.05 SITE CONDITIONS

A. Ambient Conditions:

1. Do not perform excavating, backfilling, or compacting operations when either weather conditions or the condition of the materials are such, in the opinion of the Program/Project Manager, that the work cannot be performed satisfactorily.
2. Dust Control:
 - a. In accordance with Rule 200 of the Maricopa County Air Pollution Control Regulations, a Dust Control Permit issued by the Maricopa County Air Quality Department is required for Sites where more than 0.1 acre (4356 square feet) of soil will be disturbed.
 - 1) If a Dust Control Permit is required for this Contract, in accordance with the requirements of Section 01425, Regulatory Requirements, follow the instructions in the Maricopa County Air Quality Department's "Guidance for Dust Control Permit for Application" and file the "Application for Dust Control Permit", which requires including a Dust Control Plan with the Application, and pay the permit fees in accordance with Maricopa County Air Pollution Control Regulation Rule 280.
 - a) At the Pre-Construction Conference, submit the approved Dust Control Plan to the Program Manager for information.

- (1) Include a description of equipment, personnel, and methods required for controlling dust.
- (2) Include a method for keeping public thoroughfares free of mud, dust, and debris at all times.
- b) Comply with the requirements of the Maricopa County Dust Control Permit and air pollution control requirements, particularly Maricopa County Air Pollution Control Regulation Rules 310 and 310.01.
 - (1) Rule 310 requires maintaining daily logs recording the actual implementation of control measures identified in the Dust Control Permit.
- 2) Maricopa County Air Quality Department Dust Control Permits must be renewed annually.
- 3) Conspicuously post a copy of the Maricopa County Air Quality Department Dust Control Permits in a weather resistant location at the Site where it can be read by the workers.
- b. Provide effective dust control measures on the Site to prevent the spread of dust during earth moving operations.
- c. Thoroughly moisten excavation areas by dampening the soil, or employ other similar methods as approved by the Program/Project Manager.

PART 2 PRODUCTS

NOT USED

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Notify the Program/Project Manager of unexpected subsurface conditions, and discontinue working in the affected area until notified to resume work.
- B. Pre-Installation Testing:
 1. If it is evident that the subgrade is pumping at any time prior to placing overlying material onto the subgrade, the Program/Project Manager may at no increase in Contract Price require proof rolling with a pneumatic-tire roller or other approved equipment in order to identify the limits of the unacceptable area.
 2. After completion of excavations other than utility excavations, and prior to scarification and compaction of the subgrade, proof-roll the excavation surface to detect soft or loose zones.
 - a. Notify the Program/Project Manager if any soft or loose zones are encountered during the proof-rolling.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Exercise extreme caution to prevent debris from falling into manholes or other structures.
 - a. In the event that debris should fall into a structure, remove it immediately.
- B. Surface Preparation:
 - 1. With the exception of areas where new construction is required and compacted fills have been constructed, adjust the moisture content of the subgrade to that required for compaction by adding water, by adding and blending in dry suitable material, or by drying the existing material as required.
 - a. Maintain the proper subgrade moisture content until the subgrade is compacted and the overlying material is placed.
- C. Demolition/Removal:
 - 1. Strip and properly dispose of unsuitable material in the area of the required subgrade including removing existing pavement and obstructions such as stumps, roots, rocks, and similar items from the subgrade area.
 - a. Clear and grub unpaved subgrade area in accordance with the requirements of Section 02231, Clearing and Grubbing.
 - b. Demolish existing pavement where indicated on the Contract Drawings, and properly dispose of demolition debris off-site unless otherwise allowed by the Program/Project Manager.
 - 1) Remove existing pavement under proposed median islands

3.03 RELATIVE COMPACTION

- A. Remove and replace soft, loose, and disturbed materials; and compact the replaced material as directed by the Program/Project Manager.
 - 1. If soft or loose zones are found under proposed slab, pavement, or foundation areas, excavate the soft or loose material to a depth reviewed in advance by the Program/Project Manager, then fill with structural fill as specified in Section 02300, Earthwork, and compact as specified for such fill.
- B. After adjusting the moisture content to that required for compaction, scarify and loosen the subgrade to a depth of at least 6 inches.
 - 1. Below future slabs, pavements, and foundations, scarify the exposed native and pre-existing fill subgrade soils to a depth of 8 inches
 - 2. In areas where fill material is required, a layer of approximately 3 inches of the fill material may be spread and compacted with the subgrade material to provide a better bond.

- C. Compact the material to the relative density specified.
1. Construct the cut and fill areas to achieve a uniform soil structure having the minimum dry density specified in Table 02339-1 when the compaction is tested in accordance with Method A in AASHTO T 99 and AASHTO T 191, or with ASTM D 2922 and ASTM D 3017.
 - a. Adjust the minimum dry density percent obtained from AASHTO T 99 in accordance with the coarse particle correction procedures specified in AASHTO T 224 for maximum density determination, to compensate for the rock content larger than that which will pass a Number 4 sieve.

Table 02339-1 Minimum Dry Density Required	
Location	Minimum Dry Density
Subgrade under pavement	100 percent
Subgrade under curbs, gutters, and sidewalks	95 percent

3.04 GRADING IN AREAS NOT TO BE PAVED

- A. Where grade only is called for on the Contract Drawings, grade the area to meet the tolerances for the subgrade where sub-base or base material is to be placed.
- B. Construct the surface to a straight grade from the finished pavement elevations shown on the Contract Drawings to the elevation of the existing ground at the extremities of the area to be graded.

3.05 GRADING IN AREAS TO BE PAVED

- A. Where pavement or structures are called for on the Contract Drawings, grade the area in an orderly sequence, placing base course directly following the grading.
 1. Do not allow grading operations to precede base course placement by more than 1200 feet unless otherwise specifically approved by the Program/Project Manager.
 2. At the end of each day's operations, place the first lift of base course no more than 300 feet behind the finished subgrade area.
 - a. Do not allow drop-offs on opposite sides of pavement at the same time.
- B. When excavating for concrete work, such as curb, gutter, or sidewalk, place the excavated material in uniform windrows that do not interfere with property access or traffic flow in streets.

3.06 SUBGRADE TOLERANCES:

- A. Subgrade upon which pavement, sidewalk, curb and gutter, driveways, or other structures are to be directly placed may not vary more than 1/4 inch from the specified grade and cross-section.
- B. Subgrade upon which sub-base or base material is to be placed may not vary more than 3/4 inch from the specified grade and cross-section.
- C. Variations within these specified tolerances must be compensating so that the average grade and cross-section specified are met.

3.07 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 - 1. Relative Compaction Test:
 - a. Test Procedure:
 - 1) The Testing and Inspection Agency will test the relative density of the subgrade compaction performed in accordance with Method A in AASHTO T 99 and AASHTO T 191, or with ASTM D 2922 and ASTM D 3017.
 - b. Acceptance Criteria:
 - 1) Subgrade compaction having the at least the minimum dry density specified in Table 02339-1 is acceptable.

SECTION 02361

TERMITE CONTROL

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for poisoning the soil below slab-on-grade construction to provide horizontal and vertical barriers against attack by subterranean termites.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01780 - Closeout Submittals.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. FHA: United States Federal Housing Administration.
 - 2. OPM: State of Arizona Office of Pest Management.
 - 3. VA: United States Veterans Administration.
- B. Definitions:
 - 1. Toxicant: A toxic agent, especially one for insect control that kills rather than repels.
- C. Reference Standards:
 - 1. City of Phoenix (COP):
 - a. Phoenix Building Construction Code and Amendments.
 - 2. State of Arizona:
 - a. Arizona Revised Statutes (ARS):
 - 1) ARS 32-2313 – Business License; Renewal; Financial Security; Definition.
 - b. Office of Pest Management (OPM):
 - 1) Rules and Regulations.
 - 3. United States Government:
 - a. United States Department of Agriculture (USDA):
 - 1) Forest Service:
 - a) USDA Home and Garden Bulletin 64 – Subterranean Termites-Their Prevention and Control in Buildings.
 - b. United States Environmental Protection Agency (EPA):
 - 1) United States Code (U.S.C.):
 - a) 7 U.S.C. Section 136-136y.
 - (1) Federal Insecticide, Fungicide, and Rodenticide Act, Public Law 100-532, as amended.

(2) Pesticide Registration Improvement Act of 2003, Public Law 108-199, as amended.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Do not apply toxicants without providing at least 24 hours prior notice to the Program/Project Manager and a representative of the City of Phoenix to enable their presence during application.
 - 2. Give sufficient notice to the Applicator prior to placing the concrete to permit applications to be made.
- B. Sequencing:
 - 1. If the concrete is not placed within 24 hours after the time of treatment, re-treat the area at no increase in Contract Price.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Samples:
 - 1) Sample of the termicide.
 - b. Delegated Design Submittals:
 - 1) Area and lineal calculations for the toxicants.
 - c. Qualification Statements:
 - 1) Applicator's qualifications.
- B. Informational Submittals:
 - 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Manufacturer's instructions for the toxicants.
 - b. Manufacturer's Reports:
 - 1) Material safety data sheets (MSDS) for the toxicants.
- C. Closeout Submittals:
 - 1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Bonds:
 - 1) Proof of Applicator's surety bond.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:

1. Comply with the Federal Insecticide, Fungicide, and Rodenticide Act, as amended, and the Pesticide Registration Improvement Act of 2003 as amended.
2. Comply with the Rules and Regulations of the State of Arizona Office of Pest Management (OPM).
 - a. Immediately after completion of the treatment, post a tag at the Site as prescribed by the Rules and Regulations of the State of Arizona Office of Pest Management (OPM).
 - b. Placing footing or floor slab concrete is not permitted until the information on the tag described herein has been reconciled with the requirements of this Specification by the City of Phoenix's representative.
3. Phoenix Building Construction Code:
 - a. Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments.

B. Qualifications:

1. Applicator's Qualifications:
 - a. Employ a pesticide applicator licensed, certified by, and registered with the State of Arizona Office of Pest Management (OPM).
 - b. Submit the Applicator's qualifications to the Program/Project Manager for approval.

C. Site Samples:

1. Prior to the initial application of termicide, submit a small, uncut, labeled Sample of the termicide to the Program/Project Manager for use as a control sample.
 - a. During each application, a field sample may be taken from the application nozzle by the Program/Project Manager or City Representative for testing comparison.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Deliver toxicants to the Site in sealed and labeled containers bearing the manufacturer's instructions and precautions for handling and use of the material.
2. Do not bring to the Site, or use, any emulsion of a previous application.

B. Storage and Handling Requirements:

1. Store toxicants according to the directions on the manufacturer's label.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Do not make a treatment when the soil or fill is excessively wet.

- a. If rain or other water is allowed on the treated area, re-treat the treated area.

1.08 WARRANTY/BOND

A. Special Warranty:

1. After completion of treatment, and as a condition of final acceptance, submit an Applicator's written guarantee to the Program/Project Manager and the City of Phoenix that provides the following:
 - a. Assurance the application was made at the required concentration rates using methods complying with manufacturer's label and this Specification.
 - b. A guarantee of the effectiveness of the treatment for a period of 10 years from the date of the Final Acceptance at no increase in Contract Price.
 - c. Draw the guarantee in favor of the City of Phoenix.
 - 1) Pre-printed Federal Housing Administration (FHA) or Veterans Administration (VA) guarantee forms are unacceptable.
2. The City of Phoenix reserves the option to renew the termite protection on an annual basis after the expiration of this guarantee.

B. Bond:

1. Prior to the start of treatment, submit proof that the Applicator holds a surety bond as specified in ARS 32-2313 to the Program/Project Manager and the City of Phoenix for approval.

PART 2 PRODUCTS

2.01 MATERIALS

A. Manufacturers:

1. Manufacturer List:
 - a. FMC Corp., Dragnet SFR Termiticide/Insecticide 7/02 (permethrin), www.fmc.com.
 - b. Bayer Environmental Science, Premise, www.bayerprocentral.com.
2. Substitution Limitations:
 - a. No other substitutions will be approved.

B. Regulatory Requirements:

1. Provide a termite soil treatment chemical registered with the United States Environmental Protection Agency as provided in the Federal Insecticide, Fungicide, and Rodenticide Act as amended, and the Pesticide Registration Improvement Act of 2003; and registered with the Office of the Arizona State Chemist.

C. Materials:

1. Provide one of the soil treatment products specified in Paragraph 2.01.A

2. Prior to application, submit the following to the Program/Project Manager for information:
 - a. Material safety data sheets (MSDS) for the toxicants.
 - b. Manufacturer's instructions for the toxicants.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Prior to treatment, inspect the subgrade, forms, and reinforcing steel, if applicable.

3.02 APPLICATION

- A. Perform the Work of this Section in accordance with the Rules and Regulations of the State of Arizona Office of Pest Management (OPM), the toxicant manufacturer's label, USDA Home and Garden Bulletin 64, and this Section.
- B. Toxicant Mixing:
 1. Mix toxicants onsite in an empty container or tank.
 2. Mix toxicants in accordance with the manufacturer's instructions in the presence of the Program/Project Manager and a representative of the City of Phoenix, and equaling the quantities in prescribed concentrations for coverage in approved areas to receive treatment.
 - a. Submit area and lineal calculations for the toxicants to the Program/Project Manager for approval.
 3. Mix toxicants at the highest percentage concentration allowed by the label for the type of application required to form a uniform emulsion.
- C. Areas of Application:
 1. Establish horizontal barriers under the entire surface of the slabs-on-grade, except sidewalks; and establish barriers on the sides and bottom of foundation footings.
 - a. Treat sidewalks, entrance slabs, and other slabs abutting the structure for a distance not less than 3 feet extending from and adjacent to the building.
 2. Establish vertical barriers around the base of foundations, plumbing lines, foundation walls, below grade walls, along expansion/contraction and/or cold joints, at all slab penetrations, and wherever required by the manufacturer's instructions.
 3. If these methods of treatment are not possible, rodding and/or trenching may be permitted only if under the inspection of the Program/Project Manager and a representative of the City of Phoenix.

- a. Extend rodding and/or trenching from the finished floor to the top of the footings, and take special care not to disturb applied waterproofing and other buried facilities.
- b. Perform rodding and/or trenching applications in strict accordance with the manufacturer's instructions.
4. Take particular care when treating "critical areas" as described on the manufacturer's label.

D. Application Methods:

1. Apply the toxicant emulsions using methods complying with requirements specified on the manufacturer's label.
2. Do not disturb the treated areas prior to or during concrete placement.
 - a. Re-treat those areas which are disturbed after treatment is completed according to the manufacturer's directions and at no increase in the Contract Price.

3.03 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. Inspections:
 - a. Permit the Program/Project Manager and a representative of the City of Phoenix to inspect the application, take multiple Samples for testing, and verify the rate and volumes of soil and emulsions.

B. Non-Conforming Work

1. If evidence of subterranean termite activity and/or damage to the structure resulting from such activity is discovered within the guarantee period, treat to stop the infestation of affected areas.
 - a. Upon the third recurrence of subterranean termites in the same structure within a 5 year period from the date of Final Acceptance, completely re-treat the building as specified in USDA Home and Garden Bulletin 64.
 - b. Repair all damage caused by infestation and/or re-treatment at no increase in Contract Price.

3.04 WASTE MANAGEMENT

- A. Remove excess toxicant materials safely from the Site.

END OF SECTION

REV. NO.	REV. DATE	RFC/CN/CO	Section(s) Affected	Comments
0	12/01/2017	N/A	All	First edition.

SECTION 02373

RIPRAP AND ROCK LINING

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for furnishing and placing a cover of riprap onto slopes subject to erosion in order to permanently stabilize the slopes.
 - a. Provide the type of riprap indicated on the Contract Drawings, either plain or grouted stone riprap, or sacked concrete riprap.
 - b. Provide riprap to the depths and slopes indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01780 - Closeout Submittals.
 - 3. Section 02231 - Clearing and Grubbing.

1.02 REFERENCES

- A. Definitions:
 - 1. d₅₀: A designation used to specify the size range of a stone mixture used for graded riprap that is based on a hypothetical "spherical design diameter", d, specified for the stone, and listing a percentage of the stones in the mixture required to have a weight less than the weight of a stone of diameter d.
 - a. For example, d₅₀ refers to a mixture of stones in which 50 percent of the stones would weigh less than the hypothetical stone whose "spherical design diameter", d, is specified; and d₈₅ refers to a mixture of stones in which 85 percent of the stones would weigh less than the hypothetical stone whose "spherical design diameter", d, is specified.
 - 2. Grouted Riprap: Slope protection placed on a stable and properly prepared slope and consisting of a free draining subbase or bedding layer under a layer of sound, durable stone bonded together by a mixture of cementitious materials, water, aggregates, and admixtures.
 - 3. Minimum Average Roll Value (MARV): A statistical measure used to evaluate geotextile properties derived as follows:
 - a. The MARV for a group of geotextile rolls is determined by calculating the statistical value such that 2.5 percent of the test results derived from tests performed on test samples selected from the batch of rolls in question are less than the mean value of all test results for that batch minus 2 standard deviations.

4. Riprap: A permanent, erosion-resistant ground cover of large, loose, angular stone with filter fabric or granular underlining.
5. Well-Graded Mixture: A mixture of stones whose largest stone size is 1.5 times the d_{50} size, but though composed primarily of larger stone sizes has a sufficient mixture of other sizes to fill progressively smaller voids between the stones.

B. Reference Standards:

1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. Standard Specifications for Transportation Materials and Methods of Testing and Sampling:
 - 1) AASHTO M 43 - Standard Specification for Sizes of Aggregate for Road and Bridge Construction.
 - 2) AASHTO M 80 - Standard Specification for Coarse Aggregate for Portland Cement Concrete.
 - 3) AASHTO T 99 - Standard Method of Test for Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop.
 - 4) AASHTO T 191 - Standard Method of Test for Density of Soil In-Place by the Sand-Cone Method.
2. American Society for Testing and Materials (ASTM):
 - a. ASTM C 131 - Standard Test Methods for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine.
 - b. ASTM C 143/C 143M - Standard Test Method for Slump of Hydraulic-Cement Concrete.
 - c. ASTM C 144 - Standard Specification for Aggregate for Masonry Mortar.
 - d. ASTM D 448 - Standard Classification for Sizes of Aggregate for Road and Bridge Construction.
 - e. ASTM D 2419 - Standard Test Method for Sand Equivalent Value of Soils and Fine Aggregate.
 - f. ASTM D 2922 - Standard Test Method for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).
 - g. ASTM D 3017 - Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth).
 - h. ASTM D 4355 - Standard Test Method for Deterioration of Geotextiles from Exposure to Ultraviolet Light and Water (Xenon-Arc Type Apparatus).
 - i. ASTM D 4491 - Standard Test Method for Water Permeability of Geotextiles by Permittivity.
 - j. ASTM D 4533 - Standard Test Method for Trapezoid Tearing Strength of Geotextiles.
 - k. ASTM D 4632 - Standard Test Method for Grab Breaking Load and Elongation of Geotextiles.

- I. ASTM D 4751 - Standard Test Method for Determining Apparent Opening Size of a Geotextile.
 - m. ASTM D 4833 - Standard Test Method for Index Puncture Resistance of Geotextiles, Geomembranes, and Related Products.
 - n. ASTM D 4873 - Standard Guide for Identification, Storage, and Handling of Geotextiles.
 - 3. City of Phoenix (COP):
 - a. The Code of the City of Phoenix, Arizona.
 - 1) Chapter 32C - Storm Water Quality Protection, Sections 100 through 106.
 - 4. Maricopa Association of Governments (MAG):
 - a. MAG Uniform Standard Details for Public Works Construction.
 - 1) Detail No. 190 Rock Correction Procedure for Maximum Density Determination.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Excavation Safety:
 - a. At least 3 days prior to the start of digging or excavation Work, contact Arizona Blue Stake at (602) 263-1100 to arrange for utility owners to locate and mark their underground utilities.
 - 1) Comply with applicable Arizona Revised Statutes (ARS), especially those regarding Underground Utilities and the Overhead Powerline Safety Law.
 - 2) If unexpected active underground facilities are encountered during the performance of the Work, notify the Program/Project Manager immediately.
 - b. Sole responsibility for making all excavations in a safe manner is the Contractor's.
 - c. Provide suitable protection against bodily injury.
 - 2. Do not interfere with persons, firms, corporations, or utilities, removing, changing, replacing, or employing protective measures at their property or structures.
 - a. Allow these persons, firms, corporations, or utilities to take such measures as they may consider necessary or advisable under the circumstances.
 - b. Measures employed or not employed by these entities do not relieve the Contractor of his responsibilities.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:

- a. Product Data:
 - 1) Geotextile filter fabric.
 - 2) Geotextile seam thread.
 - b. Samples:
 - 1) Samples of riprap rock at the Site.
 - c. Certificates:
 - 1) Cement manufacturer's Certificate of Compliance.
- B. Informational Submittals:
- 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Geotextile manufacturer's recommendations regarding exposure of geotextile to ultraviolet radiation.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
- 1. The Work of this section is subject to approvals before it can be put into service and accepted.
 - a. Arizona Pollutant Discharge Elimination System (AZPDES) Permits:
 - 1) In all areas of Arizona except Indian Country, the National Pollutant Discharge Elimination System (NPDES) program is administered as the Arizona Pollutant Discharge Elimination System (AZPDES).
 - 2) Comply with the requirements of all AZPDES permits applicable to the Contract.
 - a) Most stormwater discharges are permitted under various general permits; however, an individual permit is required when the general permit requirements do not accurately represent the activity at a facility and a permit is customized to the Site.
 - b) AZPDES Construction General Permit (AZG2008-001):
 - (1) Generally, stormwater and non-stormwater discharges resulting from small construction activities and that are not potential pollutant sources are regulated under the Arizona Pollutant Discharge Elimination System (AZPDES) Construction General Permit (AZG2008-001).
 - c) In accordance with Chapter 32C of The Code of the City of Phoenix, Arizona, any person applying for authorization, permission, or a permit to construct improvements or conduct activities on non-residential property that have the reasonable potential to affect storm water must prepare a detailed written storm water management plan for the management of the

volume, velocity, and quality of storm water that has the reasonable potential to be released offsite.

- b. If the Contract impacts water bodies, a Clean Water Act, Section 404 permit will be required from the U.S. Army Corps of Engineers.

B. Certifications:

1. Cement Manufacturer's Certificate of Compliance:

- a. Submit a manufacturer's Certificate of Compliance identifying the cement and certifying that the cement provided for the Work of this Section complies with the specified requirements.

C. Site Samples:

1. Provide 2 Samples of riprap rock at the Site for each type of riprap, each Sample weighing at least 2 tons and having the gradation specified for the type of riprap represented by the Sample.
 - a. One Sample of each type of riprap may be incorporated into the Work, the second Sample will be used as a reference to judge the gradation of riprap stone subsequently supplied.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Prevent segregation of riprap stone and granular materials during transportation, dumping, and off-loading.
2. Identify and handle geotextile filter fabric in accordance with the requirements of ASTM D 4873.
 - a. Label each roll of geotextile with the manufacturer's name, product identification, roll dimensions, lot number, and date of manufacturer.
3. Verify from label information that the geotextile delivered to the Site is the same as specified.
4. Deliveries of riprap stone will be visually compared to the approved field sample as a reference to judge the acceptability of the gradation, or analyzed using the Wolman count method to determine the acceptability of the size distribution of the riprap stone.
 - a. Remove rejected riprap stone from the Site, and properly dispose of it offsite.
5. Deliver cement to the Site in original unopened sacks filled at the mill and bearing the name or brand of the manufacturer.
 - a. Clearly identify the type of cement and the weight of the cement in the sack on each sack.

B. Storage and Handling Requirements:

1. Do not drag the geotextile rolls, or lift the geotextile by one end, or drop the geotextile.
2. Store geotextile filter fabric in accordance with the requirements of ASTM D 4873.

- a. Do not expose geotextile to sunlight prior to placement.
3. Store cement so that it is accessible to be inspected and identified.
4. Protect cement against damage from moisture.

PART 2 PRODUCTS

2.01 DESCRIPTION:

- A. Riprap consists of a substantial rock cover placed on top of a thin layer of filter material, and is to be located on slopes subject to erosion in order to permanently stabilize the slopes where shown on the Contract Drawings.
 1. The filter material may consist either of geotextile or granular material.
 2. Additional bedding material may be placed between the riprap and filter materials to cushion and protect the filter material during installation of the riprap.

2.02 MATERIALS

- A. Bedding Stone:
 1. Provide bedding stone that conforms to the requirements specified in AASHTO M 80.
 2. Provide bedding stone sizes in accordance with the size requirements specified in AASHTO M 43 and indicated on the Contract Drawings.
- B. Concrete:
 1. Provide concrete as specified in Section 03300, Cast-In-Place Concrete, except as modified herein.
 - a. Aggregates:
 - 1) Pitrun material at least 80 percent of which is capable of passing a 1-1/2 inch square mesh screen is an acceptable aggregate.
 - 2) Aggregate does not need to be segregated by primary sizes.
 - b. Portland Cement Content:
 - 1) Provide concrete containing 376 pounds of Portland cement per cubic yard.
 - c. Water:
 - 1) Provide water sufficient to produce a mixture having a slump of 3 to 5 inches when tested in accordance with the requirements of ASTM C 143/C 143M.
- C. Geotextile Filter Fabric:
 1. Provide either woven or non-woven geotextile filter fabric that exhibits the properties specified in Table 02373-1 for the class indicated.
 - a. Woven Geotextile Fabric:
 - 1) Provide non-filament woven geotextile.
 - b. Non-Woven Geotextile Fabric:

- 1) Needle-punched geotextile fabrics are acceptable and may be provided, but spun-bond and slit-film fabrics are unacceptable.
- 2) Mass Density: 12 ounces, minimum, per square yard.

Table 02373-1 Geotextile Filter Fabric Properties

Property	Test	Class 1	Class 2	Class 3	Class 1	Class 2	Class 3
Elongation	ASTM D 4632	<50 Percent			>50 Percent		
Grab strength	ASTM D 4632	>315 lbs	>250 lbs	>180 lbs	>200 lbs	>160 lbs	>110 lbs
Sewn seam strength	ASTM D 4632	>270 lbs	>220 lbs	>160 lbs	>180 lbs	>140 lbs	>100 lbs
Tear strength ⁽¹⁾	ASTM D 4533	>110 lbs	>90 lbs	>70 lbs	>110 lbs	>90 lbs	>70 lbs
Puncture strength	ASTM D 4833	>110 lbs	>90 lbs	>70 lbs	>110 lbs	>90 lbs	>70 lbs
Apparent opening size	ASTM D 4751	Number 40 U.S. Standard sieve, maximum					
Permittivity & permeability	ASTM D 4491	4 times greater than the base soil, minimum					
Degradation by ultraviolet light	ASTM D 4355	Greater than 50 percent of the sample's strength retained after 500 hours of exposure, minimum					
1 For woven monofilament geotextiles, the Minimum Average Roll Value (MARV) is 55 pounds.							

2. The geotextile classes required for the indicated permanent erosion control applications are as follows:
 - a. Class 1: For harsh or severe installation conditions where there is a greater potential for geotextile damage, such as when placement of riprap must occur in multiple lifts, when drop heights exceed 1 foot, or when repeated vehicular traffic is anticipated on the installation.
 - b. Class 2: For installation conditions where placement is in regular, single lifts, and vehicular traffic on the installation is anticipated to be minimal, or when individual rocks are placed using a clamshell, orange-peel grapple, or specially equipped hydraulic excavator with drop heights of less than 1 foot.
 - c. Class 3: For the least severe installation conditions where drop heights are of less than 1 foot onto a bedding layer of select sand, gravel, or other select imported material.
3. Geotextile Seam Thread:
 - a. Provide ultraviolet radiation resistant, high-strength polypropylene or polyester thread suitable for stitching geotextile strips together at seams.

4. Submit the geotextile manufacturer's Product Data for the geotextile filter fabric and seam thread to the Program/Project Manager for approval, and submit the manufacturer's recommendations regarding time limits for their exposure to ultraviolet radiation to the Program/Project Manager for information.

D. Granular Filter Material:

1. Provide granular filter material that consists of hard, durable bank or crushed gravel, stone, or slag mixed or blended with suitable filler materials to provide a uniform mixture.
 - a. Provide granular filter material free from vegetation or organic matter, free from lumps, and free from excessive quantities of clay or other objectionable or foreign substances so that less than 10 percent of the material by weight is deleterious.
2. Gradation:
 - a. Provide granular filter material having the gradation specified in Table 02373-2.

Table 02373-2 Gradation of Granular Filter Material	
Sieve Size	Percent Passing
2 Inch	100
Number 4	15 to 60
Number 100	0 to 30

E. Riprap Stone:

1. Riprap Stone Properties:
 - a. Provide sound, hard, field or quarry stone that will not disintegrate on exposure to water and weathering, that has no earthy odor, and that does not absorb water easily.
 - 1) Provide riprap rock that only breaks with difficulty; and that is not composed of appreciable amounts of clay.
 - a) Shales, mudstones, and claystones are unacceptable.
 - 2) Provide riprap rock that does not have closely spaced discontinuities, such as seams, joints, or bedding planes.
 - b. Waste concrete is acceptable riprap stone if it is free of coatings, and if it meets the specified size requirements.
2. Riprap Shape:
 - a. Provide riprap having shapes which will form a stable protection structure of the required depth.
 - 1) Angular shaped riprap stone is acceptable for use in riprap having any slope.
 - 2) Rounded riprap stone is unacceptable for use in riprap having a slope steeper than 2:1 unless it is grouted.

- 3) Flat and needle shaped riprap is unacceptable for use in riprap unless its thickness is greater than $\frac{1}{3}$ the length of the piece..
3. Riprap Weight:
 - a. Except for small stones and spalls used to chink interstices in the riprap, provide riprap stones weighing at least 10 pounds, but with the additional requirement that 50 percent or more of the riprap stone must weigh 100 pounds or more.
4. Riprap Size and Gradation:
 - a. Provide riprap stones as large as can conveniently be placed in a layer of the required depth.
 - b. Minimum Size: 1 inch.
 - c. Maximum Size: 1.5 times the d_{50} size.
 - d. Provide a well-graded mixture of stones for the riprap structures shown on the Contract Drawings.

F. Sacks:

1. Provide new or sound reclaimed burlap sacks weighing not less than 10 ounces.
2. Provide sacks having a capacity of 1.25 cubic feet, and sized approximately 19-1/2 inches by 36 inches when measured inside the seams when the sack is laid flat.

2.03 MIXES:

A. Portland Cement Mortar:

1. Provide Portland cement mortar consisting of 1 part Portland cement to 3 parts aggregate by volume.
 - a. Portland Cement:
 - 1) Provide low alkali Portland cement complying with the requirements for Type II low alkali Portland cement as specified in ASTM C 150.
 - 2) Unless otherwise approved by the Program/Project Manager, provide all cement of the same brand.
 - b. Aggregate:
 - 1) Provide aggregate consisting of 2 parts sand and 1 part gravel or blended gravel/crushed rock.
 - a) Sand:
 - (1) Provide fine granular material produced by crushing rock or gravel, or by the natural disintegration of rock, and washed to remove organic material, mica, loam, clay, oil, and other deleterious substances.
 - (2) Provide sand complying with the size and grading requirements of ASTM C 144.
 - (3) Provide sand having an average sand equivalent of 70 or greater from 3 successive test samples, with no individual

sample less than 65 when tested in accordance with the requirements of ASTM D 2419.

- b) Gravel:
 - (1) Provide gravel composed fully or partially of rounded or water worn particles capable of passing a 3/8 inch square mesh screen.
- c) Crushed Rock:
 - (1) Rock exceeding the gradation size requirements specified in ASTM D 448 and then crushed may be combined with the gravel, provided it is distributed and blended uniformly throughout the gravel.

2.04 SOURCE QUALITY CONTROL

A. Tests and Inspections:

- 1. Materials specified in this Section require advance examination or laboratory testing according to the methods referenced herein, or as required by the Program/Project Manager.
 - a. Notify the Program/Project Manager when site samples of the materials intended for the Work of this Section are available for testing and inspection.
- 2. Testing:
 - a. The Testing and Inspection Agency or the City of Phoenix Testing Laboratory will perform the source testing specified in this Paragraph.
 - b. Resistance of Riprap Stones to Degradation Test:
 - 1) Test Procedure:
 - a) A prepared test sample of riprap stones will be tested in accordance with the requirements of ASTM C 131 for Grading A.
 - 2) Acceptance Criteria:
 - a) If the loss of the sample by abrasion is 10 percent or less by weight after 100 revolutions and 40 percent or less by weight after 500 revolutions, the riprap represented by the sample is acceptable.
 - c. Geotextile Filter Fabric Tests:
 - 1) Test Procedure:
 - a) Geotextile filter fabric will be tested for conformance to the property values specified in Table 02373-1 in accordance with the requirements of ASTM D 4759 and the requirements of the tests listed in the table.
 - 2) Acceptance Criteria:
 - a) Geotextile meeting the minimum requirements specified for the geotextile will be acceptable.

B. Non-Conforming Work:

1. Dispose of or otherwise prevent rejected stone at the quarry from mixing with satisfactory stone.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Examine the locations in dry areas where riprap is to be placed to verify that the area is clean and free of potholes, rills, voids, projections, debris, construction materials, and other foreign objects that could prevent the filter from being properly placed; and that the underlying soil is satisfactory because it does not have excessive in-place moisture content, is not frozen, and does not have roots, sod, turf clods, brush, or other similar organic materials.
 - a. Satisfactory surfaces include undisturbed native soil, excavated and prepared subgrade, and acceptably placed and compacted fill.
 - b. Unsatisfactory soils defined by the Program/Project Manager may include very fine, non-cohesive soils having uniform particle size; gap-graded soils; laminated soils; and dispersive clays.
2. Where riprap is to be placed in underwater areas, have scuba divers examine the bed to verify that it is free of logs, large rocks, construction materials, and other blocky materials that would create voids beneath the riprap system.

3.02 PREPARATION

A. Surface Preparation:

1. If required, clear and grub the area where the riprap will be installed in accordance with Section 02231, Clearing and Grubbing.
2. Excavate the trenches for the riprap where shown and as indicated on the Contract Drawings.
 - a. Excavate a footing trench along the toe of the slope of the riprap channel as shown on the Contract Drawings.
 - b. Excavate and grade the surfaces so the finished surfaces are uniform planes with no abrupt breaks in the surface.
 - 1) Shape and trim the bed for the riprap to provide even surfaces.
 - 2) Where riprap is to be placed in dry areas, grade the subgrade area to prepare a smooth surface that will ensure proper contact between the filter and the subgrade surface, and between the filter and the riprap.
 - a) Compact, shape, and uniformly grade the subgrade soil to the lines, grades, and cross-sections shown on the Contract Drawings.

- b) Compact, shape, and uniformly grade the termination trenches and transitions between slopes, embankment crests, benches, berms, and the toes of slopes.
- 3) If the riprap is to be placed underwater where flow velocities are greater than 1 foot per second, isolate the work area from water currents by diverting small streams around the work area during low flow seasons, or by constructing a temporary coffer dam on larger rivers or deep water areas and dewatering the work area.
 - a) Minimize environmental degradation during construction by implementing such measures as suspending a silt curtain made of plastic sheeting from buoys around the work area.
- c. If it is necessary to excavate beyond the normal lines of excavation or below subgrade to remove boulders or other interfering objects, backfill the voids with suitable material approved by the Program/Project Manager and in the same manner used to place other backfill in the vicinity of the void and to the same density.
 - 1) Remove unsatisfactory soils and backfill the voids created by the removal with approved material, then compact the approved backfill material prior to placing the riprap.
 - 2) Unless otherwise indicated, compact the backfill to a uniform density of 90 percent.
 - 3) If allowed by the Program/Project Manager, over-excavation may be filled with concrete or riprap.
- d. Finish the slopes on which sacked concrete will be placed to within 0.2 feet of the designated grade.

3.03 INSTALLATION OF FILTER MATERIAL:

- A. Install filter that is composed of one or more layers of granular filter material, of geotextile filter fabric, or a combination of geotextile filter fabric and a layer of granular filter material at the locations and to the grades and dimensions indicated on the Contract Drawings.
 - 1. Produce a continuous filter installation that maintains intimate contact with the soil beneath, and allows water infiltration and exfiltration to occur while insuring particle retention.
 - 2. Avoid voids, gaps, tears, and other holes in the filter material to the extent practicable.
 - 3. Geotextile Filter Fabric:
 - a. Place geotextile material on the prepared area, free of folds and wrinkles so that it is directly in contact with the subgrade.
 - b. Install the geotextile so that installation of the riprap will not excessively stretch or tear the geotextile.
 - c. Overlap upstream geotextile strips over downstream strips in the direction of flow.

- d. Overlap longitudinal and transverse geotextile joints, providing at least a 1.5-foot overlap for dry installations and at least a 3-foot overlap for underwater locations.
- e. Use anchoring pins, U-staples, or weights such as sandbags to maintain the recommended overlaps and expedite construction if necessary.
- f. If the geotextile is to be placed underwater, hold the geotextile in place using sandbags or sand-filled geocontainers made from non-woven, needle-punched geotextile fabric and placed so they overlap the required area.
- 4. Granular Filter Material:
 - a. Place granular filter material only in prepared areas having slopes flatter than 4:1, typically using front-end loaders to dump and spread the material.
 - b. Granular filter thickness depends on the size of the overlying riprap and whether a layer of bedding stone will be installed between the riprap and the filter.
 - 1) In dry installations, install granular filter 0.5 to 1.0 foot thick.
 - 2) In underwater installations, increase the normal dry thickness by 50 percent.

3.04 INSTALLATION OF PLAIN RIPRAP

- A. Placing Riprap Stones:
 - 1. For riprap less than 20 inches in depth, place riprap stones by hand.
 - 2. For riprap 20 inches or more in depth, riprap stones may be placed by hand or dumped and then spread by bulldozer or other suitable equipment.
 - 3. Place larger stones in the toe trench, foundation course, and on the outer surface of the riprap.
 - 4. Place stones to provide a minimum of voids.
 - 5. Chink the interstices between stones using small stones and spalls, but do not allow larger stones to bear on the smaller stones used to chink the voids.
 - 6. Place stones with their longitudinal axis normal to the face of the embankment, and so each stone above the foundation course has at least a 3 point bearing on underlying stones.
 - 7. Plain Riprap Finished Surface Tolerance:
 - a. Provide an even and tight surface not varying from the design surface by more than 3 inches per foot of depth.

3.05 INSTALLATION OF GROUTED RIPRAP

- A. Placing Riprap Stones:
 - 1. Place the riprap stones for grouted riprap in the same manner as for plain riprap.

- B. Mixing and Applying Portland Cement Mortar:
1. Deliver grout to the locations indicated on the Contract Drawings for grouted riprap by means approved by the Program/Project Manager.
 2. Except when the Program/Project Manager allows hand mixing, mix Portland cement mortar in an approved machine mixer for not less than 1-1/2 minutes.
 - a. If hand mixing is permitted, furnish a clean, tight mortar box for mixing the cement and aggregate; and thoroughly mix sufficient clean water with the other components to provide grout of the specified consistency and having a uniform color.
 3. Add water to the mix to provide grout of a consistency approved by the Program/Project Manager and that allows the grout to flow into interstices between the riprap stones with limited spading and brooming.
 4. Prior to placing grout, wet the surfaces of the riprap stone.
 5. Use the Portland cement mortar to grout the riprap stones where grouted riprap is indicated on the Contract Drawings.
 - a. After dumping each batch of grout, immediately distribute the grout over the surface using a method that will prevent segregation of the aggregate but works the grout so it penetrates into the voids between the riprap stones.
 - 1) Do not allow the grout to flow on the riprap surface more than 5 feet.
 - 2) To aid penetration of the grout into the voids, perform barring as necessary to loosen tight pockets of riprap.
 6. On sloped surfaces, successively place grout in 10-foot wide tiers beginning at the toe of slope and progressing toward the top of the slope.
 7. Remove grout from the top surfaces of the riprap using a stiff broom.
 8. Cure the grout by keeping the grout surface continuously wet for a minimum of 7 days, or by using some other means approved by the Program/Project Manager.

3.06 INSTALLATION OF SACKED CONCRETE RIPRAP

- A. Preparing the Sacks:
1. Loosely fill each sack with 1 cubic foot of concrete, leaving just enough room to allow the open end of the sack to be folded to retain the concrete when the filled sacks are placed.
 2. Place header sacks with their folds upward.
- B. Place the sacks in the trench as soon as they have been filled, and lightly trample them to conform their lower surface contours to the adjacent ground surface and the other sacks already placed.
1. Install a first course of sacks consisting of a double row of stretchers laid in the neatly trimmed trench.
 2. Lay a single row of headers as the second course.

3. For the third and remaining courses, lay stretchers or headers as shown on the Contract Drawings.
- C. Do not place more than 4 vertical courses in any tier until the initial set has occurred in the first course of that tier.
- D. Remove dirt and debris from the tops of previously placed sacks before laying the subsequent courses.
- E. Stagger the joints between courses.
- F. Cure the sacked concrete riprap by sprinkling a fine water spray on the riprap every 2 hours for at least 3 successive days.
- G. Special Techniques:
 1. If in the opinion of the Program/Project Manager delays in placing succeeding layers prohibit the proper bearing or bonding of the sacks, or if storms, mud, or other causes hamper the Work; excavate a small trench behind the row of sacks already in place and fill the trench with fresh concrete before placing more sacks.

3.07 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. Density Test:
 - a. Test Procedure:
 - 1) The density of compacted fill materials will be determined in accordance with the Method A procedures specified in AASHTO T 99, and with AASHTO T 191 or ASTM D 2922 and ASTM D 3017.
 - 2) The density will be adjusted in accordance with the rock correction procedure for maximum density determination provided in MAG Standard Detail No. 190 to compensate for the rock content larger than that which will pass a No. 4 sieve.
 - b. Acceptance Criteria:
 - 1) Compacted fill materials having the specified compaction densities will be acceptable.
 2. Inspections:
 - a. Visually inspect the placing operations and the finished plain riprap surfaces to verify that a dense, rough surface of well-keyed graded rock of the specified quality and sizes is provided, that the layers are placed so that voids are minimized, and that the layers are of the thicknesses specified or shown on the Contract Drawings.
- B. Non-Conforming Work
 1. Correct deficiencies noted by inspections as soon as possible to prevent progressive failure of the system by successive flows.

3.08 PROTECTION

- A. After geotextile is installed, do not allow traffic over the area or other disturbances that might result in loss of contact between the riprap stone, the geotextile, and the subgrade.
 - 1. Do not allow geotextile to remain exposed longer than the geotextile manufacturer recommends in order to minimize potential damage from ultraviolet radiation from the sun.
- B. After sections of grouted riprap are completed, protect each section as follows:
 - 1. Prevent traffic by workers or equipment on the surface for 72 hours.
 - 2. Protect the surface of the grout from rain, flowing water, damage from the sun's rays, and mechanical injury.

SECTION 02473

DRILLED CONCRETE SHAFTS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for providing drilled concrete shafts constructed to the details and dimensions shown on the Contract Drawings at the locations indicated.
- B. Related Requirements:
 - 1. Section 01315 - Project Coordination.
 - 2. Section 01316 - Project Meetings.
 - 3. Section 01330 - Submittal Procedures.
 - 4. Section 01725 - Field Engineering.
 - 5. Section 01780 - Closeout Submittals.

1.02 PRICE AND PAYMENT PROCEDURES

- A. Unit Prices:
 - 1. Base the bids on the number of drilled shafts indicated on the Contract Drawings, the design length from the top elevation to the bottom of the shaft, and the diameter of each shaft.
 - 2. The unit prices bid must include the labor, materials, tools, equipment, and incidentals required for the excavation, trimming, shoring, casings, dewatering, reinforcement, concrete, slurry, and other items required for a complete drilled shaft installation.
- B. Measurement and Payment Procedures:
 - 1. Drilled concrete shafts will be measured by the linear foot of each diameter as indicated on the Proposal Summary that is constructed, tested, and accepted as specified herein; and will be paid for at the accepted unit price on the Proposal Summary for the type of drilled concrete shaft indicated.
 - a. Payment will be made based on the net volume calculated using the shaft plan diameter of drilled shafts in place and accepted.
 - b. The actual length and shaft diameter may vary to coincide with the elevation where satisfactory bearing strata is encountered, and with the stability and characteristics of soil strata as determined by independent testing and inspection.
 - c. Adjustments to the Contract Price will be made based on the net variation of total quantities, compared to the design dimensions for the drilled concrete shafts.

2. Obstructions will be measured and paid for by each obstruction encountered.
3. The Contract price paid will be payment in full for furnishing all labor, materials, tools, equipment and incidentals, necessary to complete the work specified.
 - a. No additional payment will be allowed for the excavation, concrete fill, reinforcing, casings, or other costs due to unauthorized over-excavation of the shafts.
 - b. No additional payment will be allowed for temporary steel casing that remains in place.
 - c. No additional payment will be allowed for rejected drilled shafts.
 - d. No additional payment will be allowed for concrete required to fill an oversized temporary casing.
 - e. If the Testing and Inspection Agency and/or the code-required Approved Agency must perform additional materials testing due to changes in materials or proportions requested by the Contractor, or testing required by failure of material to meet specified requirements, the testing will be at no increase in the Contract Price.
4. Payment will be made under:

Bid Item	Description	Pay Unit
[]	Drilled Concrete Shafts – 48 Inch Diameter	Linear Foot
[]	Drilled Concrete Shafts – 72 Inch Diameter	Linear Foot
[]	Drilled Concrete Shafts – 84 Inch Diameter	Linear Foot
[]	Drilled Concrete Shafts – 96 Inch Diameter	Linear Foot
[]	Drilled Concrete Shafts – 108 Inch Diameter	Linear Foot
[]	Obstructions	Each

1.03 REFERENCES

A. Definitions:

1. Drilled Concrete Shafts: Foundation elements without enlarged bearing areas formed by drilling downward through earth materials to an acceptable design depth, with or without casings, and installing concrete reinforcing “cages” into the shaft and then filling the excavated hole with cast-in-place concrete.
2. Dry Construction Method: A method of constructing drilled concrete shafts consisting of drilling the shaft excavation to the desired size required on the Contract Drawings, using machine cleaning to remove accumulated water and loose material from the bottom of the excavation, placing the reinforcing cage, and concreting the shaft in a relatively dry excavation.
3. Dry Excavations: Drilled shafts having less than 3 inches of water in the bottom of the excavation.
4. Obstructions: Either material or objects of excessive dimension encountered which could not be reasonably inferred from the geotechnical

report; drilling tools lost in the excavation are not considered to be obstructions.

5. Wet Construction Method/Slurry Method: A method of constructing drilled concrete shafts within excavations containing water consisting of using water, polymer slurry, or mineral slurry to maintain the stability of the excavation perimeter while advancing the excavation to its final depth, placing the reinforcing cage, and concreting the shaft.

- 8. U. S. Government:
 - a. Environmental Protection Agency (EPA):
 - 1) 40 CFR 51 Requirements for Preparation, Adoption, and Submittal of Implementation Plans.
 - b. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 Occupational Health and Safety Standards.
 - 2) 29 CFR 1926 Safety and Health Regulations for Construction.

1.04 ADMINISTRATIVE REQUIREMENTS

- A. Pre-Installation Meetings:
 - 1. Attend the pre-installation meeting at the Site held in compliance with the requirements of Section 01316, Project Meetings, to discuss the requirements for constructing the drilled concrete shafts under this Contract.

1.05 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Shop Drawings:
 - 1) Concrete reinforcement for the drilled concrete shafts per Subparagraph 2.02.B.1.
 - b. Special Procedure Submittals:
 - 1) Drilled Shaft Installation Plan per Subparagraph 1.06.A.1.a.
 - c. Delegated Design Submittals:

- 1) Design mixes on the "FINAL CONCRETE MIX DESIGN SUBMITTAL FORM".
 - a) Concrete.
- d. Qualification Statements:
 - 1) Drilled Shaft Subcontractor experience resume per Subparagraph 1.06.B.1.a.2.
 - 2) Certified copies of welder qualification test records per Subparagraph 1.06.B.2.a.1.
 - 3) Welding procedure qualification records per Subparagraph 1.06.B.2.b.
- B. Informational Submittals:
 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Source Quality Control Submittals:
 - 1) Concrete batch ticket information per Subparagraph 1.07.A.1.a.
 - 2) Laboratory test reports or field test data bases per Subparagraph 2.05.A.1.a.2.
 - b. Site Quality Control Submittals:
 - 1) Data for each drilled shaft.
 - 2) Test reports for slurry tests.
- C. Closeout Submittals:
 1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Record Documentation:
 - 1) Record Drawings documenting the actual location and construction of the drilled concrete shafts per Subparagraph 3.05.H.

1.06 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 1. Drilled Shaft Installation Plan:
 - a. Not less than 30 calendar days prior to beginning construction of the drilled concrete shafts, prepare and submit a Drilled Shaft Installation Plan to the Program/Project Manager which includes the following information:
 - 1) The name and experience record of the Site supervisory personnel in charge of drilled shaft operations for this Contract.
 - 2) A List of Drilled Shaft Installation Equipment to be used for this work, including, but not limited to, drilling equipment, cranes, augers, bailing buckets, rock coring equipment, final cleaning equipment, de-sanding equipment, slurry pumps, tremie equipment, casings, concrete pumps, and similar items.

- 3) The construction operation sequence for the overall construction of the drilled shafts.
- 4) Detailed procedures for drilled shaft construction, including procedures for checking the dimensions and alignment of each shaft, temporary casing withdrawal (if applicable), and cleaning of drilled shaft excavation bottoms.
- 5) Reinforcement placement procedures, including support and centering methods in drilled shaft excavations.
- 6) Welding procedures for casing and reinforcement, and the AWS welder certifications.
- 7) Concrete placement procedures for free-fall, slurry, tremie, and pumping methods.
 - a) When slurry is required, provide details of the methods proposed to mix, circulate and de-sand the slurry, and slurry disposal methods.
 - b) In conformance with ACI 301, Chapter 4, provide the concrete supplier and concrete mix design(s) for the ready-mix concrete provided for each drilled shaft.
 - c) For slurry construction methods, provide test reports from the Supplier indicating the slurry type and admixtures and the physical and chemical properties of the proposed slurry to be utilized.
- 8) Other information requested on the Contract Drawings, or requested by the Program/Project Manager.
- b. The Program/Project Manager will evaluate the Drilled Shaft Installation Plan for conformance with the Contract Documents, and will within 14 calendar days after receipt of the Plan notify the Contractor of its approval or of additional information required and/or changes necessary to meet the Contract requirements.
 - 1) Parts of the Drilled Shaft Installation Plan that are unacceptable will be rejected, and the Contractor will be required to resubmit changes for re-evaluation.
 - 2) Procedural approvals given by the Program/Project Manager are subject to trial in the field and do not relieve the Contractor of the responsibility to satisfactorily complete the Work.
2. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.

3. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency and the City of Phoenix Testing Laboratory, and having the following additional qualifications:
 - 1) Qualified according to the requirements specified in ASTM C1107/C1107M.
 - 2) Capable of performing the reviews, inspections, and testing required by this Section; including but not limited to the following:
 - a) Inspecting, sampling, and testing proposed materials and concrete production as required by the Program/Project Manager for compliance with the Contract Documents.
 - (1) Capable of conducting concrete slump, strength, and air entrainment testing.
 - (2) Capable of securing production samples of materials at plants or stockpiles during the course of the Work, and testing the samples for compliance with the Contract Documents.
 - b) Capable of reviewing and testing the Contractor's proposed mix designs.
 - b. The Test and Inspection Agency performing Gamma-Gamma Logging (GGL) Integrity Testing must provide proof that it is licensed to possess and use radioactive material in accordance with the regulations of the Arizona Radiation Regulatory Agency.

B. Qualifications:

1. Drilled Shaft Subcontractor:
 - a. To construct the drilled concrete shafts, employ an experienced firm that has installed drilled shafts within similar soil conditions and with diameters and lengths similar to those shown on the Contract Drawings within the 3 years prior to the Bid date for this Contract.
 - 1) The Drilled Shaft Subcontractor's supervisor must have at least 3 years of acceptable experience installing similar types of drilled shafts.
 - 2) Demonstrate to the Program/Project Manager that the Drilled Shaft Subcontractor's supervisor and drillers proposed for performing the Work have completed at least 5 projects for drilled shaft diameters, lengths, and subsurface conditions similar in scope to this Contract, by submitting their experience resume.
2. Welding:
 - a. Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed in AWS D1.4/D1.4M for the procedures.

- 1) Submit certified copies of qualification test records that indicate each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures.
- b. Qualify welding procedures, and submit qualification records, as prescribed in AWS D1.4/D1.4M.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 1. Measure, batch, mix, and deliver ready-mixed concrete according to ASTM C94/C94M.
 - a. Submit batch ticket information for each batch to the Program/Project Manager for information.
 2. Deliver concrete to the Site in an uninterrupted manner, and place it in the shaft excavation in a continuous manner so that all drilled shaft foundations are constructed without cold joints.
- B. Storage and Handling Requirements:
 1. Do not add water to the concrete mix in excess of the design mix amount.
 - a. Water may be added at the Site if the concrete was batched to less than the design water volume.
 - 1) The concrete truck must perform sufficient mixing revolutions if water is added at the Site prior to discharging the load.
 2. Maintain the concrete temperature so that it does not exceed 90 degrees Fahrenheit.

1.08 SITE CONDITIONS

- A. Ambient Conditions:
 1. Hot Weather Concreting:
 - a. Perform hot weather concrete work in accordance with the requirements of ACI 305R and the following additional requirements:
 - 1) Do not deliver concrete having a temperature exceeding 90 degrees Fahrenheit to the Work Site.
 - 2) Cool the mix's ingredients before mixing to prevent the temperature of the mix from exceeding 90 degrees Fahrenheit.
 - a) Furnish windbreaks, shading, fog spraying, sprinkling, or wet covering when necessary.
- B. Existing Conditions:
 1. Soil boring logs from subsurface investigations are available for information from the Program/Project Manager for information.
 - a. The data indicated on the available boring logs are not intended as representations or warranties of continuity of such conditions.

PART 2 PRODUCTS

2.01 PERFORMANCE

- A. Perform the excavations required for drilled concrete shafts through whatever materials are encountered to the dimensions and elevations shown on the Contract Drawings or otherwise required by the Specifications.
 - 1. Employ methods suitable for the intended purpose and materials encountered.
 - 2. Employ the dry construction method only at sites where the groundwater level and the soil conditions are suitable to permit construction of the shaft in a relatively dry excavation, and where the Program/Project Manager can verify the dryness of the excavation bottom by viewing the auger cuttings, auger, bell bucket, one-eye bucket, and/or by using a weighted tape prior to placement of concrete.
 - a. The Program/Project Manager will determine the final bearing level.
 - 3. Employ the wet construction method or slurry construction method at sites where a dry shaft excavation bottom cannot be maintained for placement of the drilled shaft concrete.
 - 4. Comply with the safety requirements of 29 CFR 1910 and 29 CFR 1926.

2.02 DESIGN CRITERIA

- A. Capacities:
 - 1. The drilled concrete shafts for this Contract have been designed for an allowable vertical axial capacity (dead load plus live load) as indicated in the Geotechnical Design Memorandum using skin friction and end-bearing.
- B. Shop Drawings:
 - 1. Prepare and submit Shop Drawings that detail the fabrication, bending, and placing of the concrete reinforcement for the drilled concrete shafts.

2.03 MATERIALS:

- A. Concrete:
 - 1. Provide the following materials to produce the concrete mix designs required by this Section.
 - 2. Portland Cement:
 - a. Provide Portland cement complying with the requirements for Type II as specified in ASTM C150.
 - 1) Where concrete is to be placed in drilled shaft excavations containing mineral slurry, polymer slurry, or water, provide concrete having a cement content of between 660 and 750 pounds per cubic yard.
 - 3. Aggregate:

- a. Provide aggregate complying with the requirements for uniformly graded aggregate specified in ASTM C33.
 - 1) Limit the maximum aggregate size to 20 percent of the minimum clear bar spacing (vertical and horizontal); but not exceeding 1 inch for drilled shafts constructed using a dry method of concrete placement and $\frac{3}{4}$ inch for drilled shafts constructed using a wet method of concrete placement.
 4. Water:
 - a. Provide potable water complying with the requirements specified in ASTM C94/C94M.
 5. Admixtures:
 - a. Provide admixtures certified by the manufacturer to contain no more than 0.1 percent water-soluble chloride ions by mass of the cementitious material, and to be compatible with the other admixtures and cementitious materials.
 - b. Do not use admixtures containing calcium chloride.
 - B. Concrete Reinforcement:
 1. Reinforcing Bars:
 - a. Provide deformed steel reinforcing bars complying with the requirements for Grade 60 as specified in ASTM A615/A615M.
 - C. Controlled Low Strength Material (CLSM):
 1. Provide controlled low strength material (CLSM) consisting of cement-enriched aggregate base course slurry having the cement content listed in Table 02473-1:
- | CLSM Type | Cement Content⁽¹⁾ (lbs/yd³) |
|---|--|
| 1 Sack | 94 ± 5 percent |
| 1-1/2 Sack | 141 ± 5 percent |
| 3 Sack | 282 ± 5 percent |
| 1. Determine cement content in accordance with the requirements specified in ASTM D 5982. | |
2. Submit a mix design for the controlled low strength material (CLSM) to the Program/Project Manager for approval prior to placing the controlled low strength material.
 - D. Temporary and Permanent Casing:
 1. Provide casing fabricated from steel complying with the requirements for Grade 36 as specified in ASTM A709/A709M, unless indicated otherwise.

2. Provide watertight casing of sufficient strength to withstand handling stresses, drilling stresses, concrete fluid pressures, surrounding earth and water pressures, and if required, to permit advancement of shaft excavation through caving ground.
3. Provide casing outside diameters not less than the specified diameter of the drilled concrete shaft.
4. Only use permanent casing when authorized by the Program/Project Manager.

2.04 MIXES

- A. Prepare design mixes according to ACI 211.1 and ACI 301 for each type and strength of concrete determined by either laboratory trial mix or field test data bases.
 1. Prior to producing concrete or controlled low strength material (CLSM), submit all mix designs proposed for the Contract to the Program/Project Manager for approval on the form appended to the end of this Section.
 - a. Include a standard deviation analysis or laboratory trial mixture test data with the submittal in accordance with Section 4 of ACI 301.
 - b. Use the materials specified in this Section in the proposed design mixes.
 - c. Make adjustments in the proposed design mix as directed by the Program/Project Manager.
- B. Proportion concrete mixes according to ACI 211.1 and ACI 301 to provide normal-weight concrete with the following properties:
 1. Compressive Strength (28 days), f'_c : 4000 psi minimum, or as noted on the Contract Drawings.
 - a. Provide tremie concrete having a minimum f'_c as noted on the Contract Drawings.
 2. Minimum Slump: As indicated in Table 02473-2.

Table 02473-2 Concrete Slump	
Slump Range	Condition
5 – 7 inches	Dry uncased shaft excavation
6 – 8 inches	Temporary casing
7 – 9 inches	Concrete placed by wet or slurry displacement methods

- C. The concrete mix may not contain water-soluble, chloride ion admixtures.

- D. If the characteristics of the materials, Contract conditions, weather, test results, or other circumstances warrant, adjustments to the concrete mix design may be considered.

2.05 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 - 1. Laboratory Trial Mix Tests, or field test data bases:
 - a. Test Procedure:
 - 1) Use a qualified testing agency for preparing and reporting the proposed mix designs for the laboratory trial mix basis.
 - 2) Submit the laboratory test reports or field test data bases to the Program/Project Manager for information.
 - b. Acceptance Criteria:
 - 1) Mixes that meet the specified requirements will be acceptable.
- B. Coordination of Other Tests and Inspections:
 - 1. Notify the code-required Approved Agency responsible for performing Special Inspections when concrete for this Contract requiring Special Inspections as noted on the Contract Drawings is being mixed, placed, and/or tested.
 - 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Prior to commencement of drilled shaft construction, examine the site to determine if there are any constraints to the Work presented by the existing surface conditions, and if any, report them to the Program/Project Manager.
 - 2. Review the available soil boring logs from the subsurface investigation(s).
 - a. If during construction, it is determined that the actual subsurface conditions differ substantially from those reported on the boring logs, notify the Program/Project Manager in writing within 48 hours of such determination.
 - 3. Before beginning to excavate drilled shafts, locate existing underground utilities as specified in Section 01315, Project Coordination.
 - a. At least 3 days prior to the start of digging or excavation Work, contact Arizona 811 at (602) 659-7500 to arrange for utility owners to locate and mark their underground utilities.

- 1) Comply with applicable Arizona Revised Statutes (ARS), especially those regarding Underground Utilities and the Overhead Powerline Safety Law.
 - 2) If unexpected active underground facilities are encountered during the performance of the Work, notify the Program/Project Manager immediately.
- B. Pre-Installation Testing:
1. Additional soil test borings and other exploratory procedures may be performed by the Contractor if at no increase in the Contract Price.
- C. Evaluation and Assessment:
1. It is expressly understood that the City of Phoenix and the Program/Project Manager will not be responsible for interpretations or conclusions drawn from the soil boring logs by the Contractor.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
1. If existing utilities are to remain in place, protect them from damage during drilled shaft operations.
 2. Control drilled concrete shaft installation operations to prevent damage to existing structures and utilities.
 - a. Preventative measures include, but are not limited to, selecting construction methods and procedures that will prevent caving of the shaft excavation, and monitoring and controlling the vibrations from construction activities, such as installation of casing and drilling of the shaft.
 - b. During all drilled shaft excavating and concreting operations, monitor existing structural elements within 10 drilled shaft diameters or a minimum of 50 feet away from drilled shafts measured center-to-center in accordance with the "Monitoring Notes Related to the Existing Structures" on the Contract Drawings.
- B. Surface Preparation:
1. Before beginning to excavate, have the Surveyor, required by Section 01725, Field Engineering, lay out each drilled shaft to the lines and levels required.
 - a. Record and maintain information pertinent to each drilled shaft, and cooperate with the Approved Agency performing special testing and inspections to provide data for required reports.
 - 1) Record the actual measurements of each drilled shaft's location, shaft diameter, bottom and top elevations, deviations from specified tolerances and other specified data.

3.03 DRILLING THE EXCAVATION

- A. Provide excavation and drilling equipment that has adequate capacity, including power torque and down-thrust, to excavate a shaft of both the maximum diameter and depth indicated on the Contract Drawings.
- B. Raising the tip elevation of the drilled shaft requires approval by the Program/Project Manager.
- C. If satisfactory bearing material is not encountered at the elevation indicated on the Contract Drawings, at the direction of the Program/Project Manager the bottom of any drilled shaft may be lowered.
- D. If caving soil conditions are encountered, employ a construction method acceptable to the Program/Project Manager which will prevent excessive caving.
- E. If the wet construction or slurry construction methods are used, then desanding and cleaning the slurry; final cleaning of the excavation by means of a bailing bucket, air lift, submersible pump, or other approved devices; and placing the shaft concrete beginning at the shaft bottom using a tremie or concrete pump may be required.
 - 1. During construction, maintain the slurry in the shaft excavation at a level not less than the highest expected groundwater level within the depth of the shaft.
 - 2. If the slurry method is used, make the slurry suspension using a sufficient percentage of material and with a specific gravity capable of maintaining the stability of the excavation and allowing proper concrete placement.
 - a. Only employ commercially prepared mineral slurries or polymer slurries.
 - b. Premix the mineral slurry or polymer slurry thoroughly with clean, fresh water.
 - 1) Furnish slurry tanks for slurry circulation, storage, and treatment.
 - 2) Do not mix the slurry within the drilled shaft excavation, except in cases where the slurry manufacturer allows it, and the Program/Project Manager approves of it.
 - 3) Excavated slurry pits are not allowed.
 - c. Prior to introducing the slurry into the shaft excavation, allow adequate time for hydration to occur as prescribed by the manufacturer.
 - d. Use whatever methods are necessary to prevent the slurry from setting up in the shaft.
 - 1) Methods may include, but are not limited to, agitation, circulation and/or adjusting the properties of the slurry.
 - 2) During work shifts, do not allow the slurry to stand for more than 4 hours in the excavation without agitation.

- 3) If concrete placement does not occur by the end of a work shift, or if an existing excavation contains slurry at the beginning of a work shift, agitate/circulate the slurry in the excavation.
 3. Use controlled low strength material (CLSM) only after its use is approved by the Program/Project Manager, and only within the depth intervals approved by the Program/Project Manager.
- F. Cover all open excavations at the end of each day in a manner approved by the Program/Project Manager and the City of Phoenix.

3.04 INSTALLING CASING AND CONCRETE REINFORCING STEEL

- A. Do not place reinforcing steel and concrete in the drilled shaft excavation until the design tip elevation has been reached and the excavation is acceptable to the Program/Project Manager.
- B. Prior to placing temporary casing in the excavation, clean the casing inside and out.
 1. If temporary casing is abandoned in the shaft excavation, the Contractor is responsible for the loss of frictional capacity in the cased zone.
 - a. If installed temporary casing becomes permanent, no side friction capacity will be allowed.
 - b. Such modifications are allowed only if no increase in the Contract Price results.
 - c. Notify Program/Project Manager immediately for direction on making adjustments to drilled shaft lengths per design requirements.
- C. Before placing reinforcing steel and dowels, clean off loose rust, scale, dirt, grease, and other materials which could reduce or destroy the bond to the concrete.
- D. Where a reinforcing cage consisting of longitudinal bars and spiral reinforcement or lateral ties is indicated on the Contract Drawings, completely assemble the cage prior to placing it in the shaft excavation.
 1. Provide Grade 60 reinforcing steel bars that comply with the requirements of ASTM A615/A615M.
- E. Place the reinforcement in accordance with the details shown on the Contract Drawings
 1. Do not place the steel reinforcing cage in the drilled shaft excavation until immediately before concrete operations are to be started.
 - a. In the areas at airport terminals where time constraints prohibit placement of concrete immediately following placement of the steel reinforcing cage, the reinforcing cage can be placed in the drilled shaft excavation up to 24 hours before placing concrete.

2. Splice vertical reinforcement steel only as indicated on the Contract Drawings, or as approved by the Program/Project Manager.
- F. Hold reinforcement securely in position during concrete placement.
 1. Provide spacers on the exterior of the reinforcing cage at sufficient intervals to ensure concentric spacing of the cage for its entire length within the shaft excavation.
- G. Furnish and install dowels in the top of drilled shafts where concrete components will be constructed above.
 1. Extend the dowels for a lap of 24 bar diameters, unless noted otherwise on the Contract Drawings.

3.05 PLACING CONCRETE

- A. Place drilled shaft concrete the same day the shaft excavation is completed in accordance with Section 601, Concrete Structures, of the ADOT Standard Specifications for Road and Bridge Construction.
 1. In the areas at airport terminals where time constraints prohibit placement of concrete immediately following placement of the steel reinforcing cage, the concrete can be placed in the drilled shaft excavation up to 24 hours after placing the steel cage, provided the actual shaft bottom elevation is equal to or greater than the design drilled shaft tip elevation.
- B. For concrete placement in dry excavations, concrete may be placed using free-fall methods provided the concrete is not allowed to contact the earth walls of the drilled shaft excavation, the temporary casing, or the steel reinforcement.
 1. A drop chute, elephant trunk hopper or equivalent may be used for this purpose.
- C. Exercise due care to prevent upward movement of the shaft concrete and/or reinforcing steel while extracting the temporary casing.
 1. Take corrective action when the upward movement exceeds one inch.
 - a. Corrective action may include leaving the casing in place and compensating for the loss of frictional capacity in the cased zone.
- D. Vibrate the upper 10 feet of concrete placed in dry excavations following removal of any temporary casing.
 1. Stop concrete placement at the cut-off elevation shown on the Contract Drawings, and screed the concrete level.
- E. When withdrawing the casing from the excavation, maintain a head of concrete at least 5 feet above the bottom of the temporary casing to prevent a reduction in shaft diameter due to earth or hydrostatic pressures on the fresh concrete, and to prevent extraneous materials from falling in from the sides and mixing with concrete.

1. Compare the actual volume of concrete used against the theoretically calculated volume to detect large voids or intrusions of foreign matter.
- F. Before withdrawing the casing from the excavation, ensure that the level of concrete in the shaft is sufficiently high to remain above the water level elevation in the shaft excavation as the concrete level drops to fill the void created by removal of the casing.
- G. Placing Concrete Using Wet or Slurry Methods:
 1. For placing concrete using wet or slurry methods, furnish tremie pipes and pump pipes made of steel; do not use aluminum.
 2. Furnish a tremie pipe having an inside diameter of at least 8 inches, and a pump pipe having an inside diameter of at least 5 inches.
 3. Place the discharge end within 12 inches of the bottom of the excavation prior to commencement of concrete placement.
 4. Provide the lower end of the pump or tremie pipe with a valve, sealable cap, or plug ("pig").
 - a. If a plug is used, insert it at the top after the pipe has been set in place.
 5. Do not lift the open end of the tremie pipe until the tremie pipe is completely filled with concrete.
 6. Maintain a head of 5 feet or more of concrete in the tremie pipe above the level of concrete in the drilled shaft except at the top of the shaft. During removal of temporary casing, maintain a head in the tremie pipe of at least 10 feet above the level of concrete in the drilled shaft, except at the upper 10 feet of the shaft.
 - a. Remove contaminated concrete from the shaft.
 7. Vibrate the upper 5 feet of concrete placed in wet excavations following removal of any temporary casing and after the slurry or water and any contaminated concrete has been totally expelled from the shaft.
- H. Record Drawings:
 1. At project closeout, submit record drawings documenting the actual location and construction of the drilled concrete shafts prepared using information obtained during the course of the Work.

3.06 TOLERANCES:

- A. The outside diameter of the drilled shaft cannot exceed the dimension on the Contract Drawings by more than 6 inches unless the use of telescoping casing or shallow surface casing is allowed by the installation plan.
- B. Horizontal Alignment:
 1. The actual centerlines of the drilled shaft must be within 5 percent of the shaft diameter at the plan elevation for the top of the shaft, not to exceed 3 inches of plan centerlines.

- C. Plumb:
 - 1. The out-of-plumbness at the drilled shaft actual bottom elevation must not be greater than 1-1/2 percent of the drilled shaft length.
- D. Reinforcing Steel:
 - 1. After all the shaft concrete is placed, the top of the reinforcing steel cage must not be more than 6 inches above, and no more than 3 inches below, the plan position.
 - 2. The reinforcing cage shall be concentric with the drilled shaft excavation within a tolerance of 1-½ inches.
- E. Top of Shaft Elevation:
 - 1. The top elevation of the shaft shall have a tolerance of plus 1 inch to minus 3 inches from the plan top of shaft elevation.
- F. Bottom of Excavation:
 - 1. Design excavation equipment and methods so that the completed shaft excavation bottom will consist of a level plane within a tolerance of 1 vertical to 12 horizontal.
 - 2. The cutting edges of excavation equipment must be normal to the vertical axis of the equipment within a tolerance of plus or minus 0.35 inch per foot of diameter.
 - 3. The bottom of the excavation must be clean of excavation cuttings, caved-in materials, and materials settled out of suspension at the time of placement of the concrete to the satisfaction of the code-required Approved Agency and the Program/Project Manager.

3.07 RESTORATION

- A. For drilled concrete shafts where casings are not used, fill the excavation space extending beyond the dimensions shown on the Contract Drawings with concrete at no increase in the Contract Price.

3.08 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 - 1. The Program/Project Manager and the code-required Approved Agency must perform routine and other testing of materials in addition to testing performed by the Contractor.
 - a. Advise the Program/Project Manager and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - 1) The Program/Project Manager and code-required Approved Agency will provide test reports documenting the testing they perform to the Contractor for information.

- b. A drilled shaft report will be prepared by the code-required Approved Agency for each drilled shaft, and include the following information:
 - 1) Actual top and bottom drilled shaft elevations.
 - 2) Actual diameter of drilled shaft.
 - 3) Description of soil materials encountered during drilling.
 - 4) Description, location, and dimensions of obstructions.
 - 5) Top of shaft centerline location, and deviations from requirements.
 - 6) Variation of shaft from plumb.
 - 7) Adequacy of cleanout of bottom of shaft.
 - 8) Groundwater conditions and water infiltration rate, depth, and pumping.
 - 9) Description of excavation sidewall stability, loss of ground, and means of control.
 - 10) Length and diameter of temporary casing.
 - 11) Theoretical and actual volume of concrete placed in cubic yards.
 - 12) Date and time of start and completion of excavation and concrete placement, including any delays during concrete placement.
 - 13) Reinforcing steel data.
 - 14) Concrete placement method.
 - 15) Remarks, unusual conditions encountered, and deviations from requirements.
 - c. Failure of the Program/Project Manager or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Site Tests:
- a. Slurry Property Tests:
 - 1) Test Procedure:
 - a) Perform the slurry property tests to ensure that the slurry suspension will not impede the flow of concrete to the bottom of the drilled shaft excavation.
 - b) Supply all equipment needed to allow sampling the slurry at any depth within the drilled shaft excavation.
 - c) Extract and test slurry samples from the base of the shaft and at the midpoint of the shaft until samples produce acceptable values for density, viscosity or yield point, pH, and sand content.
 - (1) A minimum of 4 sets of tests will be performed during the first 8 hours of slurry use to determine the slurry's density, yield point or viscosity, pH, and sand content using the methods specified in Paragraph 3.04 of Section 609 in the ADOT Standard Specifications for Road and Bridge Construction.

- (2) Once the test results show consistent behavior, the testing frequency may be decreased to 1 set for every 4 hours of slurry use.
 - (3) If any slurry samples are found to be unacceptable, take whatever means are necessary to bring the slurry to within the specified requirements.
 - (4) Do not place drilled shaft concrete until re-sampling and retesting results produce acceptable values.
 - d) Upon completion of each drilled shaft where slurry installation methods are used, prepare test reports for the slurry tests performed, and submit copies of the test reports to the Program/Project Manager for information.
- 2) Acceptance Criteria:
- a) For mineral slurries, a range of acceptable values for the slurry physical properties can be found in Table 02473-3.

Table 02473-3 Acceptable Values of Physical Properties for Mineral Slurries		
Physical Property	Acceptable Values	<u>Test Method</u>
Density (Pounds per Cubic Foot)		
During drilling	64.3 – 69.1	Density Balance
Immediately prior to placing concrete	64.3 – 75.0 (85 with Barite agents)	Density Balance
Viscosity (Seconds per Quart)		
During drilling	28 to 50	Marsh Funnel
Immediately prior to placing concrete	28 to 50	Marsh Funnel
pH	7 to 12	pH Paper or pH meter
Sand Content (Percent)		
At introduction	0 to 4	API Sand Content Kit
Immediately prior to placing concrete	0 to 2	API Sand Content Kit

- b) For polymer slurries, the ranges of acceptable values for physical properties can be found in Table 02473-4.

Table 02473-4 Acceptable Values of Physical Properties for Polymer Slurries	
Physical Property	Acceptable Values
Density (Pounds per Cubic Foot)	
During drilling	≤ 64
Immediately prior to placing concrete	≤ 64
Viscosity (Seconds per Quart)	
During drilling	32 to 135
Immediately prior to placing concrete	32 to 135
pH	8 to 11.5
Sand Content (Percent)	
At introduction	< 1
Immediately prior to placing concrete	< 1

b. Concrete Tests:

1) Test Procedure:

- a) The Program/Project Manager's Testing and Inspection Agency will sample fresh concrete in accordance with the requirements of ASTM C172, except as modified for slump to comply with these specifications.
- b) The concrete compressive strength will be determined in accordance with the requirements of ASTM C31/C31M.
 - (1) Obtain one set of 4 standard cylinders for each compressive strength test unless otherwise indicated.
 - (a) Mold and store the cylinders for laboratory-cured test specimens, unless field-cured test specimens are required.
 - (2) The concrete compressive strength tests will be performed in accordance with the requirements of ASTM C39/C39M.
 - (a) One set of concrete compressive strength tests will be performed for each drilled shaft, but not more than one set for each truck load.

- (b) Retain one cylinder from each set in reserve for later testing if it is required.
 - (c) When the frequency of testing will provide fewer than 5 strength tests for a given class of concrete, testing from at least 5 randomly selected batches or from each batch if fewer than 5 are used will be conducted.
 - c) The concrete slump will be determined in accordance with the requirements of ASTM C143/C143M.
 - (1) One test will be performed at the point of placement for each compressive strength test, but no fewer than one test for each drilled shaft.
 - d) The concrete temperature will be determined in accordance with the requirements of ASTM C1064.
 - (1) One test hourly will be performed when the air temperature is 40 degrees Fahrenheit and below, and when 80 degrees Fahrenheit and above, and one test will be performed for each set of compressive strength specimens.
 - e) The Program/Project Manager's Testing and Inspection Agency will report the test results in writing to the concrete Supplier, the Program/Project Manager, and the Contractor within 24 hours of the testing.
 - (1) With the reports of the compressive strength tests the project identification name and number, the date of concrete placement, the name of the concrete testing and inspection agency, the concrete type and class, the location of the concrete batch in the drilled shaft, the design compressive strength at 28 days, the concrete mix proportions and materials, and the compressive strength and type of break for both 7- and 28-day tests will be included.
- 2) Acceptance Criteria:
 - a) The strength level of the concrete will be considered satisfactory if the averages of sets of 3 consecutive strength test results equal or exceed the specified compressive strength, and no individual strength test result falls below the specified compressive strength by more than 500 psi.
- c. Integrity Testing:
 - 1) Test Procedure:
 - a) The Program/Project Manager's Testing and Inspection Agency will perform integrity tests on all drilled shafts constructed under this Contract.
 - (1) Integrity testing will include performing both Gamma-Gamma Logging (GGL) and Cross-Hole Sonic Logging (CSL).

- b) Either at the discretion of the Program/Project Manager or based on the results of the Gamma-Gamma Logging (GGL) and/or Cross-Hole Sonic Logging (CSL), additional testing such as offset elevation cross-hole sonic logging, three-dimensional tomography, sonic echo tests or coring may be required.
- c) Integrity testing will generally be performed in accordance with the requirements specified in Subsection 609-3.05, Integrity Testing, in the ADOT Standard Specifications for Road and Bridge Construction.
- d) Integrity Testing Access Tubes:
 - (1) Provide the number of clean, watertight, and unobstructed 2-1/2-inch diameter Schedule 80 PVC pipes required for the integrity tests as indicated on the Contract Drawings, but not less than 4, uniformly distributed along the inside circumference of the reinforcing steel cage.
 - (a) Provide 1 access tube for each foot of shaft diameter, rounded up to the next integer for diameters not in whole foot increments.
 - (b) Fit the tubes with a watertight cap at the bottom and a removable watertight cap or plug at the top to prevent concrete and debris from entering the tubes.
 - (c) Extend the tubes vertically from not more than 6 inches above the bottom of the reinforcing cage to at least 4 feet above the top of the shaft, or to 2 feet above the top of the rebar cage if it is above the ground.
 - (d) If joints are needed to provide the full tube length required, make the joints watertight.
 - (e) Securely fasten the tubes to the reinforcing cage at least every 10 feet vertically, and parallel to each other.
 - (f) Do not allow the tubes to rest on the bottom of the drilled shaft excavation.
 - (g) If the top of the drilled shaft is subsurface, extend the tubes to allow safe and ready access from ground level.
 - (h) Prevent damage to the tubes, tube couplings, and caps during installation of concrete reinforcement.
 - (2) Completely fill the tubes with water immediately prior to or immediately after placement of the concrete in the drilled concrete shaft, but not more than 1 hour after concrete placement is completed.
 - (a) Do not allow the water level to drop below the top of the tube prior to performing the integrity tests.

- (3) Prior to the performance of the integrity testing, a 1.5 inch diameter, 6-foot long rigid cylinder will be run through the entire length of each access tube to check the tubes for blockages.
 - (a) If blockages in the tubes prevent performing the test, core-drill or otherwise determine the extent of the defects in the concrete as directed by the Program/Project Manager at no increase in the Contract Price.
 - (4) Prior to the performance of the integrity testing, submit the following data for each drilled shaft to the Program/Project Manager for information:
 - (a) The top and bottom elevations of the shaft.
 - (b) The tube positions and lengths.
 - (c) The date the shaft was constructed.
 - (5) The Integrity Testing will not be performed until at least 48 hours after placement of the concrete.
 - (6) Cross-Hole Sonic Logging (CSL) will be completed within 4 calendar days of concrete placement.
 - (7) Gamma-Gamma Logging (GGL) will be completed within 7 calendar days of concrete placement.
- 2) Cross-Hole Sonic Logging (CSL) Integrity Test:
- a) Test Procedure:
 - (1) Readings from the cross-hole sonic logging will be taken at maximum intervals of 2 inches from top to bottom of the uniquely identified tubes in a manner similar to the procedures specified in ASTM D6760 and ADOT Specifications, and will include all possible ultrasonic "ray" paths.
 - (a) All possible tube pairs will be tested.
 - (b) Unless test results indicate potential defects, the source and receiver probes will be in the same horizontal planes when readings are taken.
 - (c) The minimum pulse frequency will be 40,000 Hz.
 - (2) The test results, including the acquired raw data, graphs of acoustic pulse arrival time versus depth, and power of the arriving signal versus depth, in each pair of tubes provided will be recorded.
 - (3) After the test has been completed and if the drilled shaft has been approved, fill the holes and test pipes from the bottom up with an approved grout having a minimum 28-day compressive strength of 1000 psi.
 - b) Acceptance Criteria:
 - (1) If the Cross-Hole Sonic Logging indicates velocity reductions less than 10 percent of the mean measured

- velocity in the drilled shaft foundation, then the drilled shaft passes the Cross-Hole Sonic Logging (CSL) test.
- (2) If the Cross-Hole Sonic Logging indicates velocity reductions greater than 10 percent of the mean measured velocity in the drilled concrete shaft foundation, or if the Program/Project Manager determines that construction defects may have occurred, then the drilled shaft is considered to have failed the test.
- 3) Gamma-Gamma Density Logging (GDL) Integrity Test:
- a) Test Procedure:
- (1) A gamma-gamma probe, consisting of a rigid cylinder containing a gamma particle emitting source and a gamma particle detector, will be suspended by a cable capable of raising and lowering the probe to the desired test depths within an inspection tube.
- (a) The gamma particle emitting source will be Cesium-137 in a sealed source form.
- (b) The gamma particle detector will consist of a gamma ray detector, such as a Geiger Mueller or scintillation-based counter, connected to a readout device capable of displaying and/or recording counts, densities, and sampling duration or probe speed.
- (2) The gamma-gamma logging will be performed in access tubes completely filled with water only if the gamma-gamma probe has been calibrated in concrete calibration samples that contained access tubes filled with water, and the radius of detection and density precision calibration have been performed under water and found to be within prescribed limits.
- (a) If gamma-gamma logging is performed in water-filled tubes, the water level in any tube during testing is not allowed to drop below the top of the tube.
- (3) Readings from the gamma-gamma logging will be taken at maximum intervals of 1.5 inches and within a density precision of 1.0 pound per cubic foot as the probe is raised from the bottom to the top of the uniquely identified tubes in a manner consistent to the procedure specified in ADOT Special Provision 609DRSFD.
- (4) One repeat log will be performed for each shaft tested to evaluate the repeatability of the GGL tests.
- (a) After all of the tubes in a given drilled shaft have been tested by Gamma-Gamma Logging (GGL), the repeat log will be performed in the first tube that was tested.
- (5) The test results will be recorded as the probe is extracted at a rate of between 8 to 10 feet per minute.

- (a) A calculation using the raw data will be performed.
- (6) In the event a known difference in the steel reinforcement, such as splices using overlapping bars, exists in a segment of a drilled shaft which affects the apparent mean of the data, then a separate mean will be generated and used as the mean for that portion of the data.
- (7) The following data will not be included in the calculation of the mean density:
 - (a) Repetitive data points collected at a single depth.
 - (b) Data collected at the top of the drilled shaft where the reading(s) were influenced by the gamma detector component exiting the drilled shaft.
 - (c) Data collected in the access tube above the top of the drilled shaft.
 - (d) Data affected by the anomalous zones of concrete.
 - (e) Data which cause the population distribution to be statistically non-normal.
- (8) In the analysis of the data, the Standard Deviation value between 2.5 pounds per cubic foot and 3.75 pounds per cubic foot will be used.
 - (a) If the calculated value is below 2.5 pounds per cubic foot, then a value of 2.5 pounds per cubic foot will be used.
 - (b) If the calculated value is above 3.75 pounds per cubic foot, then a value of 3.75 pounds per cubic foot will be used.
- (9) After the test has been completed and if the drilled shaft has been approved, fill the holes and test pipes from the bottom up with an approved grout having a minimum 28-day compressive strength of 1000 psi.
- b) Acceptance Criteria:
 - (1) If in all inspection tubes for a drilled shaft the Gamma-Gamma Logging (GGL) indicates no anomalies as defined in Subparagraphs 3.08.A.2.c.3.b.2 below, then the drilled shaft passes the Gamma-Gamma Logging (GGL) Integrity Test.
 - (2) If in a single inspection tube, all density readings over a 0.5-foot or greater depth interval are less than the mean density value by 3 standard deviations, that area is considered to be an anomaly.
 - (a) If, in addition to the anomaly identified in Subparagraph 3.08.A.2.c.3.b.2, some data point for the tube falls below the 3-standard deviation value within 1 foot above or below the anomaly, that depth will also be considered anomalous.

- (b) If in the inspection tubes adjacent to the identified anomaly some data point 2 feet above or below the identified anomaly in the other tube falls below the 3 standard deviations value, then the depth in that tube at which the anomaly is found is also anomalous.
 - 4) If the integrity testing indicates the presence of anomalies, offset elevation cross-hole sonic logging, three-dimensional tomography, sonic echo tests and/or other tests may be conducted as directed by the Program/Project Manager to determine if the drilled shaft is defective.
 - a) Any such additional testing shall be considered as included in the contract price for drilled shafts.
 - b) Nondestructive testing will not be used as the sole basis for acceptance or rejection of the concrete.
 - c) Final acceptance of the drilled shafts will be determined by the Program/Project Manager.
 - d) Do not commence subsequent construction of structures supported by the drilled concrete shafts until the Program/Project Manager approves the supporting drilled shaft.
- d. Additional Tests:
 - 1) Test Procedure:
 - a) When test results indicate concrete strengths or other requirements have not been met, the Program/Project Manager may direct the performance of additional tests on the concrete. Any such additional testing shall be considered as included in the contract price for drilled shafts.
 - b) Continuous coring of the drilled shafts may be required, at no increase in the Contract Price where observations of placement operations indicate deficient concrete quality, the presence of voids, segregation, or other possible defects. Coring shall be performed using double-tube or triple-tube core barrels.
 - 2) Acceptance Criteria:
 - a) As specified for the type of test.
- 3. Inspections:
 - a. Construction Method Log.
 - 1) During the excavation and construction of the drilled shafts, maintain and submit to the Program/Project Manager a Daily Construction Method Log which contains the following information for each drilled shaft:
 - a) Start date and completion date for the drilled concrete shaft.
 - b) Identification number of the drilled concrete shaft.
 - c) Location of the drilled concrete shaft.
 - d) Actual top and bottom elevation of drilled shaft.

- e) Shaft diameter.
 - f) Final centerline location at top.
 - g) Variation of the drilled concrete shaft from plumb.
 - h) Description of each soil and rock material encountered during excavation, and their approximate top and bottom depths or elevations.
 - i) Depth drilled into bearing stratum.
 - j) Top and bottom elevations of obstructions encountered.
 - k) Depth or elevation of encountered seepage or groundwater.
 - l) Quantity of concrete placed.
 - m) Remarks.
- B. Non-Conforming Work
- 1. If drilled concrete shafts are determined to be defective, submit a plan to the Program/Project Manager for repairing, replacing, or supplementing the defective work for approval.
 - a. Perform the approved repairs at no increase in the Contract Price.
 - 2. Drilled shaft excavations and completed shafts not constructed within the required tolerances will be considered unacceptable.
 - a. Correct all unacceptable shaft excavations and completed shafts to the satisfaction of the Program/Project Manager.
 - b. Provide materials and work necessary to correct out of tolerance drilled shafts, including engineering analysis and redesign, at no increase in the Contract Price, and without an extension of the completion dates for the Contract.

3.09 ADJUSTING

- A. During the construction of the drilled concrete shafts, if the Program/Project Manager determines that the equipment, materials, personnel, or procedures are such that defects in the work may occur, stop the Work until appropriate changes to correct the defects are made by the Contractor.

3.10 WASTE MANAGEMENT:

- A. Remove surplus excavated material and slurry.
- B. Fluids in contact with groundwater, soils removed below the groundwater table, and groundwater removed from the drilled shaft excavation that show evidence of suspected contamination due to odors, stained soil or water, and/or other similar indicators will need to be containerized and stored onsite until environmental characterization tests are completed.
- 1. The Program/Project Manager, through the City of Phoenix Aviation Department Planning and Environmental Division, will determine the type and frequency of these environmental characterization tests.

- a. At the discretion of the City of Phoenix Aviation Department Planning and Environmental Division, data referencing possible pre-existing contaminated soil and groundwater locations may be provided by the City to the Contractor.
 2. After the results of the environmental characterization tests are available, remove and dispose of these materials from the Site in accordance with applicable environmental regulations.
- C. Legally dispose of all slurry and surplus excavated material offsite at an approved disposal site.

3.11 PROTECTION

- A. Protect exposed ends of reinforcing steel bars, dowels, and anchor bolts from mechanical damage and exposure to the weather.

3.12 ATTACHMENTS

- A. The following attachments are appended to this Section following the “END OF SECTION” marker:
1. Final Concrete Mix Design Submittal Form.
 2. Test Results Submittal Form.

SECTION 02582

UNDERGROUND DUCTS AND MANHOLES

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for underground electrical work, materials, products, and raceway systems.
- B. Related Requirements:
 - 1. Section 01180 - Project Utility Sources.
 - 2. Section 01330 - Submittal Procedures.
 - 3. Section 01400 - Quality Requirements.
 - 4. Section 01568 - Temporary Tree and Plant Protection.
 - 5. Section 02316 - Trenching and Backfill.
 - 6. Section 03100 - Concrete Forms and Accessories.
 - 7. Section 03200 - Concrete Reinforcement.
 - 8. Section 03300 - Cast-In-Place Concrete.
 - 9. Section 03410 - Plant-Precast Structural Concrete.
 - 10. Section 16050 - Basic Electrical Materials and Methods
 - 11. Section 16061 - Electrical Grounding and Bonding.
 - 12. Section 16130 - Raceway and Boxes.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. AWG: An acronym for American Wire Gauge, a standard system for designating aluminum and copper electrical wire sizes as specified in ASTM B 258.
 - 2. PVC: Polyvinylchloride plastic material.
 - 3. PVC/GRSC: Polyvinylchloride coated galvanized rigid steel conduit.
- B. Definitions:
 - 1. Definitions for all items are as stated in NFPA 70, IEEE C2, and other reference documents listed unless otherwise stated, specified, or noted.
 - 2. Perm: A standard unit of permanence relating to the rate of water vapor transition through a specimen coating defined as follows:

$$\text{Perms} = \frac{(\text{Weight of water in grams})}{[(\text{Test duration in hours}) \times (\text{Specimen area in square feet}) \times (\text{Vapor pressure difference from one side of the specimen to the other in inches of mercury})]}$$

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Incoming Service Requirements:

- a. Coordinate the Work of this Section and other work requirements with the Servicing Utility Company and the Owner prior to installation.
- b. For electrical service installation requirements and to verify exactly the work required by the utility company to be performed under this Contract, contact the representative of the Arizona Public Service Company (APS) listed in Section 01180, Project Utility Sources.

2. Excavation Safety:

- a. At least 3 days prior to the start of digging or excavation Work, contact Arizona Blue Stake at (602) 263-1100 to arrange for utility owners to locate and mark their underground utilities.
 - 1) Comply with applicable Arizona Revised Statutes (ARS), especially those regarding Underground Utilities and the Overhead Powerline Safety Law.
 - 2) If unexpected active underground facilities are encountered during the performance of the Work, notify the Program/Project Manager immediately.
 - 3) Take responsibility for locating existing utilities within the work area prior to excavation.
 - a) Where underground electrical work must cross existing utilities, no splices in the existing cables are allowed except as specified on the Contract Drawings; and installation of new cable must proceed as follows: Existing cables must be located manually.
 - b) Unearthed cables must be inspected to assure absolutely no damage has occurred.
 - c) Excavations in cable areas may only proceed with the approval of the Program/Project Manager, and possible damage or disruption of existing cable must be minimized by careful backfilling in the area of cable.
 - d) In the event that any previously identified cable is damaged during the course of construction, take responsibility for the complete repair.
 - b. Sole responsibility for making all excavations in a safe manner is the Contractor's.
 - 1) Where existing active cables cross proposed installations, insure that these cables are adequately protected.
 - c. Provide suitable protection against bodily injury.
- ##### 3. Do not interfere with persons, firms, corporations, or utilities, removing, changing, replacing, or employing protective measures at their property or structures.

- a. Allow these persons, firms, corporations, or utilities to take such measures as they may consider necessary or advisable under the circumstances.
- b. Measures employed or not employed by these entities do not relieve the Contractor of his responsibilities.

1.04 SUBMITTALS

A. Action Submittals:

- 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Junction boxes and covers
 - 2) Conduit and conduit fittings by type.
 - 3) Corrosion-resistant handholes.
 - 4) Precast manholes.
 - 5) Precast handholes.
 - 6) Manhole frames and covers.
 - 7) Handhole frames and covers.
 - 8) Sump pumps.
 - 9) Waterproof mortar design mix.
 - 10) Conduit spacers and locking collars.
 - 11) Ductbank cable shields.
 - 12) Grade rings.
 - 13) Raceway identification tags.
 - 14) Pull rope.
 - 15) Detectable warning tape.
 - 16) Manways and associated hardware.
 - 17) Manhole ladders and hardware.
 - b. Shop Drawings:
 - 1) Ductbank.
 - 2) Installation details.
 - c. Samples:
 - 1) Warning tape.
 - d. Certificates:
 - 1) Precast handholes, manholes, and accessories.
 - 2) Handhole and manhole frames and covers.
 - 3) Sump pumps.
 - 4) Manhole waterproofing.
 - e. Delegated Design Submittals:
 - 1) Structural calculations for precast structures.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Packaged dry mortar manufacturer's installation instructions.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 1. Testing and Inspection Agency:
 - a. To perform testing and inspections, the Phoenix Sky harbor International Airport will employ both an independent Testing and Inspection Agency and the City of Phoenix Testing Laboratory.
- B. Qualifications:
 1. Testing and Inspection Agency Qualifications:
 - a. Employ an independent Testing and Inspection Agency having the qualifications specified in Section 01400, Quality Requirements.
- C. Certifications:
 1. Submit a manufacturer's Certificate of Compliance for each of the following products provided, certifying that they meet or exceed the Contract requirements:
 - a. Precast handholes, manholes, and accessories.
 - b. Handhole and manhole frames and covers.
 - c. Sump pumps.
 - d. Manhole waterproofing:
 - 1) Submit the manufacturer's certification and test reports from a Testing and Inspection Agency acceptable to the Program/Project Manager proving that the proposed waterproofing meets or exceeds the Contract requirements, and has been in successful commercial use on structures of a similar type for at least 5 years.
- D. Preconstruction Testing:
 1. Ascertain the type of soil or rock to be excavated before bidding for this Contract.
 2. Provide only materials and equipment tested and listed by Underwriters Laboratories, Inc. (UL), when such equipment is listed or approved by UL.
 - a. Provide products that are listed and labeled by Underwriters Laboratory (UL) for the location installed in, and the application intended, unless products meeting the requirements of UL are not available or unless standards do not exist for the products.
 - 1) Provide products marked with their intended use or classification.
 - 2) Submit evidence with the Product Data that the products represented meet Underwriters Laboratory (UL) quality verification requirements, including UL listing and labeling requirements.

- a) Such evidence may consist of either a printed mark on the data or a separate listing card.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 1. Deliver materials and equipment in a clean condition.
 - a. Provide packaging that plugs, caps, or otherwise seals openings both during shipping and temporary storage.
 2. Provide equipment needed for unloading operations, and have such equipment on the Site to perform unloading work when the material and equipment is delivered.
 - a. If possible, clearly identify pick-points or lift-points on electrical equipment crating and packaging.
 - b. In the absence of pick-points or lift-points on equipment crating and packaging, identify pick-points or lift-points on the equipment itself.
 3. When unloading materials and equipment, provide special lifting harnesses or apparatus as required by manufacturers.
 4. Inspect materials and equipment for signs of damage prior to accepting delivery of those items at the Site; and reject, segregate, and remove damaged items.
- B. Storage and Handling Requirements:
 1. Handle materials and equipment in accordance with the manufacturer's written instructions.
 2. Store all products whether on-site or off-site, indoors on blocking or pallets.
 3. Follow the manufacturer's written instructions for storing the items.
 4. Except for electrical conduit, store electrical equipment and products under cover in warehouses or in enclosed buildings that provide protection from the weather on all sides and properly condition the storage space.

PART 2 PRODUCTS

2.01 UNDERGROUND ELECTRICAL SYSTEMS

- A. Manufacturers:
 1. Manufacturer List:
 - a. Subject to compliance with the requirements specified herein, provide products manufactured by one of the manufacturers listed.
 2. Substitution Limitations:
 - a. Use of Trade Names:
 - 1) The use of trade names in the Contract Documents is intended to establish a basis of design, constructability, and the level of quality required.

- 2) The use of trade names is not intended to exclude other manufacturers whose products are equivalent to those named, subject to the other manufacturers' products complying with all Contract requirements.

B. Description:

1. Underground electrical manholes, handholes, and ductbank Work includes performing surveying and providing survey markers to properly locate the Work, performing necessary excavations, providing electrical raceway and spacers, pull cords, raceway identification tags, detectable warning tape, and concrete encasement as indicated in the Contract Documents.

C. Design Criteria:

1. Design Frame and Cover Loading:
 - a. Provide manhole and handhole frames and covers for airside applications designed to withstand loads as follow:
 - 1) Maximum Tire Pressure: 205 psi.
 - 2) Maximum Vertical Main Gear Ground Load (V_{MG}): 82,100 pounds.
 - 3) Maximum Load per Tire: 41,050 pounds.
2. Shop Drawings:
 - a. Prepare Shop Drawings of the ductbank network showing locations, duct configurations, sizes, installation details, and concrete cover and reinforcement details.
 - b. Submit the Shop Drawings to the Program/Project Manager for approval.
3. Calculations:
 - a. Have a registered Structural Engineer perform structural calculations for the precast structures to be provided under this Section.
 - b. Submit the structural calculations to the Program/Project Manager for approval.

D. Components

1. Junction Boxes and Covers:
 - a. Cast Iron Junction Boxes and Covers:
 - 1) Provide weatherproof and watertight cast iron junction boxes having a checkered cover and a neoprene gasket suitable for flush mounting.
 - 2) Size:
 - a) Provide 8-inch by 8-inch minimum junction boxes or larger if required by the NFPA 70, if indicated on the Contract Drawings, and/or required by field conditions.
 - 3) Manufacturers:
 - a) Appleton, www.appletonelec.com.
 - b) Cooper Crouse Hinds, www.crouse-hinds.com.
 - c) Hubbell Killark, <http://www.hubbell-killark.com>.
 - d) Equivalent approved by the Program/Project Manager..

- b. Nonmetallic Junction Boxes and Covers:
 - 1) Provide nonmetallic boxes and covers complying with the requirements specified in UL 514C.
- c. Submit the junction boxes and covers to the Program/Project Manager for approval.
- 2. Conduit, Conduit Fittings, and Conduit Spacers:
 - a. Provide conduit and raceway appropriate for the application as indicated in NFPA 70.
 - b. Provide the type of conduit and tubing as indicated on the Contract Drawings, and conforming to the requirements of Section 16130, Raceway and Boxes and the following:
 - 1) Intermediate Metal Conduit:
 - a) Provide intermediate metal conduit (IMC) complying with the requirements specified in UL 1242.
 - 2) Rigid Metal Conduit:
 - a) Provide rigid metal conduit complying with the requirements specified in UL 6.
 - 3) Nonmetallic Conduit:
 - a) For direct burial, provide rigid polyvinyl chloride (PVC) conduit complying with the requirements specified in UL 651 and and Article 352, *Rigid Polyvinyl Chloride Conduit: Type PVC*, of NFPA 70.
 - b) For concrete encased conduit, provide either Type EB and A rigid polyvinyl chloride (PVC) conduit complying with the requirements specified in UL 651A and Article 352, *Rigid Polyvinyl Chloride Conduit: Type PVC*, of NFPA 70, or Schedule 80 high density polyethylene (HDPE) conduit complying with the requirements specified in ASTM D 3350.
 - c) Provide the following types of nonmetallic conduit where indicated on the Contract Drawings:
 - (1) Type I: Provide Schedule 40 PVC conduit suitable for underground use either direct-buried or encased in concrete and for use as electrical system drain pipes.
 - (2) Type II: Provide Schedule 40 PVC conduit suitable for either above ground or underground use.
 - (3) HDPE: Provide high density polyethylene conduit suitable for directional boring without the need for protective sleeves
 - d) Provide the type of adhesive for nonmetallic conduit and fittings as recommended by the conduit/fitting's manufacturer.
 - 4) Split Conduit:
 - a) Provide steel or plastic split conduit pre-manufactured for the intended application.
 - 5) Conduit Fittings:

- a) Provide fittings for conduit and cable complying with the requirements specified in UL 514B.
 - c. Conduit Spacers and Locking Collars:
 - 1) Provide a conduit spacer system that consists of base spacers, intermediate spacers, and top spacers specifically designed to provide a completely enclosed and locked-in conduit assembly, and complete with interlocking cap and base pads or locking collars.
 - 2) Provide spacers compatible with the conduit utilized and conforming to those specified in other Sections of the Specifications.
 - 3) Provide prefabricated high grade, high density polyethylene double wall raceway spacers that interlock vertically and horizontally, and that are sized to create the specified spacing between raceways.
 - 4) Provide conduit spacers having sufficient strength to prevent displacement of the conduits when backfill is placed or concrete for encasement is poured.
 - a) Provide conduit spacers designed to accept vertically installed Number 4 reinforcing bars.
 - 5) Manufacturers:
 - a) Lamson and Sessions, Carlon®, www.carlon.com/Utility.
 - b) PW Eagle, Inc., www.pweagleinc.com/literature/e/.
 - c) Equivalent approved by the Program/Project Manager.
 - d. Submit the conduit, conduit fittings, conduit spacers, and locking collars to the Program/Project Manager for approval.
- 3. Corrosion-Resistant Handholes:
 - a. Provide corrosion-resistant handholes complying with the requirements specified in SCTE 77.
 - 1) Dimensions: 12 inches wide by 24 inches long.
 - 2) Unless otherwise indicated in the Contract Documents, provide handholes having a closed bottom.
 - 3) Provide handholes designed for flush burial.
 - b. Manufacturers:
 - 1) Armorcast Products Company, www.armorcastprod.com.
 - 2) Carson Industries LLC, www.carsonind.com.
 - 3) CDR Systems Corporation, www.cdrsystems.com.
 - 4) NewBasis, www.newbasis.com.
- 4. Ductbank Cable Shields:
 - a. Where cables enter and leave manholes, handholes, and other ductbank entrances provide suitable shields of a type manufactured for the purpose of protecting the cables such as end bells or other terminators.
- 5. Grade Rings:

- a. Provide precast grade rings designed for adjusting manholes to the proper grade.
6. Manhole/Handhole Frames and Covers:
 - a. Provide cast-iron or steel frames, covers, and gratings complying with the requirements of RR-F-621C and the following:
 - 1) Ductile Iron Cast Frames:
 - a) Provide ductile iron and austempered ductile iron castings that comply with the requirements specified in ASTM A 536.
 - 2) Gray Iron Cast Frames:
 - a) Provide gray iron castings that comply with the requirements specified in ASTM A 48/A 48M.
 - 3) Malleable Iron Cast Frames:
 - a) Provide malleable iron castings that comply with the requirements specified in ASTM A 47/A 47M.
 - 4) Steel Cast Frames:
 - a) Provide steel castings that comply with the requirements specified in ASTM A 27/A 27M.
 - 5) Structural Steel for Frames:
 - a) Provide structural steel that complies with the requirements for Grade D specified in ASTM A 283/A 283M.
 - b. Bolts and Anchors:
 - 1) Provide anchoring devices for fastening manhole/handhole frames to solid masonry or concrete.
 - 2) Manhole Frame Bolts:
 - a) Provide manhole frame bolts as required by the manhole frame and cover manufacturer.
 - b) Provide bolts of sufficient length to properly pass through any leveling units used to adjust to grade, and to engage the full depth of the inserts in the manhole top section.
 - c) Provide bolts of sufficient length to allow enough of the threaded end to pass through the manhole frame to allow properly tightening of the fastening nut and washer.
 - c. Preformed Sealing Compound:
 - 1) Provide a 2-inch thick preformed plastic sealing compound for sealing the perimeter of manhole/handhole frames.
 - d. Provide weatherproof covers secured by tamper-resistant locking devices.
 - 1) Color of Frame and Cover: Gray.
 - 2) Cover Finish: Non-skid finish with a minimum coefficient of friction of 0.50.
 - 3) Cover Legend: Molded lettering "ELECTRIC" OR "TELEPHONE".
 - e. Submit manhole/handhole frames and covers to the Program/Project Manager for approval.
7. Precast Concrete Electrical Manholes/Handholes:

- a. Provide watertight, precast concrete electrical manholes/handholes where indicated on the Contract Drawings.
 - 1) Make the precast units watertight by placing mortar or bitumastic sealer between their joints.
- b. Provide electrical manholes/handholes complete with the necessary, required, and specified appurtenances, such as watertight locking type covers, cable racks, pulling-in irons, ground rods, ladders, and provisions for water drainage.
 - 1) Ensure that the cable racks, including hooks and insulators, are sufficient to accommodate the cables, and are spaced not more than 24 inches horizontally.
 - 2) Provide wall brackets of glass reinforced nylon channel.
 - 3) Provide support brackets of glass reinforced nylon and of the removable type.
 - 4) Provide insulators of dry-process glazed porcelain.
 - 5) Pulling-In Irons:
 - a) Where required for pulling cables, provide a sufficient number of inserts for the proper attachment of cable supports in the walls of the manholes and handholes.
 - b) Provide steel bar pulling-in irons bent in the configuration of a deformed "Z", and cast in the manhole/handhole walls and floors; or provide 7/8-inch diameter hot-dipped galvanized steel or 7-strand, 1/2-inch diameter stress-relieved carbon steel roping having an ultimate strength of 270,000 psi designed for concrete applications.
 - (1) If stress-relieved carbon steel roping is provided, provide a rustproof sleeve installed at the hooking point, and encapsulate the exposed surfaces with a polyester coating to prevent corrosion.
 - (2) If steel bar pulling-in irons are provided, zinc-coat the pulling-in irons after fabrication.
 - c) Locate the pulling-in-irons so they do not interfere with the cable distribution racks.
 - (1) For pulling irons located in the floor, position the pulling irons in pockets centered directly under the manhole cover.
 - (2) For pulling irons located in the walls, position the pulling irons opposite the conduits entering the manhole and not less than 6 inches above or below those.
 - (3) Provide pulling-in irons that project approximately 4 inches into the manhole.
 - (4) Locate the pulling irons so they do not interfere with the cable distribution racks.

- 6) Where required for pulling cables, provide a sufficient number of inserts in the walls of the manholes/handholes for the proper attachment of cable supports.
 - c. In the floor of each manhole, provide a 1-inch diameter hole for installation of a ground rod.
 - d. Manhole Ladders:
 - 1) Provide fiberglass ladders for new manholes fabricated for use in underground electrical structures.
 - 2) Securely bolt the ladders to the concrete structure at or near the top and bottom of the ladders.
 - e. Manufacturers:
 - 1) Provide precast concrete manholes/handholes from the manufacturers indicated on Contract Drawings, or
 - 2) Equivalent approved by the Program/Project Manager.
 - f. Submit Product Data for the precast manholes, precast handholes, manhole frames and covers, and handhole frames and covers to the Program/Project Manager for approval.
 8. Pull Rope:
 - a. Provide 200 pound test nylon or polypropylene pull rope.
 - b. Submit the pull rope to the Program/Project Manager for approval.
 9. Raceway Identification Tags:
 - a. Provide brass tags inscribed or stamped with the raceway number, and having a sunlight resistant nylon tie for attaching the tag to the raceway.
 - b. Submit the raceway identification tags to the Program/Project Manager for approval.
 10. Sump Pumps:
 - a. Provide sump pumps for manholes where and as indicated on the Contract Drawings.
 - b. Submit the sump pumps to the Program/Project Manager for approval.

2.02 MATERIALS:

- A. Backfill Materials:
 1. Provide backfill material complying with the requirements specified in Section 02300, Earthwork, and Section 02316, Trenching and Backfilling; except do not provide backfill larger than 4 inches in diameter.
 2. Pea Gravel:
 - a. Provide gravel complying with the requirements specified in ASTM C 33.
 - 1) Provide coarse aggregate gradation conforming to the requirements for Size Number 57.
- B. Cable and Wire:
 1. Electrical Power Conductors:

- a. Provide electrical power conductors complying with the requirements specified in AA-59544.
 - b. Provide soft or annealed copper wire complying with the requirements specified in ASTM B 3.
 - c. Provide concentric-lay-stranded copper cable complying with the requirements specified in ASTM B 8.
- C. Concrete:
 - 1. Provide concrete conforming to the requirements for Class AA concrete (4000 psi compressive strength at 28 Days) specified in Section 03300, Cast-In-Place Concrete, except using 3/4-inch maximum coarse aggregate and having a slump of 7 inches plus or minus 1 inch.
- D. Concrete Reinforcement:
 - 1. Provide concrete reinforcement complying with the requirements specified in Section 03200, Concrete Reinforcement
- E. Waterproofing for Conduit Joints:
 - 1. For Rigid Metal Conduit and Fittings:
 - a. Provide cleaning solvent and thread sealant as recommended and approved by the conduit manufacturer.
 - 2. For Non-Metallic Conduit and Fittings:
 - a. Provide cleaning solvent and all weather, quick-set joint cement approved by the conduit manufacturer.

2.03 MIXES:

- A. Waterproof Mortar:
 - 1. Packaged Dry Mortar:
 - a. Provide Type M packaged dry mortar complying with the requirements of ASTM C 387.
 - b. Submit the packaged dry mortar manufacturer's installation instructions.
 - 2. Hydrated Lime:
 - a. Provide Type S hydrated lime complying with the requirements of ASTM C 207.
 - 3. Mortar Aggregate:
 - a. Provide mortar aggregate complying with the requirements of ASTM C 144.
 - 4. Water:
 - a. Provide clean and potable water.
 - 5. Moisture-Resistant Admixture:
 - a. Provide water repellent compound designed to reduce capillarity.
 - b. Manufacturers:
 - 1) W. R. Grace and Co., Dry-Block, www.na.graceconstruction.com.
 - 2) Solomon Grind-Chem, Inc., SGS Block-Ade.

- 3) BASF SE., Rheomix Rheopel, www.basf-admixtures.com/en/.
- 4) Equivalent approved by the Program/Project Manager..
6. Submit Product Data for the waterproof mortar design mix that indicates whether the Proportion or Property specification of ASTM C 270 is to be used, and also include required environmental conditions and admixture limitations.

B. Finishes:

1. Primer Materials:
 - a. Provide zinc chromate primer compatible with the enamel finish material.
2. Finish Materials:
 - a. Enamel:
 - 1) Provide synthetic exterior gloss enamel compatible with the zinc chromate primer.
 - b. Bitumastic Coating:
 - 1) Provide a coal-tar-based bitumastic coating with a vapor resistance of at least 0.5 perms.
 - c. Sunlight Protective Inhibitor:
 - 1) Provide a sunlight protective inhibitor compatible with the bitumastic coating.
 - d. Galvanizing Repair Compound:
 - 1) Provide a liquid cold-galvanizing compound complying with the requirements specified in MIL-P-21035.
3. Shop Finishing Methods:
 - a. Hot-dip galvanize all metal-work after fabrication that is installed within manholes, including steel ships ladders, in accordance with ASTM A 123/A 123M to the thicknesses specified therein.

2.04 ACCESSORIES

- A. Provide those accessory products, such as building wire, connectors, fittings and similar devices, required for performing the Work of this Section as specified in other Specification Sections.
- B. Grounding and Bonding Materials:
 1. Provide grounding and bonding materials conforming to the requirements of Section 16060, Grounding and Bonding.
 2. Provide copper clad steel ground rods having a diameter adequate to permit driving the full length of the rod minus 6 inches, which extends above the finished concrete slab.
 3. Provide 600 Volt ground wires sized as indicated or required by code, but not less than 6 AWG.
- C. Hangers, Supports, and Fasteners:
 1. Supporting Devices:

- a. Provide field-fabricated support systems for electrical equipment.
 - b. Pre-engineered UL-listed supporting systems fabricated from electrogalvanized steel or PVC-coated electrogalvanized steel may be provided in lieu of field-fabricated support systems.
2. Structural Angles, Channels, and Bars:
 - a. Provide steel angles, channels, and bars fabricated from steel conforming to the requirements of ASTM A 36/A 36M.
3. Fasteners:
 - a. To anchor conduit, raceway, supporting devices, or pre-engineered supporting systems to the structures, provide anchoring devices of the type specifically designed for anchoring into the structure materials.
 - 1) Toggle and Expansion Bolts:
 - a) Provide toggle and expansion bolts conforming to the requirements of FF-B-588C.
 - 2) Self-Tapping Screws:
 - a) Provide self-tapping screws conforming to the requirements of FF-S-107C(2).
 - 3) Expansion Anchors:
 - a) Provide anchoring devices for fastening into solid masonry or concrete conforming to the requirements Type 4 as specified in A-A-1923A.
 - b) Rawl plugs are unacceptable.
- D. Warning Tape:
 1. Provide detectable warning tape consisting of acid and alkali resistant printed polyethylene film, 4 mils thick minimum, and having an overcoated legend with one-inch high minimum lettering manufactured for marking and identifying underground utilities.
 2. Detection Device:
 - a. Provide a metallic core encased in a protective jacket for corrosion protection, and detectable by a metal detector when the tape is buried up to 30 inches deep.
 3. Legends:
 - a. "CAUTION-BURIED ELECTRIC LINE" for ductbank containing electric lines.
 - b. "CAUTION - BURIED TELEPHONE LINE" for ductbank containing telephone lines.
 - c. For ductbank containing both electric and telephone lines, the legend can contain both the "CAUTION-BURIED ELECTRIC LINE" and "CAUTION - BURIED TELEPHONE" messages.
 4. Color:
 - a. Provide underground warning tape colors per the APWA Uniform Color Code as described in the APWA Public Works Management Practices Manual.
 - 1) Electric: Red.
 - 2) Telephone and other communications: Orange.

5. Manufacturers:
 - a. Brady, www.bradyid.com.
 - b. Seton, <http://www.seton.com>.
6. Submit Product Data for the detectable warning tape and a Sample of the proposed warning tape to the Program/Project Manager for approval.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Notify the Program/Project Manager of unexpected subsurface conditions, and discontinue working in the affected area until notified to resume work.
- B. Pre-Installation Testing:
 1. Determine applicable soil-density relationships for bedding and compaction of backfill material for installing underground electrical ducts and manholes as indicated in Section 02316, Trenching and Backfill.
- C. Evaluation and Assessment:
 1. If raceway runs cannot be installed as shown because of conditions not discoverable prior to trenching, refer the condition to the Program/Project manager for direction before performing further work.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 1. Provide and maintain protection to retain earth banks and to protect adjoining grades and structures from caving, sliding, sloughing, erosion, or other damage.
 2. Protect trees, shrubs, and other features remaining as a portion of final landscaping in accordance with Section 01568, Temporary Tree and Plant Protection.
 3. Protect benchmarks, utilities, paving, and curbs from equipment and vehicular traffic.
 4. Protect any above-grade and below-grade utilities which are to remain.
- B. Surface Preparation:
 1. For ducts installed in or under pavement surfaces, neatly saw cut the pavement surfaces to form a vertical face.
 2. Perform earthwork excavation for buried conduit, manholes, and handholes as required and specified in Section 02316, Trenching and Backfill.
 - a. Excavated the trenches for conduits and duct banks either manually or using mechanical trenching equipment unless they are in pavement, in which case excavate the trenches using only mechanical trenching equipment.

- 1) Perform the excavation for structures and structure footings to the lines and grades or elevations shown on the Contract Drawings.
- 2) Provide excavations sufficient to permit the full width and length of the structure or structure footings shown on the Contract Drawings to be placed.
- 3) Before beginning to place concrete for duct banks, open the complete length of the trench so obstructions can be discovered, and proper provisions can be made to avoid them.
- 4) Remove boulders, logs, and other objectionable material encountered in the excavation.
 - a) If rock is encountered during excavation, remove the rock to a depth of at least 3 inches below the required conduit or duct bank depth.
 - (1) Clean rock and other hard foundation material of all loose material, and cut the material to a firm surface either level, stepped, or serrated as directed by the Program/Project Manager.
 - (2) Replace the removed rock with bedding material consisting of earth or sand containing no mineral aggregate particles that would be retained on a 1/4-inch sieve, or with flowable backfill.
 - b) Remove seams, crevices, disintegrated rock, and thin strata.
- 5) If the soil encountered at the established ductbank grade is an unsuitable material as determined by the Program/Project Manager, either remove the unsuitable material and replace the removed material with suitable material, or provide additional ductbank supports approved by the Program/Project Manager that are adequate and stable.
 - b. If concrete is to rest on a surface other than rock, take special precautions not to disturb the bottom of the excavation
 - 1) Do not excavate to the final grade until just before the concrete or reinforcing is to be placed.
 - c. Ensure that a minimum of shoulder surface is disturbed by keeping the walls of the trenches essentially vertical.
 - d. Do not use the blades of graders to excavate the trenches.
 - e. After each excavation is completed, notify the Program/Project Manager.
 - 1) Place structures only after the Program/Project Manager has approved the depth of the excavation and the suitability of the foundation material.
3. Provide bracing, sheeting, and shoring as necessary to protect the Work and provide safety for personnel and comply with governing laws.
4. Provide a compacted base under the duct bank and other structures.

- a. Prior to installing structures, provide a minimum of 6 inches of sand or another material approved by the Program/Project Manager as a suitable base to receive the structure.
 - b. Compact the base material, and grade it level at the proper elevation to receive the structure in relation to the conduit grade or ground cover requirements indicated on the Contract Drawings.
5. Do not excavate trenches for electrical ductbanks wider than necessary to construct the nominal concrete encased ductbank.
 - a. If the trench walls are stable, the trench walls may be used to as forms for the concrete encasement.
 - b. If concrete formwork is required to support the trench, furnish formwork as specified in Section 03100, Concrete Forms and Accessories.
 - c. Adjust clearances to obtain at least the minimum concrete dimensions specified or indicated in the Contract Documents.
6. Clean excavations prior to placing raceway and concrete.
 - a. Remove water from excavations by pumping or other approved methods.

3.03 INSTALLATION

A. Underground Conduit Installation:

1. Install underground conduit systems in accordance with the requirements specified in Article 300.5, *Underground Installations*, of NFPA 70, the National Electrical Code (NEC); specified requirements exceeding those of NFPA 70; and in accordance with the requirements of this Section.
 - a. Provide the type raceway indicated on the Contract Drawings.
2. Provide and arrange raceways as indicated on the Contract Drawings.
 - a. Bank conduits together to the extent indicated on the Contract Drawings.
 - 1) On multiple conduit arrays, provide a conduit spacer system applicable to the type of conduit that maintains uniform conduit spacing.
 - a) Install the spacers in accordance with manufacturer's instructions.
 - b) For every 20 feet of 2-inch conduit array, provide a minimum of 5 spacer assemblies.
 - c) For every 20 feet of 4-inch and larger conduit arrays, provide a minimum of 4 spacer assemblies.
 - d) Prior to placing the concrete encasement, drive Number 4 reinforcing bars vertically into the soil to a minimum depth of 6 inches to anchor the assembly into the earth, and fasten the spacers down with locking collars attached to the vertical bars.
 - 2) Securely fasten conduits in place during construction, and plug them to prevent contamination from entering the conduits.

- a) Secure raceways to prevent displacement during concrete encasement or earth backfilling.
 - 3) Separate conduits by the minimum spacing or concrete thickness indicated on the Contract Drawings, or as specified.
 - 4) Stagger conduit couplings in banks of conduits to provide a duct bank having the maximum strength possible.
 - a) Stagger the joints of the conduits by rows and layers.
 - 5) Consider the bending radii indicated on the Contract Drawings and specified herein as minimums unless otherwise noted.
 - 6) Make minor changes in the location or cross section of ductbanks as necessary to avoid obstructions or conflicts.
 - 7) If raceway or ductbank terminates in a building, install the raceway under the building as a continuous ductbank.
3. Slope conduit lines away from buildings and to manholes or handholes for drainage, except keep those conduit lines that run between buildings without intervening handholes or manholes level.
 - a. Lay conduit lines so a minimum slope of 3 inches per 100 feet is maintained.
 - b. Slope conduit lines that run to manholes, handholes, or similar underground structures, so they drain to such underground structure.
4. Except at conduit risers, change the direction of bends in runs exceeding a total of 10 degrees, either vertical or horizontal, by providing long sweep bends having a minimum radius of curvature of 25 feet.
 - a. Sweep bends may be made up of one or more curved or straight sections or combinations thereof.
 - b. Use only manufactured bends with a minimum radius of 18 inches for use with conduits of less than 3 inches in diameter, and a minimum radius of 36 inches for conduits of 3 inches in diameter and larger.
5. If conduits change direction or turn up at equipment, transformers, buildings, terminal poles, and similar items, use long sweep PVC coated rigid galvanized steel conduit (RGSC) elbows unless otherwise indicated on the Contract Drawings or specified.
 - a. For polyvinyl chloride (PVC) conduit:
 - 1) If the bend radius is less than 6 feet, provide ells fabricated from galvanized rigid steel conduit or PVC/GRSC.
 - a) Minimum Bend Radius: 38 inches.
 - 2) If the bend radius is 6 feet or greater (90 degrees of bend in 9.5 feet of conduit length), provide bends fabricated from Schedule 40 PVC conduit.
 - a) Either factory ells or field bent bends may be provided.
 - (1) For field bends having radii less than 100 feet, hot form the bends using a heater recommended by the conduit manufacturer.
 - (a) For 2 inch and larger conduit, furnish plugs during bending.

- (b) Remove the plugs only after the conduit has cooled.
 - (2) For field bends having radii 100 feet and greater, cold form the bends.
 - (a) When placing cold bends, maintain adequate spacing from the inside of the bend to the wall of the excavation to permit the required 3 inches of concrete to be placed.
 - b. Split Ducts:
 - 1) When existing cables are to be placed in split duct encased in concrete, carefully locate and expose the cable by using hand tools.
 - a) Prior to placing the cables into the duct, notify the Program/Project Manager so the cable may be inspected to determine if it is in satisfactory condition by the Program/Project Manager.
 - 2) Where required, provide split duct as shown on the Contract Drawings, or as required by the Program/Project Manager.
 - c. Weld polyvinyl chloride (PVC) and high density polyethylene (HDPE) conduit as recommended by the conduit manufacturer.
6. Underground Conduit for Service Feeders:
- a. Underground conduit for service feeders into buildings are indicated on the Contract Drawings.
 - b. Where a rigid steel conduit bank is utilized, protect the ends of the conduit by threaded metal caps or brushings.
 - 1) Coat the threads with graphite grease or other suitable coating.
 - c. Clean and plug the conduit before conductors are installed.
7. For ducts terminating in pull boxes, manholes, and handholes as indicated on the Contract Drawings, provide ductbank cable shields.
8. Cap raceway ends.
- a. Prior to capping conduits, swab and mandrel the conduits.
9. Pull Cords:
- a. In each individual raceway installed, whether direct-buried or a part of a duct bank, provide a pull cord for pulling the permanent wiring or for future use; and secure the pull cord at each end of the raceway by tying the cord to the end cap.
 - b. Provide a pull rope in each telephone and spare conduit and ductbank.
 - 1) Plug the open ends of spare unused (empty) conduits with removable tapered conduit plugs designed for this purpose.
 - c. Secure the ends of the pull cords, and provide a minimum of 3 additional feet of pull cord at each end.
 - 1) Ensure that a sufficient length is left in access points to prevent the pull cord from slipping back into the conduit.
10. Raceway Identification:

- a. Identify each raceway at each end by attaching raceway identification tags inscribed or stamped with the raceway number shown on the Contract Drawings.
 - b. Attach the raceway identification tags to the raceway with a tie as specified
 - c. If the Contract Drawings do not show a raceway numbering scheme, develop the numbering subject to the approval of the Program/Project Manager.
- B. Concrete Encased Underground Duct Bank:
 1. If detailed on the Contract Drawings, encase both single and banked underground conduits in concrete reinforced in accordance with Section 03200, Concrete Reinforcement, with 5/8-inch steel reinforcing rods.
 - a. Install concrete encasement as indicated and detailed.
 - b. Coordinate placement of the concrete with other work.
 - c. If the ductbank conflicts with other work, relocate the ductbank as directed by the Program/Project Manager.
 2. Construct underground duct bank lines from individual conduits encased in concrete as indicated on Contract Drawings.
 - a. Except where rigid galvanized steel (RGS) conduit is indicated or specified, use only one kind of conduit in any one duct bank.
 - b. Provide ducts not less than 4 inches in diameter unless otherwise indicated on the Contract Drawings.
 3. Enclose all conduits in the bank within concrete encasement having a rectangular in cross-section.
 - a. Place concrete in accordance with the requirements of Section 03300, Cast-In-Place Concrete.
 - 1) Adjust the delivery chute so the direct fall distance of the concrete into the trench is 2 feet or less.
 - 2) Furnish a splash board to divert the flow of concrete away from the trench sides to avoid dislodging soil and stones.
 - b. Provide at least 3 inches of concrete cover between conduit ducts and the surface of the concrete encasement.
 - c. Separate conduits within the bank from one another by a minimum concrete thickness of 2-inches.
 - d. Maintain a minimum separation between conduit centerlines of 7-1/2 inches.
 - e. Minimize expansion and contraction of plastic raceway as concrete is placed by encasing there raceway from one end of the duct section toward the other end allowing the free end to move while the concrete is placed.
 - 1) Do not place concrete from each end toward the center of the ductbank.
 - f. If indicated in the Contract Documents, reinforce the bottom side and top of encasements with steel reinforcing mesh, or fabric, or other approved metal reinforcement.

4. Additional Requirements for Underground Duct Banks in Paved and Other Special Areas:
 - a. Where the ground is soft and boggy, where ducts cross under roadways, or where shown on the Contract Drawings, provide additional supports if required by the Program/Project Manager.
 - 1) If duct bank is subject to these conditions, support the complete duct structure on reinforced concrete footings, piers, or piles spaced at intervals approximately 5 feet apart.
 - b. Underground Duct Bank in Paved Areas:
 - 1) Where concrete encased underground duct bank is installed under runways, taxiways, aprons, or other paved areas, install duct banks so the top of the concrete envelope is not less than 18 inches below the bottom of the base or stabilized base course layers unless otherwise shown on the Contract Drawings.
 - 2) Where concrete encased underground duct bank is installed in unpaved areas, install duct banks so the top of the concrete envelope is not less than 18 inches below finished grade unless otherwise shown on the Contract Drawings.
 - 3) Unless otherwise shown on the Contract Drawings, extend duct banks that are under paved areas at least 3 feet beyond the edges of the pavement, or 3 feet beyond any underdrains that are installed alongside the paved area.
5. Unless otherwise indicated in the Contract Documents, separate electrical power conduits from telephone, communication, and/or data highway conduits by a minimum of 24 inches of earth or 8 inches of concrete.
6. For ductbank between manholes, handholes, and pullboxes, place concrete continuously.
 - a. If concrete placement must stop for more than 2 hours, place 8-foot lengths of Number 4 steel reinforcement bars longitudinally around the perimeter of the concrete envelope on 12-inch centers at the end of the ductbank, and provide a 2 inches minimum of concrete cover.
 - 1) Embed half of each 8-foot bar in each of the 2 pours, the pour stopped and the future pour.
7. At access points, provide end bells or couplings installed flush with the concrete encasement.
8. Where conduits turn up into equipment or transformer pads, extend the concrete encasement for the conduits up to the top of the concrete pad, and provide a 3/4 inch chamfer around exposed top edges.
 - a. Isolate the concrete encasement for the conduits from the concrete pad for the equipment or transformer pad by providing crushable fiber materials 2 inches high around the duct bank encasement.
 - b. Extend conduits 6 inches above the concrete slab surface.
 - c. Install an insulating grounding bushing on each conduit.
9. Where conduits turn up at terminal poles, extend the concrete encasement for the conduits up the pole to a height of 24 inches above

finished grade, and provide a 3/4 inch chamfer around all exposed top edges.

10. If concrete encased duct banks are terminated for future extension, stub out and cap all conduits at least 1 foot beyond the end of the ductbank concrete.
 - a. Protect the protruding ends of the conduit from damage while they are exposed.
 - b. To make extending the ductbank in the future easier, stagger the end of each horizontal row of conduit beginning at the top row of raceway
 - c. Extend the reinforcement steel to a point beyond all of the conduit ends, leaving at least 4 feet of each rebar embedded in the ductbank concrete.

C. Manhole/Handhole Installation:

1. Build concrete structures on prepared foundations conforming to the dimensions and form indicated on the Contract Drawings.
 - a. Provide formwork, concrete, and concrete reinforcement in accordance with the requirements specified in Section 03100, Concrete Forms and Accessories; Section 03200, Concrete Reinforcement; Section 03300, Cast-In-Place Concrete; and Section 03410, Plant-Precast Structural Concrete.
 - b. Install precast units so they are plumb and true.
2. Grade Adjustments:
 - a. Where openings into manholes are below the final finished grade, extend the openings up to the required elevation using either concrete or brick suitably arranged to support and/or anchor the manhole's frames and covers.
 - b. Obtain the Program/Project Manager's approval of the construction method and procedure before any work is performed.
3. Grounding Structures:
 - a. Except in concrete structures containing Federal Aviation Administration (FAA) facilities, provide a 3/4 inch diameter by 10 foot long copper clad ground rod through the 1 inch diameter hole in a corner of the floor of manholes/handholes and other concrete structures.
 - 1) Leave 6 inches of the ground rod extended above finished floor.
 - 2) Install the ground rod within 1 foot of a corner of the concrete structure.
 - 3) For cast-in-place bottom slabs, install the ground rods prior to casting the bottom slab.
 - 4) If the soil condition does not permit driving the ground rod into the earth without damage to the ground rod, drill a 4-inch diameter hole into the earth to receive the ground rod.
 - 5) If the bottom slab of a precast structure does not have a hole for the ground rod, drill a hole through bottom slab, and then install the ground rod.

- b. Grounding Bus:
 - 1) Provide a grounding bus consisting of 4/0 AWG bare stranded copper wire exothermically bonded to the ground rod, and looped around the walls of concrete structures.
 - a) Mount the ground bus a minimum of 1 foot above the floor of the structure, and separate from other cables.
 - 2) Ground metal within the manhole to the ground rod.
 - a) Provide 2 AWG bare copper pigtails to bond the grounding bus to all cable trays and other metal hardware within the concrete structure.
 - (1) Provide exothermic welds to connect the pigtails to the grounding bus.
 - (2) Provide mechanical connections, consisting of a lug designed for that purpose, to connect the pigtails to hardware.
- c. Seal the hole through the floor around the ground rod.
 - 1) Fill the entire length of the hole around the ground rod below the slab with Portland cement grout.
 - 2) Seal bottom slab penetrations around the ground rod with Portland cement grout to make the penetration watertight.
- 4. Structure Drainage System:
 - a. Provide a manhole drainage system as indicated on the Contract Drawings.
- 5. Cable Supports:
 - a. Where cables enter and leave manholes, handholes, and other duct bank entrances, provide duct bank cable shields.
 - b. Install cable support brackets, along with the support arms and porcelain insulators, on each wall of the manhole and handhole.
 - 1) Take care not to damage the walls of the manholes and handholes during cable pulling.
 - 2) Install cable with proper regard for providing a neat and orderly appearance and location, and for providing accessibility for future connections.
 - 3) Properly dress and rack cable or wire on support arms and insulators around the walls of the manholes and handholes, providing slack where required for future rearrangements.
 - 4) Secure cables within manholes and handholes to the insulators by marlin rope.
- 6. Pulling Irons:
 - a. Provide pulling-in irons located opposite every conduit entrance into each structure to provide a strong, convenient attachment for pulling-in blocks used to install cables.
 - b. Set the pulling-in irons directly into the concrete walls of the structure.
- 7. Manhole Ladders:
 - a. Install ladders in accordance with the manufacturer's requirements.

- D. Connecting Concrete Encased Ductbank to Manholes/Handholes:
1. Adjacent to the manhole or handhole, provide a tapered section that provides shear strength to connect encased duct bank lines to manholes or handholes.
 2. Construct penetration openings through manhole and handhole walls with keyways to provide for keying the concrete envelope of the ductbank line into the wall of the manhole or handhole.
 3. To relieve stress at the joint between concrete-encased duct banks and structure walls, place reinforcement rods in the structure wall; and form and tie the reinforcement rods into the duct bank reinforcement when the duct bank is installed.
 4. Use vibrators when this portion of the envelope is poured to assure a seal between the ductbank envelope and the wall of the manhole or handhole.
- E. Cast Iron Junction Boxes:
1. Provide in-ground cast iron junction boxes installed flush with the surface at the locations indicated on the Contract Drawings.
 - a. Install cast iron junction boxes in concrete pads as detailed on the Contract Drawings.
- F. Manhole/Handhole Frames and Covers:
1. Install manhole/handhole castings, frames, and fittings in the positions indicated on the Contract Drawings, or as directed by the Program/Project Manager.
 - a. Set the castings, frames, and fittings true to line and at the correct elevation.
 - b. Unless otherwise indicated in the Contract Documents, make field connections using bolts; welding is not permitted unless shown on the approved Shop Drawings, and written permission to weld is granted by the casting manufacturer.
 - 1) Properly locate anchor bolts and anchors, and build them into the connection work.
 - 2) Preset the bolts and anchors using of templates or other methods to accurately locate the anchors and anchor bolts.
 - c. If the frames or fittings are to be set in concrete or cement mortar, place and position anchors or bolts before the concrete or mortar is placed.
 - d. Do not disturb the unit until the mortar or concrete has set.
 2. Where required, make the final adjustment of manhole/handhole frames to the proper elevation using precast grade rings.
 - a. Wet, but do not saturate, the precast grade rings immediately before laying them.
 - b. Pre-set the grade rings to the proper plane and elevation by using wedges or blocks of cementation material that do not exceed 1 square inch wide on each side to adjust the grade ring position.
 - 1) Do not use more than 4 wedges or blocks per grade ring.

- c. Set grade rings in waterproof mortar.
 - 1) Do not place mortar more than 3/4-inch or less than 3/8-inch thick.
 - 2) Incorporate the adjusting wedges or blocks in fresh mortar in a manner that completely encases each.
 - 3) Crown the fresh mortar to produce squeeze-out between grade rings.
 - d. Tool the exposed joints with an appropriately shaped tool, and compact the mortar edge into the joints between grade rings.
 - e. Clean off excess mortar prior to initial mortar set.
 - 3. After applying the preformed sealing compound on the bearing surface of the manhole frame, bolt the manhole frame in place on the manhole top section, or on leveling units.
 - a. Install and tighten the manhole frame bolts after the waterproof mortar has cured.
 - b. Remove excess sealing compound squeezed out after the manhole frame is bolted in place.
- G. Waterproofing:
 - 1. Construct underground conduit lines to be watertight.
 - 2. Waterproof conduit joints:
 - a. Solvent clean rigid metal conduit joints, and apply approved thread sealant.
 - b. Solvent clean non-metallic conduit joints, and apply approved joint cement.
 - 1) Liberally coat the end of Schedule 40 PVC plastic conduit before joining, then insert the conduit end into the coupling, push firmly, and rotate the conduit until it reaches the pre-formed stopping ridge within the coupling.
 - 3. Waterproof the precast concrete electrical manholes/handholes using approved waterproofing materials.
 - a. Provide watertight joints by applying sealant at each tongue-and-groove joint and at the roof of manholes.
 - 1) Remove excess sealant and surface projections on the exterior of the neck.
 - b. Apply a minimum of 2 coats of protective bitumastic coating to surfaces in direct contact with in ground cover in order to obtain a minimum total dry film thickness of 12.0 mils on the surfaces.
 - c. Apply the bitumastic coating in strict conformance with manufacturer's instructions.
 - d. Topcoat the bitumastic coating with a sunlight protective inhibitor.
- H. Backfilling:
 - 1. Unless otherwise indicated in the Contract Documents, remove bracing, sheeting and shoring involved in the construction of duct banks and other structures after the completion of the structures.

- a. Effect the removal in a manner that will not disturb or mar finished concrete and masonry.
 - b. Withdraw sheeting and bracing used to support the sides of trenches or other open excavations as the trenches or other open excavations are being refilled.
 - 1) Unless otherwise directed, withdraw the portion of the sheeting extending below the top of a structure before more than 6 inches of material is placed above the top of the structure and before any bracing is removed.
 - 2) Carefully refill the voids left by the sheeting with select material, and ram the select material tight with tools specially adapted for the purpose or as otherwise may be approved by the Program/Project Manager.
 - 3) The Program/Project Manager may require the Contractor to delay the removal of sheeting and bracing if, in the judgment of the Program/Project Manager, the installed work has not attained the necessary strength to permit placing backfill.
2. Ensure that trenches do not contain pools of water during backfilling operations.
3. Do not place backfill against a structure until the Program/Project Manager gives permission.
 - a. In the case of in-situ concrete, such permission will not be given until tests made by the Testing and Inspection Agency establishes that the concrete has attained sufficient strength to provide a factor of safety against damage or strain in withstanding any pressure created by the backfill or the methods used in placing it.
4. After a structure has been completed, backfill the area around it in horizontal layers not to exceed 6 inches in thickness measured after compaction to the density requirements.
 - a. Deposit each layer all around the structure to approximately the same elevation.
 - b. In areas where the existing grade treatment is asphalt, continue placing backfill to within 3 inches of the finished grade; and complete the fill to grade with asphalt..
 - c. In areas of exposed earth continue placing backfill to the existing finished grade.
 - d. The top of the fill shall meet the existing elevation unless otherwise indicated on the Contract Drawings
5. Ensure that backfill is free from roots, wood, scrap material, and other vegetable matter and refuse.
6. Provide 2-1/2 feet minimum of backfill cover over conduits and over the concrete encasement of conduit, unless otherwise indicated in the Contract Drawings or specified.

7. Progress the backfilling and compaction as rapidly as the construction, testing, and acceptance of the Work permits, and in accordance with the requirements of Section 02300, Earthwork.
 - a. If required by the Program/Project Manager, add sufficient water during compaction to assure a complete consolidation of the backfill at no increase in Contract Price.
 8. Provide a continuous detectable warning tape about 12 inches below the top of the trench directly over each underground duct bank.
- I. Field Coating:
1. Frames, Covers and Gratings:
 - a. Clean mortar, rust, grease, dirt and other deleterious materials from cast-iron or steel frames, covers, and gratings not buried in concrete or masonry by an approved abrasive media blasting process, then coat the frames, covers, and gratings with bituminous coating material.
 - b. Clean surfaces that cannot be cleaned satisfactorily by abrasive media blasting to bare metal by wire brushing or another mechanical means.
 - 1) Thoroughly wash surfaces contaminated with rust, dirt, oil, grease or other contaminants with solvents until clean.
 - 2) Immediately after cleaning, coat the surfaces with a pretreatment coating or provide a crystalline phosphate coating.
 - 3) As soon as practicable after the pretreatment coating has dried, prime treated surfaces with a coat of zinc chromate primer.
 - 4) Coat the primed surfaces with enamel.
 2. Dissimilar Surfaces Isolation:
 - a. Paint aluminum surfaces where they contact wood, concrete, or masonry construction with 1 coat of bituminous paint to provide a minimum dry mil thickness of 5.0 mils.
 - b. Clean away excess or misplaced paint materials from aluminum surfaces and adjoining construction materials.
- J. Grounding:
1. Provide non-current carrying metallic parts associated with electrical equipment with a maximum resistance to solid "earth" ground not exceeding the acceptable values listed under the Grounding Electrode System Tests in Article 3.05.
- K. Warning Tape:
1. In unpaved areas, install underground electrical warning (caution) tape in the trenches above the underground ductbanks and conduits.
 - a. Above the underground conduit or duct lines not installed under pavement, install detectable warning tape of the applicable color a minimum of 8 inches below grade.

2. If not otherwise indicated on the Contract Drawings, locate the warning tape 6 inches above the duct/conduit or the counterpoise wire if present.

3.04 REPAIR/RESTORATION

- A. Take responsibility for all damage or injury done to conduits, duct banks, structures, property, or persons due to improper placing or compacting of backfill.
- B. Restore the areas disturbed by the Work of this Section to their original condition or as otherwise indicated on the Contract Drawings.
 1. Take responsibility for maintaining the disturbed surfaces and replacements until Final Acceptance
- C. Grade around structures so positive drainage away from the structures is provided.
- D. In areas having special surface treatments, such as roads, sidewalks, or other paved areas, compact the backfill to match the surrounding areas; and repair the surfaces using materials comparable to the original materials.
- E. Repairing Galvanized Surfaces:
 1. After galvanized items have been erected, repair damaged areas by applying galvanizing repair compound.
 2. Prepare surfaces apply the repair compound in accordance with the manufacturer's recommendations.

3.05 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. Site Tests:
 - a. Grounding Electrode System Tests:
 - 1) Test Procedure:
 - a) In accordance with Paragraphs 7.13.1 and 7.13.2 of NETA ATS-2007, all made grounding electrode systems will be visually and mechanically inspected.
 - b) Prior to covering the installed products and energizing the electric service, the ground system resistance to earth will be measured with a ground megohmmeter by the Program/Project Manager.
 - c) All made grounding electrode systems will be electrically tested In accordance with Paragraphs 7.13.1 and 7.13.2 of NETA ATS-2007.
 - (1) For the point-to-point tests specified in Paragraph 7.13.2.1 of NETA ATS-2007, measurements are only required for

equipment conductors run with services, and for feeders and branch circuits rated over 400 Amperes.

- d) Each manhole ground rod will be tested in accordance with the fall-of-potential ground impedance test procedures specified in ANSI/IEEE 81 prior to establishing connections to other ground electrodes.
- 2) Acceptance Criteria:
 - a) Ground for the main service: 5 Ohms.
 - b) Ground grids for emergency/standby generators: 5 Ohms.
 - c) Ground buses for panelboards: 10 Ohms
 - d) Ground rod electrodes for manholes: 25 Ohms.
 - e) Grounds not otherwise indicated in this Section: 25 Ohms, maximum.
 - f) For continuity tests, the acceptable value for the equipment grounding conductor is determined from the following formula:

$$R_{\text{Equip Gnd Cond}} \leq 0.1 \times \left(\frac{V_{\text{Line To Gnd}}}{I_{\text{Over Current Protection}}} \right)$$

where

$R_{\text{Equip Gnd Cond}}$ = The measured resistance of the equipment grounding conductor.

$V_{\text{Line To Gnd}}$ = The nominal line to ground Voltage of the circuit or feeder.

$I_{\text{Over Current Protection}}$ = The trip, or melting current of the overcurrent protective device for the circuit.

b. Moisture/Density Tests:

1) Test Procedure:

- a) Where duct banks are installed under pavement, one moisture/density test will be performed for each lift in each 250 linear feet length of duct bank, or for each lift in one work shift, whichever is less.
- b) In-place field density tests will be performed in accordance with the methods specified in ASTM D 1556 or ASTM D 2922.
 - (1) If the methods of ASTM D 2922 are used for in-place field density testing, the moisture content will be determined as specified in ASTM D 3017.

2) Acceptance Criteria:

a) Aggregate Base:

- (1) Each layer of aggregate base course compacted to at least 98 percent of the maximum dry density as specified in ASTM D 698 have achieved acceptable compaction.

- b) Structural Fill and Granular Fill:
 - (1) Each layer of structural fill and granular fill that maintains the moisture content at compaction within 2 percentage points of optimum moisture content as determined in accordance with the requirements of ASTM D 698 have acceptable moisture content.
 - (2) Except for the upper 2 feet of structural fill and granular fill below pavement and slab areas, each layer of structural fill and granular fill below pavement and slab areas compacted to at least 95 percent of the maximum dry density as determined in accordance with the requirements of ASTM D 698 have achieved acceptable compaction.
 - (3) For structural fill and granular fill in the upper 2 feet below pavement and slab areas, each layer of fill compacted to at least 98 percent of the maximum dry density as determined in accordance with the requirements of ASTM D 698 have achieved acceptable compaction.
 - c) Non-structural Fill:
 - (1) Each layer of non-structural fill that maintains the moisture content at compaction within 3 percentage points of optimum moisture content as determined in accordance with the requirements of ASTM D 698 have acceptable moisture content.
 - (2) Each layer of non-structural fill compacted to at least 90 percent of the maximum dry density as determined in accordance with the requirements of ASTM D 698 have achieved acceptable compaction.
2. Inspections:
- a. Report shop fabrication errors and/or the deformation of manholes/handholes caused by improper handling and/or transportation that prevent the proper assembly and fitting of parts to the Program/Project Manager.
 - 1) Obtain approval of the method of correction from the Program/Project Manager, and correct the errors as approved at no increase in Contract Price.
 - b. The Program/Project Manager will inspect the underground conduit systems installation as the work progresses.
 - 1) Prior to final approval, the electrical structures will be thoroughly inspected for conformance with the Contract Documents.
 - 2) Defects in materials or workmanship discovered will be further investigated.
 - c. Each of the following must be approved by the Program/Project Manager prior to the Contractor proceeding to the next phase of the installation:

- 1) Trench bed.
 - 2) Lower sand bed.
 - 3) Lower concrete protection slab, where indicated or required.
 - 4) Upper sand bed for conduits.
 - 5) Each layer of conduits.
 - 6) Soil backfill.
 - 7) Warning Tape.
 - 8) Soil backfill.
- d. Failure to comply with any of the above indicated sequential inspection requirements is just cause for the Program/Project Manager to request removal of the work and reinstallation in accordance with this Section.
- B. Non-Conforming Work
1. All unacceptable values will be reported immediately.
 2. Correct all deficiencies found in work of this Contract, and separately report deficiencies in work of items of other contracts.
 3. Items requiring correction will be retested.
 4. Correct or have corrected any remaining deficiencies and have the corrections retested until the work is acceptable.

3.06 ADJUSTING

- A. Where required, make final adjustment of the manhole and handhole frames to the proper elevation using grade rings.

3.07 CLEANING

- A. Conduits:
1. Verify that existing ducts proposed for use under this Contract are clear and open.
 2. As each section of a duct bank line is completed from manhole to manhole, from manhole to building or structure, and/or from handhole to handhole, clean each conduit as follows:
 - a. Mandrel the conduit in ductbanks after the ductbanks have been encased in concrete, but before they have been backfilled.
 - b. Draw a testing mandrel not less than 12 inches long and having a diameter 1/4 inch less than the size of the conduit through each conduit.
 - 1) Use mandrels having a leather or rubber gasket slightly larger than the conduit hole.
 - c. After drawing the mandrel through the conduit, draw a brush with stiff bristles and having the diameter of the duct bank through the conduit until it is clear of particles of earth, sand, and/or gravel.
 - d. Install conduit plugs immediately after brushing the conduit.

- e. Immediately prior to pulling cable, swab out the conduits/ducts, and clean the interiors of base cans, handholes, pull boxes, and similar structures.
 - 1) Once the base cans, manhole, pull boxes, and similar structures have been cleaned and swabbed, keep the accessible points of entry to the duct/conduit system closed except when installing cables.
 - 2) Raceway systems left open after the initial cleaning, for any reason must be re-cleaned at no increase in the Contract Price.
 - 3) Keep accessible points closed when not installing cable.
- B. Structures:
 - 1. Prior to acceptance, clean the entire structure to remove all dirt and debris.
- C. Final Cleaning:
 - 1. After all of the Work performed under this Section is completed, remove tools and other equipment so the Site is free and clear of debris, and is in good condition.
- D. Waste Management:
 - 1. Remove excavated materials not required or suitable for backfill or embankments on the Site as determined by the Program/Project Manager, and legally dispose of them offsite.

3.08 PROTECTION

- A. During construction, protect partially completed duct bank lines from the entrance of debris such as mud, sand, and dirt by means of suitable conduit plugs.

SECTION 02591

PHOENIX SKY TRAIN SYSTEM GROUNDING

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for the Phoenix Sky Train grounding system for buildings or structures as indicated on the Contract Drawings and attachments to this Section.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01780 - Closeout Submittals.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ETL: Electrical Testing Laboratory.
 - 2. NRTL: Nationally recognized testing laboratories.
 - 3. UFER: A concrete-encased electrode.
- B. Definitions:
 - 1. Authority Having Jurisdiction (AHJ): Building Code officials, zoning officials, inspectors, and government and regulatory agencies given the authority to protect the public's health, safety, and welfare.
 - 2. Concrete-Encased Electrode: An electrode encased by at least 50mm (2 inches) of concrete, located horizontally near the bottom or vertically, within that portion of a concrete foundation or footing that is in direct contact with the earth, consisting of at least 6.0m (20 feet) of one or more bare or zinc galvanized or electrically conductive coated steel reinforcing bars or rods of not less than 13mm (1/2 inch) in diameter, or consisting of at least 6.0m (20 feet) of bare copper conductor not smaller than 4/0 AWG.
- C. Reference Standards:
 - 1. American Public Transportation Association (APTA):
 - a. APTA SS-E-005-98 - Standard for Grounding and Bonding.
 - 2. American Public Works Association (APWA):
 - a. APWA PB.APWM - APWA Public Works Management Practices Manual.
 - 3. ASTM International (ASTM):
 - a. ASTM B 1 - Standard Specification for Hard-Drawn Copper Wire.
 - b. ASTM B 8 - Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

4. City of Phoenix (COP):

6. Institute of Electrical and Electronics Engineers (IEEE)
 - a. IEEE 81 – IEEE Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potential of a Ground System Part 1: Normal Measurements.
 - b. ANSI/IEEE 142 – IEEE Recommended Practice for Grounding of Industrial and Commercial Power Systems.
7. International Code Council (ICC):
 - a. ICC International Building Code (IBC) as Amended by the City of Phoenix.
8. Underwriters Laboratories, Inc. (UL):
 - a. UL Online Certifications Directory, <http://www.ul.com/regulators/quickguide.html>.
 - b. UL 467 - Standard for Grounding and Bonding Equipment.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.
2. Coordinate installation of Phoenix Sky Train grounding system with the installation of other building systems and components, including electrical wiring, supporting structures and building materials, metal bodies that require bonding to the Phoenix Sky Train grounding system components, and building finishes.

B. Sequencing:

1. Portions of the PHX Sky Train grounding system's uppermost down conductor will be left incomplete until the future completion of the uppermost portion of the buildings or structures.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Conductors.

- 2) Exo-thermic welded connectors.
 - 3) Ground rods.
 - 4) Warning tape.
 - b. Shop Drawings:
 - 1) Phoenix Sky Train grounding system.
 - c. Certificates:
 - 1) Evidence that the products proposed for the system meet the testing agency quality verification requirements.
 - d. Qualification Statements:
 - 1) Phoenix Sky Train grounding system installer's qualifications.
- B. Closeout Submittals:
 - 1. Submit the following to the Program/ Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Record documentation:
 - 1) As-built Record Drawings.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Phoenix Building Construction Code:
 - a. Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments [ICC International Building Code (IBC) as Amended by the City of Phoenix].
 - 2. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by a code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - 1) Both continuous and periodic Special Inspections will be performed during the fabrication and erection of structural steel.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
 - 3. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ independent Testing and Inspection Agencies, including the City Building Official and the City of Phoenix Testing Laboratory.
- B. Qualifications:
 - 1. Phoenix Sky Train Grounding System Installer's Qualifications:

- a. Employ a grounding system installer, experienced installing grounding systems similar in type and scope to that required by this Contract, to install the Work of this Section.
 - 1) Employ an installation firm having a minimum of 3 years documented experience.
 - 2) The grounding system installer must employ skilled, licensed electricians to supervise the Work of the Section.
 - b. Submit information verifying the grounding system installer's and licensed electrician's qualifications to the Program/Project Manager for approval.
- C. Certifications:
- 1. Electrical Component, Device, and Accessory Certification:
 - a. Provide products that are listed and labeled by nationally recognized testing laboratories (NRTL), such as Underwriters Laboratory, Inc.; approved by FM Approvals LLC; or certified as meeting the standards of Underwriters Laboratory, Inc. by the Electrical Testing Laboratory (ETL), for the location the products are installed in and the application intended, unless products meeting the requirements of these nationally recognized testing laboratories (NRTL) are not available or unless standards do not exist for the products.
 - 1) Provide products with their intended use or classification marked on the products or on a separate listing card.
 - 2) Submit evidence that the products proposed for the system meet the testing agency quality verification requirements, including agency listing and labeling requirements, to the Program/Project Manager with the Product Data for approval.
 - a) Such evidence may consist of either a printed mark on the Product Data or a separate listing card.
 - b. Submit a written statement from those product manufacturers that do not provide evidence of the quality of their products that indicates why an item does not have quality assurance verification.
 - 1) Such statements provided in lieu of quality assurance verification are subject to the acceptance of the Owner and the Program/Project Manager.

PART 2 PRODUCTS

2.01 PHX SKY TRAIN GROUNDING SYSTEM

- A. Description:
 - 1. Provide a ground grid system consisting of copper wires, and ground rods, or concrete-encased grounding electrodes (UFERs), of the configuration indicated on the Contract Drawings to minimize station potential gradient irregularities and drain leakage and fault currents to earth.
 - 2. Regulatory Requirements:

- a. Phoenix Building Construction Code:
 - 1) Within buildings, perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments.
 - b. Other Codes:
 - 1) Perform the Work of this Section in accordance with the requirements specified in applicable state, local, and national governing codes and regulatory requirements.
- B. Performance:
- 1. Provide a Phoenix Sky Train grounding system having a resistance not greater than 5 Ohms, unless otherwise indicated in the Contract Documents.
- C. Design Criteria:
- 1. The combined ground resistance of separate systems bonded together below grade may be used to meet the specified ground resistance, but the minimum number of rods indicated must still be provided.
 - a. Measure the resistances of systems requiring separate ground resistances separately before bonding below grade.
 - 2. Only provide UL-approved materials listed for grounding systems.
 - 3. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture, unless moisture is permanently excluded from the junction of such materials.
 - 4. Conceal the following conductors.
 - a. System conductors.
 - b. Down conductors.
 - c. Interior conductors.
 - d. Conductors normally within view from exterior locations at grade that are within 200 feet of buildings, platforms, and walkways.
 - 5. Product Data:
 - a. Submit Product Data for the materials and products used to perform the Work of this Section.
 - 6. Shop Drawings:
 - a. Prepare Shop Drawings of the proposed PHX Sky Train grounding system.
 - b. Submit the Shop Drawings to the Program/Project Manager for approval.
- D. Materials:
- 1. Conductors:
 - a. Bare Ground Wire:
 - 1) For Number 6 or larger bare ground wire sizes, provide soft drawn copper, Class A or Class B, stranded wire meeting the requirements of ASTM B 8.

- 2) For Number 8 or smaller bare ground wire sizes, provide soft drawn solid copper wire meeting the requirements of ASTM B 1.
2. Exo-Thermic Welded Connectors:
 - a. Provide molds, thermite packages, and other material for exo-thermic welds that are full-rated to carry 100 percent of the cable rating, and which are letter-coded exo-thermic welded type.
 - 1) Provide the exothermic welding materials from a single manufacturer throughout the Project.
 - b. Provide the items necessary for connecting cable to ground-rods.
 - c. Manufacturers:
 - 1) Erico® International Corporation, Cadweld®, www.erico.com.
 - 2) Approved equal.
3. Ground Rods:
 - a. Provide copper-clad steel ground rods conforming to the requirements specified in UL 467.
 - 1) Diameter: 3/4 inch.
 - 2) Length: 10 feet.

2.02 ACCESSORIES

- A. Warning Tape:
 1. Provide 4-mil thick, minimum, polyethylene plastic warning tape over coated with printed graphics that read, "CAUTION-BURIED ELECTRIC LINE".
 2. Provide red colored tape in accordance with the APWA Uniform Color Code as described in the APWA Public Works Management Practices Manual.
 3. Manufacturers:
 - a. Brady Worldwide, Inc., No. 11296, www.bradyid.com.
 - b. Seton Identification Products, www.seton.com.
 - c. Approved equal.

PART 3 EXECUTION

3.01 INSTALLERS

- A. Install the Work of this Section only under the supervision of licensed electricians.

3.02 EXAMINATION

- A. Verification of Conditions:
 1. Although the Contract Drawings are generally indicative of the Work, take field measurements to verify actual conditions.
 - a. Due to the small scale of the information on the Contract Drawings, it is not possible to indicate all offsets, fittings, and apparatus required or

the minor structural obstructions that may be encountered during the Work.

3.03 INSTALLATION

- A. Install grounding components and systems in accordance with the requirements specified in UL 467, IEEE 81, and IEEE 142.
- B. System Grounding for Elevated Guideway:
 - 1. Ground Rods:
 - a. Unless otherwise indicated, drive ground rods into the ground until the tops of the rods are approximately 6 inches below finished grade.
 - b. Space ground rods as evenly as possible, at least 6 feet apart, and so conductors will be connected below grade.
 - 2. Conductors:
 - a. Provide 4/0 bare ground wire.
 - b. Provide down conductors in all vertical pre-cast vertical columns.
 - 1) Install conductors in direct paths from the top of the columns to the ground connections.
 - c. Using suitable fasteners, securely attach exposed ground wires to structural supports at not more than 2-foot intervals.
 - d. Bends in ground wires greater than 45 degrees are unacceptable.
 - 3. Cable Connections:
 - a. Use approved exothermic-welded connections for conductor splices and connections between conductors and other components.
 - b. Where practical, interconnect ground loop conductors for adjacent columns using approved connection methods.
 - 4. Grounding Rings:
 - a. Install grounding rings using 4/0 bare copper cable with ground rods spaced at 25-foot intervals, minimum, using exothermic weld connecting means as indicated on the drawings attached to the end of this Section.
 - 5. Concrete-Encased Electrodes:
 - a. Where multiple concrete-encased electrodes are present at a building or structure, it is permissible to bond only one into the grounding electrode system.
 - 6. Interface with Other Work:
 - a. At the uppermost end of the completed portions of pre-cast vertical columns and the guideway deck, provide 6 feet of excess down conductor in the form of accessible and usable tails or stubs for future extension of the down conductor to the future system grounding components that will be installed on the uppermost portion of future construction as shown in details GND-9, GND-10, GND-15, GND-16, attached to the end of this Section.
- C. System Grounding for On-Graded Guideway:

1. Ground Rods:
 - a. Drive ground rods into the ground until the tops of the rods are approximately 6 inches below finished grade.
 - b. If multiple ground rods are needed to meet the minimum resistance of 5 Ohms, space ground rods as evenly as possible, at least 6 feet apart, and so conductors will be connected below grade.
2. Conductors:
 - a. Provide 4/0 bare ground wire.
 - b. Install down conductors in the guideway in accordance with detail GND-14 attached to the end of this Section.
 - 1) Install conductors in direct paths from the top of the guideway deck to the ground connections.
 - 2) Space the grounding conductors so they are no more than 100 feet apart.
 - c. Using suitable fasteners, securely attach exposed ground wires to structural supports at not more than 2-foot intervals, where applicable.
 - d. Bends in ground wires greater than 45 degrees are unacceptable.
3. Cable Connections:
 - a. Use approved exothermic-welded connections for conductor splices and connections between conductors and other components.
 - b. Where practical, interconnect ground loop conductors for adjacent columns using approved connection methods.

3.04 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. During the period when the PHX Sky Train grounding system is being installed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - 1) Periodic Special Inspections will be performed during the erection of structural steel.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency and/or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
 2. Resistance Test:
 - a. Test Procedure:

- 1) The ground-resistance measurements of each ground rod will be taken.
 - a) The resistance to ground will be measured in accordance with the fall-of-potential method specified in IEEE 81 and IEEE 142.
 - b) Ground-resistance measurements will be made in normally dry weather, not less than 48 hours after rainfall, and with the ground under test isolated from other grounds.
 - 2) Test reports will be prepared that indicate the location of the ground rod, the grounding system, and the resistance and soil conditions at the time the test was performed.
 - b. Acceptance Criteria:
 - 1) The grounding system must have a resistance not greater than 5 Ohms.
 - 2) Do not energize any part of the electrical distribution system prior to the resistance testing of that system's ground rods and grounding system, and submission of the test results to the Program/Project Manager and their approval.
 3. Inspections:
 - a. Prepare and submit as-built Record Drawings of the Phoenix Sky Train grounding system as installed to the Program/Project Manager for approval.
- B. Non-Conforming Work
1. Where the specified ground resistance cannot be met with the number of ground rods indicated in the Contract Documents, install and connect additional ground rods, longer ground rods, or deep driven sectional rods until the specified resistance is obtained, except that not more than 3 additional ground rods are permitted at any one installation.

3.05 PROTECTION

- A. Provide protection for the down conductor tails or stubs provided for the future completion of the uppermost portion of structures so the down conductors will be accessible and usable at that future time.

3.06 ATTACHMENTS

- A. The following attachments are appended to this Section following the "END OF SECTION" marker:
1. GND-1 Automated Train Stage One Design – Cable to Ground Rod Connection.
 2. GND-2 Automated Train Stage One Design – Grounding Detail.
 3. GND-3 Automated Train Stage One Design – Grounding Detail.
 4. GND-4 Automated Train Stage One Design – Grounding Cable to Ground Rod Connection.

5. GND-5 Automated Train Stage One Design – Grounding Detail.
6. GND-6 Automated Train Stage One Design – Grounding Detail.

SECTION 02630

STORM DRAINAGE

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for providing storm drainage and irrigation piping and structures at the locations indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01400 - Quality Requirements.
 - 3. Section 01555 - Traffic Control.
 - 4. Section 01780 - Closeout Submittals.
 - 5. Section 02316 - Trenching and Backfilling.
 - 6. Section 02445 - Boring or Jacking Conduits.
 - 7. Section 02721 - Aggregate Base Course.
 - 8. Section 03200 - Concrete Reinforcement.
 - 9. Section 03300 – Cast-In-Place Concrete.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. CSP: Corrugated Steel Pipe.
 - 2. DIP: Ductile Iron Pipe.
 - 3. HDB: Hydrostatic Design Basis.
 - 4. HDPE: High Density Polyethylene.
 - 5. PS: Pipe Stiffness.
 - 6. RCP: Reinforced Concrete Pipe.
 - 7. RSC: Ring Stiffness Constant.
- B. Definitions:
 - 1. Annular: Circumferential.
 - 2. Bedding: Material to be placed in pipe trenches filling the volume from the bottom of the trench to 1 foot above the top of the buried pipe or conduit, excluding the pipe and its interior.
 - 3. Cast-In-Place Concrete Pipe (CIPP): Conduit constructed from Portland cement concrete cast monolithically in a properly prepared trench using equipment specifically designed for the purpose.
 - 4. Downgrade Pipe: Pipe which is to be used under loads less than that for which they have been designed.
 - 5. Duckbill Valve: A check valve in which flow proceeds through a soft tube that protrudes into the downstream side; back-pressure collapses this tube, cutting off flow.

6. Longitudinal Crack: A crack in a constructed cast-in-place concrete pipe having a general direction 30 degrees or less from the direction of the pipe alignment.
7. Profile Wall: A pipe wall construction that presents an essentially smooth surface in the waterway but includes ribs or other shapes, which can be either solid or hollow, that help brace the pipe against diametrical deformation.
8. Ring Stiffness Constant: The value obtained by dividing the parallel plate load in pounds per foot of pipe by the resulting deflection in percent at 3 percent deflection.
9. Springline or Springing Line: In a transverse cross section of pipe, the line of maximum horizontal dimension.

C. Reference Standards:

1. American Association of State highway and Transportation Officials (AASHTO):
 - a. AASHTO M 36 - Standard Specification for Corrugated Steel Pipe, Metallic-Coated, for Sewers and Drains.
 - b. AASHTO M 190 - Standard Specification for Bituminous-Coated Corrugated Metal Culvert Pipe and Pipe Arches.
 - c. AASHTO M 252 - Standard Specification for Corrugated Polyethylene Drainage Pipe.
 - d. AASHTO M 274 - Standard Specification for Steel Sheet, Aluminum-Coated (Type 2), for Corrugated Steel Pipe.
 - e. AASHTO M 294 – Standard Specification for Corrugated Polyethylene Pipe, 300- to 1500-mm Diameter.
 - f. AASHTO T 99 – Standard Method of Test for Moisture-Density of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop.
 - g. AASHTO T 191 - Standard Method of Test for Density of Soil In-Place by the Sand-Cone Method.
2. Arizona Department of Transportation (ADOT):

 - b. MAG Uniform Standard Details for Public Works Construction.
 - 1) Detail No. 501-1 Headwall.
 - 2) Detail No. 501-2 Headwall.

- 3) Detail No. 501-3 Headwall 42" to 84" Pipe.
 - 4) Detail No. 501-4 Headwall Irrigation 18" to 60" Pipe.
 - 5) Detail No. 501-5 Headwall Drop Inlet.
 - 6) Detail No. 502-1 Trash Rack.
 - 7) Detail No. 502-2 Trash Rack.
 - 8) Detail No. 503 Irrigation Standpipe.
 - 9) Detail No. 504 Concrete Block Junction Box.
 - 10) Detail No. 505 Concrete Pipe Collar.
 - 11) Detail No. 506 Irrigation Valve installation.
 - 12) Detail No. 507 Encased Concrete Pipe (for Shallow Installation).
 - 13) Detail No. 510 Corrugated Metal Pipe and Installation.
 - 14) Detail No. 521 Storm Drain Manhole Base (51" or Larger).
 - 15) Detail No. 522 Storm Drain Manhole Shaft.
 - 16) Detail No. 523-1 Pressure Manhole.
 - 17) Detail No. 523-2 Pressure Manhole.
 - 18) Detail No. 524 Storm Drain Lateral Pipe Connections [*Detail not allowed by the City of Phoenix*].
 - 19) Detail No. 530 3"-6" Curb Opening Catch Basin - Type "A".
 - 20) Detail No. 531 3"-6" Curb Opening Catch Basin - Type "B".
 - 21) Detail No. 532 8"-0" Curb Opening Catch Basin - Type "C".
 - 22) Detail No. 533-1 Catch Basin Type 'D'.
 - 23) Detail No. 533-2 Apron for Type 'D' Catch Basin.
 - 24) Detail No. 533-3 Frame and Grate for Type 'D' Catch Basin.
 - 25) Detail No. 534-1 Catch Basin Type 'E'.
 - 26) Detail No. 534-2 Catch Basin Type 'E' (Details).
 - 27) Detail No. 534-3 Catch Basin Type 'E' (Details).
 - 28) Detail No. 534-4 Catch Basin Type 'E' (Details).
 - 29) Detail No. 534-5 Alternate Grate Styles Sump Location.
 - 30) Detail No. 535 Catch Basin Type 'F' (for Use without Curb).
 - 31) Detail No. 536-1 Common Details and Sections for Curb Opening Catch Basins.
 - 32) Detail No. 536-2 Alternate Cover for Curb Opening Catch Basins.
 - 33) Detail No. 537 Catch Basin - Type 'G'.
 - 34) Detail No. 538 Catch Basin - Type 'H'.
 - 35) Detail No. 539 Grates for Catch Basins, Type G and H.
 - 36) Detail No. 540-1 Catch Basin Grates.
 - 37) Detail No. 540-2 Catch Basin Grates.
 - 38) Detail No. 545 End Section-Reinforced Concrete Pipe.
 - 39) Detail No. 550 Spillway Inlet and Outlet.
 - 40) Detail No. 552 Concrete Cut-Off Walls.
 - 41) Detail No. 555 Erosion Protection / Riprap.
7. NSF International (NSF):
- a. ANSI/NSF 61 Drinking Water System Components – Health Effects.

8. Plastic Pipe Institute (PPI):
 - a. PPI Third Party Certification Program.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Ensure minimum interference with roads, streets, walks, and other adjacent occupied or used facilities by construction operations.
 - a. Do not close or obstruct streets, walks, or other occupied or used facilities without permission from the authorities having jurisdiction.
 - 1) Coordinate street and sidewalk closings and traffic control with the City of Phoenix Street Transportation Department Traffic Operations Division, the City of Phoenix Right-of-Way Management program, and with other appropriate government agencies.
 - 2) Obtain all permits required by the City of Phoenix, and pay necessary fees.
 - 3) Prepare traffic control and walkway plans required by the City of Phoenix Special Traffic Regulations.
 - b. Provide alternate routes around closed or obstructed traffic ways if required by governing regulations.
 - 1) Ensure safe passage of persons around the area of construction.
2. Coordinate all utility related work during storm drainage work activities with Aviation Facilities and Services at Phoenix Sky Harbor International Airport to avoid tapping into established utilities.
3. Forward all utility information to the Design and Construction Services Division (DCS) of the Phoenix Sky Harbor International Airport.
4. Obtain the approval of serving utilities and/or the Phoenix Sky Harbor International Airport as applicable to schedule shut downs of utilities and services
5. Obtain the approval of serving utilities and/or the Phoenix Sky Harbor International Airport as applicable to disconnect, relocate, and/or provide temporary utility service connections and lines as needed if these have not been previously completed.
 - a. Coordinate all utility related work during construction activities to avoid tapping into established Aviation Facilities and Services utilities at Phoenix Sky Harbor International Airport.
 - b. Forward all utility information to the Design and Construction Services Division (DCS) of the Phoenix Sky Harbor International Airport.

B. Scheduling:

1. Cast-In-Place Concrete Pipe (CIPP):
 - a. Schedule cast-in-place concrete pipe work activities and work schedules to minimize overtime for the Program/Project Manager's staff.

- 1) No schedule requiring overtime by the Program/Project Manager's staff is authorized without the written approval of the Program/Project Manager.
- 2) Prior to starting concrete placement for cast-in-place concrete pipe, submit a written Schedule for Cast-In-Place Concrete Pipe Work Activities to the Program/Project Manager for approval.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Piping and piping specialties.
 - 2) Valves.
 - b. Shop Drawings:
 - 1) Layout drawings for piping and piping specialties.
 - 2) Drawings of the transition manhole base option using a prefabricated transition manhole base with a 48-inch stubbed manhole shaft cast as 1 structure.
 - 3) Pipe specials.
 - 4) Valves.
 - c. Certificates:
 - 1) Cement mill certificates for each load of cement delivered to the concrete pipe fabrication plant.
 - 2) Reinforced concrete pipe manufacturer's certification that calcium chloride or an admixture containing calcium chloride was not used in the pipe concrete mix.
 - 3) Reinforced concrete pipe reinforcing steel manufacturer's mill certificates, or the pipe manufacturer's certification for stockpiled pipe.
 - 4) High Density Polyethylene (HDPE) Pipe Watertight Certification.
 - 5) Certification of reinforced concrete pipe (RCP) and non-reinforced concrete pipe (NRCP) hydrostatic leak tests.
 - d. Delegated Design Submittals:
 - 1) Design mixes for mortar/grout.
 - 2) Equipment proposed to construct cast-in-place concrete pipe.
 - 3) Schedule for Cast-In-Place Concrete Pipe Work Activities.
 - e. Qualification Statements:
 - 1) Qualifications and certifications of the proposed Material Testing Laboratories.
 - 2) Experience record of the operators proposed to construct cast-in-place concrete pipe.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Corrugated Steel Pipe (CSP) Bituminous Coating Test results.
 - b. Manufacturer's Instructions:
 - 1) Manufacturer's joint preparation instructions.
 - 2) Manufacturer's recommended pipe repair procedures.
 - 3) Duckbill valve manufacturer's installation recommendations and instructions.
- C. Closeout Submittals:
 1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Record Documentation:
 - 1) As-built information for the storm drainage system.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 1. The Work of this section is subject to approvals before it can be put into service and accepted.
 - a. If the Project impacts water bodies, a Clean Water Act, Section 404 permit will be required by the U.S. Army Corps of Engineers.
 - b. Compliance with the Arizona Pollution Discharge Elimination System (AZDES) general permit for storm water discharges from construction sites is required.
 - c. Compliance with the Federal Endangered Species Act is required.
 - d. Compliance with the national Historic Preservation Act, the City's archaeological policy, the Arizona Antiquities Act, and the State Historic Preservation Act are required.
 - e. Compliance with the City of Phoenix Storm Water Policies and Standards.
- B. Qualifications:
 1. Material Testing Laboratories:
 - a. To perform testing of the materials to be incorporated into the Work, and to control testing and inspections of the Work this Section, employ the services of one or more independent certified material testing laboratories having the following qualifications:
 - 1) Each Material Testing Laboratory must be independent, certified, and comply with the quality standards for testing laboratories of the nationally recognized associations and agencies that promulgate the test standards specified and with the basic requirements of ASTM E 329 and other standards specified in individual Specification Sections.

- 2) Each Material Testing Laboratory must be capable of performing the reviews, inspections, and testing required of them by this Contract; including but not limited to the following:
 - a) Inspecting, sampling, and testing proposed materials and production as required by the Program/Project Manager for compliance with the Contract Documents.
 - b) Capable of securing production samples of materials at plants or stockpiles during the course of the work, and testing the samples for compliance with the Contract Documents.
 - 3) The Material Testing Laboratory must be approved by the Program/Project Manager, and must also be accepted by the local jurisdictions responsible for building inspection.
- b. The Material Testing Laboratories retained by the Contractor will not be responsible for performing the special inspections required by the ICC International Building Code.
- c. Dismissal and replacement of any of these independent certified Material Testing Laboratories by the Contractor requires written notice to and the approval from the Program/Project Manager.
- d. Submit the qualifications and certifications of the proposed Material Testing Laboratories to the Program/Project Manager for approval.
2. Reinforced Concrete Pipe (RCP) Manufacturer's Qualifications:
 - a. Obtain reinforced concrete pipe from a manufacturer competent to manufacture the type, size, and quality of pipe specified; having satisfactory curing and storage facilities; and having satisfactory financial resources.
3. Valve Manufacturer's Qualifications:
 - a. Obtain valves from a manufacturer having a minimum of 2 years' experience manufacturing the type, size, and quality of valves specified in this Specification Section.
4. Cast-In-Place Concrete Pipe (CIPP) Constructor Qualifications:
 - a. Employ a Subcontractor for constructing cast-in-place concrete pipe (CIPP) who has operators experienced in using the specialized type of equipment required to construct cast-in-place concrete pipe, and who can provide evidence of successful use of this equipment on prior projects.
 - 1) Submit the equipment proposed to construct cast-in-place concrete pipe for this Contract to the Program/Project Manager for approval.
 - 2) Submit the experience record of the operators proposed to construct cast-in-place concrete pipe for this Contract to the Program/Project Manager for approval.

C. Certifications:

1. For each load of cement delivered to the concrete pipe fabrication plant, submit 3 copies of the cement mill certificate indicating the specification,

- type, chemical analysis, and quantity of cement to the Program/Project Manager for information.
2. For stockpiled cement pipe, submit a manufacturer's certification that the type of cement used to manufacture the cement pipes complies with the specified requirements.
 - a. For reinforced concrete pipe, include certification that the cement content of the concrete complies with the specifications for yield per cubic yard of concrete poured.
 3. High Density Polyethylene (HDPE) Pipe Watertight Certification:
 - a. Submit a copy of the certification from an approved independent laboratory certifying that the high-density polyethylene (HDPE) pipe provided complies with the watertight standard stipulated in ASTM D 3212.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Transport pipe materials and other products specified herein in a manner recommended by the respective manufacturers to prevent damage and defects from occurring.
 - a. During transportation and handling of concrete pipes, furnish struts and other protective measures as necessary to limit cracks in the pipes that will render the pipes unacceptable as specified herein.
 - b. Strutting of corrugated metal pipe (CMP) must be approved by the Program/Project Manager.
 - c. Exercise extreme care to prevent damage to the ends of concrete pipe.
 - d. To protect the external spigot end of ductile iron pipes against abrasion and damage during shipping and handling, furnish temporary protective collars on the exterior of each spigot end of each pipe section.
 - 1) Secure the temporary protective collars to the pipe to prevent accidental removal during shipping and normal handling by the Contractor.
 - 2) Do not remove the temporary collars until immediately before the pipe is to be installed or field cut.

B. Storage and Handling Requirements:

1. Store and handle pipe materials and other products specified herein in a manner recommended by the respective manufacturers to prevent damage and defects from occurring.
 - a. Store and handle high density polyethylene (HDPE) pipe so out-of-roundness is minimized.
 - b. Store high density polyethylene (HDPE) pipe in shaded areas to minimize adverse effects of exposure to warm temperatures and ultraviolet light.

- c. Furnish cloth belt slings or ropes to hoist high density polyethylene (HDPE).
- d. Handle corrugated steel pipe (CSP) so the external coating, spelter coating, and internal lining are not damaged.
2. Protect pipe from impact shocks and free fall during handling.
3. Store rubber gaskets in a cool, dark place until they are installed.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Keep trenches dewatered until pipe joints have been made and concrete cradle and encasement, if any, have cured.
2. Do not lay pipe in water or on bedding containing frost.
3. Do not lay pipe when weather conditions are unsuitable, as determined by the Program/Project Manager, for pipe laying work.
4. Do not place concrete for the cast-in-place concrete pipe (CIPP) when the concrete temperature exceeds 90 degrees Fahrenheit or is less than 50 degrees Fahrenheit, or if the soil adjacent to the trench is below freezing.

B. Existing Conditions:

1. Boring logs shown on the Contract Drawings or included in the Specifications are included for the Contractor's convenience only, and do not constitute a part of the Contract.
 - a. It is not intended to imply that the character of the material is the same as shown on the logs at points other than where each boring was made.
 - b. It is the Contractor's responsibility to satisfy itself regarding the actual soil moisture content, and the amount of rock, gravel, sand, silt, clay, and water, to be encountered during the Work of this Section.
2. Only construct cast-in-place concrete pipe (CIPP) in ground capable of standing unsupported from the bottom of the trench to the top of the pipe without sloughing unless it is demonstrated to the satisfaction of the Program/Project Manager that placed fill will adequately support pipe or the Specifications indicate that cast-in-place concrete pipe is allowable for the application.
3. The Program/Project Manager will furnish alignment and elevation stakes at agreed upon intervals and offset, and cut sheets showing the difference in elevation from the top of the stakes to the flow line of the pipe.
4. Assume the risks attending to the presence or proximity, if any, of overhead or underground public utility and private lines, pipes, conduits and their associated support work, and other structures and property of every kind and description, in or over excavations, or in the vicinity of the work, whether above or below the surface of the ground.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA

- A. Minimum Pipe Size:
 - 1. Main Line: 18 inches.
 - 2. Catch Basin Connector Pipe: 15 inches.
- B. Use only one type and class of pipe in any continuous line of piping between structures, unless otherwise indicated on the Contract Drawings.
 - 1. For permit construction, provide either Class III reinforced concrete pipe (RCP), or high-density polyethylene (HDPE) pipe.
- C. Concrete Pipe:
 - 1. The D-loads specified for the design of concrete pipe are based on the loads to which the pipe will be subjected upon completion of the Project.
 - 2. Provide reinforced concrete pipe of the size, type, and D-load indicated on the Contract Drawings or specified for the item of Work.
 - a. For pipe installed under railroad tracks, provide Class V reinforced concrete pipe.
 - b. For pipe installed in tunnels, provide Class III or stronger reinforced concrete pipe.
- D. Cast-in-place, unreinforced concrete pipe (CIPP):
 - 1. Minimum Diameter: 30 inches.
 - 2. Minimum Allowable Thickness:
 - a. Calculate the minimum thickness of unreinforced concrete pipe in inches by adding the diameter of the pipe in feet to 1 inch; for example, the minimum thickness of a 36 inch diameter pipe, T_{36} , would be calculated as follows:
$$T_{36} = \left(\frac{36 \text{ inches}}{12 \text{ inches/foot}} \right) + 1 \text{ inch} = 4 \text{ inches}$$
 - 3. Do not use cast-in-place, unreinforced concrete pipe (CIPP) within the curb returns of major arterial or collector streets, or within other signalized or potentially signalized intersections.
 - 4. Cast-in-place, unreinforced concrete pipe (CIPP) is not allowed where the soil cannot stand vertically in trenches.
- E. Corrugated Steel Pipe (CSP):
 - 1. Corrugated steel pipe (CSP) not allowed where the soil resistivity readings are below 1500 ohms per cubic centimeter.
- F. High Density Polyethylene (HDPE) Pipe:

1. High density polyethylene (HDPE) pipe may be used for mainline storm drain pipes and catch basin connector pipes 48 inches in diameter or smaller provided the pipe is Type S with watertight joints meeting or exceeding 10.8 psi (25 feet of water head) water pressure test criteria as specified in ASTM D 3212.
 - a. Do not use High Density Polyethylene (HDPE) pipe within 24 lineal feet of an open outfall.
 - 1) Within 24 lineal feet of an open outfall, provide concrete or concrete lined storm drain outfall pipe sections in lieu of HDPE.
2. Hydrostatic Design Basis (HDB):
 - a. Provide high density polyethylene (HDPE) pipe having a Hydrostatic Design Basis (HDB) not less than 1250 psi for water at 73.4 degrees Fahrenheit as determined in accordance with Test Method ASTM D 2837.

G. Manholes:

1. Manholes are required for mainline storm drain pipe size changes, vertical grade breaks, horizontal angle deflections greater than 5 degrees, mainline pipe intersections, and periodic locations for access and maintenance.
 - a. Match the inside top of pipe elevations (pipe crowns) when the mainline pipe size changes.
 - b. If the downstream pipe size is smaller than the upstream pipe's size, match the pipe invert elevations.
2. Maximum Manhole Spacing:
 - a. For manholes less than or equal to 30 inches in diameter, the maximum spacing between manholes is 330 feet.
 - b. For manholes 33 inches to 45 inches in diameter, the maximum spacing between manholes is 440 feet.
 - c. For manholes greater than or equal to 48 inches in diameter, the maximum spacing between manholes is 600 feet.

H. Special Junction Structures:

1. To minimize head loss, join opposing storm drain laterals greater than 24 inches in diameter using a special junction structures designed by a registered Professional Engineer to be hydraulically efficient and to withstand HS-20 loading.

I. Cover or Fill Over Storm Drains:

1. The structural design of the pipe for any depth of cover is based on an unlimited trench condition.
2. Provide pipe and fittings designed to withstand trench loadings and conditions imposed by each location.
3. For reinforced concrete pipe, the minimum cover from the top of the pipe to finished grade is 2 feet, and the maximum cover is 12 feet.

- a. For pipe installed under railroad tracks, provide the minimum cover as specified in the railroad permit or as shown on the Contract Drawings, whichever is the more stringent.
 4. For high density polyethylene (HDPE) pipe, the minimum and the maximum cover from the top of the pipe to finished grade is to be as shown on the Contract Drawings or is to be in accordance with the manufacturer's recommendations, whichever is more stringent.
 - a. For high density polyethylene (HDPE) pipe installed in streets, provide a minimum of 2.0 feet of cover.
 5. Unless otherwise indicated, ensure cover or fill over storm drains is a minimum of 5 feet, and falls within the allowable ranges indicated in the Figure titled "Required "D" Load For Reinforced Concrete Pipe - Positive Projection Condition" in the City of Phoenix Storm Water Policies and Standards.
 - a. Determine "D" loads assuming a 140 pound per cubic foot load.
 - b. For up to 10 feet of cover in ordinary soil conditions, assume positive projected conditions.
 - c. For trenches deeper than 10 feet in ordinary soil conditions, assume trench conditions unless soil information indicates unstable soil, in which case assume positive projected conditions.
- J. Product Data and Shop Drawings:
 1. Prepare and submit completely dimensioned Shop Drawings, layout drawings, catalog cut sheets, and other data required to completely describe the proposed piping, piping specialties, and valves to the Program/Project Manager for approval.
 - a. Specify the maximum inside annular space satisfying the requirements specified in this Section in the Product Data and Shop Drawings.
 - b. With the valve Product Data, include information about the performance and operation of the valve, materials of construction, flow data, dimensions and weights, head loss data, and pressure ratings.

2.02 MATERIALS

- A. Concrete Pipe:
 1. Reinforced Concrete Pipe (RCP):
 - a. Provide reinforced concrete pipe manufactured from water, Portland cement, pozzolanic materials, mineral aggregates, and reinforcing steel complying with the requirements specified in ASTM C 76, except as follows:
 - 1) Concrete Mix:
 - a) Proportion the mix so that there is not less than 564 pounds of Portland cement, or a combination of Portland cement and pozzolanic materials, per cubic yard of the mix.

- (1) If pozzolanic materials are used, 17.5 percent of the combined weight of the pozzolanic materials and Portland cement must be approved pozzolanic materials.
 - b) Portland Cement:
 - (1) Provide Type II, low alkali Portland cement complying with the requirements of ASTM C 150.
 - (2) Submit a cement mill certificate for each load of cement delivered to the concrete pipe fabrication plant indicating the specification, type, chemical analysis, and quantity of cement, or the stockpiled pipe manufacturer's certification that the type of cement used to manufacture pipes complies with the specified requirements.
 - c) Pozzolanic Materials:
 - (1) Provide pozzolanic materials complying with the requirements of ASTM C 618 and Section 725.2.1, "Pozzolanic Materials", of the MAG Uniform Standard Specifications for Public Works Construction.
 - d) Concrete Admixtures:
 - (1) If approved by the Program/Project Manager, concrete admixtures may be use; however, do not use calcium chloride or an admixture containing calcium chloride.
 - (2) Submit the pipe manufacturer's certification that calcium chloride or an admixture containing calcium chloride was not used in the pipe concrete mix, and include the brand and chemical content of the admixtures used.
- 2) Concrete Reinforcement:
 - a) Provide steel concrete reinforcement complying with the requirements of Section 03200, Concrete Reinforcement.
 - b) Provide an area of steel as indicated on the approved Shop Drawing for that pipe.
 - (1) In reinforced concrete pipe having less than 36 inches inside diameter, include reinforcing steel in the bell not less than the area required for the circumferential reinforcement in the wall of the pipe.
 - c) Submit the pipe manufacturer's mill certificates showing heat numbers, chemical analysis, and physical tests on the reinforcing steel supplied; or for stockpiled pipe, submit the pipe manufacturer's certification that the type of steel used to manufacture the reinforced concrete pipe complies with the specified requirements.
2. Non-Reinforced Concrete Pipe (NRCP):
 - a. Provide non-reinforced concrete pipe of the size and Classes indicated on the Contract Drawings or specified for the item of Work.

- b. Provide concrete pipe manufactured as specified in ASTM C 14 for Strength Class 1, 2, or 3 non-reinforced concrete pipe, except as follows:
 - 1) If not otherwise shown or specified, provide Class 3 pipe.
- c. Concrete Mix:
 - 1) Provide materials as specified in ASTM C 14, except provide Type II, low alkali, cement complying with the requirements specified in ASTM C 150.
 - 2) Water-Cement Ratio: Less than 0.53.
 - 3) Submit a cement mill certificate for each load of cement delivered to the concrete pipe fabrication plant indicating the specification, type, chemical analysis, and quantity of cement, or the stockpiled pipe manufacturer's certification that the type of cement used to manufacture pipes complies with the specified requirements.
- 3. Joints for Reinforced Concrete Pipe (RCP) and Non-Reinforced Concrete Pipe (NRCP):
 - a. For concrete pipes having diameters smaller than 48 inches, joints may be either O-ring gasket joints or profile gasket/single offset joints.
 - b. For concrete pipes having diameters 48 inches and larger, joints may be tongue in groove, O-ring gasket joints, or profile gasket/single offset joints.
 - c. Gaskets for Reinforced Concrete Pipe (RCP) and Non-Reinforced Concrete Pipe Joints:
 - 1) Provide continuous ring gaskets of a size and cross section that completely fill the recess provided for it to seal the joint.
 - a) Provide gaskets that have smooth surfaces, free from pits, blisters, porosity, and other imperfections which would adversely affect sealability.
 - b) Provide gaskets designed to be the sole element making the joint watertight.
 - 2) Provide gaskets manufactured only from composition rubber containing not less than 60 percent by volume of first grade synthetic rubber, with the remainder of the composition consisting of pulverized fillers free from rubber substitutes, reclaimed rubber, and deleterious substances; and having the following properties:
 - a) Tensile Strength (Minimum): 2100 psi when measured in accordance with ASTM D 412.
 - b) Elongation at Rupture (Minimum): 400 percent when measured in accordance with ASTM D 412.
 - c) Hardness (Shore Durometer, Type A): 40 to 60 plus or minus 5 when measured in accordance with ASTM D 2240.
 - d) Cold Flow: 20 percent or less when measured in accordance with Method B as specified in ASTM D 395, except use a disc 1/2 inch thick and having the same diameter as the rubber gasket.

- (1) Do not expose the gaskets to direct sunlight longer than needed to install the gasket normally.
 - e) Specific Gravity: Between 0.95 and 1.45 when measured in accordance with ASTM D 297, but measuring consistently within plus 0.05 of the value.
- d. Grout/Cement Mortar Mix for Reinforced Concrete Pipe (RCP) and Non-Reinforced Concrete Pipe (NRCP) Joints:
 - 1) Provide grout/cement mortar consisting of Portland cement, sand, and water mixed to produce a soft workable mortar as follows:
 - a) For normal mortaring and grouting, mix 1 part Portland cement to 2 parts sand by volume.
 - b) For outside joints made by the “diaper” method, mix 1 part Portland cement to 3 parts sand by volume mixed to the consistency of thick cream.
 - c) Do not exceed a water-cement ratio of 0.53
 - 2) Cement:
 - a) Provide Portland cement conforming to the requirements for Type II, low alkali, cement specified in ASTM C 150.
 - 3) Sand:
 - a) Provide thoroughly and uniformly washed sand entirely free of oil and deleterious substances, and sufficiently free of organic material, mica, loam, clay and other deleterious substances to be suitable for constructing pipe.
 - b) Provide sand sized and graded in accordance with the requirements of ASTM C 144.
 - c) Provide sand having a sand equivalent, determined by averaging the value from 3 successive samples tested as specified in ASTM D 2419, not less than 70.
 - (1) No individual sample may have a sand equivalent less than 65.
 - 4) Water:
 - a) Provide water clean and free of injurious amounts of oils, acids, alkalis, salts, organic materials, and other substances deleterious to concrete or concrete reinforcement.
 - 5) Submit the design mixes for mortar/grout to the Program/Project Manager for approval.
- 4. Cast-In-Place Concrete Pipe (CIPP):
 - a. Provide cast-in-place concrete pipe (CIPP) constructed from Portland cement concrete cast monolithically in a properly prepared trench using equipment specifically designed for the purpose.
 - b. Concrete and Bonding Mortar Mixes:
 - 1) Concrete:
 - a) Provide Class A concrete as specified in Section 03300, Cast-In-Place Concrete, except use the sand aggregate specified herein and provide concrete having the minimum required

- slump for satisfactory placement of the concrete using the approved equipment, but not more than 3 inches.
- 2) Bonding Mortar:
 - a) Provide bonding mortar consisting of 2 or more parts of cement to 3 parts of sand by volume.
 - c. Cement:
 - 1) Provide Portland cement conforming to the requirements for Type II, low alkali, cement specified in ASTM C 150.
 - d. Water:
 - 1) Provide water clean and free of injurious amounts of oils, acids, alkalis, salts, organic materials, and other substances deleterious to concrete or concrete reinforcement.
 - e. Sand Aggregate:
 - 1) Provide thoroughly and uniformly washed sand entirely free of oil and deleterious substances, and sufficiently free of organic material, mica, loam, clay and other deleterious substances to be suitable for constructing pipe.
 - 2) Provide sand sized and graded in accordance with the requirements of ASTM C 33.
 - a) Do not provide aggregate greater than 1-1/2 inches.
 - b) Do not provide aggregate greater than 1/3 the minimum wall thickness for pipe wall thicknesses up to and including walls 4-1/2 inches thick.
 - 3) Provide sand having a sand equivalent, determined by averaging the value from 3 successive samples tested as specified in ASTM D 2419, not less than 70.
 - a) No individual sample may have a sand equivalent less than 65.
 - f. Pipe Dimensions:
 - 1) Construct cast-in-place concrete pipe (CIPP) so the internal diameter at any point is not less than 95 percent of the nominal diameter, and the average of any 4 measurements internal diameter made at 45 degree intervals is not less than the nominal diameter.
 - 2) Minimum Wall Thickness:
 - a) For pipe with inside diameter less than 15 inches: 2 inches.
 - b) For pipe with inside diameter 15 inches to 24 inches: 2-1/2 inches.
 - c) For pipe with inside diameter exceeding 24 inches: 1/12 the inside diameter plus 1 inch.
 - 3) Offsets at Form Laps and Horizontal Edges:
 - a) For pipe with inside diameter 42 inches and less: 1/2 inch.
 - b) For pipe with inside diameter greater than 42 inches but not greater than 72 inches: 3/4 inch.
 - c) For pipe with inside diameter exceeding 72 inches: 1 inch.

- g. Joints:
 - 1) Construct joints as specified in Subparagraph 3.03.G.2.
- B. Corrugated Steel Pipe (CSP):
 - 1. Provide Type II corrugated steel pipe (CSP), pipe-arches, and connectors as specified in AASHTO M 36 and indicated on the Contract Drawings.
 - a. Type II pipe, as specified herein, has a single thickness of corrugated sheet and a full circular cross section having helical corrugations that has been reformed into a pipe-arch having an approximately flat bottom.
 - b. Provide the spelter coating, method of sampling, accepted brands of metal, sheet manufacturer's certified analysis and guarantee, workmanship, marking, inspection, and rejection in accordance with the requirements of AASHTO M 36.
 - c. Steel Sheet for Pipe:
 - 1) Fabricate the corrugated steel pipe from flat aluminum-coated Type 2 steel sheet, complying with the requirements of AASHTO M274, in coils.
 - 2) Sheet Thickness:
 - a) Provide sheet thickness that will provide a 75-year design life to the first perforation based on soil conditions as indicated in Table 6.15.5 in the City of Phoenix Storm Water Policies and Standards.
 - b) Minimum Sheet Thickness: 14 gage.
 - d. Fabrication Seams:
 - 1) Provide a continuous lock or weld seam extending from end to end of each length of pipe.
 - 2) Fabricate seams so the shape and nominal diameter of the pipe is unaffected, and so they do not create weakness in the pipe.
 - 2. Coating and Lining:
 - a. Uniformly coat the exterior of the pipe with a full bituminous coating as specified for Type A pipe in AASHTO M 190, and line the entire interior of the pipe with Portland cement concrete.
 - 1) Apply the Portland cement concrete at the plant to produce a homogeneous, non-segregated lining having a mechanical trowel finish.
 - a) Provide a minimum lining thickness of 1/8 inch above the crest of the corrugation.
 - 2) Portland Cement Content of Concrete, Minimum: 564 pounds per cubic yard.
 - 3) Sand: Provide sand sized and with a gradation in accordance with ASTM C 33.
 - 4) For bituminous coated pipe, provide a smooth and neat exterior pipe coating a minimum of 0.050 inches thick both on the pipe and on the connecting band permitting the connecting band to properly seat and lock into angular corrugations and compress the gasket.

- b. Equip corrugated steel pipe arches and pipe, whether elliptical or round, that have an external coating or internal lining with lifting lugs.
- 3. Dimensions:
 - a. Provide corrugated steel pipe (CSP) conforming to the dimensions indicated in Table 8 and Table 9 in AASHTO M 36.
 - b. Dimensional Tolerances:
 - 1) For pipe having internal diameters between 12 and 24 inches, pipe may not vary more than plus or minimum 1.5 percent from the design diameter.
 - 2) For pipe having internal diameters between 27 and 108 inches, pipe may not vary more than plus or minimum 1.0 percent or 3/8 inch from the design diameter, whichever is greater.
- 4. Joints:
 - a. Provide watertight bituminous coated couplers or coupling bands constructed as specified in AASHTO M 36, and fabricated from galvanized steel 2 numerical gages lighter than the gage specified for the pipe material, but not less than 0.064 inches (16 gage) or more than 0.109 inches (12 gage).
 - 1) Provide annular corrugated type bands or hugger type bands locking in at least 1 annular corrugation, and designed to form a leak-resistant joint.
 - a) Connecting Band Width:
 - (1) For pipe diameters 12 inches to 30 inches: 7 inches.
 - (2) For pipe diameters 33 inches to 60 inches: 10-1/2 inches.
 - (3) For pipe diameters greater than 60 inches to 120 inches: 13-1/2 inches.
 - b) Provide coupling bands that overlap the pipe ends by a minimum of 2 inches.
 - c) For pipe having diameters up to and including 48 inches, one-piece bands may be used.
 - d) For pipe having diameters exceeding 48 inches, use multi-piece bands.
 - e) Design the annular corrugated type bands to accommodate a 1/4 inch thick sleeve gasket the same width as the connecting band.
 - f) Design the hugger type band to accommodate an o-ring gasket.
 - 2) Corrugated or Dimpled Couplers or Coupling Bands:
 - a) Fabricate the couplers or coupling bands to either have corrugations or dimples that match the pipe corrugations or end treatments, or that are flat.
 - (1) Provide corrugated steel pipe arches and pipe, whether elliptical or round, that have an external coating or internal lining with a positive connection that will not damage the coating on the pipe or pipe arch.

- b) Dimpled Couplers:
 - (1) Shape dimples so they conform to the general shape of the standard pipe corrugations.
 - (2) For nominal pipe diameters 12 through 60 inches, provide dimpled coupling bands that are 10-1/2 inches wide, and that have 2 rows of dimples with not less than 7 dimples per row.
 - (3) For nominal pipe diameters 60 through 96 inches, provide dimpled coupling bands that are 17 inches wide, and that have 4 rows of dimples with not less than 7 dimples per row.
 - (4) Provide dimple arrangements that allow a maximum spread.
- c) Connecting angles for both dimpled and standard corrugated coupling bands may be riveted; but dimpled coupling bands may have slotted angles in lieu of rivets.
- 3) Plain Flat Coupling Bands and Spiral Rib Flange Bands:
 - a) For nominal pipe diameters 12 through 60 inches, provide coupling bands that are 10-1/2 inches wide.
 - b) For nominal pipe diameters 60 through 96 inches, provide coupling bands that are 17 inches wide.
 - c) Flat coupling bands having a single circumferential corrugation rolled in each edge to match a similar corrugation in the end of each pipe may be 10-1/2 inches wide regardless of the pipe diameter.
 - d) If flanges are provided on pipe ends, provide couplings having a preformed channel band or other type of band incorporating a locking channel not less than 3/4 inches wide for interlocking the flanges.
 - (1) Depth of Locking Channel: 1/2 inch, minimum.
 - (2) Locking Channel Thickness: 0.079 inches.
- 4) Provide bolts for fastening the couplers or coupling bands together to join pipe sections.
 - a) Attach coupling bands using 1/2-inch nominal diameter carriage bolts as follows:
 - (1) For pipe up to 36 inches in diameter, and for flat coupling bands having a single circumferential corrugation rolled in each edge to match a similar corrugation in the end of each pipe regardless of the pipe diameter: 2 bolts.
 - (2) For pipe 36 to 60 inches in diameter: 3 bolts.
 - (3) For pipe over 36 inches in diameter: 5 bolts.
- b. Gaskets:
 - 1) Provide O-ring gaskets complying with the requirements of ASTM C 361.

- a) For pipe having diameters up to and including 48 inches, provide O-ring gaskets having a 3/4-inch diameter, minimum.
 - b) For pipe having diameters exceeding 48 inches, provide O-ring gaskets having a 7/8-inch diameter, minimum.
 - 2) Provide 1/4 inch thick closed cell rubber sleeve gaskets complying with the requirements for Grade SCE 43 as specified in ASTM D 1056, and the same width as the connecting band.
- 5. Fittings:
 - a. For lateral pipes larger than 24 inches, provide prefabricated welded fittings.
- C. Ductile Iron Pipe (DIP) and Fittings:
 - 1. Provide ductile iron pipe (DIP) and fittings complying with the requirements specified in the MAG Uniform Standard Specifications for Public Works Construction and the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - a. Provide ceramic epoxy lined ductile iron pipe (DIP) and fittings complying with the requirements specified in Section 750.2, "Ductile Iron Water Pipe", of the MAG specification as modified by the COP Supplement.
 - b. Provide ceramic epoxy lining of the ductile iron pipe and fittings complying with the requirements specified in Section 750, "Lining for Ductile Iron Sewer Pipe and Fittings" of the COP Supplement.
- D. High Density Polyethylene (HDPE) Pipe and Fittings:
 - 1. Provide corrugated high-density polyethylene pipe and fittings manufactured in compliance with the requirements of ASTM F 894, AASHTO M 252, or AASHTO M 294.
 - a. Provide Type S corrugated HDPE pipe which is defined in AASHTO M 252 and AASHTO M 294 as having a full circular cross section, an outer corrugated pipe wall and a smooth inner liner, and annular or helical corrugations.
 - b. Allowable HDPE Corrugated Pipe Materials:
 - 1) Fabricate the pipe from Class PE335420C or higher polyethylene plastic compound as defined in ASTM D 3350.
 - c. Dimensions:
 - 1) Provide corrugated HDPE pipe and fittings whose dimensions are the nominal inside diameter.
 - 2) Do not provide corrugated HDPE pipe and fittings whose nominal inside diameter dimensions deviate from its nominal pipe size by more than the minimum and maximum tolerances allowed in AASHTO M 252 or Section 7.2.3 of AASHTO M 294.
 - d. Pipe Stiffness (PS):
 - 1) Provide corrugated HDPE pipe and fittings having the pipe stiffness (PS) indicated in Section 7.5 of AASHTO M 252 or in Section 7.4 of AASHTO M 294, but not less than the equivalent

- PS value for the ring stiffness constant of profile pipe having a pipe classification RSC 63 (RSC equals 56 pounds per foot of length) as defined in ASTM F 894.
- 2) Determine the PS in accordance with ASTM D 2412 with the exceptions listed in AASHTO M 252 or AASHTO M 294.
2. HDPE Pipe Joints:
- a. Provide either gasket type or weld type watertight joints for HDPE pipe.
- b. Gasketed Joints:
- 1) Provide a piping system consisting of integral bell and spigot joints designed so a gasket placed on the spigot is compressed radially on the pipe or fitting bell to form a watertight seal against exfiltration and infiltration when the joint is assembled.
- a) Provide gaskets complying with the physical requirements specified in ASTM F 477.
- b) Ensure that all surfaces on which the gasket will bear are smooth and free of imperfections which would adversely affect sealability.
- c) Design the joint so that the gasket is not displaced from the joint during assembly or while the pipeline is in service.
- 2) Provide a home mark on the spigot end of the pipe to indicate when proper penetration into the bell end has been achieved when the joint is made.
- 3) Provide clamp gaskets at manhole entries or connections to reduce exfiltration and infiltration.
- c. Welded Joints:
- 1) Provide welded joints only if specified or shown on the Contract Drawings.
- 2) Provide a piping system consisting of integral bell and spigot joints, with or without elastomeric centering gaskets, designed to be joined together by using an extrusion welding process.
- a) Extrusion welds may be made inside the pipe, outside the pipe, or both inside and outside the pipe.
- b) Assemble welded joints in accordance with the pipe manufacturer's recommendations.
- 3) Welding Material:
- a) Provide welding material for thermally welding pipe materials that is compatible with the base material being welded.
- d. If HDPE pipes are joined to precast manholes, provide holes in the manhole large enough to allow proper grouting with a non-shrink grout around the manhole gasket.
3. Fittings:
- a. Provide fittings having bell and spigot configurations compatible with those used for the pipe.

- b. Provide clamp gaskets or other approved means at manhole entries or connections to reduce infiltration and exfiltration.
 - 4. Identification:
 - a. Clearly mark the following information on each pipe in accordance with the requirements of ASTM F 894, AASHTO M 252, or AASHTO M 294 at intervals of approximately 12 feet:
 - 1) Manufacturer's name or trademark.
 - 2) Nominal size.
 - 3) Specification designation.
 - 4) Plant designation code.
 - 5) Date of manufacture or an appropriate code.
 - 6) For corrugated HDPE pipe manufactured according to AASHTO M 294, also include the Plastic Pipe Institute Mark on each length of pipe that complies with PPI Third Party Certification Program requirements.
 - b. Mark fittings with the manufacturing specification designation and the manufacturer's identification symbol.
 - 5. Lubricants:
 - a. Provide lubricant for assembling the pipes complying with the pipe manufacturer's recommendations.
 - b. Provide lubricant that is compatible with both the pipe and the gasket materials so no detrimental effects to the pipe or gasket will occur.
 - 6. Water Stops:
 - a. Provide water stops complying with the requirements specified in ASTM C 923; with expansion rings, a tension band, or a take-up device to mechanically compress the water stop against the pipe.
 - b. Provide water stops manufactured from natural or synthetic rubber.
 - 7. Gaskets:
 - a. Provide gaskets complying with the physical requirements specified in ASTM F 477.
 - b. Gaskets for HDPE pipe may be manufactured from natural rubber, synthetic elastomer, or a blend of both.
- E. Bedding Materials:
 - 1. Provide bedding materials complying with the requirements specified in Section 02316, Trenching and Backfilling.
- F. Backfill Materials:
 - 1. Provide backfill materials complying with the requirements specified in Section 02316, Trenching and Backfilling.
- G. Concrete:
 - 1. Provide concrete complying with the requirements specified in Section 03300, Cast-In-Place Concrete, unless otherwise specified in this Section.

H. Sheet Curing Material:

1. Provide sheet curing material that will not affect the concrete finish, or lessen the concrete strength.
2. Provide polyethylene film sheet conforming to the requirements of ASTM C 171.
 - a. Nominal Thickness: 0.0015 inch.

I. Pipe Specials:

1. Provide pipe specials, such as closure pieces, wyes, tees, bends, and manhole shafts as indicated on the Contract Drawings.
2. Fabricate the pipe specials equal in strength, diameter, and other physical characteristics to the standard straight pipe lengths by using extra concrete, reinforcing, steel, or other materials.
3. Submit Shop Drawings of pipe specials to the Program/Project Manager to receive approval of each item prior to its fabrication.

J. Valves:

1. Duckbill Valves:

- a. Provide duckbill check valves designed to eliminate backflow and seal around entrapped solids.
 - 1) Taper the inlet area to a straight duckbill which allows flow in only one direction.
- b. Provide duckbill check valves designed to be inserted into existing pipes, and to be secured in place using internal expandable Type 304L stainless steel cuff-type clamps that exert a compressing force against the valve material between the clamp and the internal surface of the pipe as they are expanded.
 - 1) Provide duckbill check valves that when installed maintain at least 75 percent of the full port area of the pipe.
- c. Provide one piece duckbill valve tubes fabricated from all-elastomer or fabric reinforced elastomer having excellent corrosion and abrasion resistance.
 - 1) Provide tubes fabricated from NSF 61-approved materials.
- d. Size the duckbill valves as indicated on the Contract Drawings.
- e. Manufacturers:
 - 1) J & S Valve, Inc., Model DBV-09-SI, <http://www.jandsvalve.com/>.
 - 2) General Rubber Corporation, Style 4350, <http://www.general-rubber.com/>.
 - 3) Tideflex Technologies, Series 37G, <http://www.tideflex.com>.
 - 4) Manufacturer providing an equivalent product approved by the Program/Project Manager.

2.03 FABRICATION

A. Shop Fabrication:

1. Cement Pipes:

- a. Prior to manufacturing reinforced concrete pipe (RCP) or non-reinforced concrete pipe (NRCP), submit 4 sets of layout drawings to the Program/Project Manager for approval.
 - 1) For tongue in groove concrete pipe, indicate the maximum annular space between the tongue and groove that provides 50 percent overlap of the manufacturer's designed full seat position.
 - 2) Show pipe stubs.
 - 3) Either show catch basin connector pipe, or furnish a list of catch basin connector pipes that includes the following:
 - a) Pipe size and D-load.
 - b) The station where the pipe joins the main line.
 - c) The number of the section of pipe, the length of the section, and the type of section such as straight, horizontal bevel, vertical bevel, or other similar description.
- b. Mixing and Placing Concrete:
 - 1) Store the cement for manufacturing reinforced concrete pipe (RCP) or non-reinforced concrete pipe (NRCP) in a watertight, dry, well-ventilated structure.
 - 2) Do not use cement having a temperature above 150 degrees Fahrenheit to fabricate cement pipes until the cement cools below that temperature.
 - 3) Do not use cement salvaged by cleaning cement sacks to manufacture cement pipes.
 - 4) Do not use cement containing lumps to manufacture cement pipes.
- c. Curing Reinforced Concrete Pipe (RCP) or Non-Reinforced Concrete Pipe (NRCP):
 - 1) Do not commence curing reinforced concrete pipe (RCP) or non-reinforced concrete pipe (NRCP) until the concrete has attained its initial set, but not sooner than 1 hour or later than 8 hours after the concrete was placed.
 - 2) Either steam curing or water curing can be used.
 - a) Steam Curing:
 - (1) Furnish an adequate steam plant, piping, enclosures, and other curing facilities for curing the concrete pipe.
 - (2) Maintain the temperature between 110 and 150 degrees Fahrenheit in the enclosures.
 - b) Water Curing:
 - (1) If the reinforced concrete pipe (RCP) or non-reinforced concrete pipe (NRCP) is not immediately water cured after placing the concrete, except for the joint surfaces that will be grouted, seal the surfaces of the concrete with an approved white pigmented sealing compound complying with the *material* requirements specified in Section 726, "Concrete Curing materials", in the MAG

Uniform Standard Specifications for Public Works Construction.

- (2) Keep the reinforced concrete pipe (RCP) or non-reinforced concrete pipe (NRCP) wet during daylight hours.
 - (a) Unless the concrete pipe is kept constantly and completely wet with fog sprays during daylight hours, cover the concrete pipe, including the ends, with burlap for the first 3 days after placing the concrete.
- 3) Limit the temperature rise of the concrete to 30 degrees per hour.

2.04 SOURCE QUALITY CONTROL

A. Tests and Inspections:

1. Tests:

- a. Certain materials require testing according to the methods referenced below, or as required by Program/Project Manager, in compliance with Section 01400, Quality Requirements.
 - 1) Each pipe manufacturer must have facilities to perform the tests listed.
 - 2) The Program/Project Manager reserves the right to require the manufacturer to perform an additional number of tests as the Program/Project Manager deems necessary to establish the quality of the material offered for use.
- b. Factory testing of the pipe materials may be witnessed by the Program/Project Manager:
 - 1) Concrete Pipe Hydrostatic Tests:
 - a) At the discretion of the Program/Project Manager, hydrostatic tests may be required for reinforced concrete pipe (RCP) and/or non-reinforced concrete pipe (NRCP).
 - (1) Submit certification of the hydrostatic leak tests performed for all pipe joints.
 - b) Test Procedure:
 - (1) Hydrostatically test reinforced concrete pipe (RCP) and/or non-reinforced concrete pipe (NRCP) in accordance with the test methods specified in ASTM C 14.
 - c) Acceptance Criteria:
 - (1) Reinforced concrete pipe (RCP) and non-reinforced concrete pipe (NRCP) meeting the requirements specified herein will be acceptable.
 - 2) Duckbill Valve Hydrostatic Tests:
 - a) Test Procedure:
 - (1) Have a certified testing laboratory perform hydraulic tests on a minimum of 4 valves similar in design and stiffness as those proposed for the work of this Contract to validate

- the headloss characteristics, flow capacities, and jet velocities.
- b) Acceptance Criteria:
 - (1) Have the laboratory submit certified test reports certifying that the values on the manufacturer's published Product Data are accurate to the Program/Project Manager for information.
 - 3) Loading Test:
 - a) Test Procedure:
 - (1) Load test non-reinforced concrete pipe in accordance with the test methods specified in ASTM C 14.
 - b) Acceptance Criteria:
 - (1) Non-reinforced concrete pipe meeting the requirements specified herein will be acceptable.
 - 4) Acceptance Test for Standard Design Reinforced Concrete Pipe:
 - (1) Test Procedure:
 - (a) If the modified or special design method specified in ASTM C 76 is elected for designing the pipe, refer to Subparagraph 2.04.A.1.b.2.b. for acceptance on the basis of material tests and inspection of manufactured pipes for defects and imperfections.
 - (b) Test reinforced concrete pipe in accordance with the test methods specified in ASTM C 76.
 - (c) Concrete cylinders may be made and tested to determine the general quality of the concrete and release dates for shipping the pipe.
 - (2) Acceptance Criteria:
 - (a) Acceptance will be based on the criteria specified in ASTM C 76, the Specifications, and the following:
 - i. Slump must be less than 4 inches to preclude excessive segregation of the materials and so homogeneous concrete will result.
 - ii. The opening crack resulting from the D-Load Test must be relatively parallel to the pipe axis, and when measured at close intervals must not exceed 0.01 inch for a distance of 1 foot.
 - 5) Acceptance Test for Modified or Special Design Reinforced Concrete Pipe:
 - a) Test Procedure:
 - (1) For reinforced concrete pipe designed according to the modified or special design method of ASTM C 76, test the pipe in accordance with the procedures specified in Section 735.7.L of the MAG Uniform Standard Specifications for Public Works Construction.

- (2) This test procedure is permitted to be performed only once for each pipe manufacturer.
 - (3) The Program/Project Manager will select 1 joint of each size and D-load to test.
 - (4) Each joint selected will be tested for strength by the 3 edge bearing method specified in ASTM C 497.
 - (5) Do not place reinforcing steel in the test section to control shear cracks.
 - b) Acceptance Criteria:
 - (1) Edge bearing test results that confirm the design for the D-load will indicate the pipe represented by the test is acceptable; pipe sections failing in compression or shear before reaching the specified D-load are unacceptable.
 - (2) If a section fails the test, additional sections of the same size diameter and class may be tested until the D-load requirements are achieved.
 - (3) Slump must be less than 4 inches to preclude excessive segregation of the materials and so homogeneous concrete will result.
 - (4) The opening crack resulting from the D-Load Test must be relatively parallel to the pipe axis, and when measured at close intervals must not exceed 0.01 inch for a distance of 1 foot.
 2. Inspections:
 - a. The Program/Project Manager may inspect the pipe at the mill or warehouse where the pipe and pipe materials are manufactured or stored.
- B. Non-Conforming Work:
1. Reinforced Concrete Pipe:
 - a. Porous or honeycomb areas of the concrete 6 inches or less in diameter may be repaired; pipe having porous or honeycomb areas greater than 6 inches in diameter are unacceptable, and are reason to reject the pipe in question.
 - b. Cracks in the Pipe:
 - 1) Cracks exceeding 1 foot in length that go completely through the pipe are unacceptable, may not be repaired, and are cause for rejecting the pipe, except that a single end crack not exceeding the depth of the joint measured from the end to the inside shoulder is acceptable.
 - 2) Cracks that are 0.01 inch wide, 1/16 inch deep or deeper, and at least 1 foot long are unacceptable; and are reason to reject the pipe in question.
 - a) A single hairline crack less than 0.01 inch wide, and not extending to the reinforcing steel for at least 1 foot long are acceptable without repair.

- c. Blisters:
 - 1) Pipe joints having blisters larger than 1/4 of the interior surface are unacceptable, pipe joints having blisters 1/4 or less of the interior surface may be repaired.

C. Manufacturer Services:

- 1. Corrugated Steel Pipe (CSP) Preconstruction Demonstration:
 - a. For Contracts using concrete-lined corrugated steel mainline storm drain pipe, perform a preconstruction demonstration at the pipe manufacturer's plant prior to installing the pipe.
 - 1) Perform the demonstration in the presence of the Contractor's Superintendent and pipeline installer, the Program/Project Manager, and a representative of the pipe manufacturer.
 - 2) Demonstration Procedure:
 - a) Connect 2 pieces of pipe using O-rings and hugger bands in accordance with the manufacturer's recommendations for watertight installations.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Prior to performance of the actual work, carefully inspect the entire Site.
 - 2. Locate existing exposed and buried active utilities, and determine the requirements for their protection, or their disposition with respect to the Work of this Section.
 - a. Prior to performing excavation operations, contact Arizona Blue Stake to verify the location or existence of buried utilities and avoid damage to the utilities.
 - 1) Arizona Blue Stake may be contacted by telephone at (602) 263-1100.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Maintain and protect traffic on active streets and roads in accordance with the requirements specified in Section 01555, Traffic Control.
 - 2. Conduct construction operations in a manner that prevents injury to adjacent buildings, structures, other facilities, and persons.
 - a. If public safety could be endangered during the progress of the construction work, provide adequate protective measures to protect public pedestrian and vehicular traffic on streets and walkways.
 - 1) Provide warning signs, signals, and barricades conforming to requirements of Federal, State and local laws, rules, regulations, precautions, orders, and decrees.

- b. Leave all sidewalks, curbs, pavement, and shoring of these and similar items in place and properly braced except as otherwise indicated in the Contract Drawings.
 3. Maintain existing utilities indicated to remain on the Contract Drawings, and protect them against damage.
 - a. Coordinate with the local utility companies for necessary relocation of utilities.
 - b. Protect existing fire control hydrants and repair damaged hydrants.
 - c. If a conflicting utility not shown on the Contract Drawings is discovered during the course of the Work, notify the Program/Project Manager as soon as possible.
 - 1) The Program/Project Manager will negotiate to have the owner of the conflicting utility relocate it, have others relocate the utility, change the alignment or grade of the trench to avoid the conflict, or declare the work to resolve the conflict as extra work.
 4. Unless otherwise indicated in the Contract Documents, maintain all underground and overhead utilities in continuous service throughout the duration of the Contract, and take responsibility and accept liability for damages or interruptions of service caused by the construction.
 - a. Keep all active utilities in service.
 - 1) Protect active utilities, improvements, and services from damage.
 - b. Do not interrupt existing utilities serving occupied or used facilities, except when authorized in writing by the authorities having jurisdiction.
 - c. During interruptions to existing utilities, provide temporary services acceptable to governing authorities.
 - d. Provide permanent pipe supports for sewer, water, and other utility lines where shown on the Contract Drawings and at other locations as deemed necessary by the Program/Project Manager.
 - 1) Provide permanent pipe supports in accordance with the details shown on the Contract Drawings, the MAG Uniform Standard Details for Public Works Construction, and the Phoenix Supplemental Standard Details for Public Works – Construction.
 - e. Adequately support electronic, telephonic, telegraphic, electrical, oil, and gas lines encountered; and avoid damaging plastic pipe, pipe-way, and conduits during foundation preparation, bedding placement and backfilling operations.
 - 1) Support plastic pipe and electrical conduit continuously along the bottom of the pipe or conduit.
 - 2) Support metal pipe and electrical conduit either continuously or suspend the pipe or conduit from nylon webbing spaced at intervals not more than 10 feet apart.
 - f. If a utility or appurtenance is to be temporarily or permanently relocated or shut down, the Contractor is responsible for making the necessary arrangements and agreements with the owner of the utility and its reconstruction at no increase in the Contract Price.

- 1) Reconstruct the utility or appurtenance and the property to its previous condition or better as soon as possible.
- 2) The relocation or shutdown and restoration cycle is subject to inspection and approval by both the Program/Project Manager and the owner of the utility.

B. Surface Preparation:

1. Dust Control:

- a. Control fugitive dust by applying an adequate dust palliative, such as water, to the ground and debris in an amount sufficient to maintain dust as incidental to demolition and lot clearing operations in accordance with the requirements of the Maricopa County Air Pollution Regulations and with the requirements of other authorities having jurisdiction.
 - 1) Sprinkle water, use temporary enclosures, and employ other suitable methods to limit dust and dirt rising and scattering into the air to the lowest practical level.

2. Trench Excavation:

- a. Perform the excavation required for the installation of piped storm drainage as specified in Section 02613, Trenching and Backfilling.
 - 1) If the trenches are over-excavated, fill the trench with select materials complying with the requirements specified in Section 02721, Aggregate Base Course, and as shown on Detail No. P1200 and others Details as applicable in the Phoenix Supplemental Standard Details for Public Works – Construction.
 - 2) When the fine grading of trench bottoms is being performed, ensure that the trench is dry.
- b. Cast-In-Place Concrete Pipe (CIPP) Trench Excavation:
 - 1) Excavate trenches for the cast-in-place concrete pipe (CIPP) with neat vertical sides and semi-circular bottoms shaped to form the bottom outside of the pipe on the alignment, and to the grades indicated on the Contract Drawings.
 - a) Shape the bottom to provide the full form of the pipe, and to provide uniform support of the bottom 210 degrees of the pipe circumference by undisturbed earth or compacted fill.
 - b) The tolerance for departure from and return to the established grade of the finished pipe trench and the invert of the installed pipe is 1 inch in 10 linear feet, and a maximum allowable departure of 0.10 foot.
 - (1) Departure from and return to the specified alignment for the trench and pipe may not exceed the allowable tolerances specified for the grade.
 - c) The density of the fill must be at least 5 percent greater than the natural in-place soil, but not less than 85 percent when tested in accordance with Method A of AASHTO T 99 and AASHTO T 191, or ASTM D 2922 and ASTM D 3017.

- 2) If the cast-in-place concrete pipe (CIPP) must be installed in rocky areas, areas where sand sloughs off, or areas where soft or spongy soil is encountered, then remove the rock, and or soft or spongy soil by over-excavating the objectionable material, and providing and compacting suitable fill material to leave a minimum 6-inch cushion of compacted soil between the excavated trench and the pipe.
 - a) Completely fill areas left void by rock removal with compacted fill, then re-excavate the trench for the pipe.
 - b) If the rock below the subgrade is fractured or fragmented, or if it consists of large cobblestones or boulders, then select the replacement fill to have a gradation that will not settle downward caused by fluctuations in the water table.
 - c) Do not use expansive soils for fill.
- 3) If the cast-in-place concrete pipe (CIPP) must be installed in areas where expansive clay is encountered, thoroughly moisten the clay and maintain the moisture by ponding to completely expand the soil until the concrete is placed.
- 4) Reinforced concrete pipe (RCP) or unreinforced concrete pipe may be substituted for the cast-in-place concrete pipe (CIPP) in the unsuitable areas.
- c. Excavate trenches in rock at least 25 feet in advance of pipe laying operations.
3. Prior to placing bedding or laying pipe in trenches, remove water and debris from the finished trench.

3.03 INSTALLATION

- A. Installation in State highway right-of-way must conform to Arizona Department of Transportation permits and the requirements of the ADOT Standard Specifications for Road and Bridge Construction.
- B. Installation or pipe in the laterals of the Salt River Valley Water Users' Association Salt River Project (SRP) or other irrigation districts must conform to permits and specifications of SRP or the respective irrigation district.
- C. Pipe Bedding:
 1. Place and compact bedding for storm drain lines in accordance with the requirements of Section 02316, Trenching and Backfilling, as shown on the Contract Drawings, or as otherwise indicated, except as follows:
 - a. Before pipe joints are made, bed each section of pipe for the full length of the barrel.
 2. Special Bedding for Mainline Storm Drain Pipe:
 - a. Except for cast-in-place concrete pipe (CIPP) and catch basin connector pipes, bed mainline storm drain pipe in a controlled low

strength material (CLSM) as specified in Section 02316, Trenching and Backfilling.

- 1) Provide CLSM having a minimum slump of 8 inches, and a compressive strength between 25 psi and 100 psi based on a 28-day test.
 - b. Place the controlled low strength material (CLSM) at least from the outside bottom of the pipe to the springline of the pipe.
 - c. The Contractor may elect to excavate a trench having a cross section with a rounded rather than a flat bottom, if a 6-inch minimum clearance between the outside wall of the pipe and the trench wall is maintained.
 - 1) The minimum trench clearance on each side of the pipe at the pipe springline for all pipe sizes may be reduced from the clearance to specified in Section 02316, Trenching and Backfilling, to 6 inches if this option is elected.
 - d. The Contractor may elect to provide either controlled low strength material (CLSM) or crushed aggregate bedding materials as specified in Section 02316, Trenching and Backfilling, from the pipe springline to 1 foot over the outside top of the pipe.
 - 1) If this option is elected for high density polyethylene (HDPE) pipe or for corrugated steel pipe (CSP), the leakage test for pipes embedded using this option is not required.
3. Pipe Bedding Compaction:
- a. If water consolidation of the bedding is allowed by the Program/Project Manager, the bedding for conduits 24 inches or less in inside diameter may be placed in a single lift, but for larger conduits the first lift may not exceed the spring line of the pipe.
 - b. For mechanical consolidation of the bedding, the moisture content of the bedding must be within the range of plus 2 percent to minus 4 percent of the optimum moisture content prior to the material being placed.
 - 1) The first lift may either be 8 inches or 2/3 of the distance to the spring line of the pipe, whichever is greater.
 - 2) Lifts succeeding the first lift may not exceed 1 foot of material in the un-compacted, loose state.
 - 3) Prevent damage to and movement of the conduit by the compaction equipment.
 - c. When placing pipe bedding for high density polyethylene (HDPE) pipe and fittings, deposit the bedding material in loose lifts of 8 inches or less, and thoroughly and carefully compact the bedding material equally around both sides of the pipe.
 - 1) Use approved vibratory compactors, or other tools and equipment where applicable; or shovel slicing if approved by the Program/Project Manager, to reach compaction densities as

specified in Section 02316, Trenching and Backfilling, or as otherwise been shown on the Contract Drawings.

- 2) Continue this procedure until enough material has been placed and compacted to reach the top of the corrugated HDPE pipe.

D. Laying Pipe:

1. Furnish and use proper and suitable tools and appliances for properly and safely handling and lowering pipe into trenches and laying the pipe.
2. Provide pipe of the type, class, and size indicated on the Contract Drawings.
3. Lay pipe firmly, proceeding upgrade true to line and grades indicated on the Contract Drawings.
 - a. Use a laser to facilitate installing storm drain lines to the line and grades indicated.
 - b. Lay bell and spigot pipe with the spigot end pointing in the direction of flow.
 - c. Lay tongue and groove pipe with the groove end upgrade.
4. Ensure that each length of pipe abuts against the next so that no shoulder or unevenness of any kind occurs along the inside bottom half of the pipeline.
 - a. To prevent sudden offsets of the flow line, lay each pipe to form a close concentric joint with the adjoining pipe.
5. When pipe is being laid, no wedging or blocking is permitted unless by written order of Program/Project Manager.
 - a. Make adjustments to line and grade, scrape away or fill in under the body of the pipe.
6. Excavate recesses so the pipe invert forms a continuous grade with the invert of the pipe previously laid.
7. Dig bell holes sufficiently large to permit proper joint making, and to ensure the pipe is firmly bedded for the full length of its barrel.
8. High Density Polyethylene (HDPE) Pipe Installation:
 - a. Install high density polyethylene (HDPE) pipe in accordance with the requirements of ASTM D 2321 or the manufacturer's recommendations.
 - b. If the pipe is out-of-round, orient the pipe so the long axis is vertical when the pipe is installed in the trench.
9. Corrugated Steel Pipe (CSP) Installation:
 - a. Do not lay corrugated steel pipe (CSP) except in the presence of the Program/Project Manager's inspector.
 - 1) To determine if damage has been done to the exterior coating that will be concealed once the pipe is placed, each length of pipe will be carefully inspected immediately prior to its being placed in the trench.
 - b. Install elliptical pipe so the major or minor axis, as the case may be, coincides with the survey alignment of the trench excavation.

- 1) The major and minor axes should be indicated by suitable markings on the top of each end of the pipe section.
- c. Lay corrugated steel pipe (CSP) and/or pipe arches so the outside laps of circumferential joints point upstream, longitudinal laps are on the side, and the joint space between separate sections does not exceed 1/2 inch.
- d. Where a curved alignment is indicated in the corrugated steel pipe (CSP), form the curve using straight pipe and specials.
 - 1) Provide pipe lengths so no deflection angle in the pipeline exceeds 10 degrees.
 - 2) Locate deflection angles between the point of curvature and the point of tangent of the curve as shown on the Contract Drawings.
- e. Pipe Elongation:
 - 1) Take advantage of the buildup of side support as a pipe settles back toward a full round shape under the backfill load, elongate pipe 5 percent of the nominal diameter plus or minus 1/2 percent.
 - a) Methods or techniques for achieving and releasing the elongation are at the option of the Contractor.
 - 2) After backfill placement and compaction is completed, do not allow the vertical dimension of the pipe to be less than the nominal diameter of the pipe, or more than 5 percent greater than the nominal diameter shown on the Contract Drawings or specified elsewhere in this Section.
- f. Cutting corrugated steel pipe (CSP):
 - 1) Whenever possible, fabricate connections in the shop to minimize fire hazards caused by field cutting operations.
 - 2) Either saw cut the pipe, or use special tools that will not expose the pipe to the fire hazard of a normal acetylene torch to cut the pipe.
 - a) Due to the fire hazard posed by conventional cutting torches, their use to cut the pipe is prohibited.
- g. Apply bituminous mastic to metal in the joints not thoroughly protected, to coupling band bolts, and to damaged areas of the coupling bands and pipe prior to placing the backfill on the pipe.
10. Locate fittings as shown on the Contract Drawings, or as directed by the Program/Project Manager, and install them in accordance with the MAG and COP Standard Details.
11. After setting each length of pipe, verify the alignment and grade of the by measuring from a laser beam target, string line, or other means approved by the Program/Project Manager.

E. Joining Pipe:

1. Keep trenches water-free during joint and coupling installation.
2. Do not bring succeeding pipe into position until the preceding length is embedded and securely in place.
3. Gasketed Joints:

- a. Prior to making gasketed joints, clean, dry, and prepare the joint surfaces in accordance with the manufacturer's recommendations; and carefully center the joints.
 - b. Make joints absolutely watertight.
4. Reinforced Concrete Pipe (RCP) and Non-Reinforced Concrete Pipe (NRCP) Joints:
 - a. Cement Mortar or Grout Joints:
 - 1) O-ring gasket and profile gasket/single offset joints do not need to be mortared and grouted.
 - 2) Tongue in groove joints need to be butted together and mortared and grouted as follows:
 - a) Thoroughly clean and wet pipe ends before placing mortar and grout.
 - b) Overlap the tongue in the groove portion not less than 50 percent of the manufacturer's designed full seat position.
 - c) Unless the pipe is used on curves or angle points, tongue in groove joints do not need to be grouted on the outside.
 - (1) For curves or angle points, grout the outside of the pipe, or provide a concrete collar, as determined by the Program/Project Manager.
 - d) If the joints need to be grouted, completely fill the annular space between pipe section with mortar, and finish the inside pipe surface so it is smooth.
 - (1) Fill the entire depth of the finished joint with mortar so a strong, tight joint results.
 - e) Do not mortar joints until the next 2 joints are in place.
 - f) Cure mortar joints by keeping them wet for 3 days, or by using an approved curing compound.
5. High Density Polyethylene (HDPE) Pipe Joints:
 - a. Furnish wood blocking to protect high density polyethylene (HDPE) pipe when the HDPE pipe jointing is performed by pipe jacking, back hoe bucket, come-along, or cable pipe puller.
6. Corrugated Steel Pipe (CSP) Joints:
 - a. Join corrugated steel pipe (CSP) together using annular corrugated type bands or hugger type bands that lock in at least 1 annular corrugation.
 - 1) Tighten the bands evenly by keeping equal tension on the bolts.
 - b. Keep corrugated steel pipe (CSP) joints uncovered for a period of time designated by the Program/Project Manager so the nuts can be tested for tightness.
 - 1) If a nut loosens its grip on its bolt, retighten it and keep the joint uncovered until the connection's tightness can be retested.
 - 2) Once a tight, permanent joint is obtained, the joint may be covered.

- a) Prior to backfilling around the joint, coat the bolts, lugs, and nuts with bituminous mastic.
 - c. After bituminous coated pipe has been joined, fill the annular space between the abutting pipe sections with bituminous mastic.
 - d. After concrete lined pipe has been joined, mortar the internal joints completely around the pipe to a smooth trowel finish.
- 7. Joints for Ductile Iron Storm Drain Pipe:
 - a. Assemble storm drain pipe joints in accordance with the manufacturer's installation instructions and indicated reference standards.
- 8. Provide horizontal and vertical long-radius curves formed using bevel adapters or by beveling the strait pipe joint.
 - a. Provide bevels not exceeding 5 degrees, and limit the total angular deflection for beveled pipe to 10 degrees.
 - b. Small angular changes may be made with straight pipe provided the joint opening does not exceed 3/4 inch.
- 9. Provide horizontal and vertical short-radius curves formed using fabricated specials.
 - a. Limit the angular deflection of each segment of the fabricated section to 10 degrees.
- 10. Joint Deflections:
 - a. Pulling joints to deflect mainline storm drain pipe is only allowed if the manufacturer's specifications for horizontal deflection and tolerances are indicated on the Contract Drawings.
 - b. A vertical or horizontal angular bend in catch basin connector pipe up to and including 22-1/2 degrees may be made in accordance with Detail No. 505 in the MAG Uniform Standard Details for Public Works Construction.
 - c. Provide prefabricated pipe bends for deflections in catch basin connector pipes greater than 22-1/2 degrees.
- 11. Submit the manufacturer's joint preparation instructions.

F. Duckbill Valves:

- 1. Install the duckbill valves in accordance with the manufacturer's installation recommendations and instructions.
 - a. Submit the duckbill valve manufacturer's installation recommendations and instructions to the Program/Project Manager for information.
- 2. Insert the duckbill check valves into existing pipes where shown on the Contract Drawings.
- 3. Align the bill opening so it is vertical to maintain symmetrical loading on each side of the valve.
 - a. Do not rotate the valve out of vertical alignment to avoid peripheral interferences.

G. Backfilling and Compaction:

1. Backfill and compact storm drain lines in accordance with the requirements of Section 02316, Trenching and Backfilling.
 - a. For high density polyethylene (HDPE) pipes having nominal diameters from 8 inches to 120 inches, and which have bedding and backfill consisting of coarse aggregate, use only mechanical compaction methods to consolidate the bedding and backfill.
 - 1) Do not use water consolidation for compacting coarse aggregate, whether the coarse aggregate is used as a foundation, bedding, or backfill material.
 - 2) If other than coarse aggregate is used as backfill material, use mechanical compaction methods to consolidate the backfill.
 - a) Water consolidation may be used to compact backfill materials other than coarse aggregate only when prior approval to do so is received from the Program/Project Manager.
2. Do not backfill around mortared and grouted joints until the joints have been fully inspected and approved.

H. Special Techniques:

1. Jacking Pipe:
 - a. At locations where pipe is to be installed by boring and jacking pipe, follow the requirements specified in Section 02445, Boring or Jacking Conduits, with the following additional requirements:
 - 1) Where pipe is indicated on the Contract Drawings to be bored and jacked into place, provide reinforced concrete or other pipe of the strength specified.
 - a) Provide circular reinforcing steel of either a single or double cage design in the concrete conduit.
 - b) The design strength indicated is based upon the superimposed loads, and not upon loads imposed on the pipe as a result of jacking operations; any increase in conduit strength necessary for the conduit to withstand additional loading due to boring and jacking operations is the responsibility of the Contractor to determine.
 - 2) Provide conduit manufactured with 3 grout holes per 8-foot section of pipe.
 - 3) Place spacer blocks in the inside circular space between concrete conduit sections to equalize the pressure during jacking operations, and to allow sufficient width for point mortaring once the jacking operation is completed.
 - 4) For steel pipe 36 inches in diameter and larger, provide band type joints and double rubber gaskets.
 - 5) Make 1 hole located on the top of the concrete conduit midway between the ends of the bored and jacked conduit, and make 2 additional holes each located approximately 1.5 feet from each end and midway between the springline and top on opposite sides of the conduit.

2. Constructing Cast-In-Place Concrete Pipe (CIPP):
 - a. Do not construct cast-in-place concrete pipe (CIPP) unless the Program/Project Manager is present.
 - b. Construct cast-in-place concrete pipe with as few starts and stops as possible.
 - 1) Operate the cast-in-place concrete pipe machine at speeds and in a manner to smoothly and steadily place concrete.
 - 2) Schedule material deliveries to support continued production.
 - c. Furnish an anchoring system for the pulling system of the cast-in-place concrete pipe machine to minimize the probability of deviations in grade and/or alignment.
 - 1) Adjust or modify the anchoring system when required in the opinion of the Program/Project Manager.
 - d. Prior to placing concrete in the trench, adequately moisten the soil in the trench prior to placing concrete in the trench so water is not drawn from concrete freshly placed, and thoroughly moisten forming devices, including slipforms and the hopper of the placement device.
 - 1) Keep the trench free of excess water, mud, and debris.
 - e. Ensure that means of removing sloughed material, debris, and other foreign objects from the trench before and during concrete placement so material does not build up in front of the cast-in-place concrete pipe machine.
 - 1) Dig small transverse trenches across the trench bottom spaced no more than 25 feet apart to receive soil that builds up and is pushed ahead of the slipform.
 - f. Monolithically construct the entire cross section of the pipe in 1 placement.
 - 1) Furnish inside forms that are sufficiently rigid to withstand consolidation of the fresh concrete.
 - 2) Place concrete so a thoroughly consolidated homogeneous concrete mixture is produced.
 - a) Apply an effective means to consolidate fresh concrete within the pipe shell and over its entire circumference.
 - b) Furnish means of placing and consolidating fresh concrete at production speeds, while providing sufficient pressure to effectively bond the concrete to the surrounding earth and keep loose sand, mud, and water out of the pipe shell.
 - g. If the vibrators on the cast-in-place concrete pipe machine become inoperable, cease installing the pipe immediately; and do not furnish portable vibrators or stingers as the sole source of consolidation.
 - 1) Only use portable vibrators or stingers to supplement the internal vibrators on the cast-in-place concrete pipe machine.
 - h. Construction Joints:
 - 1) Whenever pipe placement ceases for longer than 90 minutes, form a construction joint as follows:

- a) For joints that will connect to another pipe or structure, square off the end of the pipe, and excavate along the sides and bottom of the pipe to permit casting a concrete collar around the construction joint.
- b) For joints that will not connect to another pipe or structure, slope the pipe ends so the ends slope between 20 and 45 degrees.
- c) Leave the ends that will butt against the next concrete placement in a rough condition.
 - (1) For pipes 42 inches or less in diameter, embed Number 4 reinforcing steel bars at 12 inches on center in the current pour, and extended them 12 inches into the space for next pour.
 - (2) For pipes greater than 42 inches in diameter, embed Number 4 reinforcing steel bars at 18 inches on center in the current pour, and extended them 12 inches into the space for next pour.
- d) Immediately prior to resuming concrete placement, clean the surface to be bonded of all laitance, coatings, foreign materials, and loose or defective concrete; and thoroughly wet and apply a 1/4-inch thick coating of bonding mortar, or wet and scrub neat cement paste onto the surface of the previously placed concrete.
- i. Curing Cast-In-Place Concrete Pipe (CIPP):
 - 1) Cure the cast-in-place concrete pipe while preventing premature drying of the concrete.
 - 2) Immediately after the pipe is cast, anchor sheet curing material in place on the exposed top surface of the pipe by using loose soil to assure continuous and adequate curing.
 - 3) Maintain a humid atmosphere within the pipe, indicated by condensation forming on the interior surface of the pipe, for at least 7 Days following placement, except during the 24 hour period allowed for removing forms and making repairs.
 - a) Except when work is in progress inside the pipe, keep all openings, ends, manholes, and connector pipes closed or securely covered to prevent drafts which may dry the pipe and to maintain a humid atmosphere in the pipe.
 - b) During the curing period when work is not being performed on the inside of the pipe, partially fill the pipeline with water.
- j. Removing Cast-In-Place Concrete Pipe (CIPP) Formwork:
 - 1) If metal inner forms were used, remove the forms within 4 to 6 hours of placing concrete, and start repairing, finishing, and patching the pipeline to conform to specified requirements.
 - 2) If pneumatically inflated inner liner is used to form the cast-in-place concrete pipe, remove the pneumatic inner liner within 12

- hours of placing concrete, and start repairing, finishing, and patching the pipeline to conform to specified requirements.
- k. Backfilling Cast-In-Place Concrete Pipe (CIPP):
 - 1) Do not finally backfill the cast-in-place concrete pipe and compact the backfill until the concrete has developed a compressive strength of at least 3000 psi.
 - 2) After the pipe has properly cured, backfill and compact the fill to an even grade.
 - l. Finishing Cast-In-Place Concrete Pipe (CIPP):
 - 1) Except for the form offsets, provide a better than wood float finish on the interior of the pipe.
 - 2) Trim form offsets to provide a reasonably tapered slope from surface to surface.
 - 3) Finish the bottom of the pipe below the metal forms to conform to the general circular circumference of the pipe without sags, dips, and humps.
 - 4) Remove all extraneous concrete from the interiors surface.
3. Structures:
- a. Provide inlets, manholes, and similar reinforced concrete structures to be built underground as part of the storm sewer as indicated on the Contract Drawings, MAG Standard Details, and COP Standard Details; and that comply with the material requirements specified in Section 505, Concrete Structures, in the MAG Uniform Standard Specifications for Public Works Construction.
 - 1) Provide castings that comply with the *material* requirements specified in Section 787, Gray Iron Castings, in the MAG Uniform Standard Specifications for Public Works Construction as modified by the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - 2) Provide reinforcing steel that complies with the requirements specified in Section 03200, Concrete Reinforcement.
 - 3) Storm drain manhole shafts constructed in accordance with MAG Standard Detail No. 522, Storm Drain Manhole Shaft, except that unreinforced 6-inch thick precast Class A concrete shaft pipe and cones are substituted for the 4-inch wall thickness shown in the Detail, and that do not include the steps are acceptable.
 - b. Provide through manholes, lateral manholes, or transition manholes at the locations indicated on the Contract Drawings, complete in place including the required base, shaft, reinforced concrete rings, frames and covers, concrete caps, frame adjustment to grade, and similar items as indicated on the Contract Drawings and Phoenix Supplemental Standard Details for Public Works - Construction.
 - 1) Do not install steps in the manholes; if steps have been installed, remove them and fill the holes with Class B concrete or epoxy.
 - c. Structures in Corrugated Steel Pipelines:

- 1) For manholes larger than 48 inches in diameter in corrugated steel pipelines, the Contractor may elect to construct transition manhole bases using a prefabricated transition manhole base cast with a 48-inch stubbed manhole shaft as 1 structure having dimensions equivalent to those shown on Detail No. P1560 in the Phoenix Supplemental Standard Details for Public Works - Construction.
 - a) If this option is elected, submit a Shop Drawing of the storm drain manhole base to the Program/Project Manager for approval.
 - (1) Corrugated steel manholes are not permitted unless a detail of the construction is included with the Shop Drawing and approved by the Program/Project Manager.
- 2) Layout manholes in corrugated steel pipe (CSP) so the outside edge of the manholes not located at a joint are a minimum of 1.5 pipe diameters away from the nearest joint on both sides of the manhole.
 - a) For manholes unable to be located at joints or a minimum of 1.5 pipe diameters away from the nearest joint on both sides of the manhole, extend the concrete encasement of the manhole to include the joint or joints inside the 1.5 diameter distance from the manhole shaft.
- 3) The maximum angle for a catch basin connector pipe to exit a catch basin wall is 22-1/2 degrees from perpendicular.
4. Connecting Extensions to Existing Mainline Storm Drains:
 - a. Prior to extending an existing mainline storm drain, verify the depth, size, type of pipe, and horizontal location of the existing storm drain in the field.
 - 1) If the new pipe extension is the same type and size of the existing mainline storm drain, or if the new pipe's manufacturer makes a standard watertight adapter fitting specifically manufactured to join their pipe to the existing mainline storm drain pipe type, a standard connection recommended by the manufacturer may be provided; otherwise, provide a concrete field collar to connect the pipes as shown on Detail No. 505 in the MAG Uniform Standard Details for Public Works Construction.
5. Connecting Connector Pipes to Existing Mainline Storm Drains:
 - a. Join connector pipes to existing mainline storm drains either at manholes or in accordance with Detail No. P1577 in the Phoenix Supplemental Standard Details for Public Works – Construction, or to cast-in-place pipe in accordance with Detail Number P1576 in the Phoenix Supplemental Standard Details for Public Works – Construction, or if a new reinforced concrete connector pipe whose outside diameter is greater than 1/2 the inside diameter of the existing reinforced concrete pipe main, in accordance with Detail No. P1578 in

the Phoenix Supplemental Standard Details for Public Works – Construction.

- 1) Do not use Detail No. 524, Storm Drain Lateral Pipe Connections, in the MAG Uniform Standard Details for Public Works Construction.
6. Connecting Pipes to New Storm Sewers:
 - a. When connecting pipes to new storm sewers, keep inlet connecting pipes and lateral pipes temporarily plugged until all facilities downstream have been completed to the satisfaction of the Program/Project Manager.
 - b. Connect existing storm sewers to new storm sewers at the locations indicated on the Contract Drawings, but keep the existing storm sewers intact or provide a bypass until the mainline downstream has been completed to the satisfaction of the Program/Project Manager.
 - c. Connect new mainline pipe to new mainline pipe at manholes, or special junction structures, depending on size.
 - d. Connect new mainline pipe to existing mainline pipe at manholes, special junction structures, or in accordance with Detail No. P1578 in the Phoenix Supplemental Standard Details for Public Works – Construction depending on size and the feasibility of installing the manhole or special junction structure.
7. Connecting Storm Sewers to Catch Basins:
 - a. Connect catch basin connector pipes to new mainline storm drain pipes using prefabricated tees.
 - b. One catch basin connector pipe may be joined to the mainline at a manhole if the standard required mainline manhole spacing provides a convenient location for it.
 - c. Minimize headloss and maintain the structural integrity of the mainline pipe by offsetting opposing catch basin connector pipes a minimum of 5 feet horizontally as measured from the centerline of each connector pipe.
 - 1) If there are 2 directly opposing catch basins connecting to a mainline, in the vicinity of a manhole, only 1 connector pipe may connect to the manhole and the second connector pipe must connect to the mainline at a prefabricated tee located at least 5 feet downstream of the manhole.
- I. Tolerances:
 1. Line and Grade: Plus or minus 0.10 feet.
 2. Rate of departure from or return to established grade or alignment: Less than 1 inch in 10 feet of pipe, unless otherwise approved by the Program/Project Manager.

3.04 REPAIR

- A. Remove and relay pipe that is out of alignment or grade, and pipe having disturbed joints after being laid.
- B. Remove in-place pipe sections that are found to be defective, and replace the removed pipe sections with new, good pipe.
 - 1. If any section of bored and jacked conduit shows signs of failure, remove and replace it with a new section of precast concrete conduit or with a cast-in-place concrete section.
 - a. The new precast concrete conduit or cast-in-place concrete sections must be approved by the Program/Project Manager as being adequate to carry the structural loads imposed upon them before being installed.
- C. Concrete Pipe Repair:
 - 1. Cracks allowed to be repaired may be repaired either by pressure injecting epoxy into the crack, or by chipping out a V-section to the full depth of the defect, and filling the void with an approved patching compound.
 - a. Submit the patching compound to the Program/Project Manager for approval prior to using it.
 - b. Cracks wider than 0.01 inch are assumed to indicate overstress of the reinforcing steel, and methods to repair or replace such cracks require the approval of the Program/Project Manager.
 - 1) After structural repairs have been completed, remaining cracks can be repaired as specified.
 - 2. Blisters allowed to be repaired may be repaired by first removing all loose material from the blistered area to expose the hollow area, next filling the void with fresh concrete properly bonded by using an acceptable bonding agent, then curing the repair using a membrane coating.
 - 3. Unless approved by the Program/Project Manager, using a grout "paint-like" coating to cover minor or major defects in concrete pipe is unacceptable.
- D. Cast-In-Place Concrete Pipe (CIPP) Repair:
 - 1. Clean out, moisten, and fill all rock pockets, non-longitudinal cracks, or indentations in cast-in-place concrete pipe using 1:2 cement grout or an approved epoxy material.
 - 2. Repair longitudinal cracks as required, except where, in the opinion of the Program/Project Manager, the width or length of the crack indicates a structural deficiency.
 - a. Subject to approval by the Program/Project Manager, cracks may be repaired using a pressure applied epoxy compound capable of providing structural correction to the area in addition to sealing the void.

3. Regardless of the method used to place the concrete, complete all repairs, patching, and finishing within 24 hours of placing the concrete.

E. Corrugated Steel Pipe (CSP) Repairs:

1. Repair damage to the spelter coating of corrugated steel pipe (CSP) using a zinc dust-zinc oxide coating conforming to the requirements of AASHTO M 36 and to the weight and uniformity specified in ASTM A 929/A 929M.
 - a. Repair damage resulting from strutting as directed by the Program/Project Manager at no increase in Contract Price.
2. For bituminous coated corrugated steel pipe (CSP), field repair damage to the bituminous coating or paving with approved fiber reinforced bituminous mastic to the satisfaction of the Program/Project Manager.
3. For concrete lined corrugated steel pipe (CSP), repair cracks 1/16 inch or more in width and 36 inches or more in length using an approved epoxy to the satisfaction of the Program/Project Manager.
4. Remove corrugated steel pipe (CSP) that has been damaged to the extent that, in the opinion of the Program/Project Manager, it cannot be field repaired; and replace the pipe removed with acceptable pipe at no increase in Contract Price.

F. Ductile Iron Pipe (DIP) Lining Repair:

1. Repair damaged sections of the lining of ductile iron pipe (DIP) used for sewer pipe in accordance with the requirements of Section 750.1, "Lining for Ductile Iron Sewer Pipe and Fittings", in the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.

3.05 RESTORATION

- A. Replace pavement and surfacing disturbed by storm drain installation activities in accordance with the requirements specified in Section 02316, Trenching and Backfilling.

3.06 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. Site Tests:
 - a. Leakage Test:
 - 1) High Density Polyethylene (HDPE) Pipe and Corrugated Steel Pipe (CSP):
 - a) After the first 3 installed joints of high density polyethylene (HDPE) pipe and corrugated steel pipe (CSP) mainline pipe have their bedding placed to 1 foot above the pipe, leak test the joints.
 - 2) Corrugated Steel Pipe (CSP):

- a) For concrete lined corrugated steel pipe (CSP), do not perform the leakage test until all internal joints have been filled or mortared.
 - (1) If the Contractor elects to place slurry from the springline of concrete-lined corrugated steel pipe (CSP) to 1 foot over the outside top of storm drain pipe, the leakage test for that section of pipe is not required.
- 3) Have the Material Testing Laboratory test the completed storm drain sections for leakage.
- 4) Test Procedure:
 - a) Seal off the downstream end of the line, and fill the line with water to a minimum head of 4 feet in a standpipe at the high end.
 - b) Before starting the test, allow the test section to absorb water for a period of 1 hour.
 - c) A meter or other suitable means will be used to measure the quantity of water used and lost from the line.
 - d) Allow at least 1 additional hour to perform the test after the initial hour allowed for the test section to absorb water elapses.
- 5) Acceptance Criteria:
 - a) The allowable water loss for storm drainage lines is 1.0 gallon per hour per 100 feet of pipe per inch of diameter of pipe when subjected to a head of 4 feet at the upper end of the pipe.
 - b) The allowable water loss for irrigation lines is 2.0 gallons per hour per 100 feet of pipe per inch of diameter of pipe when subjected to a head of 1 foot at the upper end of the pipe.
 - c) Storm drains leaking at a greater rate fail the test and are unacceptable.
- b. Cast-In-Place Concrete Pipe (CIPP) Wall Thickness Test:
 - 1) Test Procedure:
 - a) The top, bottom, and side wall thicknesses of cast-in-place concrete pipe (CIPP) will be randomly measure at intervals spaced approximately 100 feet along the pipeline by inserting probes into fresh concrete or small holes drilled through the concrete.
 - b) The CIPP Wall Thickness Test will be performed on a daily basis.
 - c) Properly and permanently close and seal the holes after the testing is completed flush with the inside surface of the pipe using the repair procedures specified in this Section.
 - 2) Acceptance Criteria:
 - a) Walls having the specified thicknesses are acceptable.
- c. Cast-In-Place Concrete Pipe (CIPP) Strength Test:

- 1) Test Procedure:
 - a) Test cylinders will be prepared as specified in the Concrete Strength Test for New Concrete in Section 03300, Cast-In-Place Concrete.
 - b) If the cylinder tests performed in accordance with the Concrete Strength Test for New Concrete indicate the concrete does not have the specified strength, then 14 days after the concrete was placed, cores will be taken from the section of the concrete represented by the faulty test cylinder in accordance with the Concrete Strength Test for Concrete in Place Concrete in Section 03300, Cast-In-Place Concrete, under the supervision of the Program/Project Manager.
 - (1) The diameter of the cores *should* be at least 3 times the maximum nominal size of the “coarse aggregate” used, and *must* be twice the maximum nominal size of the “coarse aggregate” used.
 - (2) The length of each specimen when capped should be twice the core diameter; do not test cores having a maximum height less than 95 percent of its diameter after capping.
 - c) If cores are taken, patch all core holes so the patch is permanent, will not leak, and has a smooth interior finish flush with the interior surface of the pipe.
- 2) Acceptance Criteria:
 - a) The strength level of the concrete cylinders will be considered satisfactory so long as the average of all sets of 3 consecutive compressive strength test results equal or exceed the specified strength f'_c , and no individual strength test result falls below the specified strength f'_c by more than 500 psi.
 - b) Concrete in the area represented by a core test will be considered adequate if the average compressive strength of the cores is equal to at least 85 percent of the specified strength f'_c , and if no single core is less than 75 percent of the specified strength f'_c .
- d. Corrugated Steel Pipe (CSP) Bituminous Coating Tests:
 - 1) Secure Samples from corrugated steel pipe (CSP) delivered, or about to be delivered, to the Contractor; or from the coating and lining facility of the pipe fabricator at the time the pipe is being coated.
 - 2) Test Procedure:
 - a) Test the bituminous coating to verify it complies with the requirements specified in AASHTO M 190 for material and thickness.
 - 3) Acceptance Criteria:

- a) Bituminous coatings complying with the requirements specified in AASHTO M 190 are acceptable.
 - b) Submit copies of the Corrugated Steel Pipe (CSP) Bituminous Coating Test results to the Program/Project Manager for information.
 - 2. Inspections:
 - a. Corrugated Steel Pipe (CSP):
 - 1) Immediately prior to laying corrugated steel pipe (CSP) in the trenches, carefully inspect the pipe for defects.
 - b. Cast-In-Place Concrete Pipe (CIPP):
 - 1) Prior to placing concrete in the trenches excavated for the cast-in-place concrete pipe (CIPP), inspect the alignment and grade of the trenches.
 - a) Submit the proposed method for controlling and verifying conformance of the grade and alignment of the trenches to the specified values to the Program/Project Manager for approval.
 - 2) Immediately following the removal of the formwork, inspect the inside of the pipeline for defects requiring repairs and for conformance to dimensional requirements.
 - a) Longitudinal cracks exceeding 0.01 inch in width and 12 inches long may, at the discretion of the Program/Project Manager, be cause for rejection, removal, and reconstruction of the defective portion of the pipeline.
 - b) The Program/Project Manager is the sole judge of whether deficiencies can be repaired or not.
 - c. High Density Polyethylene (HDPE) Pipe and Fittings:
 - 1) Inspect HDPE pipe for out of roundness.
 - 2) HDPE pipe out-of-round in excess of 3 percent of the nominal pipe diameter is unacceptable.
 - d. Prepare as-built information for the storm drainage system, and submit it to the Program/Project Manager as a record document.
- B. Non-Conforming Work
 - 1. Remove and reconstruct sections of cast-in-place concrete pipe (CIPP) the Program/Project Manager judges to be non-repairable or which are not within dimensional, alignment, grade, and/or strength tolerances.
 - 2. Do not install HDPE pipe that is out-of-round in excess of 3 percent of the nominal pipe diameter, and remove installed pipe found to be unacceptable and replace it with acceptable HDPE pipe.
 - 3. If the pipe under test fails a leakage test, repair or replace the failed section, and retest the repaired section.
 - a. Methods of repair are subject to the Program/Project Manager's approval.
 - b. Immediately repair detected leaks and defects in joints.

4. Reject corrugated steel pipe (CSP) found to be defective during inspections.

3.07 CLEANING

- A. In order to leave the pipeline clean and free from debris, garbage, rubbish, stones, deposits, and similar foreign materials, swab the conduits, flush them with water, or use other approved methods to clean the pipes.

3.08 PROTECTION

- A. Temporary Pipe Closure:
 1. At the end of each workday, place a temporary closure at the open end of all pipes.

END OF SECTION

SECTION 02637

UTILITY TRENCH DRAINS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for utility trench drains.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCE STANDARDS:

- A. American Water Works Association (AWWA):
 - 1. AWWA C110/A21.10 - American National Standard for Ductile-Iron and Gray-Iron Fittings, 3 inch through 48 inch (76 mm Through 1,219 mm), for Water.
 - 2. AWWA C111/A21.11 - American National Standard for Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
 - 3. AWWA C150/A21.50 - American National Standard for Thickness Design of Ductile-Iron Pipe.
 - 4. AWWA C150/A21.50 - American National Standard for Thickness Design of Ductile-Iron Pipe.
 - 5. AWWA C151/A21.51 - American National Standard for Ductile-Iron Pipe, Centrifugally Cast, for Water or Other Liquids.
 - 6. AWWA C153/A21.53 - American National Standard for Ductile-Iron Compact Fittings, 3 In. (76 mm) Through 64 In. (1,600 mm), for Water Service.
- B. City of Phoenix (COP):
 - 1. City of Phoenix Storm Water Policies and Standards.
- C. State of Arizona:
 - 1. Arizona Administrative Code (AAC):
 - a. AAC R18-9-A301 through E323 – Title 18 Environmental Quality, Chapter 9 Department of Environmental Quality Water Pollution Control, Article 3 Aquifer Protection Permits - General Permits.
 - b. AAC R18-9-A901 through C905 – Title 18 Environmental Quality, Chapter 9 Department of Environmental Quality Water Pollution Control, Article 9 Arizona Pollutant Discharge Elimination System.
 - 2. Arizona Department of Environmental Quality (ADEQ):
 - a. ADEQ 2008 Construction General Permit SWPPP Guidance Checklist.
- D. United States Government:
 - 1. United States Code (U.S.C.):

- a. 33 U.S.C. Section 1251 et seq.
 - 1) Water Quality Act of 1987, Public Law 100-4.
 - 2) Clean Water Act of 1977, Public Law 95-217.
 - 3) Federal Water Pollution Control Act Amendments of 1972, Public Law 95-500.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate the material sizes and installation methods of the utility trench drains with the block-outs provided in the substrates for the trench drains.
- B. Scheduling:
 - 1. Ensure that the block-outs for the utility trench drains are constructed prior to the scheduled installation of the trench drains so the Work is not delayed.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Trench drain system components and accessories.
 - b. Shop Drawings:
 - 1) Trench drain system.
- B. Informational Submittals:
 - 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Trench drain system manufacturer's storage and handling recommendations.
 - 2) Trench drain system manufacturer's recommended method(s) for suspending the assemblies in block-outs or trenches.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. The Work of this section is subject to approvals before it can be put into service and accepted as follows:
 - a. If the Project impacts water bodies, a Clean Water Act, Section 404 permit will be required by the U.S. Army Corps of Engineers.
 - b. Compliance with the Arizona Pollution Discharge Elimination System (AZDES) general permit for storm water discharges from construction sites is required.

- c. Compliance with the City of Phoenix Storm Water Policies and Standards.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. To protect the external spigot end of ductile iron pipes against abrasion and damage during shipping and handling, furnish temporary protective collars on the exterior of each spigot end of each pipe section.
 - a. Secure the temporary protective collars to the pipe to prevent accidental removal during shipping and normal handling by the Contractor.
 - b. Do not remove the temporary collars until immediately before the pipe is to be installed or field cut.
- B. Storage and Handling Requirements:
 - 1. Store and handle the utility trench drains and their accessories in accordance with the manufactures recommendations.
 - 2. Submit the trench drain system manufacturer's storage and handling recommendations to the Program/Project Manager for information.
- C. Packaging Waste Management:
 - 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

PART 2 PRODUCTS

2.01 TRENCH DRAIN SYSTEMS

- A. Manufacturers:
 - 1. Manufacturer List:
 - a. Zurn Industries, LLC, Z886-HD PERMA-TRENCH® LINEAR TRENCH DRAIN SYSTEM, www.zurn.com/operations/flothru.
 - b. Approved equal.
 - 2. Product Options:
 - a. Provide slotted grates similar to the Zurn P6-DGC- Wide Grate Item 14.
- B. Description:
 - 1. Provide a trench drain system consisting of modular channel sections having interlocking ends, radiused bottoms, and a built-in slope suitable for embedment in concrete slabs, and having a frame assembly for supporting removable drain grates.
- 2. Regulatory Requirements:
 - a. Comply with the requirements of the City of Phoenix Storm Water Policies and Standards.
- C. Performance:
 - 1. Provide a trench drain system capable of handling flow rates up to 88 gallons per minute at the location with the shallowest depth.

RFI 0736 FW Trench Drain Grate Clarification

RFI 0893 FW Trench Drain Grate Clarification

D. Design Criteria:

1. Provide a lightweight sloped trench drain system.
2. Submit Product Data for the trench drain system, including its components and accessories, to the Program/Project Manager for approval.
3. Submit Shop Drawings of the trench drain system, including its layout and sequence, details, and component identification, to the Program/Project Manager for approval.
 - a. Include unique identification numbers for each component of the system on the Shop Drawings.

E. Materials:

1. Frame:
 - a. Provide heavy-duty frames having anchor studs designed for embedment in the surrounding concrete attached, and having tie straps laterally spanning the frame.
 - b. Provide a system for properly aligning the trench drain frame and modular channel sections within the blockout or trench constructed for containing the trench drain system.
 - 1) Provide either a rebar clip system consisting of rebar clips on each side of the modular channel sections and designed to receive rebar "stakes" to support and level the trench drain assembly, or another system with similar capabilities.
 - c. Provide appropriate hardware to connect the frame assembly and modular channel sections together.
2. Modular Channel Sections:
 - a. Provide 6-inch wide modular channel sections with 4-inch throats fabricated from fiber reinforced polyester (FRP) fiberglass, and designed with interlocking ends that mate with adjoining sections.
 - b. Provide modular channel sections having sloped bottoms to promote fluid flow along the length of the section.
3. End Caps:
 - a. Provide end caps designed to fit the ends of the modular channel sections, cut to the appropriate height.
4. Outlets:
 - a. Provide end outlets designed to fit the ends of the modular channel sections, cut to the appropriate height, and having outlet diameters sized to fit with the mating drain piping.
 - b. Provide bottom outlets designed to fit the contours of the bottom of the modular channel sections, and having outlet diameters sized to fit with the mating drain piping.

5. Grates:

- a. Provide ductile iron slotted drain grates with mechanical lockdown devices.
- b. Open Area: 28.1 square inches minimum per foot of grating length.
- c. Slot Width: 0.50 inch.

2.02 ACCESSORIES

- A. Caulk/Adhesive:
 - 1. Provide silicon caulk or construction adhesive.
- B. Concrete:
 - 1. Provide concrete complying with the requirements specified in Section 03300, Cast-In-Place Concrete.
- C. Ductile Iron Pipe (DIP) and Fittings:
 - 1. Provide Class 50 ductile iron pipe (DIP) and fitting materials designed in accordance with the requirements of AWWA C151/A21.51.
 - a. Provide ductile iron pipe manufactured in accordance with the requirements of AWWA C151/A21.51.
 - b. Joints:
 - 1) Provide mechanical joints for ductile iron pipe complying with the requirements of AWWA C111/A21.11.
 - 2) Provide cast iron glands, synthetic rubber gaskets, and T-head bolts and nuts for the joints.
 - c. Fittings:
 - 1) Provide either gray-iron or ductile iron fittings complying with the requirements of either AWWA C110/A21.10 or AWWA C153/A21.53, and having mechanical joint ends.
 - a) Provide fittings complying with the requirements of AWWA C111/A21.11.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Examine trench drain block-outs in concrete or trench excavations to verify that the depth of each is a minimum of 4 inches greater than the depth of the trench drain's modular channel sections, and a minimum width of 14 inches.
- B. Evaluation and Assessment:
 - 1. Do not proceed with installation of the trench drains where the block-out in concrete or trench excavation depths are less than those required by the manufacturer for the applications indicated.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Protect adjacent areas from damage resulting from installation of the utility trench drains.
- B. Surface Preparation:
 - 1. Construct a block-out in concrete slabs or a trench in earth for containing the trench drain system.

- a. Ensure that the soil substrate where the trench drain is to be installed is not soft or shifting.

3.03 INSTALLATION

A. Modular Channel Sections:

1. Layout the modular channel sections so the individual units are in their correct locations and sequence according to the approved Shop Drawings, and their slopes are aligned to facilitate flow in the proper direction.
2. Align the mating ends of adjacent channel sections, apply caulk/adhesive to the joints as a sealer, and join the sections together.

B. Frame:

1. Attach the frame assembly to the modular channel sections using the appropriate hardware.

C. End Caps and End Outlets:

1. Prior to suspending the frame/modular channel section assembly within the block-out or open trench, attach end cap or end outlet to the end of the appropriate channel section.
 - a. If necessary, remove the male overlap portion on the end of the mating channel section, and cut the end cap or end outlet to the proper height.
 - b. Apply caulk/adhesive to the joint, and join the mating components together.
2. Attach the end cap or end outlet to the frame using an appropriate bracket and/or other hardware.

D. Bottom Outlets:

1. Prior to suspending the frame/modular channel section assembly within the block-out or open trench, attach the bottom outlet to the correct channel section at the appropriate location using caulk/adhesive.
2. Use a hole saw of the proper size to cut a round hole through the bottom of the channel section.

E. Suspending the Frame/Modular Channel Section Assembly:

1. Suspend the frame/modular channel section assembly within the block-out or open trench using an appropriate method recommended by the trench drain system's manufacturer.
 - a. Submit the method(s) for suspending the assemblies recommended by the trench drain system's manufacturer to the Program/Project Manager for information.
 - b. If the trench drain system manufacturer has no recommended method, suspend the assembly from temporary lumber spanning the top of the concrete block-out or excavated trench width.
 - c. If the trench drain is being installed in excavated trenches with rebar clips, drive the rebar provided for the clips into the ground to positively anchor the system in place.

F. Placing and Finishing Concrete:

1. Pour concrete around the 3 sides of the trench drain, being sure to properly vibrate the concrete as it is being placed to eliminate unwanted voids.
 2. Finish trowel the concrete to set the top edge of the trench drain approximately 1/16 inch below finish grade, being sure to compensate for concrete shrinkage during curing.
- G. Installing Grates:
1. After the concrete has been placed, vibrated, and cured, install the grates.
- H. Installing Storm Drain Pipe:
1. Install storm drain pipe and fittings as shown on the Contract Drawings in accordance with the manufacturer's written instructions.
 2. Joints for Ductile Iron Storm Drain Pipe:
 - a. Assemble storm drain pipe joints in accordance with the manufacturer's installation instructions and indicated reference standards.

3.04 CLEANING

- A. Waste Management:
1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

SECTION 02702

CONCRETE CURB, GUTTER, DRIVEWAY, SIDEWALK, AND ALLEY ENTRANCE

PART 1 GENERAL

RFI
1209

Forms for Curb & Gutter and Sidewalk

It is acceptable to use standard lumber sizes
as formwork for curb, gutter, and sidewalks.

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for various types of concrete curb, gutter, sidewalk, sidewalk ramps, driveways, and alley intersections.
 - 2. Requirements for contraction joints and expansion joints in concrete curb, gutter, sidewalk, sidewalk ramps, driveways, and alley intersections.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01555 - Traffic Control.
 - 3. Section 02339 - Subgrade Preparation.
 - 4. Section 03100 - Concrete Forms and Accessories.
 - 5. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCE STANDARDS:

- A. American Concrete Institute (ACI):
 - 1. ACI 305R - Hot Weather Concreting.
 - 2. ACI 306R - Cold Weather Concreting.
- B. Arizona Department of Transportation (ADOT):
 - 1. ADOT Standard Specifications for Road and Bridge Construction.
 - 2. Arizona Stored Specifications:
 - 3. ADOT Standard Drawings – Construction Standards.
- C. ASTM International (ASTM):
 - 1. ASTM D 1751 – Standard Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types).
 - 2. ASTM D 1752 – Standard Specification for Preformed Sponge Rubber Cork and Recycled PVC Expansion Joint Filler for Concrete Paving and Structural Construction.
 - 3. ASTM D 2628 – Standard Specification for Preformed Polychloroprene Elastomeric Joint Seals for Concrete Pavements.
- D. City of Phoenix (COP):
 - 1. City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - a. Section 725 - Portland Concrete Cement.
 - 2. Phoenix Supplemental Standard Details for Public Works:

- a. Detail No. P1016 Right Turn Lane Design for Public Cross Streets.
- b. Detail No. P1016-1 Right Turn Lane Design for Driveways.
- c. Detail No. P1164 Maximum Driveways & Alleys Slope.
- d. Detail No. P1230 Sidewalks.
- e. Detail No. P1231 Apron Joints.
- f. Detail No. P1235 Sidewalk Ramp Detail – Type “C”.
- g. Detail No. P1235-1 Sidewalk Ramp Detail (Type C Modified) (Detached Sidewalk).
- h. Detail No. P1236 Mid-Block Ramp with 4” Roll Curb.
- i. Detail No. P1237 Apron Joints.
- j. Detail No. P1238 Sidewalk Ramp Detail – 25’ or 30’ Radius Curb Return.
- k. Detail No. P1240 Sidewalk Ramp Detail – 35’ Radius Curb Return.
- l. Detail No. P1241 Sidewalk Ramp Detail – 20’ Radius Curb Return.
- m. Detail No. P1241-1 Sidewalk Ramp Detail – 20’ Radius Curb Return.
- n. Detail No. P1241-2 Sidewalk Ramp Detail – with Limited R/W.
- o. Detail No. P1241-3 Single Sidewalk Ramp Detail – 20’ Radius Curb Return.
- p. Detail No. P1242 Sidewalk Ramp Detail – 4” Vertical Curb Return.
- q. Detail No. P1243 Return Type Driveways with Attached Sidewalk.
- r. Detail No. P1243-1 No Right Turn Lane.
- s. Detail No. P1243-2 Right Turn Lane.
- t. Detail No. P1244 Driveway-Pedestrian Ramp Combination (for Use at T Type Intersections).
- u. Detail No. P1255-1 Driveway Entrance - Type I (Sidewalk Adjacent to Curb).
- v. Detail No. P1255-2 Driveway Entrance - Type II (Detached Sidewalk).
- w. Detail No. P1255-3 Driveway Entrance – ADA Retrofit.
- x. Detail No. P1255-3 Driveway Widths Policy.

E. Maricopa Association of Governments (MAG):

- 1. Uniform Standard Specifications for Public Works Construction:
 - a. Section 725 - Portland Concrete Cement.
 - b. Section 729 - Expansion Joint Filler.
- 2. Uniform Standard Details for Public Works Construction.
 - a. Detail No. 202 Alley details (Paved and Unpaved).
 - b. Detail No. 203 Scuppers.
 - c. Detail No. 206-1 Concrete Scupper.
 - d. Detail No. 206-2 Concrete Scupper.

- e. Detail No. 210 Residential Speed Hump.
- f. Detail No. 220 Curb and Gutter Types A, B, and C.
- g. Detail No. 221 Curb and Gutter (Transition, Integral & Warning Beacon.
- h. Detail No. 222 Single Curb - Types A, B, and Termination.
- i. Detail No. 223 Median Nose Transition.
- j. Detail No. 224 Joint for Drainage inlets and Manhole Covers.
- k. Detail No. 230 Sidewalks.
- l. Detail No. 231 Sidewalk Ramps – Type ‘A’.
- m. Detail No. 232 Sidewalk Ramps – Type ‘B’.
- n. Detail No. 233 Sidewalk Ramps – Type ‘C’.
- o. Detail No. 234 Sidewalk Ramps – Type ‘D’.
- p. Detail No. 240 Valley Gutter.
- q. Detail No. 250 Driveway Entrances.
- r. Detail No. 250 Return Type Driveways.
- s. Detail No. 260 Alley Entrance (with Combined Curb and Gutter).
- t. Detail No. 261 Alley Entrance (with Roll Type Curb and Gutter).
- u. Detail No. 262 Wing Type Alley Entrance (with Combined Curb and Gutter).
- v. Detail No. 263 Wing Type Alley Entrance (with Roll Type Curb and Gutter).

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Depending on where the curb, gutter, sidewalk, sidewalk ramp, driveway, or alley entrance construction is to occur and the owner of the right-of- way, coordinate with and obtain the required approvals from the appropriate State and municipal departments, including but not limited to, the following:
 - a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Streets Department.
 - c. Phoenix Sky Harbor International Airport.
2. Adhere to each owner’s specifications and/or permits, and comply with additional requirements of the owners, regarding the Work of this Section.
3. If the owner of the right-of- way is other than the Phoenix Sky Harbor International Airport, the owner of the right-of- way will be provided on the Contract Drawings.

B. Sequencing:

1. Include provisions for traffic control during concreting operations in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the curbs, gutters, sidewalks, sidewalk ramps, driveways, and alley entrances from traffic for a minimum of 7 Days after concrete placement.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Concrete.
 - 2) Expansion joint filler.
 - b. Shop Drawings:
 - 1) Working Drawings for the curb, gutters, sidewalks, sidewalk ramps, driveways, and alley entrances.
 - c. Certificates:
 - 1) Certificates of Compliance for expansion joint filler.
 - d. Special Procedure Submittals:
 - 1) Manufacturer's data for machinery used in lieu of conventional concrete forms.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Required approvals depend on who owns the right-of- way and where the curb, gutter, sidewalk, sidewalk ramp, driveway, or alley entrance is to be constructed, but must be obtained before construction activities begin from the appropriate State and municipal departments, which may include but are not limited to, the following:
 - a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Streets Department.
 - c. Phoenix Sky Harbor International Airport Design and Construction Services.
2. If the owner of the right-of- way is other than the Phoenix Sky Harbor International Airport, that information will be provided on the Contract Drawings.

B. Certifications:

1. Submit Certificates of Compliance for expansion joint filler that include the following information:
 - a. Description of material supplied.
 - b. Quantity represented by the Certificate.
 - c. A means of identifying the material, such as a label, lot number, or marking.
 - d. A statement certifying the material complies with the requirements of specifications cited.
 - e. The name, title and signature of a person having the authority to bind the manufacturer or Supplier of the material.

1.06 SITE CONDITIONS

- A. Ambient Conditions:
 - 1. Cold Weather Concreting:
 - a. Perform cold weather concrete work in accordance with the requirements of ACI 306R.
 - 2. Hot Weather Concreting:
 - a. Perform hot weather concrete work in accordance with the requirements of ACI 305R and the following additional requirements:
 - 1) Do not deliver concrete having a temperature exceeding 90 degrees Fahrenheit to the Work Site.
 - 2) Cool the mix's ingredients before mixing to prevent the temperature of the mix from exceeding 90 degrees Fahrenheit.
 - 3) Furnish windbreaks, shading, fog spraying, sprinkling, or wet covering when necessary.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Concrete:
 - 1. Provide concrete complying with the requirements for Class B concrete as specified in Section 03300, Cast-In-Place Concrete.
- B. Expansion Joint Filler:
 - 1. Provide expansion joint filler complying with the requirements specified in MAG Section 729 and ASTM D 1751, ASTM D 1752, or ASTM D 2628.
- C. Design Criteria:
 - 1. Submit Product Data for the proposed materials to the Program/Project Manager for approval.
 - 2. Submit Working Drawings for the curb, gutters, sidewalks, sidewalk ramps, driveways, and alley entrances to the Program/Project Manager for approval.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Inspect the locations intended to receive cast-in-place concrete for deficiencies which would prevent proper execution of the concrete work.
- B. Evaluation and Assessment:
 - 1. Do not proceed with concrete placement until deficiencies discovered by the inspection are corrected to the satisfaction of the Program/Project Manager.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Do not place excavated material where it will interfere with access to property or traffic flow in the street.
- B. Surface Preparation:
 - 1. Do not place material displaced by the construction on the base and/or surfacing material already in place on adjacent roadways.
 - 2. Construct and compact the subgrade true to grades and lines shown on the Plans and as specified in Section 02339.
 - a. Remove all soft or unsuitable material to a depth not less than 6 inches below subgrade elevation and replace it with Material acceptable to the Program/Project Manager.
 - b. When the Program/Project Manager determines that the existing subgrade consists of soils with swelling characteristics, bring the moisture content as close as possible to the optimum required for compaction.
 - 1) Obtain optimum moisture content by the addition of water, by the addition and blending of dry suitable material, or by drying the existing material.
 - c. Compact the subgrade to a relative density of 90 percent minimum.
- C. Demolition/Removal:
 - 1. Cut existing pavements and concrete joined to new construction.
 - a. Smoothly saw cut concrete to neat, straight, vertical, true lines so the adjoining surface will not be damaged.
 - 1) The minimum depth of cut is 1-1/2 inches or 1/4 of the thickness (D/4), whichever is greater.
 - 2) Clean-cut asphalt concrete only with approved equipment and methods
 - a) Paint trimmed edges with a light coating of asphalt cement or emulsified asphalt immediately prior to constructing the new abutting asphalt concrete.
 - 3) Do not rip or root outside the limits of cuts.
 - b. Remove existing concrete sidewalks and driveways that abut the new sidewalks and driveway entrances to a distance required to maintain slope as indicated in MAG Standard Details or not to exceed 1-inch per foot where sidewalks are concerned.
 - c. Saw cutting is required at the match lines.

3.03 INSTALLATION

- A. Construct concrete curb, gutter, sidewalk, sidewalk ramps, driveways, and alley intersections to the dimensions indicated on the Contract Drawings and MAG Standard Details.

B. Concrete Formwork:

1. Furnish conventional concrete forms as specified in Section 03100, Concrete Forms and Accessories, unless otherwise approved.
 - a. Carefully set forms that conform to the dimensions of the curb, gutter, sidewalk, sidewalk ramp, driveway, or alley entrance to line and grade, and securely stake them into position.
 - b. Water the forms and subgrade immediately in advance of placing concrete.
 - c. Clean forms thoroughly each time they are used.
 - d. Coat forms with a light oil or other releasing agent which does not discolor the concrete.
2. Construct concrete curbs and gutters by using conventional concrete forms, or when approved by the Program/Project Manager by means of an appropriate machine.
 - a. If applicable, submit the manufacturer's data for machinery used in lieu of conventional forms to the Program/Project Manager for approval of the equipment.
3. All construction requirements applicable to the use of conventional forms also apply to the use of the machines.
 - a. If machines approved by the Program/Project Manager and specifically designed for such Work are used, the results must be equal to or better than those produced by the use of conventional forms.
 - b. If the results are unsatisfactory to the Program/Project Manager, discontinue using the machines and make necessary repairs at no increase in Contract Price.

C. Placing Concrete:

1. Place the concrete in the forms.
2. Spade concrete away from the forms so there will be no rock pockets next to the forms.
3. Compact concrete using mechanical vibrators approved by the Program/Project Manager.
4. Continue tamping or vibrating the concrete until mortar flushes to the surface, and the coarse aggregate is below the concrete surface.

D. Finishing and Curing Concrete:

1. Finish and cure the concrete as specified in Section 03300.

E. Expansion Joints:

1. Unless otherwise specified or shown, construct expansion joints in accordance with the City of Phoenix Standard Detail P1230.
2. Construct expansion joints in a straight line and vertical plane perpendicular to the longitudinal line of the sidewalk, curb, or gutter except, in the case of a curved alignment, construct expansion joints along radial lines of the curve.

3. Construct expansion joints to the full depth and width of the concrete, and match the joints in the adjacent pavement, sidewalk, curb, or gutter.
4. Extend the expansion joint material through the concrete from the surface to one inch into the subgrade.
5. Construct expansion joints at all radius points, driveways, alley entrances, and at adjoining structures.
 - a. Construct expansion joints with a maximum interval of 100 feet between joints.

F. Contraction Joints:

1. Unless otherwise specified, construct contraction joints in accordance with City of Phoenix Standard Detail P1230.
2. Construct contraction joints in a straight line and vertical plane perpendicular to the longitudinal line of the sidewalk, curb, or gutter, except, in the case of a curved alignment, construct contraction joints along radial lines of the curve.
3. Construct contraction joints to a depth of 1-1/2 inches at 10 foot intervals on all sidewalks regardless of the width.
4. Unless an expansion joint is required, construct contraction joints to coincide with each form joint.
5. Provide sidewalk score marks at least 1/2 inch deep at the mid-point of the contraction joint.

G. Edges:

1. Shape all edges with a suitable tool formed to round the edges to a radius as indicated on the MAG Standard Details.

H. Identification:

1. Stamp the Contractor's name and the year the Work is performed on all Work done by the Contractor.
2. Locate this information on each end of the curb, gutter, sidewalk, or sidewalk ramp with letters not less than 3/4 inch in height.

I. Formwork Removal:

1. Exercise care to prevent damage when removing concrete forms.
2. Do not remove the front face form before the concrete has taken initial set and has sufficient strength to carry its own weight.
3. Do not remove gutter forms and rear forms until the concrete has hardened sufficiently to prevent damage to the edges.

J. Backfilling:

1. Unless otherwise specified, backfill behind the curbs, sidewalk, or sidewalk ramps with soil native to the area and to the lines and grades shown on the Contract Drawings.

K. Tolerances:

1. Curb and Gutter: 1/4 inch when measured with a 10 foot straight edge.
2. Sidewalk and Sidewalk Ramps: 1/8 inch when measured with a 5 foot straight edge.

3.04 REPAIR

- A. Repair any portion of concrete damaged while stripping forms; or if the damage is severe, replace the concrete at no additional increase in Contract Price.
- B. Remove and replace any section of the Work deficient in depth or not conforming to the Contract Drawings or Specifications at no additional increase in Contract Price.

3.05 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. Curb and Gutter Tolerance Test:
 - a. Test Procedure:
 - 1) With a 10-foot straight edge or curve template, check the face, top, back, and flow line of the curbs and gutters will be checked longitudinally along the surface to verify they are constructed as indicated on the Contract Drawings within the allowable tolerances.
 - b. Acceptance Criteria:
 - 1) Curbs and gutters having deviations within the specified allowable tolerance are acceptable.
 2. Sidewalk and Sidewalk Ramp Tolerance Test:
 - a. Test Procedure:
 - 1) With a 5-foot straight edge, the sidewalks and sidewalk ramps will be checked to verify they are constructed as indicated on the Contract Drawings within the allowable tolerances.
 - b. Acceptance Criteria:
 - 1) Sidewalks and sidewalk ramps having deviations within the specified allowable tolerance are acceptable.
 3. Gutter Drainage Test:
 - a. Test Procedure:
 - 1) Gutters that have a slope of 0.8 foot per hundred feet or less and gutters having unusual or special conditions that cast doubt on the capability of the gutters to drain may be tested by applying water from a hydrant, tank truck or other source to establish the flow in the length of gutter to be tested.
 - 2) 1 hour after the supply of water is shut off, the gutter will be inspected for evidence of ponding or improper shape.
 - b. Acceptance Criteria:

- 1) Ponded water in the gutter or on adjacent asphalt pavement to a depth of more than 1/2 inch is unacceptable.

B. Non-Conforming Work

1. Correct any deviations in curbs, gutters, sidewalks, and sidewalk ramps in excess of the specified allowable tolerances at no increase in Contract Price.
2. If water is found ponded in gutters or on adjacent asphalt pavement to a depth of more than 1/2 inch, correct the defect or defects in a manner acceptable to the Program/Project Manager at no increase in contract Price.

3.06 WASTE MANAGEMENT:

- A. Haul demolished surface materials away from the Site as soon as practical, and do not use them as backfill.

SECTION 02721

AGGREGATE BASE COURSE

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for untreated base, such as select material or aggregate base course, to be place on prepared surfaces to distribute wheel loads and provide material on which to support surface courses.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 02339 - Subgrade Preparation.
 - 4. Section 02741 - Bituminous Concrete Pavement.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. FAA: Federal Aviation Administration.
- B. Definitions:
 - 1. Fine Aggregate: Fines produced by the crushing operation performed on coarse aggregate which pass the Number 4 sieve.
- C. Reference Standards:

 - a. Uniform Standard Specifications for Public Works Construction:
 - 1) Section 330 - Asphalt Chip Seal.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Except when materials will be provided from a previously approved source, notify the Program/Project Manager of the source of aggregate in writing at least 10 Days in advance of delivering the material to allow sufficient time for required material acceptance testing.
- B. Sequencing:
 - 1. Prior to placing aggregate base course materials, properly prepare the subgrade in accordance with Section 02339, Subgrade Preparation.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Aggregate base course material.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
 - 2. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency and the City of Phoenix Testing Laboratory.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Transport aggregate base in suitable vehicles with covers to prevent stray particles from falling off the vehicles onto the streets.

PART 2 PRODUCTS

2.01 MATERIAL

- A. Aggregate:
 - 1. Provide crushed aggregate complying with the requirements specified herein unless the use of a different type of material is specifically authorized on the Contract Drawings.
 - a. Crushed Aggregate:
 - 1) Provide clean, hard, sound, and durable crushed stone, rock, or gravel or a combination thereof; and which has the following additional properties:
 - a) Gradation (Job Mix):
 - (1) Provide continuously and well graded crushed aggregate when tested in accordance with ASTM C 117 and ASTM C 136, and having the gradation indicated in Table 02721-1.

Table 02721-1 Crushed Aggregate Gradation
--

Sieve Sizes (Square Openings)	Design Range Percentage by Weight Passing Sieve				
	Select Material		Aggregate Base		Tolerance (Percent) ⁽¹⁾
	Type A	Type B	Type C	Type D	
3 inches	100	-	-	-	-
2 inches	-	-	-	100	0
1-1/2 inches	-	100	-	95-100	±5
1-1/4 inches	-	-	100	-	-
1 inch	-	-	-	70-95	±8
3/4 inch	-	-	-	55-85	±8
Number 4	30-75	30-70	38-65	30-60	±8
Number 8	20-60	20-60	25-60	-	-
Number 30	10-40	10-40	10-40	12-30	±5
Number 200	0-12	0-12	3-12	0-8	±3
1. The job mix tolerance listed in Table 02721-1 applies only to Type D aggregate base, and when applied to a job mix gradation establishes a job control grading band. If application of the tolerance results in a job control grading band outside the design range, the full tolerance still applies; however, the job mix range must be capable of being tested in accordance with the requirements specified in ASTM D 1556 and ASTM D 1557.					

- 2) Type A, Type B, and Type C Crushed Aggregate:
- Provide crushed aggregate uniform in quality, and free of soft, friable, thin elongated, or laminated pieces; disintegrated material; organic material; oil, alkali, and other deleterious substances.
 - Special Gradation Requirements:
 - When crushed rock is required, provide material with at least one rough, angular surface produced by crushing; and a gradation complying with the requirements of ASTM D 448.
 - For sizes 3/4 inch or larger maximum sizes, the portion of the material retained on a No. 4 sieve must be 50 percent by weight.
 - For sizes less than 3/4 inch, the portion of the material retained on a No. 8 sieve must be 50 percent by weight.

- (2) When gravel is required, provide material having particles that are fully or partially rounded and water-worn.
 - (a) Crushed rock obtained by crushing rock which exceeds the maximum gradation sizes specified in ASTM D 448 may be combined with gravel provided it is uniformly distributed throughout and blended with the gravel.
- c) Plasticity Index:
 - (1) Unless otherwise indicated, provide material having a plasticity index not more than 5 when tested in accordance with the requirements of AASHTO T 146 Method A (Wet Preparation), AASHTO T 89, and AASHTO T 90.
- d) Soundness:
 - (1) Provide crushed aggregate having a percentage of wear not exceeding 40 after 500 revolutions in the Los Angeles abrasion machine as determined in accordance with Grading B as specified in ASTM C 131.
- 3) Type D Crushed Aggregate (FAA P-209):
 - a) Provide crushed aggregate free from coatings of clay, silt, vegetable matter, and other objectionable materials; and containing no clay balls.
 - b) Special Gradation Requirements:
 - (1) Provide crushed aggregate continuously well graded from coarse to fine that does not vary from the low limit on one sieve to the high limit on an adjacent sieve or vice versa.
 - (2) If necessary, fine aggregate, defined as fines produced by the crushing operation performed on coarse aggregate and passing the Number 4 sieve, may be added to produce the correct gradation.
 - (a) Produce the fine aggregate by crushing stone or gravel complying with the wear and soundness requirements specified for coarse aggregate.
 - (3) The portion of the material retained on a No. 4 sieve must not contain more than 15 percent by weight of flat or elongated particles as defined in ASTM D 693; and must contain at least 90 percent by weight of particles having at least 2 fractured faces and 100 percent having at least 1 fractured face.
 - (a) The area of each face must be equal to at least 75 percent of the smallest mid-sectional area of the piece.
 - (b) If 2 fractured faces are contiguous, the angle between the planes of the fractures must be at least 30 degrees to count as 2 fractured faces.

- (4) 70 percent passing the 3/4 inch sieve is the limit of the design and job mixes.
- (5) The fraction of the final mixture that passes the Number 200 sieve may not exceed 60 percent of the fraction passing the Number 30 sieve.
- (6) Uniformly blend and mix aggregate during crushing operations or mixing in a plant to comply with specified requirements and secure the proper mixture content for compaction.
- c) Liquid Limit:
 - (1) Provide material so the liquid limit of the fraction passing the Number 40 sieve is no greater than 25 when tested in accordance with the requirements specified in ASTM D 4318.
- d) Plasticity Index:
 - (1) Provide material having a plasticity index not more than 4 when tested in accordance with the requirements specified in ASTM D 4318.
- e) Sand Equivalent Value:
 - (1) Provide material so the fine aggregate has a minimum sand equivalent value of 35 when tested in accordance with the requirements specified in ASTM D 2419.
- f) Soundness:
 - (1) Provide crushed aggregate having a percentage of wear not exceeding 45 as determined in accordance with the procedures specified in ASTM C 131.
 - (2) Provide crushed aggregate having sodium sulfate soundness loss after 5 cycles not exceeding 12 percent as determined in accordance with the procedures specified ASTM C 88.
- b. Processed Natural Material:
 - 1) Provide processed natural material consisting of hard, durable fragments of stone or gravel and a filler of sand or other finely divided matter; free of an excess of soft or disintegrating pieces, alkali, adobe, vegetable matter, loam, or other deleterious substances; and has the following additional properties:
 - a) Gradation:
 - (1) Provide processed natural material having the gradation indicated in Table 02721-1 except that the least dimension of the maximum particle size cannot exceed 2/3 of the compacted thickness of the specified lift being placed.
 - b) Soundness:
 - (1) Provide processed natural material having a percentage of wear not exceeding 40 after 500 revolutions in the Los

Angeles abrasion machine as determined in accordance with Grading B as specified in ASTM C 131.

- c) Plasticity Index:
 - (1) Unless otherwise indicated, provide material having a plasticity index not more than 5 when tested in accordance with the requirements of AASHTO T 146 Method A (Wet Preparation), AASHTO T 89, and AASHTO T 90.
- d) Liquid Limit:
 - (1) Provide processed natural material having a liquid limit not exceeding 25 percent when tested in accordance with AASHTO T 89.
- c. Decomposed Granite:
 - 1) Provide decomposed granite consisting principally of quartz and feldspar granitoid igneous rock which has been weathered in place and fragments of granitic rock not yet broken down into the component minerals.
 - a) Provide decomposed granite which will remain stable when saturated with water.
 - b) Gradation:
 - (1) Do not use particles larger than 3 inches which will not be broken in the rolling and tamping process.
 - (2) Provide decomposed granite such that no more than 20 percent will pass the number 200 mesh sieve when subjected to the Decomposed Granite Gradation Test specified in Subparagraph 2.03.A.3.
 - c) Plasticity Index:
 - (1) The material passing the number 200 mesh sieve from the gradation test must have a plasticity index not less than 3 or more than 10 when determined in accordance with the requirements of AASHTO T 146 Method A (Wet Preparation), AASHTO T 89, and AASHTO T 90.
- 2. Submit Product Data for the aggregate material to the Program/Project Manager for approval.

2.02 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 - 1. Prior to the start of production, at the start of production, and at intervals during production, submit Samples of each material for preliminary testing to the City of Phoenix Materials Laboratory for testing and as the basis for approval of specific lots of aggregates.
 - a. The Program/Project Manager will determine the sampling points and intervals.

2. In lieu of material testing, the Program/Project Manager may accept certified test results from the State that indicate the aggregate complies with the specified requirements.
3. Decomposed Granite Gradation Test:
 - a. Test Procedure:
 - 1) A sample quantity of decomposed granite sufficient to have a dry weight of 15 pounds after being dried at a temperature between 215 degrees Fahrenheit and 230 degrees Fahrenheit to a constant weight will be selected and dried.
 - 2) 15 pounds of the dried decomposed granite and nothing else will be placed in a Los Angeles abrasion machine and subjected to 500 revolutions in accordance the requirements specified for Grading B in ASTM C 131.
 - 3) The percentage of material passing through a Number 200 mesh sieve by washing will be determined in accordance with the procedure specified in ASTM C 117.
 - b. Acceptance Criteria:
 - 1) Decomposed granite samples that do not pass more than 20 percent of their material through the Number 200 mesh sieve will pass the Decomposed Granite Gradation Test.
- B. Non-Conforming Work
 1. Correct deficiencies uncovered by the measurements or Samples.
- C. Coordination of Other Tests and Inspections:
 1. Notify the code-required Approved Agency responsible for performing special inspections when aggregate base for this Contract is being placed and/or tested.
 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Verify that the subgrade has been properly prepared to receive the aggregate base course.

3.02 PREPARATION

- A. Surface Preparation:
 1. Prepare the subgrade as specified in Section 02339, Subgrade Preparation.

2. Correct ruts and soft yielding places caused by improper drainage conditions, hauling, or other causes before placing the base course.

3.03 INSTALLATION

- A. Place base course material in lifts to provide a course to the lines, grades, dimensions, moisture, density, and typical sections as indicated in the Contract Documents.
 1. Aggregate base course measuring 6 inches or less in compacted thickness may be placed in a single layer.
 2. Deliver the aggregate to the roadbed as a uniform mixture, and spread the aggregate in one operation.
 3. Avoid segregation of the material into pockets of fine and coarse material.
 4. Place Type D aggregate on moistened subgrade in layers of uniform thickness not more than 6 inches deep using a mechanical spreader.
 - a. Do not place aggregate on frozen subgrade.
- B. Aggregate base course measuring more than 6 inches in compacted thickness must be built up from successive layers, each of approximately equal compacted thickness not to exceed 6 inches per layer.
 1. Clean previously constructed layers of loose and foreign material prior to placing the next layer.
- C. After distributing the aggregate base course, water the material and, immediately thereafter, blade the material to a uniform layer that will net the required thickness after compaction.
 1. Apply a quantity of water that will assist compaction, taking care to avoid wetting the subgrade or any lower base course during the watering operation to an extent that is detrimental to the Work.
 - a. Moisture condition the material within the range of plus or minus 2 percent of optimum moisture, and compact the material to a dry density greater than 95 percent of maximum dry density as determined in accordance with the requirements of ASTM D 1557.
 2. Keep the surfaces of the compacted material in lower layers moist until the material is covered by the next layer.
 3. If the materials deposited are not uniformly blended together, continue the blading operation as necessary to eliminate segregation.
- D. Compact the material to assure a compacted relative density of 100 percent as determined using the methods and other criteria defined in Section 02339, Subgrade Preparation.
- E. Upon completion of the entire operation, the base surface must be true, even, uniform, and conform to the grade and cross-section specified or shown on the Contract Drawings.

1. Finish the base course by blading the surface of the aggregate base course using equipment designed especially for this purpose.

F. Tolerances:

1. Finished Surface Tolerance:

- a. The finished surface of the aggregate base course may not vary more than 1/2 inch above or below required grade and cross-section when tested with a 16-foot straightedge applied parallel with and at right angles to the centerline.

- 1) Do not add thin layers of material to the top layer of base course to meet the specified grade.

- a) If the elevation of the top layer is 1/2 inch or more below grade, scarify the top layer of the base to a depth at least 3 inches, add new material, and blend and re-compact the material to bring it to grade.

- 2) If the finished surface is above the design grade, cut the material back to grade and re-roll the surface.

2. Thickness Tolerance:

- a. The completed thickness of the aggregate base course may not vary more than 1/2 inch of the design thickness.

3. Moisture Content Tolerance:

- a. During placing operations, the moisture content of the material may not vary by more than 1-1/2 percentage points from the optimum moisture content as determined in accordance with the requirements specified in ASTM D 1557.

3.04 RESTORATION

- A. Restore to their original condition those portions of the Site not designated for alteration.

3.05 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. During the period when aggregate base is being placed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials or proportions requested by the Contractor or testing required due to failure of material to meet specified requirements.

- c. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
- 2. Gradation Test:
 - a. Test Procedure:
 - 1) Gradation Tests will be performed by the Testing and Inspection Agency on samples taken from material delivered to the Site at a rate of 1 test for each 300 tons placed, or once a day, whichever is greater.
 - a) Sampling will be performed in accordance with the requirements specified in ASTM D 75.
 - b) Testing will be performed in accordance with the requirements specified in ASTM C 117 and ASTM C 136.
 - b. Acceptance Criteria:
 - 1) The average value of individual gradation tests for all sieve size determinations must comply with the specified gradations within plus or minus 8 percent for sieves larger than No. 4, within plus or minus 5 percent for sieves No. 30, and within plus or minus 3 percent for sieves No. 200.
- 3. Moisture Density Test:
 - a. Test Procedure:
 - 1) Moisture Density Tests will be performed by the Testing and Inspection Agency on samples taken from material delivered to the Site at a rate of 1 test for each 300 tons placed, or once a day, whichever is greater.
 - b. Acceptance Criteria:
 - 1) Material represented by the samples will be acceptable if the compaction meets the specified moisture density criteria.
- 4. Compaction Test for Other Materials than Type D Crushed Aggregate:
 - a. Test Procedure:
 - 1) Compaction Tests will be performed by the Testing and Inspection Agency at a rate of 1 test for each 500 square yards per lift placed.
 - 2) Testing will be performed as specified in ASTM D 2922 and ASTM D 3017
 - b. Acceptance Criteria:
 - 1) Areas represented by the tests will be acceptable if the compaction meets the specified compaction criteria.
- 5. Compaction Test for Type D Crushed Aggregate:
 - a. Either Test Procedure 1 or Test Procedure 2 specified herein below may be used to determine the compaction of Type D crushed aggregate.

- 1) If Test Method 2 is to be used, at least 1 in 4 of the tests must be performed in accordance with Test Method 1 in order to correlate the test results.
 - a) Calibration tests will be conducted on each lot of material placed that complies with the specified density requirements.
 - 2) Aggregate base course testing will be performed on a lot basis.
 - a) A lot consists of one day's production if is not expected to exceed 2400 yards.
 - b) A lot consists of one-half day's production if is expected to include 2400 yards or more.
 - c) Each lot includes 2 equal sublots.
 - 3) One test will be performed for each subplot on material specimens sampled from locations randomly selected by the Program/Project Manager in accordance with the statistical procedures specified in ASTM D 3665.
- b. Test Procedure 1:
- 1) The specimens will be compacted and laboratory tested in accordance with the procedures specified in ASTM D 1557.
 - 2) The in-place field density will be determined in accordance with the procedures specified in ASTM D 1556 or ASTM D 2167.
 - 3) If the specified density is not attained, the entire lot must be reworked and/or re-compacted, and 2 additional tests on randomly selected samples from the lot will be performed.
 - a) Continue this procedure until the specified density is attained.
- c. Acceptance Criteria for Test Procedure 1:
- 1) Aggregate base course acceptance will be on a lot basis.
 - 2) If the field density is at least 100 percent of the maximum density of laboratory specimens prepared from samples of base course material delivered to the Site, the subplot represented by that sample will pass the Compaction Test for Type D Crushed Aggregate.
- d. Test Procedure 2:
- 1) The specimens will be tested using a nuclear gage in accordance with the procedures specified in ASTM D 2922.
 - a) The nuclear gage will be field calibrated in accordance with the paragraph 4 in ASTM D 2922.
 - b) Calibration tests will be conducted on the first lot of material placed that complies with the specified density requirements.
 - 2) Because the procedures specified in ASTM D 2922 result in a wet unit weight, the procedures specified in ASTM D 3017 will be used to determine the moisture content of the material.
 - a) The calibration curve furnished with the moisture gages will be checked as specified in paragraph 7 in ASTM D 3017.

- b) Calibration verifications of both density and moisture gages will be performed at the beginning of the base course Work, and at intervals determined by the Program/Project Manager.
 - e. Acceptance Criteria for Test Procedure 2:
 - 1) Aggregate base course acceptance will be on a lot basis.
 - 2) If the field density is at least 100 percent of the maximum density of laboratory specimens prepared from samples of base course material delivered to the Site, the subplot represented by that sample will pass the Compaction Test for Type D Crushed Aggregate.
 - 6. Inspections:
 - a. If the Program/Project Manager believes that a deficiency in thickness, or an excess of plasticity exists, take measurements or samples in the same pattern as that defined in Section 02741, Bituminous Concrete Pavement, except for Type D aggregate base material.
 - 1) For Type D aggregate base material, 4 thickness determinations will be made for each lot by dividing the lot into 4 equal sublots and performing 1 test on each of these sublots at random locations determined by the Program/Project Manager in accordance with the statistical procedures specified in ASTM D 3665.
 - a) If the thickness is determined to be deficient, additional test holes may be required to identify the limits of the deficient areas.
- B. Non-Conforming Work
 - 1. Correct deficiencies uncovered by the measurements or Samples.
 - a. Rework and retest areas represented by noncompliant tests.
 - b. Do not add thin layers of material to the top layer of base course to meet the specified grade.
 - 1) If the elevation of the top layer is 1/2 inch or more below grade, scarify the top layer of the base to a depth at least 3 inches, add new material, and blend and re-compact the material to bring it to grade.
 - c. If the finished surface is above the design grade, cut the material back to grade and re-roll the surface.
 - 2. If the base has been covered or it is otherwise impractical to correct the deficiency, take the corrective measures in Table 02721-2 at no increase in Contract Price.

Table 02721-2 Aggregate Base Course Thickness and Plasticity Deficiency		
Type	Deficiency	Corrective Measure
I	1/2 inch or more but less than 1 inch in thickness	Place asphalt chip seal using pre-coated chips in accordance with MAG Section 330 for the full roadway width over the area involved, but for not less than 660 feet or one City block in length.
II	1 inch or more in thickness	Place an additional asphalt concrete overlay, a 3/8-inch mix 1/2 the thickness of the deficiency for the full roadway width over the area involved, but for not less than 660 feet or one City block in length.
III	A plasticity index of 6 to 7 inclusive ⁽¹⁾	Place a 1/2 inch thick asphalt concrete overlay over the same total area as required for Types I and II.
IV	A plasticity index over 7 ⁽¹⁾	Remove deficient material from the affected area, and replace the removed material with material complying with the Specifications.
1. The plasticity index must be in accordance with AASHTO T 146 Method A (Wet Preparation), AASHTO T 89, and AASHTO T 90.		

3.06 CLEANING

- A. Remove tools, construction equipment and machinery, and surplus materials from the Site.
- B. Waste Management:
 - 1. Remove waste materials, rubbish, and debris from and about the premises.
 - 2. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

3.07 PROTECTION

- A. Limit traffic on compacted aggregate base course to final surfacing traffic and vehicles applying moisture control.
 - 1. Equipment used to construct adjoining sections may be routed over completed portions of the base course provided no damage results and the equipment is routed over the full width of the base course so rutting or uneven compaction is avoided.
- B. Maintain the base course in a condition complying with specified requirements until the Work is accepted.

SECTION 02741

BITUMINOUS CONCRETE PAVEMENT

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for placing bituminous concrete as a surface course, base course, and/or curb upon a previously prepared base or subgrade as shown on the Contract Drawings or as ordered in writing by the Program/Project Manager.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01555 - Traffic Control.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 02786 - Tack Coat.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. COP: City of Phoenix.
 - 2. JMF: Job Mix Formula.
 - 3. MAG: Maricopa Association of Governments.
- B. Definitions:
 - 1. Screed: Any strike off device that operates by cutting, crowding, or other practical action which is effective on mixtures at workable temperatures without tearing, shoving, or gouging, and which will produce a finished surface of the smoothness and texture required.
 - 2. Leveling Course: A layer of material used to bring existing pavement to a uniform grade prior to placing an overlay or other course.
 - 3. Float Rock: Aggregate that has segregated to the surface of an asphalt concrete pavement course.
- C. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO T 168 – Standard Method of Test for Sampling Bituminous Paving Mixtures.
 - b. AASHTO T 245 – Standard Method of Test for Resistance to Plastic Flow of Bituminous Mixtures Using Marshall Apparatus.
 - 2. American Society for Testing and Materials (ASTM):
 - a. ASTM D 29 – Standard Test Methods for Sampling and Testing Lac Resins [*withdrawn 2005 without replacement*].

- b. ASTM D 36 - Standard Test Method for Softening Point of Bitumen (Ring-and-Ball Apparatus)
- c. ASTM D 464 - Standard Test Methods for Saponification Number of Naval Store Products Including Tall Oil and Other Related Products
- d. ASTM D 465 - Standard Test Methods for Acid Number of Naval Stores Products Including Tall Oil and Other Related Products
- e. ASTM D 2041 - Standard Test Method for Theoretical Maximum Specific Gravity and Density of Bituminous Paving Mixtures
- 3. Arizona Department of Transportation (ADOT):
 - a. ADOT Standard Specifications for Road and Bridge Construction:
 - 1) Section 406 - Asphaltic Concrete.
 - 2) Section 407 - Asphaltic Concrete Friction Course.
 - 3) Section 408 - Recycled Asphaltic Concrete.
 - 4) Section 409 - Asphaltic Concrete (Miscellaneous Structural).
 - 5) Section 410 - Asphalt-Rubber Stress-Absorbing Membrane.
 - 6) Section 411 - Asphaltic Concrete Friction Course (Miscellaneous).

 - a. AI SP-2 – Superpave Mix Design
 - b. AI MS-2 – Mix Design Methods for Asphalt Concrete and Other Hot-Mix Types
5. City of Phoenix (COP):
 - a. City of Phoenix Standard Details:
 - 1) Detail No. P1102 Depth of Base Course (Residential Street).
 - 2) Detail No. P1103 Depth of Base Course (Local Commercial & Light Industrial Streets).
 - 3) Detail No. P1104 Depth of Base Course (Major Streets & Heavy Industrial Streets).
 - b. City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - 1) Section 321 – Asphalt Concrete Pavement.
 - 2) Section 710 - Asphalt Concrete.
6. Maricopa Association of Governments (MAG):
 - a. Uniform Standard Specifications for Public Works Construction:
 - 1) Section 330 – Asphalt Chip Seal.
 - 2) Section 334 - Preservative Seal for Asphalt Concrete.
 - 3) Section 713 - Emulsified Asphalts.
 - b. Uniform Standard Details for Public Works Construction:
 - 1) Standard Detail No. 201 - Pavement Section at Termination.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 1. Depending on where the paving operation is to occur and the owner of the right-of-way, coordinate with and obtain the required approvals from the appropriate State and municipal departments, including but not limited to, the following:
 - a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Streets Department.
 - c. Phoenix Sky Harbor International Airport.
 2. Adhere to each owner's specifications and/or permits, and comply with additional requirements of the owners, regarding the Work of this Section.

3. If the owner of the right-of-way is other than the Phoenix Sky Harbor International Airport, the owner of the right-of-way will be provided on the Contract Drawings.

B. Sequencing:

1. Include provisions for traffic control during concrete paving operations in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the pavement from traffic.

C. Scheduling:

1. Submit a detailed sequence and schedule of bituminous concrete placement operations including, but not limited to; plant location, width of the pavement to be placed, proposed equipment, production rates, working hours, bituminous concrete hauling and number of trucks available, placement methods, and cutting and sealing methods.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Samples:
 - 1) Mineral aggregate.
 - b. Delegated Design Submittals:
 - 1) Bituminous concrete mix designs.
 - 2) Bituminous concrete pavement Quality Control and Placement Plan.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Reports:
 - 1) Delivery tickets (Weigh Master's Certificates) for asphalt materials.

C. Closeout Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Warranty Documentation:
 - 1) Special Warranty for bituminous concrete pavement.
 - b. Record Documentation:
 - 1) As-built information recording the actual depths and profiles of the bituminous concrete pavement.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Required approvals depend on who owns the right-of- way and where the bituminous concrete paving is to be constructed, but must be obtained before construction activities begin from the appropriate State and municipal departments, which may include but are not limited to, the following:
 - a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Streets Department.
 - c. Phoenix Sky Harbor International Airport Design and Construction Services.
 - 2. If the owner of the right-of- way is other than the Phoenix Sky Harbor International Airport, the owner of the right-of- way will be provided on the Contract Drawings.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Deliver asphalt mixtures to the Site without segregation of the ingredients and within the temperature range specified in Section 321 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - 2. At the time each asphalt mixture is delivered to the Site, submit a delivery ticket (Weigh Master's Certificate) to the Program/Project Manager containing the following information for information:
 - a. Date.
 - b. Supplier's name.
 - c. Plant location and/or plant number.
 - d. Ticket number.
 - e. Contractor's name.
 - f. Project name and/or location.
 - g. Product code/description with percent asphalt.
 - h. Mineral filler/additive and percent.
 - i. Temperature and batching.
 - j. Time of batching, arrival, and unloading.
 - k. Material weight or vehicle weight with and without material.
 - l. Weight of additive loads.
- B. Storage and Handling Requirements:
 - 1. Stockpile, store, and handle aggregate in accordance with the requirements specified in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. For base paving 2 inches thick or greater, verify that the atmospheric temperature is 40 degrees Fahrenheit and rising before proceeding.
2. For surface paving or pavement less than 2 inches thick, verify that the surface temperature is 50 degrees Fahrenheit or greater before proceeding.

1.08 WARRANTY

A. Special Warranty:

1. Remove bituminous concrete pavement mix whose stability is affected by excess asphalt cement content to such an extent that the pavement is displaced under normal traffic loads within a period of 1 year after acceptance, and replace it with new material at no increase in Contract Price.
2. Submit a written Special Warranty for bituminous concrete pavement to the Program/Project Manager warranting the bituminous concrete pavement against displacement under normal traffic loads within a period of 1 year.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA:

- A. If the paving is within Arizona Department of Transportation (ADOT) right-of-way, comply with the material and construction requirements of the applicable Sections in the ADOT Standard Specifications for Road and Bridge Construction, of the applicable Arizona Stored Specifications, and of the applicable ADOT Standard Drawings.
- B. Submit a Quality Control and Placement Plan detailing methods of controlling the quality of the bituminous mix during placement operations.

2.02 MATERIALS

A. Manufacturers:

1. Use material manufacturers providing the type of asphalt materials specified and which comply with the requirements for Suppliers as specified in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.

B. Asphalt Concrete Materials:

1. Provide asphalt concrete materials complying with the requirements specified in Section 710 of the City of Phoenix Supplement to Maricopa

Association of Governments Uniform Standard Specifications for the type of asphalt paving required.

C. Tack Coat:

1. Provide tack coat complying with the requirements specified in Section 02786, Tack Coat, using emulsified asphalt grade SS-1 as specified.

2.03 MIXES

A. The City of Phoenix Materials Lab will provide the Job Mix Formula (JMF) letter for the "Standard Mix" required for the asphalt pavement at the Site.

1. The required gradation of mineral aggregate is given in Table 710 in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
2. The Job-Mix Tolerances Percentage of Asphalt Range is given in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
3. The allowable temperature range for mixing and placing asphalt is given in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.

B. Submit the mix designs to the Program/Project Manager for approval.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Ensure the base on which the asphalt concrete is to be placed is smooth, firm, and true to grade and cross-section as shown on the Contract Drawings.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Maintain and protect traffic on active streets and roads in accordance with the requirements specified in Section 01555, Traffic Control.

B. Surface Preparation:

1. Base
 - a. If necessary to meet the conditions specified in Paragraph 3.01.A and if ordered by the Program/Project Manager, spread aggregate base or a leveling course of asphalt concrete compacted in layers not exceeding 2-inches in thickness to level irregularities such as dips, depressions, and sags.
 - 1) Maintain the base throughout the period of placing asphalt concrete.

- 2) Remove all irregularities such as humps or high spots to provide a smooth uniform grade and cross-section, so that subsequent surfacing will be of uniform thickness.
 - b. Install pavement terminations per MAG Standard Detail 201, Type A or Type B, on the street edges where no other curb or retainment has been installed.
 - 1) This applies to, but is not limited to, the centerline of half streets, diagonal or perpendicular end terminations, street edges without curb and gutter or single curb.
 2. Tack Coat
 - a. Apply a tack coat to all existing and to each new course of bituminous surfaces prior to placing a succeeding layer of bituminous mixed Material.
 - 1) Apply the tack coat in accordance with Section 02786, Tack Coat.
 - 2) Surfaces to be covered may require repair or patching as directed by the Program/Project Manager.
 - 3) When approved by the Program/Project Manager, the tack coat may be deleted when a succeeding layer of asphalt concrete is being applied over a freshly laid course that has been subjected to very little traffic.
 - b. Apply a tack coat to the vertical surfaces of existing pavements, curbs, and gutters against which asphalt concrete is to be placed.
 3. Construction Joints:
 - a. Trimming Construction Joints:
 - 1) Before a base or surface course is placed adjacent to cold transverse construction joints, trim the joints to create a vertical face by saw cutting the joints to their full depth and removing cut off material to expose a fresh surface.
 - 2) Cut the joint on a 10 to 15 degree skew from a perpendicular to the centerline of the street or roadway.
 - b. Joint Bulkheads:
 - 1) For short overnight intermissions in paving, a full depth bulkhead (i.e., wooden member) can be placed near the end of the day's pavement placement.
 - 2) Remove the bulkheads and excess material just prior to the placement of the following day's pavement.
 - c. Joint Heaters:
 - 1) If conditions warrant and it is deemed necessary by the Program/Project Manager, use an approved joint heater on cold transverse or longitudinal joints.
 - 2) Ensure the joint heater is capable of heating the joint to a minimum temperature of 200 degrees Fahrenheit for a minimum depth of 1/4 inch at a speed commensurate with that of the laydown machine.

RFI Tack Coat

1348

This has been approved by the Program/Project Manager

3.03 INSTALLATION

A. Equipment:

1. Mixing Equipment:

- a. Furnish a twin-shaft pug mill equipped with paddles of sufficient size and number to deliver a thorough and uniform mixture.
 - 1) Insulate boxes, hoppers, buckets, and similar receptacles furnished for weighing mineral aggregate, filler material, and asphalt, and the scales used to batch materials, against the vibration and movement of the rest of the plant to keep errors in weighing below 2 percent for any setting and 1-1/2 percent for any batch.
 - 2) Mount dial heads or readout devices separate from the batch plant and tower supports to nullify most vibrations from the readout.
 - 3) Promptly remove worn parts that would adversely affect the quality of the mixing or allow leakage from the discharge gate.
 - 4) Make adjustments in the equipment to eliminate dead areas in which the material does not move or is not sufficiently agitated.

2. Spreading and Finishing Equipment:

- a. Self-propelled mechanical spreader(s) and finishing equipment:
 - 1) Furnish self-propelled mechanical spreader(s) and finishing equipment equipped with a vibrating screed or strike off assembly capable of distributing not less than the full width of a traffic lane.
 - a) Furnish a screed adjustable to the required template and elevation.
 - b) Furnish self-propelled mechanical spreading and finishing equipment capable of having the forward speed of operation regulated so that no irregularities result in the surface texture or smoothness of the mat due to excessive forward speed of the spreading machine.
 - 2) Screed Control System:
 - a) Equip self-propelled mechanical spreading and finishing equipment with a control system capable of automatically maintaining the specified screed elevation.
 - b) Furnish a control system that is actuated automatically from either a reference line or surface through a system of mechanical sensors or sensor directed mechanisms or devices that maintains the paver screed at a predetermined transverse slope and at the proper elevation to obtain the required surface.
 - (1) When approved or requested by the Program/Project Manager, make the transverse slope control system inoperative and provide screed control by sensor directed automatic mechanisms that independently

- control the elevation of each end of the screed from the reference lines or surfaces.
- (2) If the Program/Project Manager determines that the automatic screed control operation is not practical under a particular set of conditions, the use of manual control may be ordered in lieu thereof, but the machine must still be equipped with the automatic device.
 - c) Furnish controls capable of working in conjunction with any of the following attachments:
 - (1) Ski-type device not less than 30 feet in length.
 - (2) Taut string line or wire set to grade.
 - d) Use the ski-type device, string line, or wire set described in Subparagraph 3.03.A.2.a.2.c.1 or 3.03.A.2.a.2.c.2 as directed by the Program/Project Manager.
 - (1) In conditions where a curb and/or gutter is not even and true to grade, the Program/Project Manager may require the Contractor to use the ski-type device or stringline to establish the grade of the asphalt concrete surface adjacent to the curb or gutter.
 - b. Spreader boxes:
 - 1) Equip the spreader box with a readily adjustable strike off blade.
 - c. Tired blade grader
 - 1) The use of a self-propelled pneumatic tired blade grader must have the approval, in writing, of the Program/Project Manager.
 - 2) Equip the tired blade grader with an automatic leveling device capable of accurately maintaining transverse slope of the blade at a preset angle.
 - 3) Furnish a grader blade not less than 12 feet long.
 - 4) Ensure that the blade control in motor graders is free from appreciable lost motion.
 - 3. Compaction Equipment
 - a. Furnish self-propelled and reversible rollers for compacting asphalt concrete having a minimum weight of 8 tons.
 - 1) Maintain the rollers to ensure smooth steering and the ability to smoothly stop, start, and reverse.
 - 2) Equip the rollers with an automatic device or devices capable of properly dispensing an approved releasing agent on the wheels to prevent the wheels from picking up the asphalt concrete.
 - a) Do not use diesel fuel as a releasing agent.
 - 3) Equip the rollers with scrapers to keep the wheels clean from asphalt and other debris
 - b. Pneumatic-tired rollers
 - 1) Furnish 2-axle tandem type pneumatic rollers having a roller width of not less than 5 feet.

- a) Furnish rollers with tires not less than 20 inches in diameter, all of the same size, and with treads acceptable to the Program/Project Manager.
 - b) Furnish rollers having an operating weight not less than 2000 pounds per tire, and with the tires spaced so that the entire gap between adjacent tires will be covered by the tread of the following tire.
 - (1) Inflate each tire to 90 psi, except as otherwise specified.
 - (2) The maximum allowable variance between tire air pressure and specified air pressure is 5 psi.
 - c) Equip pneumatic tired rollers with skirt-type devices mounted around the tires to maintain the temperature of the tires during the rolling process.
 - c. Steel-wheeled tandem rollers and vibratory rollers:
 - 1) Furnish rollers having straight steel wheels free from grooves and/or pits.
 - 4. Curb forming equipment:
 - a. Furnish an extrusion type machine for curb forming.
- B. Handling Asphalt Concrete:
- 1. Make sure the asphalt concrete mix is at a temperature within the job mix formula limits specified in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - a. Take the asphalt concrete temperature at a point 6 inches below the exposed surface of the material, in the truck, on the job Site, and just prior to placement.
 - b. Furnish and use tarpaulins to cover the loads during transportation if the temperature of the mixture is below the job mix formula limits specified in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - 2. When releasing agents are placed in the truck bed, ensure that no free fluid is present in the truck bodies at the time the asphalt concrete is loaded.
 - a. Do not use diesel fuel as a releasing agent.
 - 3. Ensure the handling of the completed mixture at all times prevents segregation.
 - a. Handle all material within the self-propelled mechanical spreading and finishing equipment in a manner that prevents segregation of the aggregate.
 - 1) Include material-handling devices such as augers, screws, or slat conveyors on the equipment to prevent segregation.
 - a) Extend these devices to the final or termination point where the material is being transported within the equipment.

- 2) In the case of the screed, install auger extensions and vibrators wherever the screed is extended more than 1 foot beyond the end of the base auger or auger extension.
 - a) The Program/Project Manager may waive the auger extensions and vibrators when material is placed against an extremely uneven curb or edge over a short distance.
- 3) If any of the devices fail to function, terminate the paving operation immediately until repairs are completed.
 - b. Insure that asphalt material spread is free from areas of excess coarse or fine material.
4. Back trucks carrying asphalt material into self-propelled mechanical spreading and finishing equipment in a manner that will not jar the equipment excessively or move it out of line.
 - a. Securely attach the truck to the equipment during spreading and finishing.

C. Placing Asphalt Concrete:

1. Begin placement of pavement at points farthest from the source of supply, and progress continuously toward the source of supply, unless otherwise ordered by the Program/Project Manager.
 - a. Do not place more than 1/2 day's delivery to the Site in any one lane in advance of the other lanes.
 - b. Stagger the end of each lane in relation to the adjacent lane.
2. Use self-propelled mechanical spreading and finishing equipment for placing asphalt concrete, but do not allow the forward speed of operation of the equipment to exceed 55 feet per minute unless it can be demonstrated to the satisfaction of the Program/Project Manager that higher speeds will not affect the smoothness of the mat.
 - a. For locations where the mixture is to be placed over areas inaccessible to the specified spreading or compacting equipment or over areas where the use of the specified spreading and compacting equipment would not be practicable, have spreading or compacting the asphalt mixture by other means approved by the Program/Project Manager.
 - b. Spreader boxes will be permitted for alleys and on narrow paving projects where it is not practical to use self-propelled equipment.
 - 1) The use of spreader boxes must have the approval, in writing, of the Program/Project Manager.
 - 2) Minimize manipulation of the spreader box in order to obtain a smooth surface.
 - 3) Back trucks into the spreader box in a manner which will not jar the equipment excessively or move it out of line.
 - a) Securely attach the trucks to the equipment during spreading and finishing.
3. Place float rock that developed during the raking process on an underlying course or otherwise dispose of it.

- a. Never scatter float rock over the final course surface.
- D. Compacting Asphalt Concrete:
- 1. Use steel-wheeled tandem rollers or vibratory rollers where applicable.
 - a. In all cases, operate the larger of the 2 roller wheels in the forward position.
 - b. Operate vibratory rollers in accordance with standard practices and manufacturer recommendations.
- E. Leveling Course:
- 1. Use a leveling course when specified or when directed in writing by the Program/Project Manager to bring existing pavement to a uniform grade prior to placing an overlay or other course.
 - 2. After the prime coat or tack coat has been applied, spread the leveling course mixture to the proper width and to such depth as will compact to the required thickness.
 - a. The Program/Project Manager will determine actual quantities of the mixture required.
 - 3. Spread a leveling course only to a distance in advance of the following course covering it as ordered by the Program/Project Manager.
 - a. Do not place the leveling course less than one lane in width, but place the longest practical length for any one lay, preferably not less than 1200 feet.
 - b. Have the Program/Project Manager approve the exact width and length.
 - 4. Prior to finishing the leveling course by means of self-propelled spreading equipment, a spreader box, or motor graders, place the material in layers of 2 inches maximum compacted thickness.
 - 5. The Program/Project Manager may approve other means for placing the leveling course provided that the method provides a finish surface that does not vary from the design surface by more than the amount specified herein.
 - a. Minimize manipulation of controls of the paver in order to obtain a smooth surface.
 - 1) Unless otherwise permitted by the Program/Project Manager, do not make adjustments on less than 50 foot intervals except where the machine is equipped with electronic grade controls, and any adjustments may not result in a change in pavement thickness in excess of 1/8 inch.
 - 6. Thoroughly compact the leveling course, smooth and true to grade and cross-section, and free from ruts, humps, depressions, and irregularities.
 - a. Use a pneumatic tire or steel wheeled roller for leveling course compaction.
 - b. Roll the leveling course concurrently with the laydown of the leveling course.

- c. During the rolling operation, do not allow the speed of the roller to exceed 3 miles per hour.
 - d. Additional rollers may be required depending on the placement rate of the asphalt concrete.
 - 1) If an ample number of rollers are not present, adjust the placement rate to accommodate the roller speed.
- F. Asphalt Base and Surface Courses:
 - 1. Spread and finish asphalt base and surface courses by means of self-propelled mechanical spreading and finishing equipment, except as otherwise noted.
 - 2. When more than one course is placed, stagger the longitudinal joints of each course not less than 6 inches with relation to the longitudinal joints of the underlying course.
 - 3. Perform break down and compaction rolling with either steel-wheel or pneumatic-tire.
 - a. The compacted thickness of layers placed may not exceed 150 percent of the design thickness specified in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications except as otherwise provided in the Contract Drawings and Specifications, or if approved in writing by the Program/Project Manager.
 - b. Operate all rollers continuously from breakdown through finish rolling.
 - 4. Furnish sufficient rolling equipment to satisfactorily compact and finish the amount of mixture being placed.
 - a. Prior to placing any asphalt material, verify that the required type and number of rollers are on the Site and in acceptable operating condition.
 - 1) Vibratory rollers may be used in lieu of the steel-wheeled rollers; however, when the thickness of the asphalt is 1 inch or less all rolling must be done in the static mode.
 - 2) Furnish a minimum of two rollers with 2 operators on the Site at all times.
 - 3) Upon approval of the Program/Project Manager, one of the rollers may be a pneumatic tire roller.
 - b. During the rolling operation, the speed of the roller may not exceed 3 miles per hour.
 - 1) If an ample number of rollers are not present, adjust the placement rate to accommodate the roller speed.
 - 5. Begin breakdown rolling as soon as the mixture will bear the roller without undue displacement.
 - a. Roll longitudinally along the pavement, overlapping on successive trips by at least 1/2 but not more than 3/4 the width of the rear wheels.
 - b. On alternate trips of the roller vary the lengths slightly.
 - c. Ensure that the motion of the roller at all time is slow enough to avoid displacement of the mixture.

- d. The Program/Project Manager may require a pneumatic roller for one of the rolling operations.
 6. When more than one width of asphalt concrete material will be placed, do not roll a 6-inch strip adjacent to the area on which future material is to be laid until such material has been placed.
 - a. Do not leave the 6-inch strip unrolled for more than 2 hours after it is placed unless it is first heated with a joint heater before being rolled.
 - b. After the first strip or width has been compacted; place, finish and compact the second width in a manner similar to the first width except that the 6-inch width not previously compacted must also be compacted.
 7. If the mix was designed with the Marshall method in accordance with the Asphalt Institute's MS-2, continue rolling until the specific gravity of the compacted mixture is not less than 95 percent of the specific gravity of specimens composed of the same materials in similar proportions or composed of the same mixture compacted in the laboratory by the 75-blow method of AASHTO T 245.
 8. If the mix was designed with the Asphalt Institute's Superpave gyratory method in accordance with Asphalt Institute's SP-2, continue rolling until the specific gravity of the compacted mixture is not less than 93 percent of the maximum theoretical specific gravity according to ASTM D 2041 of specimens composed of the same materials in similar proportions or composed of the same mixture compacted in the laboratory.
 9. At any place not accessible to roller compaction, thoroughly compact the mixture with tampers, and where necessary finish with a hot smoothing iron to provide a uniform and smooth layer over the entire area compacted in this manner.
 10. Perform finish rolling using steel-wheeled rollers or vibratory steel-wheeled rollers operated in the static mode.
 11. The completed surface must be thoroughly compacted, smooth, true to grade and cross-section, and free from ruts, humps, depressions, or irregularities.
- G. Construction Joints:
1. Use a light coat of asphalt emulsion applied to the exposed edge before the joint is made, if it deemed necessary by the Program/Project Manager.
 2. Verify that construction joints formed when the fresh mixture is placed are dense and well sealed.
 3. Test transverse construction joints with a 25 foot straightedge in accordance with Paragraph 3.03.I.
- H. Curbs:
1. Place curbs using an approved extrusion type machine.
 - a. Have curb extrusion templates varying from the cross-section shown on the Contract Drawings approved by the Program/Project Manager.

2. Use a 1/2-inch asphalt mix in accordance with Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - a. Ensure one percent by weight of the total mixture consists of a granulated synthetic resin stiffener, Lexite or equal, in accordance with the following:
 - 1) Softening Point (Ring & Ball): 210 degrees Fahrenheit, minimum, in accordance with ASTM D 36.
 - 2) Acid Number: Less than 1.00 in accordance with ASTM D 465.
 - 3) Saponifiable Matter: Less than 1 percent in accordance with ASTM D 464.
 - 4) Iodine Number: 175 - 185 in accordance with ASTM D 29.
- I. Tolerances:
 1. Tolerances of Leveling and Surface Courses:
 - a. An acceptable leveling course surface may not vary more than 1/2 inch from the lower edge of a 25-foot straightedge placed parallel to the centerline of the roadway.
 - b. An acceptable finish course surface may not vary more than 1/4 inch from the lower edge of a 25-foot straightedge placed parallel to the centerline of the roadway.

3.04 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. Site Tests:
 - a. The Testing and Inspection Agency and the City of Phoenix Testing Laboratory will test the asphalt pavement provided under this Section.
 - b. Pavement Drainage Test:
 - 1) Test Procedure:
 - a) Before final acceptance and in the presence of the Program/Project Manager, the Testing and Inspection Agency will test the drainage of the streets paved with asphalt under this Section by applying water to the surface.
 - b) Provide the water for this test at no increase in the Contract Price.
 - 2) Acceptance Criteria:
 - a) Demonstrate that the pavement allows for proper drainage.
 - c. Mineral Aggregate Gradation Test:
 - 1) Test Procedure:
 - a) At least 3 weeks prior to using mineral aggregates, submit a sample of the combined aggregates to the City of Phoenix Testing Laboratory for verification it's gradation is within the tolerances for The Standard Mix.
 - 2) Acceptance Criteria:
 - a) Aggregate within the specified tolerances will be acceptable.

d. Asphalt Pavement Thickness Test:

1) Test Procedure:

- a) If in the opinion of the Program/Project Manager there is reason to believe that the pavement thickness is deficient, the City of Phoenix Testing Laboratory will take cores to verify conditions at random locations as follows:
 - (1) 1 core will be taken for each 8 feet or portion thereof of width and for every 500 feet of lineal distance.
 - (2) 1 core will be taken for each 8 feet of width between intersecting streets or portion thereof.
 - (3) If a deficiency of more than 1/4 inch from the required thickness is found, 2 additional cores will be taken not closer than 100 feet apart or closer than 100 feet to the original deficient core.
 - (a) The average of these 3 cores will be used to determine the amount of any deficiency.
 - (4) Core thickness will be determined by average caliper measurement.
- b) Further cores may be taken by the Contractor, if he so chooses to determine the limits of the deficiency, if at no increase in the Contract Price.
 - (1) These cores will not be used to determine the average thickness of the pavement.
 - (2) Coring to establish if the pavement is deficient will be at no increase in the Contract Price.

2) Acceptance Criteria:

- a) Asphalt pavement of the specified thickness will be acceptable.

e. Asphalt Density Test:

1) Test Procedure:

- a) When in the opinion of the Program/Project Manager there is reason to believe that the compaction of the mixture is deficient, the City of Phoenix Testing Laboratory will take cores to verify conditions at random locations as follows.
 - (1) 1 core will be taken for each 8 feet or portion thereof of width and for every 500 feet of lineal distance.
 - (2) 1 core will be taken for each 8 feet of width between intersecting streets or portion thereof.
 - (3) If a deficiency of more than 1 percent from the required specific gravity defined in Subparagraph 3.03.F.7 or Subparagraph 3.03.F.8 is found, 2 additional cores will be taken not closer than 100 feet apart or closer than 100 feet to the original deficient core.
 - (a) The average of these 3 cores will be used to determine the amount of any deficiency.

- (4) Further cores may be taken by the Contractor, if he so chooses to determine the limits of the deficiency, if at no increase in the Contract Price.
 - (a) These cores will not be used to determine the average specific gravity of the pavement.
 - (b) Coring to establish if the pavement is deficient will be at no increase in the Contract Price.
 - 2) Acceptance Criteria:
 - a) Asphalt pavement having the required specific gravity defined in Subparagraph 3.03.F.7 or Subparagraph 3.03.F.8 will be acceptable.
 - f. Asphalt Cement Content Test:
 - 1) Test Procedure:
 - a) Samples will be secured from the roadway by City of Phoenix Testing Laboratory in accordance with the provisions of Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications and AASHTO T 168 for the purpose of determining asphalt cement content.
 - b) If the asphalt cement content determined by tests performed on the samples exceeds the limits established in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications, for each deficient test taken 2 additional cores not closer than 100 feet apart or closer than 100 feet to the original core will be taken, and the testing on these 2 additional cores will be repeated.
 - c) The average of all 3 tests made will be used to determine the asphalt cement content.
 - 2) Acceptance Criteria:
 - a) Asphalt pavement of having cement content within the limits established in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications will be acceptable.
 - 2. Inspections:
 - a. The Program Project Manager will measure the base, leveling, and surface courses to verify they are within the tolerances specified in Subparagraph 3.03.I.1.
 - b. Prepare and submit as-built information recording the actual depths and profiles of the pavement to the Program/Project Manager for information.
- B. Non-Conforming Work
- 1. Drainage Deficiencies:
 - a. Correct any areas not draining properly, as demonstrated by the Pavement Drainage Test described in Paragraph 3.04.A.1.b, to the Program/Project Manager's satisfaction.

- b. Correct drainage deficiencies at no increase in the Contract Price.
 2. Mineral Aggregate Gradation Deficiencies:
 - a. When the mineral aggregate gradation deviates from the specified requirements in an amount that, in the opinion of the Program/Project Manager, will affect the stability or durability of the mix, do either of the following:
 - 1) Remove and replace the asphalt concrete pavement with material that meets the requirements of this Section.
 - 2) Place an additional mat of such thickness and gradation as required by the Program/Project Manager which will, in the opinion of the Program/Project Manager, correct the deficiency.
 - b. Repair mineral aggregate gradation deficiencies at no increase in the Contract Price.
 3. Pavement Thickness Deficiencies:
 - a. When a deficiency of pavement thickness discovered by using methods described in Paragraph 3.04.A.1.d exceed 1/2 inch, overlay the pavement on the area affected as follows:
 - 1) Overlay not less than one city block or 660 feet, whichever is less in length, for the full width of the deficient area.
 - 2) Overlay the area specified in Paragraph 3.04.A.1.d with a new mat of material as specified by the Program/Project Manager and equal in thickness to the deficiency but not less than 1/2 inch in any instance.
 - b. Overlay deficiencies in thickness at no increase in the Contract Price.
 4. Pavement Compaction Deficiencies:
 - a. When a deficiency of the pavement density discovered by using methods described in Paragraph 3.04.A.1.e exceeds 5 percent, which is a greater deviation than the permitted deviation, overlay the pavement in the area affected with a standard pre-coated chip seal complying with the requirements of with MAG Section 330.
 - 1) Overlay not less than one city block or 660 feet, whichever is shorter, for the full width of the deficient area.
 - b. Overlay pavement compaction deficiencies at no increase in the Contract Price.
 5. Asphalt Cement Content Deficiencies:
 - a. When the asphalt cement content is in excess of the limits established in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications, remove any areas of bleeding as directed by the Program/Project Manager, but in no case less than the specified roller width.
 - 1) Replace the affected material with new material meeting the specification requirements for the mix type involved.
 - 2) At any time bleeding occurs within the period lasting from placement until 1 year after placement, remove and replace defective material until the bleeding has been corrected.

- b. When the deviation of the pavement asphalt cement content exceeds 0.2 percentage points by weight from limits established in Table 710-7 in Section 710 of the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications, which is a greater deviation than the permitted deviation, overlay the pavement on the area affected with a standard pre-coated chip seal in conformance with MAG Section 330.
 - 1) Overlay not less than one city block or 660 feet, whichever is shorter, for the full width of the deficient area.
 - c. Repair asphalt cement content deficiencies at no increase in the Contract Price.
- 6. Leveling Course Deficiencies:
 - a. Correct leveling course deviations that exceed the tolerances specified in Subparagraph 3.03.I.1, such as humps, or depressions, to meet the specified tolerance.
 - b. Adjustment in the cost for the material may be requested by either the Owner or the Contractor depending on the type of deviation.
 - c. Provide the labor and equipment necessary to correct such deviations at no increase in the Contract Price.
- 7. Asphalt Base and Surface Course Deficiencies:
 - a. If asphalt base and surface course deviations that exceed the tolerances specified in Subparagraph 3.03.I.2 such as humps and depressions are found, do either of the following:
 - 1) Correct asphalt base and surface course deviations.
 - 2) Cut out the deviating areas along neat straight lines and replace those areas with fresh hot mixture, and thoroughly compact them to conform and bond to the surrounding area.
 - b. Repair asphalt base and surface course deficiencies at no increase in the Contract Price.

3.05 CLEANING

- A. At the completion of the pavement construction, remove all forms, mixing and paving equipment, and traffic control devices furnished under this Section from the Site.

3.06 PROTECTION

- A. Apply an asphalt concrete preservative seal on all new asphalt concrete pavements in accordance with MAG Section 334, except as modified below.
 - 1. The Program/Project Manager will make a field determination whether the seal is required, and will then either provide the actual application rate or delete the requirement.
 - 2. This seal is not required for pavement matching and surface replacement over pipe trenches and other similar features unless specified on the Contract Drawings.

SECTION 02749

COLORED ASPHALT AND CONCRETE PAVING

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for providing a colored and coated asphalt and concrete surface here indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 01555 - Traffic Control.
 - 4. Section 01780 - Closeout Submittals.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. CIE: International Commission on Illumination.
 - 2. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
 - 3. MAG: Maricopa Association of Governments.
 - 4. MEK: Methyl ethyl ketone, also known as butanone, is an organic compound with the formula $\text{CH}_3\text{C}(\text{O})\text{CH}_2\text{CH}_3$.
 - 5. QUV®: Q-Lab Corporation’s registered trademark for a series of accelerated weathering testers.
 - 6. VOC: An acronym for volatile organic compounds, generally meant to refer to organic chemical compounds that have high enough vapor pressures under normal conditions to significantly vaporize and enter the atmosphere.
- B. Definitions:
 - 1. Authority Having Jurisdiction (AHJ): Building Code officials, zoning officials, inspectors, and government and regulatory agencies given the authority to protect the public’s health, safety, and welfare.
 - 2. Decorative Colored Asphalt and Concrete: Asphalt and concrete pavement that has been subjected to coloring in a specific pattern.

Applying decorative coloring is a highly specialized process that requires the skill of a qualified applicator working with the proper equipment and applying highly specialized coating(s) designed specifically for application to asphalt and concrete pavement.

3. Non-textured Asphalt Pavement: Asphalt pavement that is unstamped and is sometimes referred to as “flatwork”.
4. Scuffing: Tearing of asphalt pavement caused by an external force, such as stationary vehicle tires turning on the pavement surface.

C. Reference Standards:

1. ASTM International (ASTM):
 - a. ASTM D522 - Standard Test Methods for Mandrel Bend Test of Attached Organic Coatings.
 - b. ASTM D2486 - Standard Test Methods for Scrub Resistance of Wall Paints.
 - c. ASTM D3960 - Standard Practice for Determining Volatile Organic Compound (VOC) Content of Paints and Related Coatings.
 - d. ASTM D4060 - Standard Test Method for Abrasion Resistance of Organic Coatings by the Taber Abraser.
 - e. ASTM D4541 - Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers.
 - f. ASTM E303 - Standard Test Method for Measuring Surface Frictional Properties Using the British Pendulum Tester.
 - g. ASTM G155 - Standard Practice for Operating Xenon Arc Light Apparatus for Exposure of Non- Metallic Materials.
2. City of Phoenix (COP):
 - a. City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - 1) Section 321 - Asphalt Concrete Pavement.
 - 2) Section 702 - Base Materials.
 - 3) Section 710 - Asphalt Concrete.
3. Maricopa Association of Governments (MAG):
 - a. Uniform Standard Specifications for Public Works Construction:
 - 1) Section 321 - Placement and Construction of Asphalt Concrete Pavement.
 - 2) Section 329 - Tack Coat.
 - 3) Section 702 - Base Materials.
 - 4) Section 710 - Asphalt Concrete.
4. United States Government:
 - a. Environmental Protection Agency (EPA):
 - 1) 40 CFR 59 – National Volatile Organic Compound Emission Standards for Consumer and Commercial Products.
 - b. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 Occupational Health and Safety Standards.
 - 2) 29 CFR 1926 Safety and Health Regulations for Construction.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Include provisions for traffic control during operations in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the pavement from traffic.
- B. Sequencing:
 - 1. Insure the paving has been placed and is ready for application when scheduled.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Names of the pavement coating(s) and the coating supplier.
 - b. Shop Drawings:
 - 1) Proposed layout, patterns, colors, and extent of the colored paving.
 - c. Samples:
 - 1) Paving coating color and texture Samples.
 - d. Certificates:
 - 1) Pavement Coating Certificate of Analysis.
 - e. Special Procedure Submittals:
 - 1) List of the major colored paving application equipment.
 - f. Qualification Statements:
 - 1) Colored paving applicator's license.
 - 2) Applicator's certification of and references for each completed decorative paving project.
- B. Informational Submittals:
 - 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Manufacturer's storage instructions.
- C. Closeout Submittals:
 - 1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Warranty Documentation:
 - 1) Colored Paving Coating Materials Warranty.
 - 2) Colored Paving Coatings Installation Warranty.

1.05 QUALITY ASSURANCE

A. Qualifications:

1. Applicator's Qualifications:

- a. Employ a colored paving applicator licensed by a recognized authority in the execution of decorative paving work, and that has completed a minimum of 10 decorative paving projects, each project having at least 1000 square feet.
- b. Submit a copy of the colored paving applicator's current year license to the Program/Project Manager for confirmation and approval.
 - 1) Do not begin the colored paving Work until approval of the Applicator's qualifications is received.
- c. Submit a certification of and references for each completed decorative colored paving project to the Program/Project Manager for confirmation and approval.

2. Testing and Inspection Agency:

- a. Employ an independent certified materials testing laboratory approved by the Program/Project Manager and appropriate State and municipal departments that is experienced in performing the tests required by this Section to perform testing and certify the results.
- b. Submit the name and qualifications of the independent certified materials testing laboratory to the Program/Project Manager for approval.

B. Certifications:

1. Asphalt Pavement Coating Certificate of Analysis:

- a. Submit the Colored Pavement Coating Certificate of Analysis to the Program/Project Manager for approval.

C. Site Samples:

1. For each coating for colored paving, submit Samples representing the manufacturer's full range of available colors and textures to the Program/Project Manager for approval and color selection.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Deliver material to the Site in original, sealed, undamaged, unopened containers clearly labeled by the manufacturer with the trade name, type, grade, shelf life, and other identifying data on an intact identification label.
2. Acceptance Documentation:
 - a. Record batch numbers, product identification, and quantities on appropriate Quality Control documents.
 - b. Attach a copy of the transport document and the Manufacturer's Certificate of Conformance to the material delivery Quality Control form.

- B. Storage and Handling Requirements:
 - 1. Store coating materials in air tight containers protected from the weather.
 - 2. Discard coating materials that have exceeded their shelf life without use.
 - 3. Store coating materials in strict accordance with manufacturers documented instructions.
 - a. Submit the coating materials manufacturer's documented storage instructions to the Program/Project Manager for information.
 - 4. Store hazardous materials, and materials contaminated by hazardous materials, in accordance with requirements of the local Authorities Having Jurisdiction.
- C. Packaging Waste Management:
 - 1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

1.07 SITE CONDITIONS

- A. Existing Conditions:
 - 1. The existing pavement was installed in accordance with the requirements for asphalt pavement specified in the Maricopa Association of Governments (MAG) Uniform Standard Specifications for Public Works Construction as modified by the City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - a. A durable and stable asphalt pavement mix design installed according to best practices over a properly prepared and stable substrate is a pre-requisite for long-lasting asphalt pavement surfaces.
 - b. Applicable sections of the standards are listed in Subparagraphs 1.02.C.2 and 1.02.C.3.

1.08 WARRANTY

- A. Manufacturer Warranty:
 - 1. Warrant the colored pavement coatings against defects in materials within the 1-year period after the Date of Substantial Completion:
 - a. The manufacturer's liability does not include variable factors out of the manufacturer's control, such as environmental conditions, application techniques, and surface conditions which are critical to the results obtained.
 - b. Submit a Colored Coating Materials Warranty on the colored pavement coating manufacturer's standard or customized form, without monetary limitation, in which the colored pavement coating manufacturer agrees to replace properly applied colored pavement coatings that fail in materials within the specified warranty period to the Program/Project Manager for approval.
 - 1) Have the manufacturer's standard form signed by the Contractor and manufacturer.

- B. Special Warranty:
1. Installer's Warranty:
 - a. Warrant the colored pavement coatings workmanship against failures within the 3-year period after the Date of Substantial Completion:
 - 1) Submit a Colored Pavement Coatings Installation Warranty on the installer's standard or customized form, without monetary limitation, in which installer agrees to repair colored pavement coatings that fail within the specified warranty period to the Program/Project Manager for approval.

PART 2 PRODUCTS

2.01 COLORED PAVING

- A. Description:
1. Regulatory Requirements:
 - a. Comply with the Occupational Safety and Health Administration (OSHA) regulations stipulated in 29 CFR 1910 and 29 CFR 1926.
 2. Sustainability Characteristics:
 - a. Volatile Organic Compounds (VOC) Content of liquid-type auxiliary materials:
 - 1) Provide liquid-type auxiliary materials for the colored paving having volatile organic compound content less than 150 grams per liter when calculated according to Environmental Protection Agency (EPA) Reference Method 24 as described in 40 CFR 59, and that comply with the volatile organic compounds (VOC) limits of the Authorities Having Jurisdiction.
- B. Performance:
1. Provide colored pavement coating having at a minimum the performance properties specified in Table 02749-1.

Table 02749-1 Colored Pavement Coating Performance Properties		
Characteristic	Test Specification	Performance
Durability Taber Abrasion	ASTM D4060 Abrasion resistance of organic coatings (wet wear) 7 day cure, 24 hour soak; H-10 wheel	Wear Index (WI) < 5.0 (cycles to wear-through)
Color stability	ASTM G155 QUV® 2,000 hours (CIE units)	Brick color $\Delta E < 1.5$

Table 02749-1 Colored Pavement Coating Performance Properties		
Characteristic	Test Specification	Performance
Flexibility: Mandrel Bend	ASTM D522 Flexibility as measured by mandrel bend	0.5mm thick sample passes 10mm at 21°C 0.5mm thick sample passes 125mm at -18°C
Chemical resistance	ASTM D2486 Modified MEK scrubs 16 dry mils	> 5000 (number of scrubs until 50% substrate exposed)
Adhesion to Asphalt	ASTM D4541	Substrate failure
Friction Wet	ASTM E303 British Pendulum Tester	> 55
Environmental Sensitivity	EPA Reference Method 24 or ASTM D3960 Volatile Organic Compounds	VOC < 150

C. Design Criteria:

1. Prepare Shop Drawings showing the proposed layout, patterns, colors, and extent of the colored paving.
2. Submit the Shop Drawings of the colored paving to the Program/Project Manager for approval.

D. Materials:

1. Colored Pavement Coatings:
 - a. Furnish properly designed colored pavement coatings having the optimal balance of performance properties scientifically formulated to provide a durable, long lasting color and texture when applied to colored pavement surfaces.
 - 1) Key properties are specified in Table 02749-1, and include wet wear durability, crack resistance, and fade resistance, adhesion, and friction properties.
 - 2) The colored pavement coating must be environmentally safe and meet Environmental Protection Agency (EPA) requirements for Volatile Organic Compounds (VOC).
 - b. Submit the name of the colored pavement coating(s) and the coating supplier's name to the Program/Project Manager for approval.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Asphalt Pavement:
 - a. Verify that the asphalt pavement to receive the coating is highly stable and free of defects.
 2. Concrete Pavement:
 - a. Verify that the concrete pavement to receive the coating is highly stable and free of defects.
- B. Evaluation and Assessment:
1. Do not install the pavement texturing system over poor quality asphalt or concrete pavement.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
1. Maintain and protect traffic on active streets and roads in accordance with the requirements specified in Section 01555, Traffic Control.
 2. Protect equipment and surfaces not scheduled to receive asphalt/concrete paving coatings from damage from overspray, fall-out, or dusting.
- B. Surface Preparation:
1. Ensure that the asphalt/concrete pavement surface is dry and free from foreign matter, including but not limited to dirt, dust, de-icing materials, and chemical residue.
 2. Depending upon the condition and age of the pre-existing pavement, primer may be required.
 - a. If required, apply a suitable primer approved by the asphalt/concrete coating manufacturer.

3.03 APPLICATION

- A. Application Equipment:
1. Furnish specialized equipment for executing of the Work:
 - a. Asphalt Pavement Re-Heating Equipment:
 - 1) Furnish asphalt pavement re-heating equipment specifically designed for decorative asphalt.
 - 2) Furnish primary asphalt pavement re-heat equipment capable of cycling the application of heat, and allowing the equipment operator to check the pavement surface temperature during the heating process.
 - a) Furnish controls that enable the operator to gradually elevate the pavement temperature and ensure the pavement is not overheated or adversely affected.
 - b) Do not furnish heaters without these controls as the primary re-heating equipment.
 - b. Portable Heating Devices:
 - 1) Furnish hand-held portable heating devices.
 - c. Finishing Tools:

- 1) Furnish finishing tools designed to enable applicators to complete imprinting of the asphalt pavement in areas inaccessible to the template, such as curbs and manhole covers.
 - d. Compactors:
 - 1) Furnish vibratory plate compactors for pressing the templates into the heated asphalt pavement to create the specified pattern.
 - e. Spray Equipment:
 - 1) Furnish spray equipment capable of applying the specialized asphalt/concrete pavement coating to the pavement surface in a thin, controlled film to optimize the drying and curing time of the coating.
 - a) Furnish a spray equipment pump capable of providing continuous recirculation of the coating that keeps the solids within the coating in suspension.
 2. Submit a list of the major colored paving application equipment proposed for executing the Work to the Program/Project Manager for approval.
 - a. Include the colored pavement reheat machinery, spray equipment, and compactor(s), in the list.
- B. Layout:
1. Layout of the pattern for coating of the surface of the asphalt/concrete pavement as indicated in the Contract Drawings.
- C. Heating the Asphalt Pavement:
1. Cycle the application of heat, and check the pavement surface temperature during the heating process.
 - a. Gradually elevate the pavement temperature, but do not overheat or adversely affect the pavement.
 - b. For areas where it is difficult to operate asphalt pavement re-heat machines, use hand-held portable heating devices.
 - 1) These may not be used as the primary pavement re-heating device.
 2. The optimal pavement temperature for imprinting the template is dependent upon mix design, modifiers used in the mix, the age of the pavement, and the weather.
 - a. Do not allow the surface temperature of the pavement to exceed 325 degrees Fahrenheit as determined by an infra-red thermometer reading taken after the heat is applied to the asphalt pavement.
 - b. In order to achieve the proper depth of imprint, elevate the asphalt pavement temperature to a minimum depth of 1/2 inch (12.5mm) without burning the pavement surface.
- D. Applying Asphalt/concrete Pavement Coatings:
1. Coat the pavement surface with a coating or system of coatings specifically formulated as a colorant for asphalt/concrete pavement as a colorant.

2. Verify that the pavement surface is completely dry and thoroughly cleaned prior to application of the asphalt/concrete pavement coating(s).
3. Coat the pavement surface in accordance with the asphalt/concrete pavement coating supplier's specifications and recommendations for application.
 - a. Apply the asphalt/concrete pavement coatings in environmental conditions that permit proper cure.
 - b. Apply the coating in accordance with the asphalt/concrete pavement coating supplier's recommendations for coating coverage rate, number of recommended passes, and recommended film thickness.
 - c. Submit the asphalt/concrete pavement coating supplier's specifications and recommendations for application to the Program/Project Manager for information.

3.04 SITE QUALITY CONTROL

- A. Site Inspections:
 1. The Program Project Manager will inspect the asphalt/concrete paving coating to verify it complies with the specified requirements.
- B. Non-Conforming Work
 1. Remove defective work, and replace it with acceptable asphalt/concrete paving coatings.

3.05 CLEANING

- A. At the completion of the asphalt/concrete paving coating application, remove all equipment, and traffic control devices, required to facilitate the Work of this Section from the Site.
- B. Waste Management:
 1. Remove waste materials in accordance with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.
 2. Dispose of hazardous materials, and materials contaminated by hazardous materials, in accordance with requirements of the local Authorities Having Jurisdiction.

3.06 PROTECTION

- A. Do not permit traffic on the coated asphalt/concrete pavement surface before the surface coating is 100 percent dry.
 1. Provide the necessary personnel and equipment to divert traffic from the installation area where Work is in progress and during drying time when, in the opinion of the Program/Project Manager, diversion of traffic is necessary.

2. Refer to the asphalt/concrete pavement coating supplier's guide for other required protective measures.

SECTION 02751

PLAIN CEMENT CONCRETE PAVEMENT

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for construction of plain jointed Portland cement concrete pavement on a prepared subgrade.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01555 - Traffic Control.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 02339 - Subgrade Preparation.
 - 5. Section 02702 - Concrete Curb, Gutter, Driveway, Sidewalk, and Alley Entrance.

1.02 REFERENCES

- A. Definitions:
 - 1. Internal Joint Surface: The full depth surface of the crack created as the result of saw cutting a joint in the concrete pavement.
 - 2. Primary Unit of Pavement: The area of pavement placed in each day's paving operation, in an intersection, or in a special section.
 - 3. Secondary Unit of Pavement: 1,000 linear feet, or excess fraction thereof, of each traffic lane; or each 1,300 square yards of pavement in intersections and similar areas, regardless of when the concrete was placed.
- B. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO T 148 - Measuring Length of Drilled Concrete Cores.
 - b. AASHTO T 176 - Plastic Fines in Graded Aggregates and Soils by Use of the Sand Equivalent Test.
 - 2. American Concrete Institute (ACI):
 - a. ACI Manual of Concrete Practice.
 - b. ACI 305R - Hot Weather Concreting.
 - c. ACI 306R - Cold Weather Concreting.
 - d. ACI 318/318R - Building Code Requirements for Structural Concrete and Commentary (Includes International Conference of Building Officials Evaluation Report).
 - 3. Arizona Department of Transportation (ADOT):
 - a. ADOT Standard Specifications for Road and Bridge Construction.

- 1) Section 401 – Portland Cement Concrete Pavement.
- 2) Section 402 – Portland Cement Concrete Pavement Repairs.
- 3) Section 1003 – Reinforcing Steel.
- 4) Section 1006 – Portland Cement Concrete.
- 5) Section 1011 – Joint Materials.
- b. Arizona Stored Specifications:
 - 1) Section 401– Portland Cement Concrete (C-22.10 Utility Line Slab) - (401PCCUC, 04/15/91)
 - 2) Section 401– Portland Cement Concrete (Latex Modified Overlay) – (401LMCO, 05/15/92)
 - 3) Section 401– Load Transfer Dowel Assembly – (401LTDA, 11/01/93)
 - 4) Section 1006 – Portland Cement Concrete – (1006QCPC, 07/12/05)
- c. ADOT Standard Drawings – Construction Standards.
- d. ADOT Materials Testing Manual:
 - 1) Arizona Test Method 801a – Evaluation of Profiles.
4. ASTM International (ASTM):

 - b. ASTM C 31/C 31M - Practice for Making and Curing Concrete Test Specimens in the Field
 - c. ASTM C 33 - Specification for Concrete Aggregates
 - d. ASTM C 39/C 39M - Test Method for Compressive Strength of Cylindrical Concrete Specimens
 - e. ASTM C 78 - Test Method for Flexural Strength of Concrete (Using Simple Beam with Third-Point Loading)
 - f. ASTM C 150 - Specification for Portland Cement
 - g. ASTM D 1751 - Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
 - h. ASTM D 2419 - Test Method for Sand Equivalent Value of Soils and Fine Aggregate
 - i. ASTM D 3406 - Specification for Joint Sealant, Hot-Applied, Elastomeric Type, for Portland Cement Concrete Pavements
5. Maricopa Association of Governments (MAG):
 - a. MAG Uniform Standard Specifications for Public Works Construction:
 - 1) Section 725 – Portland Cement Concrete
 - 2) Section 726 – Concrete Curing Materials
 - 3) Section 729 - Expansion Joint Filler
 - b. MAG Uniform Standard Details for Public Works Construction:
 - 1) Standard Detail 224 - Joint for Drainage Inlets and Manhole Covers.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Depending on where the paving removal operation is to occur and the owner of the right-of- way, coordinate with and obtain the required approvals from the appropriate State and municipal departments, including but not limited to, the following:
 - a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Streets Department.
 - c. Phoenix Sky Harbor International Airport.
2. Adhere to each owner's specifications and/or permits, and comply with additional requirements of the owners, regarding the Work of this Section.
3. If the owner of the right-of- way is other than the Phoenix Sky Harbor International Airport, the owner of the right-of- way will be provided on the Contract Drawings.

B. Sequencing:

1. Include provisions for traffic control during concrete paving operations in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the pavement from traffic for a minimum of 7 Days after concrete placement.

C. Scheduling:

1. Submit a detailed sequence and schedule of concrete placement operations including, but not limited to; plant location, width of the pavement to be placed, proposed equipment, production rates, working hours, concrete hauling and number of trucks available, placement methods, and curing, sawing and sealing methods.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Portland cement.
 - 2) Aggregates.
 - 3) Concrete reinforcement.
 - 4) Metal sleeve design for use with dowel bars.
 - 5) Basket support for holding reinforcing steel bars parallel to pavement surface.
 - 6) Concrete Curing Materials.
 - 7) Joint Materials.
 - b. Shop Drawings:

- 1) Working Drawings of the plain cement concrete pavement.
 - c. Certificates:
 - 1) Certificates of Analysis for hydraulic cement.
 - 2) Certificates of Compliance for joint sealant.
 - 3) Certificates of Compliance for expansion joint filler.
 - d. Delegated Design Submittals:
 - 1) Mix designs for plain cement concrete pavement.
 - 2) Sequence and schedule of plain cement concrete pavement placement operations.
 - e. Qualification Statements:
 - 1) Qualifications of the certified materials testing laboratory.
- B. Informational Submittals:
 - 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Data from modulus of rupture tests demonstrating that concrete will conform to the modulus of rupture requirements of the Specifications.
 - 2) Data results of compressive strength tests conducted at the same age as modulus of rupture tests to establish the correlation.
 - 3) Optional compressive strength test of specimens fabricated in accordance with ASTM C 31/C 31M and tested in accordance with ASTM C 39/C 39M.
 - 4) Test records and all other required testing documentation.
 - b. Manufacturer's Instructions:
 - 1) Data for fog spraying equipment used for applying water to the pavement surface during screeding and finishing operations.
 - 2) Design, capacity, and mechanical condition of equipment and tools.
 - c. Manufacturer's Reports:
 - 1) Shipping documents for reinforcing steel.
- C. Closeout Submittals:
 - 1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Record Documentation:
 - 1) As-built information recording the actual depths and profiles of the plain cement concrete pavement.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Right-of Way Owner Approvals:

- a. Required approvals depend on who owns the right-of-way and where the plain concrete pavement is to be constructed, but must be obtained before construction activities begin from the appropriate State and municipal departments, which may include but are not limited to, the following:
 - 1) Arizona Department of Transportation (ADOT).
 - 2) City of Phoenix Streets Department.
 - 3) Phoenix Sky Harbor International Airport Design and Construction Services.
 - b. If the owner of the Right-of-Way is other than the Phoenix Sky Harbor International Airport, the owner of the Right-of-Way will be provided on the Contract Drawings.
- B. Certifications:
 - 1. Submit Certificates of Analysis for hydraulic cement that include the following information:
 - a. Description of material supplied.
 - b. Quantity represented by the Certificate.
 - c. A means of identifying the material, such as a label, lot number, or marking.
 - d. A statement certifying the material complies with the requirements of specifications cited.
 - e. The name, title and signature of a person having the authority to bind the manufacturer or Supplier of the material.
 - f. The results of the tests required by the Specifications.
 - 2. Submit Certificates of Compliance for both joint sealant and expansion joint filler that include the following information:
 - a. Description of material supplied.
 - b. Quantity represented by the Certificate.
 - c. A means of identifying the material, such as a label, lot number, or marking.
 - d. A statement certifying the material complies with the requirements of specifications cited.
 - e. The name, title and signature of a person having the authority to bind the manufacturer or Supplier of the material.
- C. Preconstruction Testing:
 - 1. Employ an independent certified materials testing laboratory approved by the Program/Project Manager and appropriate State and municipal departments that is experienced in performing all of the tests required by this Section to perform or witness testing and certify the results.
 - 2. At least 30 days in advance of the start of concrete paving operations, submit data acceptable to the Program/Project Manager which demonstrates that concrete, produced with materials and proportions as proposed for use in the construction, will conform to the modulus of rupture requirements of this Section.

- a. Fabricate modulus of rupture test specimens in accordance with ASTM C 31/C 31M and test specimens in accordance with ASTM C 78 at 14 Days and at 28 Days.
- b. Include results of compressive strength tests conducted at the same age as modulus of rupture tests to establish the correlation which can be expected between the flexural and compressive strength properties of the concrete.
- c. The Program/Project Manager may, at his option, have the Testing and Inspection Agency use a compressive strength test of specimens fabricated in accordance with ASTM C 31/C 31M and tested in accordance with ASTM C 39/C 39M to verify conformance to the modulus of rupture requirements of this Section.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 1. Submit 3 copies of the shipping documents for reinforcing steel to the Program/Project Manager for information that show the delivered sizes, lengths, and weights separately for each structure.
- B. Storage and Handling Requirements:
 1. Do not intermingle different types or brands of hydraulic cement, or use different types or brands in the same batch.
 2. Store and protect hydraulic cement from damage from moisture.
 - a. Do not use cement which has become partially set or which contains caked lumps.
 3. Store and handle concrete aggregate to minimize segregation and intermixing and contamination by foreign materials.
 - a. Separate different sizes of aggregates in separate stockpiles sufficiently removed from one another to prevent the material from becoming intermixed.
 - b. If aggregates are stored on the ground, level and clear the site of all vegetation.

1.07 SITE CONDITIONS

- A. Ambient Conditions:
 1. Hot Weather Concreting:
 - a. If daytime ambient temperatures are expected to exceed 100 degrees Fahrenheit, place concrete only between the hours of 8:00 p.m. and 8:00 a.m.
 2. Take adequate steps to protect concrete placed during rain and hot or cold weather as defined in ACI Standards:
 - a. ACI 305R - Hot Weather Concreting.
 - b. ACI 306R - Cold Weather Concreting.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA:

A. Concrete Paving Methods:

1. Slip-Form Paving Machine Supported on Subgrade Method:
 - a. Spread, consolidate, screed, and float-finish slip-form concrete in one complete pass of the slip-form paving machine.
 - b. Operate the slip-form paving machine as nearly as possible in the forward direction only, and coordinate all paving operations to provide uniform progress with minimal stopping and starting of the paving machine.
 - c. Rigidly hold the sliding side forms together to prevent their spreading.
 - d. While concrete is being spread, compacted, and shaped; operate vibrating units within the fresh concrete so that the longitudinal axis, at the center of each vibrating unit, is not more than 6 inches above the top of the subgrade.
 - e. Use a vibration amplitude that is sufficient to be perceptible on the surface of the concrete along the entire length of the vibrating units and for a distance of at least one foot from the vibrating units.
2. Mechanical Equipment Supported on Fixed Form Method:
 - a. Strike off and consolidate concrete so that the surface conforms to the finished grade and cross-section shown on the Contract Drawings and has sufficient material on the surface for floating operations.
 - b. After concrete has been struck off and consolidated, float the concrete with a longitudinal float of a type approved by the Program/Project Manager.
 - c. A slip-form paving machine or a single machine which will effectively spread, consolidate, screed, and float in one operation may be used in lieu of separate finishing and floating equipment.
3. Manual Methods with Fixed Forms:
 - a. Deposit, spread, and strike off concrete to an elevation such that the surface will conform to the required lines and grades when properly consolidated.
 - 1) Keep a slight excess of concrete in front of the screed at all times during the strike-off operation.
 - b. Consolidate concrete by internal vibration as it is struck off with the screed.
 - c. After consolidation and screeding, tamp the concrete to the proper surface elevation and cross-section using either a heavy plank with a length in excess of the width of payment being placed by one foot or more, or with a mechanical vibrating unit spanning the full width between forms.
 - 1) If a tamping plank is used, stiffen it as necessary to prevent sag, and cover the lower tamping edge with a metal guard.

- 2) If a tamping plank is used, move the tamping plank forward with a combined vertical and longitudinal screeding motion so that the concrete will be thoroughly consolidated and the surface screeded to the required elevation.
 - 3) Keep a small surplus of concrete in front of the tamper or vibrating unit.
 - 4) Continue tamping or vibrating until the specified cross-section is obtained and the mortar is flushed slightly to the surface.
 - 5) In lieu of using a tamping plank for screeding, other methods may be utilized if they are approved by the Program/Project Manager.
 - d. On grades in excess of 5 percent a second strike board shall follow from 25 to 50 feet behind the tamper or vibratory unit, and used in the same manner to remove waves caused by the flow of concrete behind the first strike board.
 - e. Finish pavement smooth and true to grade with suitable manually operated floats or powered finishing equipment.
- B. If the paving is within Arizona Department of Transportation (ADOT) right-of-way, comply with the material and construction requirements of the applicable Sections in the ADOT Standard Specifications for Road and Bridge Construction and Arizona Standard Specifications, and with the applicable ADOT Standard Drawings.

2.02 MATERIALS

- A. Concrete Materials:
1. Portland cement:
 - a. Provide Portland cement conforming to the requirements of MAG Section 725.
 - b. As an option, Portland cement conforming to the requirements of ASTM C 150 for Type III, low alkali, may be used.
 2. Aggregates: Provide crushed rock or gravel conforming to the requirements of ASTM C 33.
 - a. Provide coarse aggregate gradation conforming to the requirements for Size No. 57.
 - b. Provide fine aggregate with an average sand equivalent of not less than 75 when tested in accordance with the requirements of AASHTO T 176 or ASTM D 2419.
- B. Concrete Reinforcement
1. Tie bars:
 - a. Provide deformed billet steel reinforcing bars conforming to the requirements of ASTM A 615/A 615M, Grade 40.
 2. Dowel bars:
 - a. Provide plain round bars conforming to the requirements of ASTM A 615/A 615M, Grade 40.

- 1) Paint one-half the length of each dowel bar with one coat of tar paint.
- 2) Provide metal sleeves of an approved design for use with dowel bars.
 - a) Design the sleeves to prevent collapse during construction.
 - b) Provide sleeves that cover 2 inches plus or minus 1/4 inch of the dowel.
 - c) Provide sleeves having a closed end with a suitable stop to hold the closed end at least 1 inch from the end of the bar.
- 3) Use an approved basket support to hold the bars parallel to pavement surface.

C. Concrete Curing Materials:

1. Provide concrete curing materials conforming to the requirements of MAG Section 726.

D. Joint Materials:

1. Joint Sealant:
 - a. Provide one component, hot poured type joint sealant, conforming to the requirements of ASTM D 3406.
 - b. If approved by the Program/Project Manager, other pour type joint sealants conforming to the requirements of MAG Section 729.2 may be used in lieu of that specified in Subparagraph 2.02.D.1.a.
2. Backer Rod or Tape and Bond Breakers:
 - a. Provide type that controls the depth of sealant, achieves the desired shape factor, supports the sealant against indentation and sag, and prevents the sealant from bonding to the bottom concrete surface.
 - b. Provide type that is compatible with the joint sealant Material.
3. Expansion Joint Filler:
 - a. Provide preformed expansion joint filler conforming to the requirements of ASTM D 1751.

2.03 MIXES:

A. Portland Cement Concrete:

1. Provide Portland cement concrete conforming to the applicable requirements of MAG Section 725 and the additional requirements of this Section.
2. Modulus of Rupture:
 - a. Not less than 520 psi within 14 Days after placement.
 - b. Not less than 650 psi at 28 Days.
3. Slump (Maximum):
 - a. Provide Portland cement concrete having a slump as determined by the approved mix design.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Ensure that the subgrade conforms to the compaction and elevation tolerances for the material involved.

3.02 PREPARATION

- A. Surface Preparation:
 - 1. Subgrade Preparation:
 - a. Prepare the subgrade in accordance with Section 02339, Subgrade Preparation.
 - b. Keep subgrade smooth, compacted, and free of all loose and extraneous material when concrete is placed.
 - 1) Check and correct the grade immediately ahead of concrete placement and properly re-compact all disturbed subgrade.
 - c. Keep the surface of the subgrade uniformly moist when concrete is placed.
 - 1) Moisten the surface of the subgrade immediately prior to placement of concrete if necessary to produce a uniformly moist condition.
 - 2) Remove excess water standing in pools or flowing on the surface prior to placing concrete.
 - d. Compact and cut to grade the subgrade under forms so that when the form is set it will be uniformly supported for its entire length at the specified elevation.

3.03 CONSTRUCTION

- A. Furnish all labor, materials, and equipment necessary for the construction of the pavement in accordance with the Specifications, and in reasonably close conformity to the lines, grades, thickness, and details indicated on the Contract Drawings or as established by the Program/Project Manager.
- B. Equipment:
 - 1. Equipment Approval:
 - a. Submit the design, capacity, and mechanical condition of equipment and tools necessary for handling materials and performing all parts of the Work to the Program/Project Manager for approval.
 - b. Transport equipment to the Site sufficiently ahead of the start of concrete paving operations to permit thorough examination and approval by the Program/Project Manager prior to the start of concrete paving.
 - 2. Equipment Capability:

- a. Furnish one or more machines for placing concrete that are capable of uniformly distributing and consolidating the concrete as it is placed without segregation, and that are capable of producing concrete pavement that will conform to the required cross-section with a minimum of handwork.
 - 1) Furnish an adequate number of machines with the capacity to perform the Work at a rate equal to the concrete delivery rate.
 - 2) If equipment will be used to place concrete adjacent to existing pavement or curb and gutter, equip that part of the equipment supported on the existing pavement or curb and gutter with protective pads on crawler tracks or with rubber-tired wheels with bearing surfaces offset a sufficient distance from the edge of the pavement or curb and gutter to avoid edge damage.
 - a) Alternatively, protect the surface of the existing pavement or curb and gutter against edge damage in a manner approved by the Program/Project Manager.
- 3. Slip-Form Paving Equipment:
 - a. If slip-form paving equipment is to be used, furnish equipment capable of being wholly or partially supported on the subgrade; and that has traveling side forms of sufficient dimensions, shape, and strength to support the concrete at free edges laterally for a sufficient length of time during placement to produce pavement of the required cross-section.
 - b. Furnish slip-form paving equipment that has automatic sensing and control devices to automatically sense deviations from the established guideline and cause the necessary corrective maneuvers required to overcome variations from correct grade and alignment to be performed.
- 4. Vibrators:
 - a. Rate of Vibration:
 - 1) Not less than 3500 cycles per minute for surface vibrators and not less than 8000 cycles per minute for internal vibrators.
 - 2) Furnish a tachometer or other suitable device for measuring and indicating the frequency of vibration.
 - b. For vibrators mounted on mechanical equipment, furnish power connections to the vibrators that cause vibration to cease when forward or backward motion of the equipment is stopped.
 - c. If slip-form paving equipment is to be used; furnish equipment with high frequency internal vibrators mounted with axes either parallel or normal to the pavement alignment for the full paving width.
 - 1) Space vibrators mounted with axes parallel with pavement alignment at intervals not exceeding 24 inches measured center to center.

- 2) Space vibrators mounted with axes normal to pavement alignment so that lateral clearance between individual vibrating units does not exceed 6 inches.
 5. Stationary Concrete Side Forms:
 - a. Furnish side forms having the cross-section and strength to resist the pressure of the concrete being placed when the forms are properly secured and supported on the subgrade.
 - b. Furnish concrete side forms with a base width of at least 4 inches and a minimum depth equal to the thickness of the pavement.
 - c. For straight sections, furnish metal concrete side forms that are straight and free from warps, bends, indentations, and other defects.
 - 1) Furnish sections that do not exhibit any variation from a true plane greater than 1/8 inch in 10 feet on the top of the form, or more than 1/4 inch in 10 feet on the inside face.
 - 2) If approved by the Program/Project Manager, suitable materials other than metal may be used to form end closures or at other locations where use of metal forms is not practical.
 - d. For curves of 100 feet radius or less, furnish flexible or curved forms of proper radius.
- C. Concrete Paving Methods:
1. Use one of the concrete paving methods described in Paragraph 2.01.A to construct the concrete pavement.
 2. Use either mechanical equipment in combination with stationary concrete side forms or slip-form paving equipment without stationary side forms, except as noted in Subparagraphs 3.03.C.2.a and 3.03.C.2.b.
 - a. For areas inaccessible to mechanical equipment, manual methods of placing and finishing concrete using stationary side forms may be permitted with the approval of the Program/Project Manager.
 - b. If approved by the Program/Project Manager, pavement lanes of irregular width or of widths less than 10 feet and those sections of intersections or other locations with complex variable surface configurations may be constructed using manual methods of placing, spreading, and compacting.
 3. If job conditions permit paving equipment to operate from outside the paving lane, do not operate the construction equipment on the subgrade in the paving lane.
 - a. If job conditions make it necessary to operate equipment on the subgrade in the paving lane, provide suitable runways or take other precautions to prevent rutting or displacement of subgrade material.
 - b. If concrete pavement will be placed using slip-form paving equipment which will be supported and operated on the subgrade, bring the subgrade and slip-form paving equipment track to the proper grade and cross-section by means of a properly designed and operated machine.

D. Concrete Side Forms:

1. Thoroughly clean and oil concrete forms each time they are used.
2. Set the forms to the required lines and grades well in advance of the time the concrete will be placed and at a distance sufficiently ahead of the pours to avoid delaying concrete placement, and have the forms in place approved by the Program/Project Manager prior to placing concrete.
 - a. If any form is disturbed or any grade becomes unstable, reset the form and recheck it.
3. Properly secure and support the forms on the subgrade so that they are capable of resisting the impact and vibration of any equipment they are to support without springing or settlement.
 - a. Support and secure the forms during the entire operation of placing and finishing so that the forms do not deviate vertically at any point more than 1/8 inch from the proper elevation.
4. Use a method of connecting the concrete form sections which insures that the joints do not move in any direction.
5. Maintain side forms in place until the edge of the pavement no longer requires the protection of the forms, and at a minimum until the day after concrete is placed.
 - a. When the time to remove the side forms comes, carefully remove the forms in a manner that prevents damaging the pavement.
 - b. Do not use pry bars between the pavement and the forms.

E. Placing and Spreading Concrete:

1. Have the materials and equipment needed for adequate curing at hand and ready to install before concrete placement begins.
2. Construct concrete pavement of the thicknesses indicated on the Contract Drawings and in the Specifications.
 - a. Do not use the tolerances given for base and subgrade construction or other provisions of this Section which may affect thickness, to modify the thickness requirements of the Contract Drawings and Specifications.
3. Except when otherwise approved by the Program/Project Manager, deposit concrete on the subgrade and spread it the full width between the forms using mechanical methods that result in a minimum of handling and segregation.
 - a. If it is necessary to hand spread the concrete, use shovels not rakes.
4. Continuously place the concrete between transverse joints without using intermediate bulkheads.
5. Make adequate advance arrangements to prevent delaying delivery and placing of the concrete.
 - a. An interval of more than 15 minutes between placing of any 2 consecutive batches is sufficient cause to stop operations, and requires installation of a construction joint in the concrete already placed at a location and of a type as directed by the Program/Project Manager.

6. Deposit concrete as near to expansion and construction joints as possible without disturbing them, do not dump concrete onto a joint assembly.

F. Compacting Concrete:

1. Thoroughly consolidate concrete against and along the faces of all forms, adjacent pavement and curb and gutter, and on both sides of all joint assemblies.
2. Use vibrators to consolidate concrete.
 - a. Do not permit vibrators to come in contact with joint assemblies, the grade, or side forms.
 - b. Do not operate vibrators longer than 15 seconds in any one location.
3. If concrete is spread without the use of internal vibration by the mechanical equipment supported on fixed forms method, equip the finishing machine with vibrating equipment that will internally vibrate the concrete for the full paving width and with not less than two oscillating or reciprocating screeds.
4. Do not allow workmen to walk in freshly placed concrete with boots or shoes coated in soil or other foreign materials.

G. Shaping and Initial Finishing:

1. Strike off, consolidate, and float finish concrete with slip-form paving equipment, a mechanical finishing machine, a vibrating screed, or by hand finishing methods if approved by the Program/Project Manager so that the complete pavement conforms to the thickness and cross-section requirements of the Contract Drawings and Specifications.
2. When the pavement being constructed is contiguous to existing parallel concrete pavement or curb and gutter, set the elevation of the new pavement as close as possible to the elevation of the existing pavement or gutter surface and in a manner which will prevent ponding.
3. Do not apply water to the pavement surface during screeding and finishing operations in excess of the amount lost by evaporation.
 - a. Adding water to the surface of the concrete to assist in finishing operations is not permitted.
 - b. When applications of water to the surface are required to prevent rapid evaporation of water from the surface during finishing operations, apply it as a fog spray with approved spray equipment.

H. Final Finishing:

1. After the pavement has been initially finished with a float, scrape the concrete with a 10-foot long straightedge equipped with a handle to permit operations from the edge of the pavement.
 - a. Remove excess water and laitance from the surface.
 - b. Operate the straightedge parallel to the centerline of the pavement, and move it forward one-half the length of the straightedge after each pass.
 - c. Correct irregularities by adding or removing concrete.

- 1) Scrape disturbed places with the straight edge again.
 2. Use long handled wood floats only in areas not accessible to finishing equipment and in emergencies.
 - a. Keep the use of long handled wood floats to a minimum.
 3. Do not add water to the surface of the concrete to assist in finishing operations unless doing so is approved by the Program/Project Manager.
 - a. If the adding water to the surface is permitted to prevent rapid evaporation of water from the surface during finish, apply the water as a fog spray with approved spray equipment.
 4. Construct edge joints and pavement edges in accordance with details shown on the Contract Drawings or as directed by the Program/Project Manager.
 5. Texture the pavement surface prior to curing operations.
 - a. The Program/Project Manager will finish the surface of a portion of the initial construction to demonstrate the final surface texturing that will be expected and approved by him.
 - 1) Do not change the approved surface finish as provided on the initial construction without approval by the Program/Project Manager.
 - b. Perform texturing by using an artificial turf drag with a board added to provide the weight needed to obtain an approved surface.
 - c. Provide artificial turf having a molded composite structure with a polyethylene face, nylon and polyester backing, a pile height of 0.85 inches, and a total weight of 75 ounces per square yard.
 - d. Each time the construction is stopped or the texturing is caused to stop, shake the artificial turf clean before continuing.
- I. Curing Concrete:
1. After finishing operations have been completed, cure the newly placed concrete by moist curing methods, by the application of a white liquid membrane compound, or a combination of these methods.
 - a. Begin curing immediately following surface texturing and edging.
 2. Keep all surfaces that are not covered by reasonably waterproof forms damp.
 - a. Apply water from a nozzle that atomizes the flow of water to form a fog mist, but not a spray, until one of the following occurs:
 - 1) The surface is covered with liquid membrane compound, or
 - 2) The surface has hardened sufficiently to permit sprinkling of the surface, or
 - 3) Moist curing by covering with wet burlap or other approved Materials is initiated.
 - b. Do not apply moisture from the nozzle, under pressure, directly upon the concrete.
 - c. Do not allow moisture to accumulate on the concrete in a quantity sufficient to cause a flow and erode the surface.

- d. Continue moist curing until a liquid membrane curing compound or other type of curing membrane is applied.
 3. The membrane method of curing may be applied behind the final finishing operation after all free water has disappeared from the surface.
 - a. Apply membrane curing compound to pavement using an automatic mechanical method from a construction bridge.
 - b. Provide complete and uniform coverage at a rate of one gallon per 100 square feet, or as otherwise recommended by the manufacturer.
 - c. Keep membrane curing compound agitated to prevent pigment from settling.
 4. Protect the edges of concrete slabs exposed by the removal of forms immediately with continuous curing treatment equal to the method selected for curing the pavement surface.
 - J. Curb and Gutter Construction:
 1. Construct curbs, or combined curb and gutter, where shown on the Contract Drawings along the edges of pavement; and form them to the cross-section indicated on the Contract Drawings or on State or municipal Standard Drawings.
 - a. Curbs may be constructed integrally with the pavement using slip-form or extrusion equipment, or placed immediately after finishing operations by hand forming or using face forms.
 - b. Alternatively, curbs may be constructed as a separate operation after pavement construction using forms, or slip-form or extrusion equipment.
 - c. If curb and gutter sections are built before the pavement is placed, the edge of each gutter of the curb and gutter section may be used as a side form in lieu of setting stationary side forms.
 - 1) Curb, or curb and gutter, constructed as a separate operation, must conform to the requirements of Section 02702, Concrete Curb, Gutter, Driveway, Sidewalk, and Alley Entrance.
 - d. Construct the curb and gutter sections to the same thickness as the main roadway section.
 - e. Align all joints in the curb and gutters with the roadway joints.

3.04 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. Pavement Thickness Test:
 - a. Test Procedure:
 - 1) Pavement thickness will be measured by the Testing and Inspection Agency in accordance with Section 401-4.04 of the ADOT Standard Specifications for Road and Bridge Construction.
 - 2) Where concrete cores have been removed, fill the holes with concrete as directed by the Program/Project Manager.
 - b. Acceptance Criteria:

- 1) Acceptance of the pavement will be in accordance with the criteria specified in Section 401-4.04 of the ADOT Standard Specifications for Road and Bridge Construction.
2. Inspections:
 - a. The pavement will be inspected for cracks.
 - b. Prepare and submit as-built information recording the actual depths and profiles of the pavement to the Program/Project Manager for information.
- B. Non-Conforming Work
 1. Either repair the pavement cracks discovered that penetrate the full depth of the pavement, or remove and replace the cracked pavement at no increase in Contract Price before opening the pavement to public traffic.
 - a. Repair cracks in accordance with the methods specified in Sections 401 and 402 of the ADOT Standard Specifications for Road and Bridge Construction as directed by the Program/Project Manager.

3.05 CLEANING

- A. At the completion of the pavement construction, remove all concrete forms, mixing and paving equipment, and traffic control devices furnished under this Section from the Site.

3.06 PROTECTION

- A. Protect exposed base or subgrade when equipment is cleaned at the end of each day's production.
 1. Remove concrete deposited on the base or subgrade immediately after the cleaning is completed.
- B. When ordered by the Program/Project Manager, construct pavement crossings for the convenience of public traffic.
 1. Where motor vehicles are encountered, provide a temporary bridge to span the newly placed concrete.
- C. Do not permit traffic or construction equipment, except as herein provided, on the concrete pavement until the concrete has developed a compressive strength of at least 3500 psi.
 1. Equipment for sawing joints is permitted on the concrete pavement if, in the Contractor's judgment, the concrete pavement has developed sufficient strength to support the equipment without damage to the concrete pavement.
 2. In case of visible cracking or other damage to the pavement, immediately discontinue operation of the equipment on the pavement.

SECTION 02761

PLASTIC PAVEMENT MARKINGS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for cleaning and preparing the pavement surface.
 - 2. Requirements for furnishing the following:
 - a. White or yellow thermoplastic reflectorized pavement markings.
 - b. Preformed reflectorized pavement marking tape, symbols, and legends.
 - 3. Requirements for applying these pavement markings to the prepared pavement surface at the locations shown on the Contract Drawings in accordance with the details shown on the Contract Drawings, and in accordance with the requirements of the Federal Highway Administration's Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), the manufacturer's recommendations, and the requirements of the Specifications.
 - 4. Note that the plastic pavement markings specified herein are not permitted for airside applications.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01400 - Quality Requirements.
 - 3. Section 01555 - Traffic Control.
 - 4. Section 02763 - Painted Pavement Markings.
 - 5. Section 02223 - Removal of Pavement Markings and Markers.

1.02 REFERENCES

- A. Definitions:
 - 1. Glass Beads or Glass Spheres: The terms "glass beads" is synonymous with "glass spheres" as used herein.
 - 2. Drying Time: The minimum elapsed time, after application, when a thermoplastic pavement marking will have and will retain the characteristics required herein and after which normal traffic will leave no impression or imprint on the newly applied marking.
- B. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO M 247 - Standard Specification for Glass Beads Used in Traffic Paint.

- b. AASHTO T 250 - Standard Method of Test for Thermoplastic Traffic Line Material.
- 2. ASTM International (ASTM):
 - a. ASTM D 36 - Standard Test Method for Softening Point of Bitumen (Ring-and-Ball Apparatus).
 - b. ASTM D 92 - Standard Test Method for Flash and Fire Points by Cleveland Open Cup Tester.
 - c. ASTM D 476 - Standard Classification for Dry Pigmentary Titanium Dioxide Products.
 - d. ASTM D 570 - Standard Test Method for Water Absorption of Plastics.
 - e. ASTM D 638 - Standard Test Method for Tensile Properties of Plastics.
 - f. ASTM D 711 - Standard Test Method for No-Pick-Up Time of Traffic Paint.

 - b. General Services Administration (GSA):
 - 1) Federal Standards (FED-STD):
 - a) FED-STD-141/GEN - Paint, Varnish, Lacquer, and Related Materials: Methods of Inspection, Sampling, and Testing (There are 105 individual standards available in the complete Federal Standard 141).
 - b) FED-STD-595B - Colors Volume 1.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate the Work of this Section with the appropriate State and municipal departments who own the Right-of-Way where the plastic pavement marking installation is to occur.

B. Sequencing:

1. Include provisions for traffic control during pavement marking operations in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the workers and the public.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Reflective glass beads.
 - b. Samples:
 - 1) Thermoplastic material, if requested.
 - 2) Drop-on beads, if requested.
 - 3) Primer-sealer, if requested.
 - c. Certificates:
 - 1) Certificates of Compliance for each type of preformed plastic pavement marking.
 - 2) Certificate of Compliance for each lot or batch of thermoplastic reflectorized material.
 - d. Special Procedure Submittals:
 - 1) Logbook of pavement surface temperatures for the thermoplastic pavement striping installations.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Reports:
 - 1) Certified test report for the thermoplastic material binder.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Right-of Way Owner Approvals:
 - a. Required approvals depend on who owns the right-of- way and where the plastic pavement markings are to be applied, but must be obtained before construction activities begin from the appropriate State and

municipal departments, which may include but are not limited to, the following:

- 1) Arizona Department of Transportation (ADOT).
 - 2) City of Phoenix Street Transportation Department.
 - 3) Phoenix Sky Harbor International Airport Design and Construction Services.
- b. If the owner of the Right-of-Way is other than the Phoenix Sky Harbor International Airport, the owner of the Right-of-Way will be provided on the Contract Drawings.
2. Approval of any type of marking material for use is subject to satisfactory performance under traffic.

B. Qualifications:

1. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections, the Phoenix Sky Harbor International Airport will employ an independent Testing and Inspection Agency having the qualifications specified in Section 01400, Quality Requirements, and the City of Phoenix Testing Laboratory.
 - 1) Testing will be conducted in accordance with the latest AASHTO and ASTM test methods, Federal Standards, and the ADOT Materials Testing Manual as specified herein.

C. Certifications:

1. Submit a Certificate of Compliance for each type of preformed plastic pavement marking material prior to use.
2. Submit a Certificate of Compliance for each lot or batch of thermoplastic reflectorized material prior to use.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Notify the Program/Project Manager of the proposed sources of the materials provided under this Section prior to their delivery in order to expedite inspection and/or testing of the materials.
2. Properly package all materials to protect them from damage.
3. Clearly label each thermoplastic material container to indicate the following information:
 - a. Nature, type and formulation of the material, including whether it is an alkyd or hydrocarbon.
 - b. Manufacturer, batch number, and date of manufacture.
 - 1) Clearly mark the month and year of manufacture on all packages of thermoplastic material.
 - c. Application requirements and constraints.
 - d. Compatibility requirements and constraints, particularly those pertaining to equipment, storage, and other materials to be used.

- B. Storage and Handling Requirements:
 - 1. Properly store all materials to protect them from damage.
 - 2. Storage Life:
 - a. Provide new thermoplastic materials that will meet the requirements of the Specifications for a period of 1 year from the date of manufacture.
 - 1) Provide thermoplastic material that will melt uniformly with no evidence of skins or un-melted particles for this 1-year period.
 - 2) Do not use any material which does not meet the requirements, or which is no longer within this 1-year period at the time of application.
 - 3) Replace any outdated thermoplastic material with material meeting the performance and time requirements at no increase in Contract Price.

1.07 SITE CONDITIONS

- A. Ambient Conditions:
 - 1. Pavement Temperatures:
 - a. For Preformed Pavement Markings:
 - 1) The pavement surfaces temperature at the time preformed pavement markings are applied must not be less than 60 degrees Fahrenheit, and the pavement surface must be absolutely dry.
 - a) For temporary markings, the weather conditions noted above may be waived at the Program/Project Manager's discretion to obtain a traffic stripe prior to allowing traffic to traverse the roadway.
 - b) Regardless of whether or not the required minimum surface temperature and surface condition are met, the Program/Project Manager may at any time require that work cease or that the work day be reduced due to weather conditions, either existing or expected, which would have an adverse affect upon the working conditions.
 - b. For Thermoplastic Pavement Marking:
 - 1) Measure pavement surface temperatures 1/2 hour prior to the start of the thermoplastic pavement striping installation and as deemed necessary by the Program/Project Manager until the end of the application period.
 - a) Measure the pavement surface temperature with a standard surface temperature thermometer or a non-contact infrared thermometer.
 - b) The lowest temperature measured will govern the work, unless otherwise requested by the Program/Project Manager.
 - c) At elevation changes greater than 1,000 feet, take temperature readings at the highest elevation and use them to

govern the work unless otherwise requested by the Program/Project Manager.

- d) Record the temperature measurements in a logbook, and submit them to the Program/Project Manager when requested.
- 2) For thermoplastic pavement marking application procedures other than for primer-sealer, the road surface temperature at the time of application must be a minimum of 55 degrees Fahrenheit and rising.
- 3) Do not use ribbon-gun application procedures for thermoplastic pavement markings if the wind chill factor is below 65 degrees Fahrenheit.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Use only approved thermoplastic materials from manufacturers currently shown on the Arizona Department of Transportation's Approved Products List.
 - 1. The current ADOT Approved Products List is available from the Engineering Records Office, 1655 West Jackson Street, Phoenix, AZ 85007; (602) 712-8216; or online at <https://www.azdot.gov/docs/default-source/approved-products/apl.pdf?sfvrsn=14>

2.02 REGULATORY REQUIREMENTS

- A. Provide pavement markings conforming to the requirements of the following:
 - 1. FHWA Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), as revised.
 - 2. ADOT Arizona Supplement to the 2009 Manual on Uniform Traffic Control Devices
 - 3. ADOT Standard Drawings –Signing and Marking Standards.
 - 4. ADOT Traffic Engineering Manual of Approved Signs (MOAS).
- B. If the plastic pavement markings are within Arizona Department of Transportation (ADOT) right-of-way, comply with the material and construction requirements of the applicable Sections in the ADOT Standard Specifications for Road and Bridge Construction and Arizona Stored Specifications, and with the applicable ADOT Standard Drawings.

2.03 DESIGN CRITERIA

- A. Preformed Pavement Marking Tape, Symbols, and Legends:
 - 1. Provide the following preformed pavement marking tape, symbols, and legends designed for use in the following applications unless otherwise indicated in the Contract Drawings and/or specified:

2. Type I Preformed Pavement Markings - Permanent:
 - a. Design Type I preformed plastic pavement markings to be a general-purpose high durability retro-reflective pliant polymer film for preformed striping and markings to be used for finished permanent markings.
 - b. Design Type I preformed plastic pavement markings to be capable of performing as specified herein when subjected to high traffic volumes and severe wear conditions such as repeated shear action from crossover or encroachment on edge and channelization lines, starting, stopping, and turning movements.
 - c. Design the film to be weather resistant, and to show no appreciable fading, lifting, or shrinkage or significant tearing, roll back, or other signs of poor adhesion through normal traffic wear throughout the useful life of the marking.
 3. Type II Preformed Pavement Markings - Temporary Removable:
 - a. Design Type II preformed plastic pavement markings to be a removable preformed retro-reflective pavement marking capable of performing for the duration of a normal construction season.
 - b. Design Type II preformed plastic pavement markings to be weather resistant and show no appreciable fading, lifting, shrinkage, tearing, roll back, or other signs of poor adhesion through normal traffic wear throughout the useful life of the marking.
 - c. Design Type II preformed plastic pavement markings to be used on finished pavement surfaces, but to be removed prior to applying final pavement markings.
 - d. Design Type II preformed plastic pavement markings to be removable either manually or with a roll-up device at pavement temperatures above 40 degrees Fahrenheit without the use of heat, solvents, grinding, or sand blasting.
 4. Type III Preformed Pavement Markings - Temporary Non-Removable:
 - a. Design Type III preformed plastic pavement markings to be a non-removable preformed retro-reflective film on a conformable metallic backing capable of performing for the duration of a normal construction season.
 - b. Design Type III preformed plastic pavement markings to be weather resistant and show no appreciable fading, lifting, shrinkage, tearing, roll back or other signs of poor adhesion through normal traffic wear throughout the useful life of the marking.
 - c. Design Type III preformed plastic pavement markings to be used in construction zones where removal is unnecessary.
- B. Thermoplastic Pavement Marking Materials Selection and Compatibility:
1. The physical and chemical properties for thermoplastic pavement markings materials contained in this Specification apply regardless of the type of formulation used.
 2. Do not use incompatible materials together.

**2.04 MATERIALS:****A. Preformed Pavement Markings – Type I (Permanent):**

1. Provide preformed plastic pavement marking material consisting of a homogeneous, extruded, pre-fabricated white or yellow thermoplastic film of specified thickness and width that is capable of being permanently affixed to non-bleeding bituminous or Portland cement concrete.
 - a. Supply the plastic film either complete with pre-coated, factory-applied pressure sensitive adhesive backing covered by a protective release paper, or with adhesive separately applied as recommended by the manufacturer.
 - b. Whether the adhesive is pre-coated or supplied separately, provide adhesive that will allow the plastic film to be repositioned on the pavement surface to which it is applied before permanently fixing it in its final position with a downward pressure.
2. Supply plastic film of good appearance, free of cracks and discolorations, and with clean-cut and well defined the edges.
3. Composition:
 - a. Provide reflective glass beads uniformly distributed throughout the entire cross section and bonded to the top surface of the material.
 - b. Provide preformed plastic pavement marking Material consisting of the following components as shown in Table 02761-1.

Table 02761-1 Pavement Marking Material Components	
Component	Minimum Percent by Weight
Resins and Plasticizers	20
Pigments	30
Reflective Glass Beads	20

4. Physical Requirements:

- a. Color:
 - 1) Select and blend pigments to provide a white or yellow marking film that conforms to standard highway colors as specified in City standards or ADOT Standard Specifications for Road and Bridge Construction throughout the expected life of the film.
- b. Thickness:
 - 1) Provide 0.060 inch thick, minimum, extruded plastic film not including the adhesive.

B. Preformed Pavement Markings - Type II (Temporary - Removable):

1. Provide preformed plastic pavement marking material intended for marking applications where markings will be required to be removed.
 - a. Pre-coat the markings with a pressure sensitive adhesive capable of adhering to roadway surfaces under climatic and traffic conditions normally encountered in the construction work zone when applied in accordance with the manufacturer's instructions and without the use of heat, solvents, or other additional adhesives.
 - b. Provide temporary pavement markings capable of being removed manually or with a recommended roll up device from asphalt and concrete pavement either intact or in large sections by following the manufacturer's instructions.
 - 1) Use adhesive that permits visible adhesive residue remaining after removal of temporary pavement markings to be easily removed without the use of solvents or grinding and without damaging or scarring the pavement surface.
 2. Provide a mixture of good appearance, free of cracks, and with clean-cut and true, straight, and unbroken the edges.
 3. Provide temporary pavement markings capable of being immediately exposed to traffic without pickup or distortion by vehicles even when newly applied.
 4. Composition:
 - a. Provide a non-metallic mixture of high quality conformable materials and pigments.
 - b. Provide reflective glass beads uniformly distributed throughout the entire cross section and bonded to the top surface of the material.
 - 1) Provide glass beads that meet the durability and reflectance criteria specified in Section 02763, Painted Pavement Markings.
 5. Physical Requirements:
 - a. Color:
 - 1) Provide a white or yellow retro-reflective film that conforms to standard highway colors as specified in City standards or ADOT Standard Specifications for Road and Bridge Construction with glass beads in a reflective layer bonded to the top surface.
 - b. Thickness:
 - 1) Provide 0.045 inch thick, minimum, extruded pavement-marking material not including the adhesive.
- C. Preformed Pavement Markings – Type III (Temporary – Nonremovable)
1. Provide preformed plastic pavement marking material consisting of a retro-reflective film on a conformable metallic backing intended for marking applications where removal is not a requirement.
 - a. Pre-coat the markings with a pressure sensitive adhesive capable of adhering to roadway surfaces under climatic and traffic conditions normally encountered in the construction work zone when applied in accordance with the manufacturer's instructions and without the use of heat, solvents, or other additional adhesives.

2. Provide temporary pavement markings capable of being immediately exposed to traffic without pickup or distortion by vehicles even when newly applied.
3. Physical Requirements:
 - a. Color:
 - 1) Provide white or yellow markings that conform to standard highway colors as specified in City standards or ADOT Standard Specifications for Road and Bridge Construction and containing glass beads meeting the durability and reflectance criteria specified in Section 02763, Painted Pavement Markings.

D. Thermoplastic Reflectorized Material:

1. Provide thermoplastic reflectorized material consisting of a solid mixture of heat-stable resins to act as a binder, white or yellow pigment, inter-mixed glass beads, filler, and other materials in granular or block form specifically compounded for reflectorized pavement markings to be applied to the pavement in a molten state.
2. Thoroughly mix the ingredients into a solid or sectionalized block, or free-flowing granular form.
 - a. The material is to be free from all skins, dirt, and foreign objects.
 - b. Uniformly disperse the pigment, glass beads, and filler in the binder resin.
 - c. Comply with composition requirements of Table 02761-2.

Table 02761-2 Thermoplastic Reflectorized Material Composition		
Component	Percent by Weight	
	White	Yellow
Binder (hydrocarbon or alkyd)	18 to 25	18 to 26
Reflective glass inter-mix beads	30 to 40	30 to 40
Titanium Dioxide	10 to 15	---
Basic lead chromate	---	2 to 10
Calcium carbonate or equivalent filler	20 to 40	25 to 45

3. The material must be capable of complete and even coverage of specified areas with the required thickness when the proper application method and rate are used.

E. Thermoplastic Binder Material:

1. Base the composition of the thermoplastic material on one of the following two types:

- a. Hydrocarbon: Consisting mainly of synthetic petroleum hydrocarbon resins with appropriate fillers and pigments added.
 - b. Alkyd: Consisting of a mixture of synthetic resins, at least one of which is solid at room temperature, and of high-boiling-point plasticizers.
 - 1) At least one third of the binder composition and no less than eight percent by weight of the entire material formulation must be solid maleic-modified glycerol ester resin.
 - 2) The alkyd binder must not contain any petroleum-based hydrocarbon resins.
 - 2. Do not combine alkyd and hydrocarbon materials in thermoplastic pavement marking preparation or application equipment.
 - 3. Thoroughly clean thermoplastic pavement marking preparation and application equipment when materials are changed.
- F. Reflective Glass Beads (Pre-Mix):
- 1. Provide glass beads conforming to the requirements of AASHTO M 247 for Type 1, either coated or uncoated as recommended by the manufacturer; and exhibiting all of the properties specified herein.
 - a. Submit Product Data for the reflective glass beads.
 - 2. Manufacture glass beads from glass of a composition designated to be highly resistant to traffic wear and the effects of weathering.
 - a. Glass Bead color: Water white.
 - b. Provide glass beads free from air inclusions and scratches that might affect their function as a reflecting media.
 - 3. Provide glass beads essentially free of sharp angular particles, and not showing milkiness or surface scoring and scratching.
 - 4. Provide moisture-proof glass beads containing less than 0.25 percent moisture by weight and free of trash, dirt or other deleterious materials.
 - a. Moisture Proofing:
 - 1) During bead manufacture, apply a moisture-proof overlay consisting of water repellant material to all glass beads.
 - a) Provide an overlay treatment that prevents the beads from absorbing moisture in storage and keeps them free from clustering and lumping.
 - b) Provide an overlay treatment that assures the beads will flow freely from dispensing and testing equipment.
 - c) If uncoated beads are used, configure the thermoplastic formulation to minimize settling of the intermix beads when the material is heated and applied.
- G. Thermoplastic Reflectorized Material Filler:
- 1. Material:
 - a. White Calcium Carbonate, or equivalent:
 - 1) Compressive strength: 5000 pounds per square inch, minimum.
 - b. Titanium Oxide:

- 1) Conform to the requirements of ASTM D 476 for Type II (92 percent).
- H. Thermoplastic Reflectorized Material Pigment:
 1. Provide pigment consisting of silica double encapsulated heat resistant lead chromate.
- I. Thermoplastic Reflectorized Material Primer-Sealer:
 1. Provide primer-sealer compounded specifically for use with the specified thermoplastic material.

2.05 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 1. The Testing and Inspection Agency will conduct testing in accordance with the latest AASHTO and ASTM test methods, Federal Standards, and the ADOT Materials Testing Manual as specified herein.
 2. Type I Preformed Pavement Markings Acceptance Tests:
 - a. Bend Test:
 - 1) Test Method:
 - a) At a temperature of 78 to 82 degrees Fahrenheit, bend a 3-inch by 6-inch un-mounted piece of material (without adhesive and paper backing) over a 1-inch mandrel until the end faces are parallel and 1 inch apart.
 - 2) Acceptance Criteria:
 - a) The plastic film must be sufficiently flexible so it shows no fracture lines in the uppermost surface.
 - b. Tensile Strength:
 - 1) Test Method:
 - a) Test a 6-inch long by 1-inch wide specimen in accordance with the requirements of ASTM D 638.
 - b) Use a 0.25 inch per minute rate of pull.
 - c) Conduct the test at a temperature between 70 and 80 degrees Fahrenheit.
 - 2) Acceptance Criteria:
 - a) The plastic film (without adhesive or paper backing) must have a minimum tensile strength of 40 pounds per square inch.
 - b) The elongation may be no greater than 75 percent.
 - c. Plastic Pull Test:
 - 1) Test Method:
 - a) Suspend a dead load weight of four pounds from a 6-inch long by 1-inch wide section of the plastic film (without adhesive and paper backing).
 - b) Perform the test at a temperature between 70 and 80 degrees Fahrenheit.

- 2) Acceptance Criteria:
 - a) The section must support the weight for not less than five minutes.
- d. Abrasion Resistance:
 - 1) Test Method:
 - a) Abrade the plastic film according to FED-STD-141, Method 6192, using H-18 calibrase wheels with a 1000-gram load on each wheel for 500 revolutions.
 - 2) Acceptance Criteria:
 - a) The plastic film may have a maximum weight loss of 0.25 grams.
3. Thermoplastic Traffic Line Acceptance Tests:
 - a. Perform the acceptance testing specified in Subparagraphs 2.05.A.4, 2.05.A.5, and 2.05.A.6; and the following:
 - 1) Make a small trial batch prior to making the thermoplastic traffic line in large quantities to make certain the finished product will comply with all the requirements of this Section.
 - 2) For acceptance testing, do not use a batch size of thermoplastic striping material less than 1,360kg (3000 pounds) unless the total order is less than this amount.
4. Thermoplastic Reflectorized Material Tests:
 - a. Melt Test:
 - 1) Test Method:
 - a) Heat thermoplastic reflectorized material in a melting apparatus to the molten application temperature.
 - 2) Acceptance Criteria:
 - a) The material must readily liquefy into a uniform solution free from all skins, dirt, foreign objects, or any other ingredient that would cause bleeding, staining, blotting, or discoloration when applied to the bituminous or concrete pavement surfaces.
 - b) The material cannot exude toxic fumes which are injurious to persons or property.
 - c) The material must remain stable when held for 4 hours at the temperature range specified by the manufacturer, or when subjected to reheating up to 4 times, not exceeding a total of 4 hours, after cooling to ambient temperature.
 - (1) The temperature viscosity characteristics of the plastic material must remain constant throughout the reheating and will show like characteristics from batch to batch.
 - (2) There can be no obvious change in color of the thermoplastic material as a result of reheating, and the color of the material cannot vary from batch to batch.

- d) Upon cooling to normal pavement temperature, this material must produce an adherent reflectorized marking capable of resisting deformation and wear in the roadway.
- 5. Thermoplastic Binder Material Tests:
 - a. Color:
 - 1) Test Procedure:
 - a) After heating for four hours at 425 degrees Fahrenheit plus or minus 3 degrees Fahrenheit and cooled to 77 degrees Fahrenheit plus or minus 3 degrees Fahrenheit, the material must meet the following requirements:
 - 2) Acceptance Criteria:
 - a) White:
 - (1) Daylight reflectance at 45 degrees - 0 degrees: 75 percent minimum.
 - (2) The color must match FED-STD-595B, Color Chip No. 17925.
 - b) Yellow:
 - (1) Daylight reflectance at 45 degrees - 0 degrees: 45 percent minimum.
 - (2) The color must match FED-STD-595B, Color Chip No. 13538.
 - b. Retro-Reflectance:
 - 1) Test Procedure:
 - a) 30 Days after application of the thermoplastic material to the roadway surface, measure the retro-reflectance of white and yellow thermoplastic materials at 86.5 degrees illumination angle and 1.5 degrees observation angle using a Mirolux 212 portable retro-reflectometer.
 - 2) Acceptance Criteria:
 - a) Provide white and yellow thermoplastic materials with the minimum retro-reflectance values as shown in Table 02761-3.

Table 02761-3 White and Yellow Thermoplastic Material Retro-Reflectance	
Thermoplastic Color	Retro-Reflectance (Millicandles)
White	200
Yellow	150

- c. Water Absorption:
 - 1) Test Method:
 - a) Determine the water absorption of the thermoplastic material in accordance with the requirements of ASTM D 570.

- 2) Acceptance Criteria:
 - a) The thermoplastic material may not absorb water exceeding 0.5 percent, by weight, or retain water.
- d. Specific Gravity:
 - 1) Test Method:
 - a) Determine the specific gravity of the thermoplastic material in accordance with the requirements of Section 11 of AASHTO T 250.
 - 2) Acceptance Criteria:
 - a) The specific gravity of the material must be between 1.85 and 2.3.
- e. Drying Time:
 - 1) Test Procedure:
 - a) Apply material having a thickness of 0.125 inches at a temperature of 425 degrees Fahrenheit, and measure the time the material takes to set.
 - 2) Acceptance Criteria:
 - a) Material that is set to bear traffic in not more than 2 minutes when the air temperature is 50 degrees Fahrenheit and in not more than 15 minutes when the air temperature is 90 degrees Fahrenheit. Is acceptable.
- f. Bond Strength:
 - 1) Test Method:
 - a) Determine the bond strength of the thermoplastic material in accordance with the requirements of Section 7 of AASHTO T 250.
 - b) Heat the thermoplastic material for four hours at 425 degrees Fahrenheit plus or minus 3 degrees Fahrenheit.
 - 2) Acceptance Criteria:
 - a) The bond strength to Portland cement concrete must not be less than 0.18 ksi.
- g. Low Temperature Crack Resistance:
 - 1) Test Method:
 - a) Determine the low temperature crack resistance of the thermoplastic material in accordance with the requirements of Section 8 of AASHTO T 250.
 - b) Heat the thermoplastic material for four hours plus or minus 5 minutes at 425 degrees Fahrenheit plus or minus 3 degrees Fahrenheit.
 - c) Apply the material to concrete blocks.
 - d) Cool the material and blocks to 15 degrees Fahrenheit plus or minus 3 degrees Fahrenheit.
 - 2) Acceptance Criteria:
 - a) The material must show no cracks when observed from a distance not exceeding 1 foot.

- h. Impact Resistance:
 - 1) Test Method:
 - a) Determine the impact resistance of the thermoplastic material in accordance with the requirements of Section 9 of AASHTO T 250.
 - b) Heat the thermoplastic material for 4 hours plus or minus 5 minutes at 425 degrees Fahrenheit plus or minus 3 degrees Fahrenheit.
 - c) Form test specimens and run the test.
 - 2) Acceptance Criteria:
 - a) The material impact resistance must be not less than 10 inch pounds.
- i. Softening Point:
 - 1) Test Method:
 - a) Determine the softening point of the thermoplastic material in accordance with the requirements of ASTM D 36.
 - b) Heat the thermoplastic material for four hours plus or minus 5 minutes at 425 degrees Fahrenheit plus or minus 3 degrees Fahrenheit.
 - 2) Acceptance Criteria:
 - a) The material softening point must not be less than 215 degrees Fahrenheit plus or minus 15 degrees Fahrenheit.
- j. Yellowness Index:
 - 1) Test Method:
 - a) Determine the yellowness index of the white thermoplastic material in accordance with the requirements of Section 4 of AASHTO T 250.
 - b) Acceptance Criteria:
 - (1) The white thermoplastic material must not exceed a yellowness index of 0.12.
- k. Flowability (Extended Heating):
 - 1) Test Method:
 - a) Determine the extended heating flowability of the thermoplastic material in accordance with the requirements of Section 12 of AASHTO T 250.
 - b) Heat the thermoplastic material for 8-1/2 hours plus or minus 5 minutes at 425 degrees Fahrenheit plus or minus 3 degrees Fahrenheit.
 - c) Stir the material for the last six hours and then test for flowability.
 - 2) Acceptance Criteria:
 - a) Thermoplastic material having 28 percent residue, maximum, is acceptable.
- l. Flowability:
 - 1) Test Method:

- a) Determine the extended heating flowability of the thermoplastic material in accordance with the requirements of Section 6 of AASHTO T 250.
 - b) Heat the thermoplastic material for 4 hours plus or minus 5 minutes at 425 degrees Fahrenheit plus or minus 3 degrees Fahrenheit.
 - c) Test for flowability.
 - 2) Acceptance Criteria:
 - a) White thermoplastic: 18 percent residue, maximum.
 - b) Yellow thermoplastic: 21 percent residue, maximum.
 - m. Abrasion Resistance:
 - 1) Test Method:
 - a) Apply a suitable primer to a four-inch square monel panel that is 0.050-inch thick plus or minus 0.001 inch.
 - b) Form a 0.125-inch thick representative lot of the material on the monel square.
 - c) Subject the material on the monel square to 200 revolutions on a Taber Abraser at 25 degrees Celsius using H-22 calibrated wheels weighted to 250 grams.
 - d) Keep the wearing surface wet with distilled water throughout the test.
 - 2) Acceptance Criteria:
 - a) The maximum loss of thermoplastic material must not exceed 0.5 grams.
 - n. Flash Point:
 - 1) Test Method:
 - a) Determine the flash point of the thermoplastic material in accordance with the requirements of ASTM D 92.
 - 2) Acceptance Criteria:
 - a) Thermoplastic material having a flash point of 475 degrees Fahrenheit, minimum, is acceptable.
 - o. Submit a verifiable certified test report from the thermoplastic material binder manufacturer showing the acceptability of the binder system as specified; including an infrared spectra of the extracted binder compared to the characteristic absorption bands of maleic-modified glycerol ester of wood resin.
- 6- Reflective Glass Beads (Pre-Mix) Tests:
- a. Index of Refraction Test
 - 1) Test Procedure:
 - a) Test beads by a liquid immersion method at a temperature of 25 degrees Celsius.
 - 2) Acceptance Criteria:
 - a) Beads must have an index of refraction of 1.50 to 1.57.
 - b. Glass Bead Roundness Test:
 - 1) Test Procedure:

- a) Test glass beads in accordance with ASTM D 1155, Procedure B except delete paragraphs F and G.
- 2) Acceptance Criteria:
 - a) Glass beads retained on any screen specified in the gradation requirements are to contain a minimum of 70 percent true spheres.
- c. Glass Bead Moisture Test:
 - 1) Test glass beads for compliance with specification requirements for moisture proofing using the following procedure or an approved alternate.
 - 2) Test Procedure:
 - a) Conduct the test at a temperature of 25 plus or minus 1 degree Celsius and a relative humidity of 50 plus or minus 5 percent.
 - b) Weigh 900 grams of glass beads into a clean, dry, flat-bottomed pan.
 - c) Dry the beads at 150 degrees Celsius for 2 hours.
 - d) Cool the beads to room temperature of 25 degrees plus or minus 1 degree Celsius in a desiccator.
 - e) Wash an unbleached cotton bag in hot water and detergent.
 - (1) Provide a 10-1/2 inch by 17-1/2 inch bag sewn into an L-shape and having a fabric thread count of 48 by 48.
 - (2) Turn the bag inside out so that the sewn seam-allowance is on the outside
 - f) Place the quantity of glass beads into the inverted cotton bag
 - g) Gather the top of the bag and lower it into a container of distilled water until the beads are approximately 25 millimeters below the water level.
 - (1) Use a container having sufficient dimensions so that the bag does not contact the sides or bottom during immersion.
 - (2) Immerse each bag individually.
 - (3) Do not allow one bag to contact another if multiple tests are run.
 - h) Remove the bag after 30 seconds of immersion time.
 - i) Twist the top neck of the bag until the twisted bag is compressed firmly against the beads.
 - (1) Continue twisting the bag until excess water no longer drips from the bag.
 - j) After the excess water has been squeezed from the bag, allow the bag to unwind.
 - k) Gather and clamp the top of the bag.
 - l) Suspend the bag on a ring stand or other support so that the bottom or sides of the bag do not contact the support.

- m) After two hours at room temperature of 25 degrees Celsius, plus or minus 1 degree, remove the bag from the support.
- n) Mix the sample thoroughly by holding the bottom seam allowance in one hand and gathered neck of the bag in the other, inverting the bag, and shaking it up and down 5 times.
- o) Transfer the sample into a clean, dry standard laboratory funnel with a top opening diameter of 125 millimeters, a 150-millimeter stem length, and inside stem diameter between 9 and 10 millimeters.
 - (1) If consecutive tests are run, be sure the funnel is clean and free of beads from prior tests.
- 3) Acceptance Criteria:
 - a) The entire glass bead sample must flow through the funnel without stoppage.
 - (1) At the start of the test only, it is permissible to lightly tap the stem of the funnel to initiate flow.
 - (2) Small quantities of beads adhering to the side of the funnel or stem are not cause for failure.
- d. Glass Bead Gradation:
 - 1) Test Procedure:
 - a) Test the gradation of the glass beads in accordance with the procedures described in ASTM D 1214.
 - 2) Acceptance Criteria:
 - a) Provide beads containing the percentages of each size bead as allowed by Table 02761-4.

Table 02761-4 Glass Bead Gradation	
Size of Sieve	Percent Passing
Number 30	100
Number 50	15 to 35
Number 70	0 to 15
Number 100	0 to 5

- e. Specific Gravity:
 - 1) Test Procedure:
 - a) Place 100 grams of beads in an oven at 110 degrees Celsius for one hour.
 - b) Remove the beads and place them in a desiccator until the sample is cool.
 - c) Remove approximately 60 grams of beads from the desiccator and weigh the sample accurately on a balance accurate to 0.1 grams.

- d) Measure the volume of the sample:
 - (1) Pour the beads slowly into a clean 100-millimeter graduated cylinder containing 50 millimeters of isopropyl alcohol making sure there is no air trapped among the beads.
 - (2) The total volume, minus 50, will give the volume of the beads.
- e) Calculate the specific gravity as follows:

$$\text{Specific Gravity} = \frac{\text{Weight of the Sample}}{\text{Volume of the Sample}}$$

- 2) Acceptance Criteria:
 - a) The specific gravity of the beads must be in the range from 2.40 to 2.60.
- f. Chemical Stability:
 - 1) Prior to acceptance, glass beads that show a tendency toward decomposition, including surface etching when exposed to atmospheric conditions, moisture, dilute acids, or alkalis or paint film constituents, may be required to demonstrate satisfactory reflectance behavior when subjected to such tests as may be prescribed.
- g. Chemical Resistance:
 - 1) Test Procedure:
 - a) Place three to five gram portions of the sample in each of 3 Pyrex glass beakers or porcelain dishes.
 - b) Cover one sample with distilled water, one with a 3N solution of sulfuric acid, and the third with a 50 percent solution of sodium sulfide.
 - c) After one hour of immersion, microscopically examine the glass beads of each sample for evidence of darkening and frosting.
 - 2) Acceptance Criteria:
 - a) Glass beads must withstand immersion in water and acids with no noticeable corrosion, etching, darkening, or otherwise noticeable decomposition caused by the sulfides.
- 7. Inspections:
 - a. Thermoplastic material, drop-on beads, and primer-sealer must be inspected and approved by the Program/Project Manager before their application.
 - 1) Submit Samples of thermoplastic material, drop-on beads, and primer-sealer if requested by the Program/Project Manager.

B. Non-Conforming Work:

- 1. Do not apply non-conforming materials.

2. Evidence of adulteration or improper formulation of thermoplastic pavement marking material is cause for rejection.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Perform a field inspection to determine if the striping exceeds the Contract's construction limits.
- B. Evaluation and Assessment:
 1. It is possible that the required striping may exceed the Contract's construction limits in order to match and/or tie into the existing striping.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 1. Maintain and protect traffic on active streets and roads in accordance with the requirements specified in Section 01555, Traffic Control.
 - a. Provide the necessary personnel and equipment to divert traffic from the installation area where Work is in progress and during curing time when, in the opinion of the Program/Project Manager, diversion of traffic is necessary.
- B. Surface Preparation:
 1. Thoroughly clean pavement surfaces of loose, foreign, or other material that may adversely affect bonding.
 2. Remove all dirt, dust, grease, oil, and other detrimental material from the road surface by sweeping and using a high-pressure air spray.
 - a. The method of cleaning the surface and removal of detrimental material is subject to approval by the Program/Project Manager, including sweeping and the use of high-pressure air spray.
 3. Newly placed surfaces where preformed plastic pavement marking will be applied do not need to be cleaned unless, in the opinion of the Program/Project Manager, the surface has become contamination.
 4. Where thermoplastic pavement markings will be applied, prepare the surface in accordance with the recommendations of the thermoplastic material manufacturer prior to application of thermoplastic stripes, arrows, legends, or symbols.
 - a. Remove loose material, including all grindings and obliterated markings, from the pavement surface and properly dispose of this material.
 - b. Scrub any area that cannot otherwise be satisfactorily cleaned with a biodegradable Citrus Solv Plus, or approved equal.

- c. If thermoplastic markings are to be applied to new Portland cement concrete pavement, remove any curing compound by means of a high-pressure water jet or sand blasting, followed by sweeping and high-pressure air spray.
 - 1) Remove the curing compound at least 2 inches beyond the entire perimeter of each marking to be installed.
5. Layout of Work:
 - a. Spot mark the proposed locations of striping at 10-foot intervals in conformance with the striping indicated on the Contract Drawings and layout pavement markings for the entire Contract.
 - 1) Layout lane widths, parking spaces, and crosswalks in accordance with the regulations of the Authorities Having Jurisdiction and as indicated on the Contract Drawings.
 - 2) Position pavement markings as defined on the Contract Drawings and in the Specifications.
6. Upon completion of the spot marking, notify the Program/Project Manager that the spot marking is ready for inspection.
7. The Program/Project Manager will complete an inspection of the proposed striping within the 3 working days after notification.
 - a. If a conflict exists between the actual field conditions and the pavement marking plans on the Contract Drawings, cease working and notify the Program/Project Manager immediately.
 - b. If it becomes necessary for proper installation, the Program/Project Manager may revise individual marking locations.
 - c. Do not apply the plastic pavement markings without the approval of the Program/Project Manager.
 - 1) Approval of the spot marking does not relieve the Contractor from obtaining a final inspection.
8. After installing asphalt concrete pavement, allow a cooling down period of at least 12 hours prior to the installation of thermoplastic pavement markings.
9. On Portland cement concrete and existing hot mix asphaltic concrete surfaces, use primer-sealers prior to application of thermoplastic material.
 - a. Apply primer-sealers as recommended by the thermoplastic material manufacturer.
 - b. Application of primer-sealer is not required on newly placed hot-mix asphaltic concrete surfaces prior to application of the thermoplastic Material.
10. When primer-sealer and thermoplastics are applied, the road surface must be absolutely dry with no detectable or measurable surface or near-surface dampness.
 - a. If precipitation or other surface wetting is imminent, stop all marking operations.
 - b. If any surface dampness is detected during marking activities, stop marking operations until the pavement dries.

C. Demolition/Removal:

1. If pavement marking or marker obliteration is necessary, perform this work in accordance with the requirements of Section 02223, Removal of Pavement Markings and Markers.
 - a. Complete removal of existing pavement markings prior to the spot marking the locations of new plastic pavement markings.

3.03 APPLICATION

A. Preformed Plastic Pavement Marking:

1. Apply preformed pavement markings immediately after the surface has been prepared, or as soon as possible after placement and completion of new pavement.
2. Install preformed pavement markings at the locations shown on the Contract Drawings, or as directed by the Program/Project Manager.
 - a. Use Type I preformed plastic pavement markings for finished permanent markings that will be subjected to high traffic volumes and severe wear conditions such as repeated shear action from crossover or encroachment on edge and channelization lines, starting, stopping, and turning movements.
 - b. Use Type II preformed plastic pavement markings on finished pavement surfaces where traffic control or channelization through a construction zone is temporary requiring removal prior to application of final pavement markings.
 - c. Use Type III preformed plastic pavement markings in construction zones where removal is unnecessary due to placement of future paving courses or where pavement will be removed, obliterated, or abandoned at the completion of the Contract.
3. Apply preformed pavement markings in accordance with the recommendations of the manufacturer of the material and these Specifications
 - a. Minor changes in procedures recommended may be allowed if they are shown to produce an equal or better application and are approved by the Program/Project Manager.
 - b. Apply preformed marking tape manually or with the tape applicators approved by the tape manufacturer.
 - c. Only use butt splices and do not overlap preformed marking material.
 - d. Do not apply preformed pavement markings over other markings or old paint unless that is specified in the Contract Drawings or directed by the Program/Project Manager.
4. Thoroughly tamp all preformed markings with approved mechanical tampers.

B. Thermoplastic Pavement Markings:

1. Equipment:

- a. Provide preparation and application equipment in accordance with the Specifications and conforming to the recommendations of the materials manufacturer.
 - 1) Use equipment with controls located in such a position to enable full visibility of the striping apparatus.
 - 2) Use mobile and maneuverable application equipment that can follow straight lines and can make normal curves in a true arc.
 - 3) Application equipment for roadway installations may include truck-mounted units, motorized ride-on equipment, or manually pushed equipment depending on the type of marking required.
 - a) Equip the truck-mounted units with high-pressure air spray jets in front of the pavement marking material applicators to remove loose matter from the pavement surface where the marking material is to be applied.
 - b) Use truck-mounted or motorized ride-on units for center lines, lane lines, and edge lines that consist of a mobile self-contained unit carrying its own material and capable of operating at a minimum speed of five miles per hour while applying striping.
 - c) Use hand applicator equipment capable of applying material both longitudinally and transversely.
 - (1) Use hand applicator units with either self-contained melters or reservoirs that are filled from a separate melter unit.
 - (a) Either type of unit must be able to maintain and measure the required application temperatures.
 - (2) Use only hand applicator equipment sufficiently maneuverable to install symbols, legends, and curved and straight lines.
- b. Use equipment designed to provide continuous uniform heating at temperatures exceeding 400 degrees Fahrenheit while mixing and agitating the material to install hot applied thermoplastic material.
 - 1) Use equipment with a special kettle for uniformly melting and heating the thermoplastic material.
 - a) The heating kettle and application equipment must comply with the requirements of NFPA 385, the State, and local authorities.
 - b) Equip the heating mechanism of the kettle with a heat transfer medium consisting of oil or air.
 - c) Do not allow the burner flame to directly contact the material vessel surface.
 - 2) Provide functioning and calibrated temperature sensing devices for melting and application equipment to verify that the temperature requirements are being met.

- a) Equip the kettle with 2 temperature gauges, one to indicate the temperature of the oil or air heat transfer medium and the other to indicate the temperature of the thermoplastic material.
 - b) Equip the kettle with an automatic thermostatic control device that allows for positive temperature control to prevent overheating or under heating the material.
 - c) Submit proof that the temperature sensing devices and thermometers are fully functional upon request from the Program/Project Manager.
 - d) Use equipment with a mixing and agitating mechanism capable of thoroughly mixing the material at a rate, which ensures constant uniform temperature distribution.
 - e) Use equipment that operates all mixing and conveying parts, including the line-dispensing device, while maintain the material at the plastic temperature.
- c. Configure the conveying portion of the equipment, between the main material reservoir and the line-dispensing device, to prevent accumulation and clogging, and to maintain the material at the specified application temperature.
- 1) Use equipment whose parts that come in contact with the material are designed for easy accessibility for cleaning and maintenance.
- d. Use application equipment designed to assure continuous uniformity in the dimensions of the pavement marking.
- 1) Use an applicator having a means for cleanly cutting off square pavement marking edges and providing a method of applying "skip" and solid lane lines.
 - 2) Use equipment capable of varying the widths and thicknesses of pavement markings.
 - a) Use extrusion, ribbon, or spray dispensing devices capable of applying the required shape and thickness.
 - 3) If screed or extrusion application of thermoplastic is allowed by the Program/Project Manager for short applications, use the screed/extrusion application method wherein one side of the shaping die is the pavement and the other three sides are contained by equipment suitable for heating or controlling the flow of material.
 - 4) Do not use pans, aprons, or similar appliances which the dispenser overruns.
- e. Equip thermoplastic melting units, trucks, or trailers with foam-type fire extinguishers suitable for application to thermoplastic material that is at the flash point.
- f. Use an automatic glass bead dispenser attached to the striping machine so that a glass bead top dressing is applied to the completed molten thermoplastic material immediately after it has been applied to the pavement.

- 1) For truck-mounted or motorized ride-on units, use pressure-type spray gun bead dispensers, and for hand applicators use a drop-on bead dispenser.
 - 2) Use bead dispensers capable of evenly distributing glass beads at the required application rate immediately after the application of the thermoplastic.
 - 3) Use bead dispenser that embeds the beads in the surface of the molten thermoplastic at an anchoring depth of from 55 to 60 percent of the bead diameter.
 - 4) Equip the bead dispenser with an automatic cut-off synchronized with the cut-off of the thermoplastic material.
2. Placement and Location:
 - a. Position pavement markings as shown on the Contract Drawings and described in the Specifications.
 - 1) Individual marking locations may be revised by the Program/Project Manager if it becomes necessary for proper installation or to accommodate the following requirements:
 - a) Do not place marking lines on parallel construction or expansion joints.
 - b) Offset longitudinal lines to provide 2 to 4 inches of clearance from parallel construction and expansion joints unless otherwise directed by the Program/Project Manager.
 - c) Offset longitudinal lines at least 12 inches clear of construction joints, unless otherwise requested by the Program/Project Manager.
 - d) Avoid placing symbols and legends on construction joints, expansion joints, or uneven pavement surfaces.
 - 2) Identify locations where construction joints, expansion joints, or otherwise unsuitable surfaces conflict with the specified locations for symbols or legends so that the Program/Project Manager can designate new locations for such symbols or legends.
3. Primer-Sealer Application:
 - a. If recommended by the manufacturer, use a primer-sealer on both old and new Portland cement concrete pavement.
 - 1) Apply the primer-sealer at the manufacturer's recommended application rates prior to placing the thermoplastic material.
 - 2) Allow the primer-sealer to cure for the manufacturer's specified cure or evaporation time so it will be free of solvent and water when the thermoplastic is applied.
 - 3) If epoxy primer is used, complete the thermoplastic application before the epoxy has cured.
 - b. Apply the thermoplastic material to the primed pavement surfaces within the working time specified by the primer-sealer and thermoplastic materials manufacturers.

- 1) If the primed surfaces are not marked within the specified time limits, re-prime the surfaces as required by the manufacturer at no increase in Contract Price.
- c. Improper primer-sealer application may result in bond failure between the thermoplastic and the pavement surface and may cause the thermoplastic surface to pinhole or blister.
 - 1) Should bond failure, pinholing, or blistering occur, stop all application operations until the cause is determined and corrected, and remove and replace all defective markings at no increase in Contract Price.
4. Thermoplastic and Glass Bead Application:
 - a. Note the start of the heating time for each batch of thermoplastic material in the temperature log and on the side of the kettle to which it applies.
 - 1) Unless otherwise requested by the Program/Project Manager, monitor the temperature of the material at 30-minute intervals and maintain a log of the temperature readings.
 - 2) Take readings at the melting kettle or the application outlet point, as determined by the Program/Project Manager.
 - b. Maintain specified temperature requirements at all times during the application.
 - 1) Material temperatures for applying alkyd and hydrocarbon thermoplastic cannot exceed 450 degrees Fahrenheit at any time.
 - 2) Temperatures exceeding 440 degrees Fahrenheit may be allowed for short periods of time; however, do not hold the material above 440 degrees Fahrenheit in any case for more than 4 hours.
 - 3) Do not allow total heating time for any batch of material to exceed 6 hours.
 - c. Extrude or spray thermoplastic pavement marking material on to the pavement surface.
 - 1) If the hot-applied thermoplastic marking blisters upon application, stop marking operations until the cause, potentially including surface moisture, is determined and corrected.
 - 2) Provide uniform thermoplastic thickness consistent throughout the total length of the marking required.
 - a) Perform periodic spot checks of the thermoplastic material to verify that the required thickness has been attained.
 - b) Spot check procedures include the following:
 - (1) For wet thermoplastic:
 - (a) Field test the thickness immediately after applying the thermoplastic marking by inserting a thin, graduated machinist rule or similar instrument into the molten thermoplastic to the depth of the pavement surface.

- (b) Determine the thickness visually by noting on the scale the depth of the penetration or coating on the instrument.
 - (2) For dry thermoplastic:
 - (a) Field test the thickness by placing a small flat sheet of metal with a thickness known to be the same as the required thermoplastic thickness immediately ahead of the striping apparatus, and compare depths.
 - (b) After striping, remove a sample and use a suitable measuring device, such as a caliper or micrometer, to determine the thickness of the dried marking.
- d. Minimize the thermoplastic material remaining in the kettle at the end of each workday, and blend a minimum of 80 percent of fresh material into the kettle at the start of each day.
 - 1) During delays and subject to specified limits on total acceptable heating time for each batch, transfer heated thermoplastic Material into approved containers for later re-use.
- e. Mechanically deposit drop-on glass beads at the specified rate into the thermoplastic material immediately after the thermoplastic marking is applied.
 - 1) Use the bead dispenser to evenly distribute the beads so that they embed in the surface of the thermoplastic as specified.
 - 2) If the glass beads do not adhere to the thermoplastic marking, stop the operation until the problem has been corrected.
 - 3) Remove and replace markings which do not meet the specified requirements as determined by the Program/Project Manager at no increase in Contract Price.
- f. Longitudinal Pavement Markings:
 - 1) Either an alkyd or a hydrocarbon thermoplastic formulation may be used for longitudinal lines, including lane lines and edge lines, unless otherwise shown on the Contract Drawings or specified herein.
 - a) Place 60-mil (0.060 inch) thick hot-sprayed thermoplastic reflectorized final striping within 7 to 14 calendar days after completion of the final pavement surface, or as directed by the Program/Project Manager.
 - b) Apply all other markings at the same time.
 - 2) Use spray formulations in accordance with requirements of the application equipment used to install the markings.
- g. Transverse Pavement Markings:
 - 1) Use an extruded alkyd thermoplastic formulation for all transverse lines, including stop bars and crosswalks.
 - 2) Place 90-mil (0.090 inch) extruded thermoplastic reflectorized striping final striping at the same time as all other markings as directed by the Program/Project Manager.

- 3) Use extrusion formulations in accordance with requirements of the application equipment used to install the markings.

C. Tolerances:

1. Provide finished thermoplastic lines free from waviness and having well defined edges.
2. Lateral deviation of the thermoplastic stripe: 1.0 inch in 100 feet maximum.
3. The longitudinal deviation of a painted segment and gap must not vary more than 6 inches in a 40-foot cycle.
4. The actual width of stripe must be within the limits specified in Table 02761-5, according to the width of stripe called for on the Contract Drawings:

Table 02761-5 Tolerances for Stripe Width	
Drawing Width	Actual Width
4 inches	4 to 4-1/2 inches
8 inches	8 to 9 inches
Over 8 inches	Plus or minus 1.0 inch

3.04 REPAIR/RESTORATION

- A. Maintain temporary preformed plastic pavement markings or replace them when necessary until they are covered with the next overlay course or are removed because they are no longer applicable.
- B. Immediately remove temporary preformed plastic pavement markings when they are no longer needed for traffic control or when they are in conflict with the succeeding traffic pattern.
 1. Remove pronounced markings across lanes, transitions, or tapers caused by the adhesive.
 2. Remove preformed pavement markings using methods recommended by the manufacturer and approved by the Program/Project Manager.
 3. Do not bum or grind off removable temporary marking material.
 4. Immediately remove residual adhesive, ghosting, shadows, or pavement scarring which might cause confusion during darkness or adverse weather conditions when so ordered by the Program/Project Manager.
- C. Immediately repair any failure during the time frame the preformed plastic material is scheduled to perform.
- D. Continued failure of a preformed plastic material to perform is cause for disallowing further use of that particular manufacturer's material.

3.05 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. The Testing and Inspection Agency will conduct testing in accordance with the latest AASHTO and ASTM test methods, Federal Standards, and the ADOT Materials Testing Manual as specified herein.
2. Thermoplastic Marking Tests:
 - a. Test Procedure:
 - 1) Apply thermoplastic material within a temperature range of 412.5 degrees Fahrenheit plus or minus 12.5 degrees Fahrenheit at a thickness of between 60 to 90 mils to pavement.
 - 2) The Program/Project Manager may conduct field tests in accordance with ASTM D 711 to verify actual drying times.
 - b. Acceptance Criteria:
 - 1) The material must set to bear traffic in not more than 2 minutes when the air and road surface temperature is approximately 50 degrees Fahrenheit plus or minus 3 degrees Fahrenheit, and not more than 10 minutes when the air and road surface temperature is approximately 90 degrees Fahrenheit plus or minus 3 degrees Fahrenheit.
 - 2) After application and sufficient drying time, the thermoplastic marking must show no appreciable deformation or discoloration under local traffic conditions in an air and/or road temperature ranging from minus 10 degrees Fahrenheit to 180 degrees Fahrenheit.
3. Inspections:
 - a. Perform daily maintenance and operation inspections of all application equipment to ensure that it is operable within the requirements of the Specifications.
 - 1) Inform the Program/Project Manager of any equipment breakdowns, intermittent malfunctions, or other conditions that may impact the proper application of the specified markings.
 - 2) Repair or replace any equipment judged to be unsuitable by the Program/Project Manager.
 - b. The final striping inspection will be made by the Program/Project Manager within 3 Days after all pavement markings and markers have been installed.

B. Non-Conforming Work

1. Failure of materials, inadequate marking characteristics, or any other confusing or unsafe condition in a construction work zone will not be tolerated.
2. Failure of any particular type of marking material to satisfactorily adhere to the pavement or to be satisfactorily removable is reason for disallowing its use.

3. Immediately correct all misalignments when ordered to do so by the Program/Project Manager.
 - a. Remove and reinstall the misaligned portions in accordance with the Specifications.

3.06 SYSTEM STARTUP

- A. All areas marked with preformed marking tape must be ready for traffic immediately after application.

3.07 WASTE MANAGEMENT

- A. Dispose of excess materials, cleaning fluids, and empty material containers offsite in conformance with the State and Federal requirements.

3.08 PROTECTION

- A. If so ordered by the Program/Project Manager, remedy any condition where the safety of workmen or the traveling public might be endangered.

SECTION 02763

PAINTED PAVEMENT MARKINGS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for cleaning and preparing the pavement surface.
 - 2. Requirements for providing pavement markings consisting of white, yellow, red, black, and blue water-borne, lead-free, rapid-dry traffic paint and reflective glass beads at the locations and in accordance with the details shown on the Contract Drawings, the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), and the requirements of the Specifications, or as directed by the Program/Project Manager.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01400 - Quality Requirements.
 - 3. Section 01555 - Traffic Control.
 - 4. Section 02223 - Removal of Pavement Markings and Markers.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. MSDS: Material Safety Data Sheet.
- B. Definitions:
 - 1. Glass Beads or Glass Spheres: The terms "glass beads" is synonymous with "glass spheres" as used herein.
 - 2. VOC: An acronym for volatile organic compounds, generally meant to refer to organic chemical compounds that have high enough vapor pressures under normal conditions to significantly vaporize and enter the atmosphere.
 - a. The U.S. Environmental Protection Agency has composed the following definition for regulatory, not necessarily scientific, purposes: "VOC means any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions (and then lists several other exemptions)."
- C. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):

- a. AASHTO M 247 – Standard Specification for Glass Beads Used in Traffic Paints.
2. American Concrete Institute (ACI):
 - a. ACI 503R – Use of Epoxy Compounds with Concrete.
3. ASTM International (ASTM):
 - a. ASTM D 93 - Standard Test Methods for Flash Point by Penske-Martens Closed Cup Tester.
 - b. ASTM D 562 - Standard Test Method for Consistency of Paints Measuring Krebs Unit (KU) Viscosity Using a Stormer-Type Viscometer.
 - c. ASTM D 711 - Standard Test Method for No-Pick-Up Time of Traffic Paint.
 - d. ASTM D 713 - Standard Practice for Conducting Road Service Tests on Fluid Traffic Marking Materials.
 - e. ASTM D 913 - Standard Test Method for Evaluating Degree of Resistance to Wear of Traffic Paint.
 - f. ASTM D 1155 - Standard Test Method for Roundness of Glass Spheres.
 - g. ASTM D 1210 - Standard Test Method for Fineness of Dispersion of Pigment-Vehicle Systems by Hegman-Type Gage.
 - h. ASTM D 1214 - Standard Test Method for Sieve Analysis of Glass Spheres.
 - i. ASTM D 1475 - Standard Test Method for Density of Liquid Coatings, Inks, and Related Products.
 - j. ASTM D 1640 - Standard Test Methods for Drying, Curing, or Film Formation of Organic Coatings at Room Temperature.
 - k. ASTM D 2243 - Standard Test Method for Freeze-Thaw Resistance of Water-Borne Coatings.
 - l. ASTM D 2369 - Standard Test Method for Volatile Content of Coatings.
 - m. ASTM D 2486 - Standard Test Methods for Scrub Resistance of Wall Paints.
 - n. ASTM D 2621 - Standard Test Method for Infrared Identification of Vehicle Solids from Solvent-Reducible Paints.
 - o. ASTM D 3723 - Standard Test Method for Pigment Content of Water-Emulsion Paints by Low-Temperature Ashing.
 - p. ASTM D 3960 - Standard Practice for Determining Volatile Organic Compound (VOC) Content of Paints and Related Coatings.

 - b) FED-STD-595B - Colors Volume 1.
 - e. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 Occupational Health and Safety Standards.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate the Work of this Section with the appropriate State and municipal departments who own the Right-of-Way where the painted pavement markings are to be applied.
- B. Sequencing:
 - 1. Include provisions for traffic control during pavement marking operations in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the workers and the public.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Pavement marking paint.
 - 2) Reflective glass beads.
 - 3) Material Safety Data Sheets (MSDS) for the pavement marking paint.
 - b. Samples:
 - 1) Verification samples from each lot or batch of material for each paint formulation not certified by a Certificate of Compliance for testing.
 - 2) Samples from each lot or batch of material for reflective glass beads.
 - c. Certificates:
 - 1) Certificate of Compliance (in lieu of verification samples) for each single component paint formulations.
 - 2) Manufacturer's Certification that the pavement marking paint does not contain hazardous materials as defined in Section 1200 of 29 CFR 1910.
 - d. Qualification Statements:
 - 1) Pertinent work experience of the applicator personnel.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Right-of Way Owner Approvals:
 - a. Required approvals depend on who owns the right-of- way and where the painted pavement markings are to be applied, but must be obtained before construction activities begin from the appropriate State and municipal departments, which may include but are not limited to, the following:
 - 1) Arizona Department of Transportation (ADOT).
 - 2) City of Phoenix Streets Department.
 - 3) Phoenix Sky Harbor International Airport Design and Construction Services.
 - b. If the owner of the Right-of-Way is other than the Phoenix Sky Harbor International Airport, the owner of the Right-of-Way will be provided on the Contract Drawings.
2. U.S. Environmental Protection Agency Requirements:
 - a. Only provide paint which complies with the low volatile organic compound (VOC) requirements as defined in 40 CFR 51.100,

Requirements for Preparation, Adoption, and Submittal of Implementation Plans.

3. Notify the Program/Project Manager of any change in pavement marking paint formulation.
 - a. The Program/Project Manager must approve any change in the formulation of the paint.

B. Qualifications:

1. Applicator Qualifications:

- a. Only allow personnel who are experienced in this type of work to place traffic marking.
- b. Submit pertinent work experience of the applicator personnel to the Program/Project Manager for approval.

C. Certifications:

1. Submit a Certificate of Compliance for each single component paint formulation that certifies the material complies with the requirements specified herein to the Program/Project Manager for approval.
 - a. Submit Certificates of Compliance for each lot or batch of material prior to its use.
 - b. Certify that material complies with each test specified for the material.

D. Sustainability Standards Certifications:

1. Submit the manufacturer's Certification that the pavement marking paint does not contain mercury, lead, hexavalent chromium, toluene, chlorinated solvents, hydrolysable chlorine derivatives, ethylene-based glycol ethers and their acetates, and not any carcinogen, as defined in Section 1200, Hazard Communication, of 29 CFR 1910.
 - a. Lead content must not exceed 0.06 percent of weight of the dry film.
 - b. Test for chromium content must be negative.

E. Preconstruction Testing:

1. If an acceptable Certificate of Compliance for each single component paint formulation and/or an acceptable Certificate of Analysis for each lot or batch of reflective glass beads is not provided, submit paint and/or bead test samples to the Program/Project Manager for testing by the Testing and Inspection Agency specified in Section 01400, Quality Requirements, to verify the materials comply with the requirements specified in Article 2.03.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. One Component Pavement Marking Paint:
 - a. Packaging:

- 1) All shipping containers for paint must comply with the requirements of 49 CFR 173, particularly Section 173.24, General Requirements for Packagings and Packages.
 - 2) Provide containers and lids lined with a suitable coating to prevent attack of the paint by agents in the air space above the paint.
 - a) The lining must not come off the container or lid as skins.
 - 3) Provide containers colored white, including the lids; and include an identifying band of the appropriate color around and within the top one third of the container.
 - 4) Properly seal the containers with suitable gaskets.
 - 5) Provide containers showing no evidence of leakage.
 - 6) Provide containers capable of remaining in satisfactory condition for a period of 12 months after delivery to a distributor or paint applicator.
- b. Labeling:
- 1) Label the paint containers on both the side of the container and on the lid to show the manufacturer's name, date of manufacture, paint color, product code, manufacturer's batch number, and quantity or weight of paint.
 - 2) Clearly mark or label containers as either rapid or fast dry, lead-free water-borne traffic paints.
 - 3) Label the paint containers to indicate that the contents fully comply with all rules and regulations concerning air pollution control in the State of Arizona and Maricopa County.
 - 4) The manufacturer of the paint is responsible for attaching proper shipping labels indicating whether the contents are toxic, corrosive, flammable, or as otherwise required by 49 CFR 173, particularly Section 173.24, Shippers Responsibility.
- B. Storage and Handling Requirements:
1. Single Component Pavement Marking Paint:
 - a. Access to Paint Storage:
 - 1) If single component pavement marking paint is shipped to a distributor or paint applicator for storage prior to application, the distributor or paint applicator must allow the Program/Project Manager or his designee free access to the facility where the paint is stored and provide every reasonable facility for sampling the paint.
 2. Unused Paint:
 - a. Package paint that is to be saved for later use as specified, and ship it to a storage location.

1.07 SITE CONDITIONS

- A. Ambient Conditions:
1. Moisture Conditions:

- a. Apply painted and dual component pavement markings only when the pavement surface is dry and the weather is not foggy, rainy, or otherwise adverse to the application of markings.
- b. Do not apply water-borne paints if rain is expected within 1 hour of application, unless otherwise approved by the Program/Project Manager.
2. Temperature Conditions:
 - a. Do not apply water-borne paints when the atmospheric temperature is below 50 degrees Fahrenheit, or when it can be anticipated that the atmospheric temperature will drop below 50 degrees Fahrenheit during the drying period.
 - b. Apply dual component pavement markings only when the atmospheric temperature is a minimum of 40 degrees Fahrenheit and rising, and do not apply them if the wind chill factor is below 35 degrees Fahrenheit.
 - 1) Measure the surface temperature 1/2 hour prior to the start of striping operations, and every 1 to 2 hours thereafter if requested by the Program/Project Manager.
 - 2) Use standard surface temperature or infrared non-contact thermometers for measuring the temperatures.

PART 2 PRODUCTS

2.01 REGULATORY REQUIREMENTS:

- A. Provide pavement markings conforming to the requirements of the following:
 1. FHWA Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), as revised.
 2. ADOT Arizona Supplement to the 2003 Manual on Uniform Traffic Control Devices
 3. ADOT Standard Drawings –Signing and Marking Standards.
- B. If the painted pavement markings are within Arizona Department of Transportation (ADOT) right-of- way, comply with the material and construction requirements of the applicable Sections in the ADOT Standard Specifications for Road and Bridge Construction and Arizona Stored Specifications, and with the applicable ADOT Standard Drawings.
- C. If the painted pavement markings are within airport runways, taxiways, or aprons, comply with the requirements specified in FAA AC No. 150/5340-1J.

2.02 MATERIALS

- A. Pavement Marking Paint:
 1. Pavement Marking Paint:

- a. Provide ready-mixed, single component traffic line paint of the correct color(s) for application to either asphalt or Portland cement concrete pavement.
 - b. Formulate one component pigmented water-borne paint in a consistent manner containing all the necessary co-solvents, dispersant, wetting agents, preservatives and all other additives, so that the paint retains its viscosity, stability, and all of the properties as specified herein.
 - 1) Provide well ground paint pigments properly dispersed in the paint vehicle.
 - 2) Provide pigment that does not cake or thicken in the container and that does not become granular or curdled.
 - 3) Any settlement of the pigment in the paint must result in a thoroughly wetted, soft mass, permitting the complete and easy vertical penetration of a paddle.
 - a) Settled pigment must be easily re-dispersed, with minimum resistance to the sideways manual motion of a paddle across the bottom of the container, to form a smooth product of the proper consistency.
 - b) If the settled pigment cannot be easily re-dispersed, due to excessive pigment settlement as described above or due to any other cause, the paint will be considered unfit for use.
 - c. Provide paint free from foreign materials such as dirt, sand, fibers from bags, or other materials capable of clogging screens, valves, pumps and other equipment used in a paint striping apparatus.
 - d. Provide paint that retains all specified properties under normal storage conditions for 12 months after acceptance and delivery.
 2. All manufactured paint prepared at the factory must be ready for application.
 3. Manufacturers:
 - a. 3M, www.3m.com.
 - b. Ennis Traffic Safety Solution, www.ennistraffic.com.
 - c. Approved equal.
 4. Submit Product Data and Material Safety Data Sheets (MSDS) for the single component water-borne pavement marking paint to the Program/Project Manager for approval.
- B. Reflective Glass Beads for Pavement Marking Paint:
1. For pavement markings not on the airfield, provide glass beads conforming to the requirements specified for Type 1 beads in AASHTO M 247, either coated or uncoated as recommended by the manufacturer; and exhibiting all of the properties specified herein.
 - a. Provide glass beads essentially free of sharp angular particles, and not showing milkiness or surface scoring and scratching.
 - b. Manufacture glass beads from glass of a composition designated to be highly resistant to traffic wear and the effects of weathering.
 - c. Glass Bead color: Water white.

- d. Provide glass beads free from air inclusions and scratches that might affect their function as a reflecting media.
- e. Glass Bead Moisture Proofing:
 - 1) Provide moisture-proof glass beads containing less than 0.25 percent moisture by weight and free of trash, dirt or other deleterious materials.
 - a) During bead manufacture, apply a moisture-proof overlay consisting of water repellant material to all glass beads.
 - (1) Provide an overlay treatment that prevents the beads from absorbing moisture in storage and keeps them free from clustering and lumping.
 - (2) Provide an overlay treatment that assures the beads will flow freely from dispensing and testing equipment.
- 2. For pavement markings on the airfield, provide glass beads conforming to the requirements specified for Type III beads in FS TT-B-1325, either coated or uncoated as recommended by the manufacturers of the paint and reflective glass beads.
- 3. Submit Product Data for the reflective glass beads to the Program/Project Manager for approval.

2.03 SOURCE QUALITY CONTROL

A. Tests and Inspections:

- 1. If an acceptable Certificate of Compliance for each single component paint formulation and/or an acceptable Certificate of Analysis for each lot or batch of reflective glass beads is not provided, the Testing and Inspection Agency will conduct verification testing on samples submitted in accordance with the latest ASTM test methods, Federal Test Method Standard No. 141, and the ADOT Materials Testing Manual, as specified herein:
- 2. Pavement Marking Paint Qualitative Requirements:
 - a. Color:
 - 1) Test Procedure:
 - a) Provide black paint having a color closely matching FED-STD-595B, Color Chip No. 37038.
 - b) Provide blue paint having a color closely matching FED-STD-595B, Color Chip No. 35180.
 - c) Provide green paint having a color closely matching FED-STD-595B, Color Chip No. 34090.
 - d) Provide red paint having a color closely matching FED-STD-595B, Color Chip No. 31136.
 - e) Provide white paint having a color closely matching FED-STD-595B, Color Chip No. 37925.
 - f) Provide yellow paint having a color closely matching FED-STD-595B, Color Chip No. 33538 or 33655.
 - g) Visually check the color against Tristimulus Values for the color according to FED-STD-141.

- 2) Acceptance Criteria:
 - a) Colors matching the specified color are acceptable.
- b. Dry Opacity:
 - 1) Test Procedure:
 - a) Determine dry opacity for the paint using a black-white Lenata Chart, Form 2C Opacity and a Photovolt 577 Reflectance Meter or equal.
 - b) Using a 10-mil gap doctor blade, draw down a film of paint, covering both black and white portions of the chart.
 - (1) Dry the film for 24 hours.
 - (2) After calibrating the Reflectance Meter according to the manufacturer's instructions, measure the reflectance over the white and black portions with the green Tristimulus filter.
 - (3) Calculate dry opacity as follows:

$$\text{Dry Opacity} = \frac{\text{Reflectance over black}}{\text{Reflectance over white}}$$

- 2) Acceptance Criteria:
 - a) Dry Opacity for both white and yellow paint: 0.90, minimum.
- c. Yellowness Index:
 - 1) Test Procedure:
 - a) Determine the yellowness Index for white paint as described for dry opacity, except use a 15-mil gap doctor blade to draw down the paint.
 - b) After 24 hours for drying, measure the reflectance of the paint film, using green, blue, and amber Tristimulus filters.
 - c) Calculate the Yellowness Index as follows:

$$\text{Yellow Index} = \frac{\text{Amber} - \text{Blue}}{\text{Green} \times 100}$$

- 2) Acceptance Criteria:
 - a) Yellowness Index for the white paint: 10, maximum.
- d. Reflectance:
 - 1) Test Procedure:
 - a) Determine reflectance for both white and yellow paint using the same 15-mil drawdown film as for the Yellowness Index.
 - (1) For white paint, the same sample may be utilized for both the yellowness index and reflectance.
 - (2) Measure the reflectance of the paint film using the green Tristimulus filter.
 - 2) Acceptance Criteria:
 - (1) Reflectance for the white paint: 85, minimum.

- (2) Reflectance for the yellow paint: Within a range from 42 to 59, inclusive.
- e. UV Color Durability:
 - 1) Test Procedure:
 - a) Determine UV Color Durability using a QUV Weatherometer, with ultra violet light and condensate according to ASTM G 154, for 300 hours total.
 - b) Use a repeating cycle of four hours UV exposure at 60 degrees Celsius followed by four hours condensate exposure at 40 degrees Celsius.
 - 2) Acceptance Criteria:
 - a) After 300 hours of exposure, the yellowness index for white paint must not exceed 12, and yellow paint must still match FED-STD-595B, Color No. 33538.
- f. Static Heat Stability:
 - 1) Test Procedure:
 - a) Place one pint of paint in a sealed can and heat in an air circulation oven at 120 degrees Fahrenheit plus or minus 1 degree Fahrenheit for a period of one week.
 - b) Remove the paint from the oven and check the viscosity in Krebs Units at 77 degrees Fahrenheit plus or minus 1 degree Fahrenheit according to ASTM D 562.
 - 2) Acceptance Criteria:
 - a) The viscosity measured must be in the range from 68 to 90, inclusive.
 - b) Also, check for any signs of instability.
- g. Heat Shear Stability:
 - 1) Test Procedure:
 - a) Shear one pint of paint in a Waring blender at high speed to 150 degrees Fahrenheit.
 - (1) Use a blender having tight fitting lid taped onto it to minimize volatile loss.
 - b) When the paint reaches 150 degrees Fahrenheit, stop the blender, immediately pour the paint into a sample can, and apply a cover to seal the can.
 - c) Let the paint cool overnight, and examine for jelling or other signs of instability.
 - d) Measure its viscosity in Krebs Units at 77 degrees Fahrenheit plus or minus 1 degree Fahrenheit according to ASTM D 562.
 - 2) Acceptance Criteria:
 - a) The viscosity measured must be in the range from 68 to 95, inclusive.
 - b) If the viscosity measured is not within the upper limit, run total solids on the sheared paint and adjust solids, if necessary, by adding water to reach the original solids content.

- (1) If the solids content requires adjustment, check the viscosity of the paint again.
 - (a) The viscosity must be in the range from 68 to 95, inclusive.
- h. Scrub Resistance:
 - 1) Test Procedure:
 - a) Determine scrub resistance in accordance to ASTM D 2486.
 - b) Use an appropriate doctor blade to provide a dry film thickness of 3 to 4 mils.
 - c) Allow the paint to cure for 24 hours.
 - d) Perform the scrub resistance test at 77 degrees Fahrenheit plus or minus 1 degree Fahrenheit and 50 percent plus or minus 5 percent humidity.
 - e) Record the number of cycles to remove the paint film.
 - 2) Acceptance Criteria:
 - a) The number of cycles must be a minimum of 800.
- i. Spraying Properties:
 - 1) Test Procedure:
 - a) Apply paint providing a 15-mil wet film thickness in the field.
 - 2) Acceptance Criteria:
 - a) The paint must show the following properties at ambient temperatures of 50 to 100 degrees Fahrenheit with a paint spray temperature of 150 degrees Fahrenheit, maximum; and 6 to 8 pounds of post-applied glass beads per gallon of paint:
 - (1) Dry to a no-track condition in five minutes or less when the line is crossed over in a passing maneuver with a standard-sized automobile.
 - (2) Produce a clean-cut, smooth line with no overspray or puddling.
 - (3) Accept glass beads immediately after application so that the spheres will be embedded into the paint film to a depth of 50 percent of their diameter.
 - (4) When heated to the temperature necessary to obtain the specified dry time, show no signs of instability, such as viscosity increase, jelling, or poor spray application.
- j. Freeze-Thaw Properties:
 - 1) Test Procedure:
 - a) Test the paint for freeze-thaw resistance by subjecting it to 5 cycles of according to the requirements of ASTM D 2243.
 - 2) Acceptance Criteria:
 - a) The paint viscosity may not change significantly.
- k. Road Service Rating:
 - 1) Test Procedure:

- a) Apply 4 inch wide paint test stripes approximately 12 feet long transversely across the road at a location approved by the Program/Project Manager.
 - b) Provide test stripes with a wet film thickness of approximately 15-mils as determined according to ASTM D 4414 and ASTM D 713.
 - (1) To aid in obtaining the correct film thickness, a length of roofing paper placed by the side of the road prior to test stripe application can be used.
 - (a) Place a rigid metal test panel on the roofing paper in the path of a test line.
 - (b) Immediately after the test stripe is applied, measure the wet film thickness.
 - (c) If it is not satisfactory, adjust the spray pressure and repeat this process until the target wet fill thickness is attained.
 - (2) It is important that no glass beads be present that would give a false wet film thickness.
 - c) Determine the initial bead retention using the following samples:
 - (1) When the wet film thickness is correct, apply a test line across a tarred metal test panel.
 - (2) After this, apply another test line across a different tarred metal test panel and add the glass beads.
 - (a) Apply the glass beads after the paint has been applied, but during the same striping operation, and at a rate so that the initial bead retention on the test line is a minimum of 6 pounds of beads per gallon of wet paint.
 - (b) Ensure that the glass bead spheres are embedded into the paint film to a depth of 50 percent of their diameter.
- 2) Acceptance Criteria:
- a) Evaluate paints for wear according to ASTM D 913.
 - (1) Observe test stripes for a period of 180 Days from the date of application, and take all rating measurements in the wheel track area.
 - (a) Determine bead loss by taking close-up photographs of the paint film and counting the average bead loss.
 - (b) Glass beads may show no more than a 30 percent loss after 180 Days of the test to be acceptable.
 - (c) After 180 Days of service, paints must have a rating of 92 percent or better on a visual rating scale of 0 to 100 percent to be acceptable.

- b) At the option of the Program/Project Manager, the road service rating test may be waived or evaluated for a period of time less than 180 Days.
3. Pavement Marking Paint Quantitative Requirements:
- a. Provide one component water-borne pavement marking paint complying with the quantitative requirements listed in Table 02763-1.

Table 02763-1 Quantitative Requirements of Mixed Paints		
Property	Test Method	Quantitative Requirement
Pigment: Percent by weight, allowable variation from qualifying sample.	ASTM D 3723	±2.0
Non-volatile Content: Percent by weight, allowable variation from qualifying sample.	ASTM D 2369	±2.0
Viscosity: Krebbs Units at 77°±1°F.	ASTM D 562	80 to 95
Weight per Gallon: Pounds per gallon at 77°± 1°F, allowable variation from qualifying sample.	ASTM D 1475	±0.3
Vehicle Composition: Vehicle infrared spectra, allowable variation from qualifying sample.	ASTM D 2621	None
pH: Allowable variation from qualifying sample.	ASTM E 70	±1.0
Fineness of Dispersion: HEGMAN, minimum.	ASTM D 1210	3.0
Volatile Organic Compounds (VOC): Pounds per gallon of paint, maximum.	ASTM D 3960 according to 10.2.1	2.1
Flash Point: °F, minimum.	ASTM D 93, Method A	100
Dry Time to No Pick Up: With no beads, minutes, maximum.	ASTM D 711	10

Table 02763-1 Quantitative Requirements of Mixed Paints		
Property	Test Method	Quantitative Requirement
Dry Through Time: Minutes.	ASTM D 1640, except do not apply thumb pressure when rotating thumb 90 degrees on the paint film.	20
Flexibility:	FS TT-P-1952	Pass

4. Reflective Glass Bead Qualitative Requirements:
 - a. Reflective Glass Bead Index of Refraction Test:
 - 1) Test Procedure:
 - a) Test beads by a liquid immersion method at a temperature of 25 degrees Celsius.
 - 2) Acceptance Criteria:
 - a) Beads must have an index of refraction of 1.50 to 1.57.
 - b. Reflective Glass Bead Roundness Test:
 - 1) Test Procedure:
 - a) Test glass beads in accordance with ASTM D 1155, Procedure B except delete paragraphs F and G.
 - 2) Acceptance Criteria:
 - a) Glass beads retained on any screen specified in the gradation requirements are to contain a minimum of 75 percent true spheres.
 - c. Reflective Glass Bead Moisture Test:
 - 1) Test Procedure:
 - a) Test glass beads for compliance with specification requirements for moisture proofing using the following procedure or an approved alternate.
 - b) Conduct the test at a temperature of 25 plus or minus 1 degree Celsius and a relative humidity of 50 plus or minus 5 percent.
 - c) Weigh 900 grams of glass beads into a clean, dry, flat-bottomed pan.
 - d) Dry the beads at 150 degrees Celsius for 2 hours.
 - e) Cool the beads to room temperature of 25 degrees plus or minus 1 degree Celsius in a desiccator.
 - f) Wash an unbleached cotton bag in hot water and detergent.
 - (1) Provide a 10-1/2 inch by 17-1/2 inch bag sewn into an L-shape and having a fabric thread count of 48 by 48.

- (2) Turn the bag inside out so that the sewn seam-allowance is on the outside.
 - g) Place the quantity of glass beads into the inverted cotton bag
 - h) Gather the top of the bag and lower it into a container of distilled water until the beads are approximately 25 millimeters below the water level.
 - (1) Use a container having sufficient dimensions so that the bag does not contact the sides or bottom during immersion.
 - (2) Immerse each bag individually.
 - (3) Do not allow one bag to contact another if multiple tests are run.
 - i) Remove the bag after 30 seconds of immersion time.
 - j) Twist the top neck of the bag until the twisted bag is compressed firmly against the beads.
 - (1) Turn the bag inside out so that the sewn seam-allowance is on the outside.
 - (2) Continue twisting the bag until excess water no longer drips from the bag.
 - (3) After the excess water has been squeezed from the bag, allow the bag to unwind.
 - (4) Gather and clamp the top of the bag.
 - k) Suspend the bag on a ring stand or other support so that the bottom or sides of the bag do not contact the support.
 - l) After two hours at room temperature of 25 degrees Celsius, plus or minus 1 degree, remove the bag from the support.
 - m) Mix the sample thoroughly by holding the bottom seam allowance in one hand and gathered neck of the bag in the other, inverting the bag, and shaking it up and down 5 times.
 - n) Transfer the sample into a clean, dry standard laboratory funnel with a top opening diameter of 125 millimeters, a 150-millimeter stem length, and an inside stem diameter between 9 and 10 millimeters.
 - (1) If consecutive tests are run, be sure the funnel is clean and free of beads from prior tests.
- 2) Acceptance Criteria:
- a) The entire glass bead sample must flow through the funnel without stoppage.
 - (1) At the start of the test only, it is permissible to lightly tap the stem of the funnel to initiate flow.
 - (2) Small quantities of beads adhering to the side of the funnel or stem are not cause for test failure.
- d. Reflective Glass Bead Gradation:

- 1) Provide beads containing the percentages of each size bead as allowed by Table 02763-3 when tested in accordance with ASTM D 1214.

Table 02763-3 Gradation of Reflective Glass Beads (for One Component Pavement Marking Paint)	
Size of Sieve	Percent Passing
No. 30	100
No. 50	15 to 35
No. 70	0 to 15
No. 100	0 to 5

e. Reflective Glass Bead Specific Gravity:

1) Test Procedure:

- a) Place 100 grams of beads in an oven at 110 degrees Celsius for one hour.
- b) Remove the beads and place them in a desiccator until the sample is cool.
- c) Remove approximately 60 grams of beads from the desiccator and weigh the sample accurately on a balance accurate to 0.1 grams.
- d) Measure the volume of the sample:
 - (1) Pour the beads slowly into a clean 100-millimeter graduated cylinder containing 50 millimeters of isopropyl alcohol making sure there is no air trapped among the beads.
 - (2) The total volume, minus 50, will give the volume of the beads.
- e) Calculate the specific gravity as follows:

$$\text{Specific gravity} = \frac{\text{Weight of the sample}}{\text{Volume of the sample}}$$

2) Acceptance Criteria:

- a) The specific gravity of the beads must be in the range from 2.40 to 2.60.

f. Reflective Glass Bead Chemical Stability:

- 1) Prior to acceptance, glass beads that show a tendency toward decomposition, including surface etching when exposed to atmospheric conditions, moisture, dilute acids, or alkalis or paint

film constituents, may be required to demonstrate satisfactory reflectance behavior when subjected to such tests as may be prescribed by the Program/Project Manager.

g. Reflective Glass Bead Chemical Resistance:

1) Test Procedure:

- a) Place 3 to 5 gram portions of the sample in each of 3 Pyrex glass beakers or porcelain dishes.
- b) Cover one sample with distilled water, one with a 3N solution of sulfuric acid, and the third with a 50 percent solution of sodium sulfide.
- c) After one hour of immersion, microscopically examine the glass beads of each sample for evidence of darkening and frosting.

2) Acceptance Criteria:

- a) Glass beads must withstand immersion in water and acids with no noticeable corrosion, etching, darkening, or otherwise noticeable decomposition caused by the sulfides

5. Inspections:

- a. Advise the Program/Project Manager when paint is to be manufactured and furnish free access to all parts of the plant involved in manufacturing the paint for the purpose of sampling both the paint and the raw Materials during manufacturing.
 - 1) Materials used in product formulation must meet the requirements of this Specification.
 - 2) Materials not specifically specified must receive the approval of the Program/Project Manager.

B. Non-Conforming Work:

1. Do not use non-conforming materials for the Work of this Contract.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Layout of Work:

- a. Spot mark the proposed locations of striping for the entire Contract at 10-foot intervals in conformance with the striping indicated on the Contract Drawings.
 - 1) Layout lane widths, parking spaces, and crosswalks in accordance with the regulations of the Authorities Having Jurisdiction and as indicated on the Contract Drawings.
 - b. Position pavement markings as defined on the Contract Drawings and in the Specifications.
2. Upon completion of the spot marking, notify the Program/Project Manager that the spot marking is ready for inspection.

3. The Program/Project Manager will complete an inspection of the proposed striping within the 3 working days after notification.
 - a. If it becomes necessary for proper installation, the Program/Project Manager may revise individual marking locations.
 - 1) It is possible that the required striping may exceed the Contract's construction limits in order to match and/or tie into the existing striping.
 - a) A field inspection will determine if the striping exceeds the Contract's construction limits.
 - b. Do not apply the paint without the approval of the Program/Project Manager.
 - 1) Approval of the spot marking does not relieve the Contractor from obtaining a final inspection.

B. Pre-Installation Testing:

1. Paint will normally be sampled at the place of storage or at the Site prior to application of the paint.
 - a. Notify the Program/Project Manager a minimum of 14 Working Days prior to any traffic painting operation to allow access at that time for paint sampling at the storage location.
 - b. Furnish a minimum of 1 paint Sample from each lot of paint.
 - c. At the time of paint application and at intervals determined by the Program/Project Manager, furnish samples of paint to the Program/Project Manager.

C. Evaluation and Assessment:

1. If a conflict exists between the actual field conditions and the pavement marking on the Contract Drawings, cease working and notify the Program/Project Manager immediately.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Maintain and protect traffic on active streets and roads in accordance with the requirements specified in Section 01555, Traffic Control.
 - a. Provide the necessary personnel and equipment to divert traffic from the installation area where Work is in progress and during drying time when, in the opinion of the Program/Project Manager, diversion of traffic is necessary.

B. Surface Preparation:

1. Verify that the pavement surface is free from excess asphalt or deleterious substances before traffic paint, beads, or primer are applied.
 - a. Remove all dirt, debris, grease, oil, rocks, and chips from the pavement surface before applying markings.

- b. Scrub areas with a biodegradable chemical that cannot otherwise be satisfactorily cleaned.
 - c. The method of cleaning the pavement surface and removal of detrimental material is subject to approval by the Program/Project Manager including sweeping and the use of high-pressure air spray.
 - 2. If a seal is required, allow a sufficient drying time (48 hours minimum) before applying any pavement markings.
 - a. If after the 48 hours drying time has passed the seal remains tacky or excessive oil has risen to the roadway surface, apply a sand blotter to absorb the excess oil.
 - b. If the seal remains tacky, no pavement marking may be applied.

C. Demolition/Removal:

- 1. Removal existing pavement markings and markers in accordance with the requirements of Section 02223, Removal of Pavement Markings and Markers.
 - a. Prior to spot marking the proposed locations of striping as specified in Subparagraph 3.01.A.1, complete the removal of existing pavement markings.

3.03 APPLICATION

A. Equipment:

- 1. Place pavement marking (traffic) paint and beads on the pavement using a spray-type, self-propelled pavement marking machine.
 - a. Temporary striping during construction may be placed with other equipment designed for application of paint and beads with the approval of the Program/Project Manager.
 - 2. Provide application equipment for roadway installation having, at a minimum, the following characteristics and/or apparatus:
 - a. Capability to apply clear-cut lines of the width specified on the Contract Drawings.
 - b. A mechanical device capable of placing a broken reflectorized line with a 10-foot painted segment and a 30-foot gap.
 - c. An air-operated glass bead drop-in dispenser controlled by the spray gun mechanism.
 - 1) Use a glass bead dispenser, capable of placing the glass beads into the paint line as the paint is applied to the pavement
 - 2) No glass beads are allowed in the pavement marking paint before the paint is applied.
 - a) Apply glass beads after the paint has been applied.

B. Applying Paint and Beads:

- 1. Unless otherwise indicated, apply painted pavement markings having the dimensions required by the Authorities Having Jurisdiction and as indicated on the Contract Drawings.

- a. Unless otherwise indicated, provide 4-inch wide pavement stripes.
 - b. Provide median ends (bull-noses) in accordance with ADOT Standard Drawing No. M-1.
 - c. Provide stop bar marking in accordance with ADOT Standard Drawing No. M-6.
 2. Initially apply the lane lines, edge lines, centerlines, crosswalks, and stop bars required under this Contract within 2 days of placing the final lift of asphalt or concrete pavement, or as directed by the Program/Project Manager.
 3. 30 to 45 days after the initial lane lines, edge lines, centerlines, crosswalks, and stop bars required under this Contract were applied, restripe these items throughout the entire Contract Site; and at the same time apply the symbols, transverse markings, and other markings remaining to be applied as indicated on the Contract Drawings or in the Specifications.
 4. Application Rates:
 - a. For Pavement Markings Not on the Airfield:
 - 1) Based on a 10-foot stripe and a 30-foot gap (40-foot cycle), apply pavement marking paint at the following rates for the type of pavement marking indicated:
 - a) Solid 4-inch line: 16 gallons per mile.
 - b) Broken 4-inch line: 4 gallons per mile.
 - 2) Apply glass reflectorizing beads onto the wet paint at a minimum rate of 6 pounds of beads for each gallon of paint.
 - b. For Airfield Pavement Markings:
 - 1) Apply pavement marking paint at a rate of 115 square feet for each gallon of paint.
 - 2) Apply glass reflectorized beads onto wet paint at a minimum rate of 10 pounds of beads for each gallon of paint.
 5. Wet Thickness:
 - a. Apply pavement marking paint to achieve a wet thickness not less than 15 mils.
 6. Do not allow the paint to bleed, curl, or discolor while it is applied to the roadway surface.
 7. Do not heat water-borne paint to a temperature greater than 150 degrees Fahrenheit to accelerate drying.
- C. Tolerances:
1. Length:
 - a. Do not allow the length of a painted segment and gap to vary more than 6 inches in a 40-foot cycle.
 2. Width:
 - a. Provide 4-inch, 8-inch, or 12-inch wide painted lines as shown on the Contract Drawings with a tolerance of plus or minus 1/8-inch.
 3. Alignment:

- a. Do not allow new pavement striping to vary from the striping alignment indicated on the Contract Drawings more than 1/2-inch in 50 feet.
- 4. Re-striping:
 - a. When existing pavement markings require re-striping, completely cover existing markings to within 1/4-inch and within a longitudinal tolerance of 6 inches at the beginning and at the end of each stripe.

3.04 REPAIR

- A. If bleeding, curling, or discoloration occurs, apply additional coats of paint to the unsatisfactory areas to correct the problem.
 - 1. In the event the additional coats of paint are insufficient, the Program/Project Manager will determine what method of correction may be used.
- B. If a sand blotter is applied after the installation of pavement markings to absorb excess paint, remove all marking affected and re-applied it.
- C. Make repairs and corrections at no increase in Contract Price.

3.05 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 - 1. Site Tests:
 - a. The Program/Project Manager may send paint samples from the paint provided for this Contract to the Independent Testing and Inspection Agency for testing to verify its adherence to the specified requirements.
 - 2. Inspections:
 - a. The Program/Project Manager will perform a final striping inspection within 3 working days after all pavement markings and markers have been applied and/or installed.
 - 1) Finished lines are to be smooth, opaque, aesthetically acceptable, and free from undue waviness.
- B. Non-Conforming Work
 - 1. If upon final inspection, the Program/Project Manager decides that more than one coat of paint is required, apply the additional coat(s) at no increase in Contract Price.

3.06 CLEANING

- A. Waste Management:
 - 1. Disposal of unused quantities of pavement marking paint is the responsibility of the Contractor, and must meet all applicable Federal regulations for waste disposal.
 - a. Unused paint must be identified on the container.

- b. Unused paint may be utilized on a future project provided the paint still conforms to all specifications contained herein.

3.07 PROTECTION

- A. If so ordered by the Program/Project Manager, remedy any condition where the safety of workmen or the traveling public might be endangered.

3.08 MAINTENANCE

- A. Perform daily maintenance and operation inspections of all application equipment to ensure that it is operable within the requirements of the Specifications.
 - 1. Inform the Program/Project Manager of any equipment breakdowns, intermittent malfunctions, or other conditions that may impact the proper application of the specified markings.
 - 2. Repair or replace any equipment judged to be unsuitable by the Program/Project Manager.

SECTION 02766

RAISED PAVEMENT MARKERS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for cleaning and preparing the pavement surface.
 - 2. Requirements for providing raised pavement markers of the type indicated in ADOT standard details and/or on the Contract Drawings for the locations shown.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01555 - Traffic Control.
 - 3. Section 02223 – Removal of Pavement Markings and Markers.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ADOT: Arizona Department of Transportation.
 - 2. RPM: Raised pavement marker.
 - 3. RRPM: Retro-reflective raised pavement marker.
- B. Definitions:
 - 1. Dagmar: A reflectorized raised pavement marker (RPM) having a circular base and a spherical or parabolic crown.
- C. Reference Standards:
 - 1. Arizona Department of Transportation (ADOT):
 - a. ADOT Arizona Supplement to the 2009 Manual on Uniform Traffic Control Devices.
 - b. ADOT Standard Drawings –Signing and Marking Standards.
 - 1) Drawing No. M-19, Sheet 1 of 9 – Raised Pavement Marker Plan Legend.
 - 2) Drawing No. M-19, Sheet 2 of 9 – Non-Reflective Raised Pavement Marker Details.
 - 3) Drawing No. M-19, Sheet 3 of 9 – Retro-Reflective Raised Pavement Marker Details.
 - 4) Drawing No. M-19, Sheet 4 of 9 –Pavement Marking Application and General Notes.
 - 5) Drawing No. M-19, Sheet 5 of 9 – Pavement Marking Details for Undivided Highways.

- 6) Drawing No. M-19, Sheet 6 of 9 – Series 40 Retro-Reflective Raised Pavement Markers (RPM) for Undivided Highways.
- 7) Drawing No. M-19, Sheet 7 of 9 – Series 80 Retro-Reflective Raised Pavement Markers (RPM) for Undivided Highways.
- 8) Drawing No. M-19, Sheet 8 of 9 – Typical Marking Details for Divided Highways.
- 9) Drawing No. M-19, Sheet 9 of 9 – Pavement Marking Cross-Section Details for Highways.
- c. ADOT Standard Specifications for Road and Bridge Construction.
 - 1) Section 706 – Raised Pavement Markers.
2. U. S. Government:
 - a. Department of Transportation (DOT):
 - 1) Federal Highway Administration (FHWA):
 - a) FHWA Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), as revised.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 1. Coordinate the Work of this Section with the appropriate State and municipal departments who own the Right-of-Way where the raised pavement marker installation is to occur.
- B. Sequencing:
 1. Include provisions for traffic control during pavement marker installation operations in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the workers and the public.

1.04 SUBMITTALS

- A. Action Submittals:
 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Samples:
 - 1) Raised pavement markers.
 - b. Certificates:
 - 1) Certificates of Compliance for raised pavement markers.
 - 2) Certificates of Compliance raised pavement marker adhesive.
- B. Informational Submittals:
 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Raised pavement marker manufacturer's installation instructions.

b. Manufacturer's Reports:

- 1) Material Safety Data Sheets (MSDS) for the bituminous adhesive.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Right-of Way Owner Approvals:

- a. Required approvals depend on who owns the right-of- way and where the painted pavement markings are to be applied, but must be obtained before construction activities begin from the appropriate State and municipal departments, which may include but are not limited to, the following:
 - 1) Arizona Department of Transportation (ADOT).
 - 2) City of Phoenix Street Transportation Department.
 - 3) Phoenix Sky Harbor International Airport Design and Construction Services.
- b. If the owner of the Right-of-Way is other than the Phoenix Sky Harbor International Airport, the owner of the Right-of-Way will be provided on the Contract Drawings.

B. Certifications:

1. Submit Certificates of Compliance for raised pavement markers and adhesive to the Program/Project Manager for approval at least 10 days prior to use.

C. Site Samples:

1. Submit a minimum of one Sample per lot to the Program/Project Manager for approval for each type of marker provided.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Notify the Program/Project Manager of the proposed sources of the materials provided under this Section prior to their delivery in order to expedite inspection and/or testing of the materials.

B. Storage and Handling Requirements:

1. Store and handle raised pavement markers as recommended by the marker's manufacturer.
2. Store and handle raised pavement marker adhesive as recommended by the adhesive manufacturer.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Do not install raised pavement markers when the temperature of the pavement surface or the atmosphere is less than 40 degrees Fahrenheit,

when the relative humidity is 80 percent or higher, or when the pavement surface is not dry.

PART 2 PRODUCTS

2.01 MANUFACTURED UNITS

A. Reflective Pavement Markers:

1. Provide reflective pavement markers of the prismatic reflector type consisting of a molded shell filled with a mixture of an inert thermosetting compound and filler material, and complying with the requirements indicated in Drawing Number M-19, Sheets 1 through 3, of the ADOT Standard Drawings –Signing and Marking Standards.
 - a. Shell Material: Methyl methacrylate or suitably compounded acrylonitrile butadiene styrene (ABS).
 - b. Shell Surface: Smooth exterior containing one or two prismatic reflector faces of the color specified.
2. Reflector Color:
 - a. Provide clear, yellow, or red as designated for the marker type when illuminated by a vehicles headlight.
 - 1) Reflector color must be approved, and those not meeting the required color requirements may be rejected.
3. Reflector Surface:
 - a. Bond thin untempered glass or other abrasion resistant material to the prismatic reflector face to provide an extremely hard and durable, abrasive resistant reflector surface on permanent reflective pavement markers.
 - 1) Provide an area covered by glass or abrasion resistant surface not less than 3 square inches.
 - 2) Glass, or another abrasion resistant surface, is not required on the red faces of two-way (clear/red) permanent reflective markers.
4. Marker Base:
 - a. Provide a base free from glass glaze or from substances that may reduce its bond to the adhesive.
 - b. Base Flatness: No deviation of more than 0.05 inches from a flat surface.
5. Specific intensity:
 - a. Provide each reflecting surface for both temporary and permanent reflective markers with an original specific intensity not less than that shown in Table 02766-1.

Table 02766-1 Specific Intensity of Reflecting Surfaces			
Reflectance	Specific Intensity (Candelas/Foot-Candle)		
	Clear	Yellow	Red
0 Degrees Incidence	3.0	1.8	0.75
20 Degrees Incidence	1.2	0.72	0.30

6. Reflective pavement markers type designations are as follows:
 - a. Type C: Clear, red, two-way.
 - b. Type D: Yellow, two-way.
 - c. Type E: Clear, yellow, two-way.
 - d. Type G: Clear, one-way.
 - e. Type H: Yellow, one-way.
7. Manufacturers:
 - a. Ennis Paint, <http://www.ennispaint.com/products/product.asp?ID=7>.
 - b. 3M, Traffic Safety Systems Division, <http://solutions.3m.com/wps>.
 - c. Safeline Industries/Highway Ceramics, Inc.
 - d. Pac-Tec, Inc., <http://www.rayolite.com/braa.pdf>.

B. Reflectorized Dagmars:

1. Provide reflectorized dagmars with top surfaces in reasonably close conformity with the configuration shown for types J and JY on Drawing Number M-19, Sheet 3 of 9, of the ADOT Standard Drawings –Signing and Marking Standards, and the Contract Drawings.
 - a. Provide reflectorized dagmars with encapsulated lens reflectors conforming to standard manufacturing practices.
 - b. Provide convex markers with radius of curvature between 3.5 inches and 6.0 inches, except that the radius of curvature of the 1/2-inch nearest the edge may be less.
 - c. Round all edges and ensure that any change in curvature is gradual.
 - d. Provide smooth top and sides free of mold marks, pits, indentations, air bubbles, or other marks or discolorations.
2. Provide reflectorized dagmars consisting of a heat-fired, vitreous ceramic base and a heat-fired, opaque glazed surface that will produce the required properties.
 - a. Produce markers from any suitable combination of intimately mixed clays, shales, flints, feldspars, or other inorganic material that will meet the properties required by the Specifications.
 - b. Provide markers thoroughly and evenly matured and free from defects that will affect appearance or serviceability.
3. Provide dagmars and non-reflective pavement markers complying with the requirements of Table 02766-2.

Table 02766-2 Pavement Marker and Dagmar Requirements	
Property	Requirement
Glaze Thickness, minimum	0.005 inches
Moh Hardness, minimum	6
Directional Reflectance (White Only), minimum	
Glazed Surface	75
Body of Marker	70
Yellowness Index (White Only), maximum	
Glazed Surface	0.07
Body of Marker	0.12
Color (Yellow Only)	
Purity, Range	75 to 96 percent
Dominant Wave Length, μ , Range	579 to 585
Total Luminous Reflectance (Y value), minimum	0.41
Compressive Strength, minimum	1500 pounds
Water Absorption, maximum	2.0 percent
Autoclave	Glaze cannot spall, craze, or peel

4. Reflectorized dagmar type designations are as follows:
 - a. Type J: White.
 - b. Type JY: Yellow.
5. Manufacturers:
 - a. Ennis Paint, <http://www.ennispaint.com/products/product.asp?ID=7>.
 - b. 3M, Traffic Safety Systems Division, <http://solutions.3m.com/wps>.
 - c. Safeline Industries/Highway Ceramics, Inc.
 - d. Pac-Tec, Inc., <http://www.rayolite.com/braa.pdf>.

2.02 DESIGN CRITERIA:

- A. Provide raised pavement markers conforming to the dimensional and material requirements shown in the applicable ADOT Standard Drawings and specified in the ADOT Standard Specifications for Road and Bridge Construction.

- B. If the raised pavement markers are within Arizona Department of Transportation (ADOT) right-of-way, comply with the material and construction requirements of the applicable Sections in the ADOT Standard Specifications for Road and Bridge Construction and Arizona Standard Specifications, and with the applicable ADOT Standard Drawings.

2.03 ACCESSORIES

- A. Bituminous Adhesive:
 - 1. Provide approved bituminous adhesive compatible with the raised pavement markers they are fastening and capable of bonding the markers to the asphalt or concrete substrate.
 - 2. Submit Material Safety Data Sheets (MSDS) for the bituminous adhesive to the Program/Project Manager for information.
 - 3. Manufacturers:
 - a. Crafcro, Inc., <http://www.crafcro.com>.
 - b. Martin Asphalt Company, <http://www.martinasphalt.com>.
 - c. Ennispaint, Inc., www.ennispaint.com.
 - d. Approved equal.
- B. Adhesive thinners and solvents:
 - 1. Provide adhesive thinners and/or solvents that are not detrimental to the markers or the bond provided by the bituminous adhesive.

2.04 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 - 1. Source Tests:
 - a. Test permanent and temporary reflective pavement markers as follows:
 - 1) Compressive Strength Test:
 - a) Test Method:
 - (1) Compressively load a permanent or temporary reflective pavement marker and measure the load until failure.
 - b) Acceptance Criteria:
 - (1) Both permanent and temporary reflective pavement markers tested must withstand a load of at least 2,000 pounds without failure.
 - 2) Abrasion Resistance Test:
 - a) Test Method:
 - (1) Temporary reflective pavement markers, or permanent reflective pavement markers used as temporary markers, do not need to be tested for abrasion resistance.
 - (2) Form a 1 0-inch diameter flat pad using No. 3 coarse steel wool.
 - (3) Place the steel wool pad on the reflector lens face.

(4) Apply a force of 50 pounds and rub the entire lens surface 100 times.

b) Acceptance Criteria:

(1) After the lens has been abraded, the specific intensity of each clear and yellow reflective surface may not be less than that required in Table 02766-1.

B. Non-Conforming Work:

1. Do not use raised pavement markers that do not pass the source tests.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Prior to installing raised pavement markers, lay out the pavement marker locations as indicated on the Contract Drawings and ADOT Standard Drawings –Signing and Marking Standards, on a line approved by the Program/Project Manager.
 - a. Do not locate raised pavement markers within 4 inches of a pavement joint.
 - b. Do not locate raised pavement markers on pavement surfaces that show visible evidence of pavement cracking, checking, spalling, or failure of underlying base material.

B. Evaluation and Assessment:

1. If existing conditions require a raised pavement marker's location to change, relocate the marker longitudinally to a location as directed by the Program/Project Manager.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Maintain and protect traffic on active streets and roads in accordance with the requirements specified in Section 01555, Traffic Control.

B. Surface Preparation:

1. Remove dirt, existing painted lines, curing compound, grease, oil, moisture, loose or unsound layers, and any other material that could adversely affect the bond of the adhesive from that portion of the roadway on which the markers are to be placed.
2. Use a method of cleaning the pavement surfaces and removing detrimental material that is approved by the Program/Project Manager and includes sweeping and the using high-pressure air spray.
 - a. On Portland cement concrete pavement and old asphaltic concrete pavements, clean the pavement surfaces by sandblasting, followed by sweeping and/or air blowing.

- b. Newly placed asphalt concrete pavement does not need to be sandblasted unless, in the opinion of the Program/Project Manager, the surface is contaminated with materials that would adversely affect the bond of the adhesive.

3.03 INSTALLATION

- A. Install the raised pavement markers in accordance with the manufacturer's recommendations and the requirements of this Section.
 - 1. Submit the raised pavement marker manufacturer's installation instructions to the Program/Project Manager for information.
- B. Place adhesive uniformly on the cleaned pavement surface with no voids present and sufficient to completely cover the area that will come into contact with the markers with a slight excess amount after the markers have been placed.
- C. Install the markers on a line approved by the Program/Project Manager and in such a manner that the reflective face of the markers is perpendicular to a line parallel to the roadway centerline.
 - 1. Place the markers in position and apply pressure until firm contact is made with the pavement.
 - 2. Remove excessive adhesive on the pavement or on the exposed surface of the markers immediately.
 - a. To remove the excess adhesive, do not use thinners or solvents that may be detrimental to the markers or the bond provided by the adhesive.
- D. Interface with Other Work:
 - 1. Do not install pavement markers over longitudinal or transverse joints of the pavement surface.

3.04 PROTECTION

- A. Protect the markers against impact until the adhesive has set to the degree acceptable to the Program/Project Manager.

SECTION 02769

TACTILE WARNING SURFACE

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for surface applied detectable/tactile warning surface tiles where indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 01780 - Closeout Submittals.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
 - 2. PVC: Polyvinyl-chloride.
- B. Reference Standards:
 - 1. ASTM International (ASTM):
 - a. ASTM C 67 - Standard Test Methods for Sampling and Testing Brick and Structural Clay Tile.
 - b. ASTM C 936 - Standard Specification for Solid Concrete Interlocking Paving Units.
 - c. ASTM E 699 - Standard Practice for Evaluation of Agencies Involved in Testing, Quality Assurance, and Evaluating of Building Components.
 - 2. United States Government:
 - a. Americans with Disabilities Act Accessibility Guidelines (ADAAG) for Buildings and Facilities [Federal Register Volume 56 Number 144 (1991)].
 - b. Department of Justice:

- 1) 28 CFR 36 – Nondiscrimination on the Basis of Disability by Public Accommodations and in Commercial Facilities.
3. Institute for Sustainable Infrastructure (ISI):
 - a. a. ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.03 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Tactile warning surface pavers.
 - 2) Edge restraints.
 - 3) Filter cloth.
 - 4) Paver sealer.
 - b. Shop Drawings:
 - 1) Tactile warning surface pavers.
 - c. Samples:
 - 1) Tactile warning surface paver tile Samples.
 - 2) Samples of each type and kind of restrainer strip.
 - d. Certificates:
 - 1) Tactile Warning Surface Paver Tile Certificate of Compliance.
 - e. Qualification Statements:
 - 1) Tactile warning surface paver tile Testing and Inspection Agency's qualifications.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Tactile warning surface paver manufacturer's literature describing installation procedures.

C. Closeout Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Operation and Maintenance Data:
 - 1) Tactile warning surface paver tile manufacture's information regarding routine maintenance practices, including sealing and cleaning, for each type of paver tile and accessory provided.
 - b. Sustainable Design Closeout Documentation:

- 1) In accordance with ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.04 QUALITY ASSURANCE

A. Qualifications:

1. Tactile Warning Surface Paver Tile Testing and Inspection Agency's Qualifications:
 - a. To perform the testing of the tactile warning surface paver tile provided under this Section, employ the services of one or more independent certified testing laboratories having the following qualifications:
 - 1) Each testing laboratory must be independent, certified, and comply with the quality standards for testing laboratories of the nationally recognized associations and agencies that promulgate the test standards specified and with the basic requirements of ASTM E 699.
 - a) Each testing laboratory must have the experience and capability to satisfactorily perform the reviews, inspections, and testing required of them by this Contract, including but not limited to, inspecting, sampling, and testing proposed materials and systems as required by the Program/Project Manager for compliance with the Contract Documents.
 - b) The testing laboratory must be approved by the Program/Project Manager.
 - b. Dismissal and replacement of any of these independent certified testing laboratories by the Contractor requires written notice to and the approval from the Program/Project Manager.
 - c. Submit the qualifications and certifications of the proposed testing laboratories to the Program/Project Manager for approval.

B. Certifications:

1. Supplier/Manufacturer's Certificates of Compliance:
 - a. Tactile Warning Surface Paver Tile Certificate of Compliance:
 - 1) Employ a qualified accredited independent testing laboratory to conduct certification tests on a surface applied detectable/tactile warning surface tile system similar in every way to the system being provided under this Section.
 - 2) Submit a written Certificate of Compliance from the qualified accredited independent testing laboratory, certifying that the tactile warning surface paver tile materials being provided meet or exceed the requirements specified, to the Program/Project Manager for approval.

C. Sustainability Standards Certifications:

1. Recycled Content ENVISION Submittals:
 - a. For concrete containing recycled content, submit Product Data, including documentation indicating percentages by weight of post-consumer and pre-consumer recycled content, certifying that these products qualify the Project to claim ENVISION Credit RA 1.3 Use Recycled Materials: At Least 20% From Recycled Materials.
 - b. These credits are based on weight or volume.

D. Site Samples:

1. Tactile Warning Surface Paver Tile Samples:
 - a. Submit a minimum of 2 tile Samples of each type and color proposed for the Work of this Section to the Program/Project Manager for approval.
 - b. Submit 2 Samples of each type and kind of restrainer strip specified, each strip Sample 6 inches in length, to the Program/Project Manager for approval.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Deliver materials in their original packages, containers, or bundles bearing the brand name and identification of the manufacturer or supplier.

B. Storage and Handling Requirements:

1. Tactile Warning Surface Paver Units:
 - a. Store and handle tactile warning surface units so breakage and other damage is avoided.
2. Tactile Warning Surface Paver Accessories:
 - a. Store metal accessories so corrosion is prevented.

C. Packaging Waste Management:

1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

PART 2 PRODUCTS

2.01 MANUFACTURED TACTILE WARNING SURFACE PAVERS

A. Manufacturers:

1. Manufacturer List:
 - a. Subject to compliance with the requirements specified herein, provide products manufactured by one of the manufacturers listed.
2. Substitution Limitations:

- a. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from manufacturers other than those listed herein may be provided.
 - b. Source Limitations:
 - 1) Obtain tactile warning surface pavers from single source from single manufacturer.
- B. Description:
 - 1. Regulatory Requirements:
 - a. Provide pavers manufactured in accordance with the requirements specified in the Americans with Disabilities Act Accessibility Guidelines (ADAAG) for aligned domes.
 - 2. Sustainability Requirements:
 - a. ENVISION Credits:
 - 1) ENVISION Credit RA 1.3 - Use Recycled Materials: At Least 20% From Recycled Materials.
- C. Performance:
 - 1. Compressive Strength:
 - a. Provide pavers having a minimum compressive strength of 8500 psi when tested in accordance with the requirements specified in ASTM C 67.
 - 2. Absorption:
 - a. Provide pavers having a boiling water absorption percentage of 5 percent when tested in accordance with the requirements specified in ASTM C 67.
 - 3. Freezing and Thawing:
 - a. Provide pavers receiving a "passing" grade when tested in accordance with the requirements specified in ASTM C 67.
- D. Design Criteria:
 - 1. Provide concrete pavers complying with the requirements specified in ASTM C 936.
 - 2. Consider local soils and drainage conditions, the type of expected traffic, and municipal requirements when designing the base material for the paver installation.
 - 3. Product Data:
 - a. Obtain Product Data for the tactile warning surface paver products and accessories including the manufacturer's literature describing the products, installation procedures, and routine maintenance.
 - b. Submit the Product Data to the Program/Project Manager for approval.
 - 4. Shop Drawings:
 - a. Prepare Shop Drawings for the tactile warning surface pavers showing material to be used, fabrication details, composite structural system,

tile surface profile, fastener locations, and plans of tile placement including joints, installation materials, and procedures.

- b. Submit the Shop Drawings to the Program/Project Manager for approval.

E. Materials:

1. Tactile Warning Surface Pavers:

- a. Provide high density, hydraulically pressed concrete pavers having tactile warning surfaces, and made from Portland cement and both fine and coarse aggregate.
- b. Size:
 - 1) Provide tactile warning surface pavers sized as indicated in the Contract Drawings, or as indicated in approved Shop Drawings.
- c. Thickness:
 - 1) Provide tactile warning surface pavers having the thickness indicated in the Contract Drawings, or as indicated in approved Shop Drawings.
- d. Manufacturers:
 - 1) Hanover Architectural Products, <http://www.hanoverpavers.com>.
 - 2) Approved equal.

F. Fabrication:

1. Shop Fabrication:

- a. Provide pavers produced by subjecting a homogeneous concrete mix to a minimum pressure of 1,000 pounds per square inch over entire surface area to create the high density and strength of natural stone, and a specialized non-slip textured and non-directional surface finish, which exposes the aggregate giving the paver a granite-like appearance.

2. Fabrication Tolerances:

- a. Size Tolerance:
 - 1) Provide concrete tactile warning surface pavers manufactured to within plus or minus 1/8 inch of the size indicated in the manufacturer's Product Data.

2.02 ACCESSORIES

A. Edge Restraints:

1. Provide edge restraints fabricated from wood, steel, polyvinyl-chloride (PVC), or other systems specifically designed to restrain concrete pavers.

B. Filter Cloth:

1. Provide geotextile filter cloth as recommended by the paver manufacturer.

C. Paver Sealer:

1. Provide the paver manufacturer's recommended paver sealer.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Examine the elements and surfaces to receive the tactile warning surface pavers for compliance with the installation tolerances and other conditions affecting performance of the Work.
- B. Evaluation and Assessment:
 - 1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Protect adjacent areas from damage resulting from installation of the tactile warning surface pavers.
- B. Surface Preparation:
 - 1. Edge Restraint:
 - a. Provide adequate edge restraints.
 - 1) If providing a bituminous setting bed, edge restraints can be wood, steel, polyvinyl-chloride (PVC), or other systems specifically designed to restrain concrete pavers.
 - 2. Base:
 - a. Provide a properly prepared base.
 - 1) A bituminous setting bed over a 4-inch thick concrete base slab is the preferred method for pavers; however, an asphaltic concrete base slab is also acceptable.
 - 2) Alternate installation methods include a latex modified mortar setting bed over a concrete base slab.
 - b. If paver are being installed as an overlay system on existing concrete or asphalt pavement, provide filter cloth over the existing pavement prior to installing the pavers.

3.03 INSTALLATION

- A. Install and seal the tactile warning surface pavers in accordance with the manufacturer's installation instructions.
 - 1. Submit the manufacturer's written installation instructions to the Program/Project Manager for information.

3.04 CLEANING

- A. After installation, clean the detectable warning surface paver tile surfaces as recommended by the paver tile manufacturer.
- B. Waste Management:
 - 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

3.05 MAINTENANCE

- A. For each type of paver tile and accessory provided, submit the detectable warning surface paver tile manufacture's information regarding maintenance practices, including sealing and cleaning, to the Program/Project Manager.

SECTION 02786

TACK COAT

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for tack coat for bituminous paved surfaces.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.

1.02 REFERENCES

- A. Definitions:
 - 1. Anionic: Asphalt globules that are electro-negatively charged.
 - 2. Cationic: Asphalt globules that are electro-positively charged.
- B. Reference Standards:
 - 1. Maricopa Association of Governments (MAG):
 - a. Uniform Standard Specifications for Public Works Construction.
 - 1) Section 713 – Emulsified Asphalts.

1.03 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Certificates:
 - 1) Certificates of Compliance for tack coat.

1.04 QUALITY ASSURANCE

- A. Certifications:
 - 1. Certificates of Compliance:
 - a. At the time tack coat is delivered, submit 3 copies of a Certificate of Compliance from the Supplier certifying that the material complies with the material properties specified, and that includes the following information:
 - 1) Name of the refinery and Supplier.
 - 2) Quantity delivered.
 - 3) Delivery ticket number.
 - 4) Purchase order number.

- 5) Test results for the property tests specified in Table 02786-1 or Table 02786-2 as applicable for the type and grade.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Storage and Handling Requirements:

1. Once emulsified asphalt has been loaded into vehicles for transportation to the Site, do not allow the material's temperature to exceed the maximum temperature for the type or grade indicated in Table 02786-3.
2. Do not allow the material's temperature to cool below 40 degrees Fahrenheit.
3. If emulsified asphalt is held overnight, prior to further application reheat the material while agitating it to avoid localized overheating.
 - a. When heating emulsified asphalt, do not allow steam or hot oils to be introduced directly into the material.
4. If emulsified asphalt separates, thoroughly mix it to insure homogeneity; however, if it has separated due to freezing, do not use the material.
5. Do not use emulsified asphalt after 30 days from the date it was delivered.

PART 2 PRODUCTS

2.01 MATERIALS:

A. Tack coat:

1. Provide a mixture of 50 percent homogeneous emulsified asphalt, as specified in MAG Section 713, or Table 02786-1 and Table 02786-2; and 50 percent water.
2. The type, grade, or other designation will be indicated on the Contract Drawings or specified by the Program/Project Manager.

1. If the Particle Charge Test result is inconclusive for CSS-1 and CSS-1h, material having a maximum pil value of 6.7 is acceptable.								

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Do not apply the tack coat until the Program/Project Manager has inspected the surface and determined that it is suitable for tack coating.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Protect adjacent property by preventing the emulsion from being sprayed on adjacent pavements, including that portion of the pavement being used for traffic, on structures, guard rails, guide posts, markers, trees, shrubs, and property of all kinds.

B. Surface Preparation:

1. Immediately before applying the tack coat, clean the area to be coated by removing loose material, dirt, and other objectionable material.
 - a. In urban areas, clean the surfaces with a self-propelled pickup sweeper.
 - b. In rural areas, clean the surfaces with power brooms.
 - c. If necessary, supplement the cleaning with hand brooming.

3.03 EQUIPMENT

A. Distributor Trucks:

1. Trucks:
 - a. Furnish pressure type distributor trucks having insulated tanks and designed to uniformly apply material in controlled amounts ranging from 0.05 to 2.0 gallons per square yard.
 - b. The transverse variation rate may not exceed 10 percent of the specified application rate.
 - c. Do not use gravity distributors.
2. Spray Bars and Extensions:

- a. Furnish fully circulating type spray bars, adjustable to permit varying the height above the surface to be treated.
3. Nozzles:
 - a. Space nozzles to not exceed 6 inches center to center.
4. Valves:
 - a. Furnish valves having the capability for one valve or all valves to be opened or closed quickly in one operation.
 - b. To control the flow of material from the nozzles, furnish positive acting valves designed to provide a uniform, unbroken spread of material on the surface.
5. Distributor Equipment:
 - a. Furnish devices and charts providing an accurate, rapid determination of the amount of material being applied, and capable of controlling the amount of material dispensed.
 - b. Furnish an auxiliary wheel type tachometer to register the speed in feet per minute.
 - c. Furnish pressure gauges and an accurate thermometer to determine the temperature of the material.
 - d. Furnish a hose and nozzle attachment for spotting skipped areas inaccessible to the distributor.

B. Hand Spraying Equipment:

1. Furnish a hose or bar with a gear pump or air tank for providing the pressure required to dispense material.

3.04 APPLICATION

- A. Apply tack coat using distributor trucks, taking care to provide uniform coverage.**
1. Apply the tack coat at a rate of 0.05 to 0.10 gallons per square yard.
 2. Apply the tack coat in advance of subsequent construction as ordered by the Program/Project Manager.
 - a. Do not apply more bituminous material in 1 day than will be covered by bituminous mixed materials during that same day.
 3. Maintain the distributor trucks to prevent material dripping from any part of the equipment.
 4. Unless otherwise specified or directed by the Program/Project Manager, apply tack coat at temperatures within the ranges indicated in Table 02786-3.

Table 02786-3 Application Temperatures		
Grade of Emulsified Asphalt	Minimum (°F.)	Maximum (°F.)
RS-1, MS-1, SS-1, SS-1h, CSS-1, CSS-1h	70	140

Table 02786-3 Application Temperatures		
Grade of Emulsified Asphalt	Minimum (°F.)	Maximum (°F.)
RS-2, MS-2, MS-2h, CRS-1, CRS-1h, CRS-2h, CMS-2, CMS-2h, QSH, CQSH	125	185

B. Special Techniques:

1. For resurfacing Work, corners, or tacking vertical edges, it is acceptable to use hand spraying equipment.

C. Interface with Other Work:

1. Ensure that the emulsified asphalt has broken before placing asphaltic concrete.

3.05 SITE QUALITY CONTROL

A. Non-Conforming Work

1. Remove equipment that performs unsatisfactorily from the Project.

SECTION 02789

ASPHALTIC-RUBBER SEAL COATS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for asphaltic seal and fog coats consisting of an application of a hot paving grade asphalt and ground tire rubber mixture on existing pavement surfaces immediately covered with a cover material.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 02786 - Tack Coat.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. COC: Cleveland Open Cup.
 - 2. SUS: Saybolt Universal Seconds.
- B. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. ASSHTO M 29 – Standard Specification for Fine Aggregate for Bituminous Paving Mixtures.
 - b. ASHTO T 89 - Standard Method of Test for Determining the Liquid Limit of Soils.
 - c. ASSHTO T 90 - Standard Method of Test for Determining the Plastic Limit and Plasticity Index of Soils.
 - d. ASSHTO T 104 – Standard Method of Test for Soundness of Aggregate by Use of Sodium Sulfate or Magnesium Sulfate.
 - 2. ASTM International (ASTM):
 - a. ASTM C 117 – Standard Test Method for Materials Finer than 75µm (No. 200) Sieve in Mineral Aggregates by Washing.
 - b. ASTM C 131 - Standard Test Method for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine.
 - c. ASTM C 136 - Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.
 - d. ASTM D 5 - Standard Test Method for Penetration of Bituminous Materials.
 - e. ASTM D 36 - Standard Test Method for Softening Point of Bitumin (Ring-and-Ball Apparatus).

- f. ASTM D 88 - Standard Test Method for Saybolt Viscosity.
- g. ASTM D 92 - Standard Test Method for Flash and Fire Points by Cleveland Open Cup Tester.
- h. ASTM D 297 - Standard Test Methods for Rubber Products—Chemical Analysis.
- i. ASTM D 850 - Standard Test Method for Distillation of Industrial Aromatic Hydrocarbons and Related Materials.
- j. ASTM D 2007 - Standard Test Method for Characteristic Groups in Rubber Extender and Processing Oils and Other Petroleum-Derived Oils by the Clay-Gel Absorption Chromatographic Method.
- k. ASTM D 2042 - Standard Test Method for Solubility of Asphalt Materials in Trichloroethylene.
- l. ASTM D 2939 - Standard Test Methods for Emulsified Bitumens Used as Protective Coatings.
- m. ASTM D 2994 - Standard Test Methods for Rubberized Tar [*withdrawn*].
- n. ASTM G 154 - Standard Practice for Operating Fluorescent Light Apparatus for UV Exposure of Nonmetallic Materials.
- 3. International Slurry Surfacing Association (ISSA):
 - a. ISSA TB 2007 – Design Technical Bulletins.
 - 1) ISSA TB 100 - Test Method for Wet Track Abrasion of Slurry Surfaces.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate closures of pavement areas for performance of the Work of this Section with the Program/Project Manager.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Samples:
 - 1) Material Samples.
 - b. Certificates:
 - 1) Test Report and Certification for Bituminous Materials.
 - c. Delegated Design Submittals:
 - 1) Asphaltic-rubber seal coat design mix.
- B. Informational Submittals:
 - 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:

- a. Manufacturer's Instructions:
 - 1) Manufacturer's installation recommendations and instructions.

1.05 QUALITY ASSURANCE

- A. Certifications:
 - 1. Certificates of Compliance:
 - a. Prepare Certificates of Compliance from the Supplier certifying that the material delivered to the Site complies with the material properties specified, and that include the following information:
 - 1) Name of the asphaltic-rubber seal refinery and Supplier.
 - 2) Quantity delivered.
 - 3) Delivery ticket number.
 - 4) Purchase order number.
 - 5) Test results for the property tests specified in Table 02789-1, Table 02789-2, and Table 02789-3.
 - b. Have an authorized representative of the Supplier sign the test reports to certify that the product delivered conforms to the specified requirements.
- B. Site Samples:
 - 1. At least 7 days prior to application, submit material Samples to the Program/Project Manager for approval.
 - a. When requested by the Program/Project Manager, submit additional Samples at no increase in Contract Price.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. At the time asphaltic-rubber seal coat material is delivered, submit 3 copies of the Certificate of Compliance from the Supplier to the Program/Project Manager for approval.
 - 2. Until the certified test reports and Samples of the material have been checked and approved by the Program/Project Manager, that material will only be tentatively accepted by the Program/Project Manager.
 - a. Final acceptance depends upon the Program/Project Manager determining that the material represented by the tests and Samples fulfills the requirements specified.
- B. Storage and Handling Requirements:
 - 1. Store and handle emulsified asphalt in accordance with the requirements specified in Section 02786, Tack Coat.
- C. Packaging Waste Management:

1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Do not apply the asphaltic-rubber seal material unless the ambient and surface temperatures are at least 60 degrees Fahrenheit and rising.
 - a. Do not apply the mixture during unsuitable weather or when there is an imminent threat of rain.

PART 2 PRODUCTS

2.01 ASPHALTIC-RUBBER AND FOG SEAL COAT SYSTEMS

A. Manufacturers:

1. Manufacturer List:

- a. Subject to compliance with the requirements specified herein, provide products manufactured by one of the manufacturers listed.

2. Substitution Limitations:

- a. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from manufacturers other than those listed herein may be provided.

B. Description:

1. Provide a clay-stabilized, mineral filled, modified asphalt emulsion designed to protect asphalt pavements.

C. Materials:

1. Modified Clay-Stabilized Mineral Filled Asphalt Emulsion:

- a. Provide clay-stabilized, mineral filled, asphalt emulsion modified with terminal blended, ground whole scrap tire asphalt cement.
- b. Asphalt Emulsion:
 - 1) Provide an asphalt emulsion having the properties specified in Table 02789-1.

Table 02789-1 Asphalt Emulsion Properties		
Property	Test Method	Requirement
Minimum residue by evaporation	ADTM D 2939	50 percent
Minimum weight at 25 degrees Celsius	ADTM D 2939	10 pounds per gallon
Wet track abrasion	ISSA TB 100	Less than 5 percent loss

Table 02789-1 Asphalt Emulsion Properties		
Property	Test Method	Requirement
Accelerated weathering test for 1000 hours	ADTM G 154	Pass
Aggregate content	Manufacturing controls	2 to 3 pounds per gallon
Material conformity	ADTM D 2939	Pass
Flash point	ADTM D 2939	Pass/None
Drying time	ADTM D 2939	Pass
Resistance to heat	ADTM D 2939	Pass
Resistance to water	ADTM D 2939	Pass
Flexibility	ADTM D 2939	Pass
Wet flow	ADTM D 2939	Pass
Resistance to volatilization	ADTM D 2939	Pass
Wet film continuity	ADTM D 2939	Pass
Resistance to impact	ADTM D 2939	Pass

c. Ground Vulcanized Rubber:

- 1) Provide vulcanized rubber scrap free from fabric, wire, and other contaminating material.
- 2) Provide vulcanized rubber scrap having natural rubber content of at least 25 percent by weight when analyzed in accordance with the requirements specified in ASTM D 297.
- 3) Grind the rubber so it is dry and free flowing after grinding, and has the gradation indicated in Table 02789-2 when tested in accordance with the method specified in ASTM C 136.
 - a) To prevent sticking or caking of the particles, mineral powder such as calcium carbonate may be added to the rubber, but may not be more than 4 percent by weight of the mixture.

Table 02789-2 Ground Vulcanized Rubber Gradation	
Sieve Size	Percent Passing by Weight
Number 8	100
Number 30	25 to 50
Number 50	5 to 45

**Table 02789-2 Ground Vulcanized Rubber Gradation**

Sieve Size	Percent Passing by Weight
Number 100	0 to 10

d. Rubber Modified Asphalt Cement:

- 1) Provide a rubber modified asphalt cement having the properties specified in Table 02789-3.

Table 02789-3 Rubber Modified Asphalt Cement Properties

Property	Test Method	Requirement	
		Min.	Max.
Percent of rubber in cement	Terminal certification	10	-
Penetration 77 degrees, 100g, 5 seconds, dmm	ASTM D 5	15	35
Softening point in degrees Fahrenheit.	ASTM D 36	130	160
Solubility percent	ASTM D 2042	98	-

e. Bentonite Clay and Ball Clay:

- 1) Provide bentonite clay and ball clay as required by the rubber modified asphalt cement manufacturer.

f. Manufacturers:

- 1) Sealmaster®, MasterSeal™ MTR (Modified Tire Rubberized Sealcoat), <http://www.sealmaster.net>.
- 2) Approved equal.

2. Extender Oil:

- a. Provide extender oil consisting of a resinous, high flash point, naphthenic/aromatic hydrocarbon having the properties specified in Table 02789-4.

Table 02789-4 Extender Oil Properties

Property	Test Method	Requirement
Viscosity, at 100 degrees Fahrenheit	ASTM D 88	2500 SUS, minimum
Flash point, Cleveland Open Cup, degrees Fahrenheit	ASTM D 92	390° F. minimum

Table 02789-4 Extender Oil Properties		
Property	Test Method	Requirement
Molecular analysis		
Asphaltines, percent by weight	ASTM D 2007	0.0 maximum
Aromatics, percent by weight	ASTM D 2007	55.0 minimum

3. Sand Blotter:

- a. Provide sand consisting of fine, granular, disintegrated or crushed rock that is free from organic material, mica, loam, clay, and other substances deleterious to its use as a sand blotter.
- b. Provide sand complying with the requirements specified in AASHTO M 29; except provide sand having the gradation in Table 02789-5 instead of the gradation in AASHTO M 2, having a sand equivalent not less than 50, and that is non-plastic when tested in accordance with the requirements specified in AASHTO T 89 and AASHTO T 90.

Table 02789-5 Sand Blotter Gradation	
Sieve Size	Percent Passing by Weight
3/8 inch	100
Number 4	90 to 100
Number 200	0 to 12

4. Stone Chips (Cover Material):

- a. Provide stone chips consisting of crushed rock, stone, or gravel having at least one rough, angular surface; and having the following properties:
 - 1) Weight Loss:
 - a) Provide stone chips having a weight loss less than 40 percent when tested in accordance with the method specified in ASTM C 131 for 500 revolutions.
 - 2) Sodium Sulfate Soundness:
 - a) Provide stone chips having a weight loss less than 12 percent when tested in accordance with the method specified in AASHTO T 104.
- b. Provide stone chips having the gradation indicated in Table 02789-6 when tested in accordance with the methods specified in ASTM C 117 and ASTM C 136.

- 1) A minimum of 75 percent by weight of the material retained on the Number 8 sieve must have at least one fractured face produced by crushing.

Table 02789-5 Stone Chips (Cover Material) Gradation	
Sieve Size	Percent Passing by Weight
3/4 inch	100
1/2 inch	97 to 100
3/8 inch	70 to 100
1/4 inch	0 to 10
Number 8	0 to 5
Number 200	0 to 2

- c. Provide stone chips
5. Tack Coat:
 - a. Provide tack coats complying with the requirements specified in Section 02786, Tack Coat.
6. Flush Coat:
 - a. Provide a flush coat consisting of grade SS-1h, grade CSS-1h, or grade CQSH emulsified asphalt complying with the requirements specified in Section 02786, Tack Coat, diluted in a proportion of 50 percent water to 50 percent emulsified asphalt.
7. Water:
 - a. Provide potable water compatible with the asphaltic-rubber seal and fog coat ingredients used.
- D. Mixes:
 1. Provide a properly proportioned mixture-including asphalt, ground tire rubber, bentonite clay, ball clay, extender oil, carbon black, water, and mineral aggregate mixed to a uniform consistency.
 - a. Submit the mix design to the Program/Project Manager for approval.
 2. Based on 100 gallons of the rubber modified asphalt cement, provide a mix compounded as follows:
 - a. Rubber Modified Asphalt Cement: 100 gallons.
 - b. Water: 20 to 25 gallons.
 - c. Sand: 100 to 300 pounds.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Verify that the surface to receive the asphaltic-rubber seal coat is dry.
 - 2. Locate cracks and grease, oil, and gasoline spots that must be remediated before application of the asphaltic-rubber seal coat.
- B. Evaluation and Assessment:
 - 1. Do not apply the asphaltic-rubber seal until an inspection of the surface has been made by the Program/Project Manager, and he has determined the surface is suitable.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Protect adjacent areas from damage resulting from application of the asphaltic-rubber seal and fog coats.
 - 2. Take care to prevent spraying asphaltic-rubber seal on adjacent pavements, including portions of pavement being used by traffic, on structures, guard rails, guide posts, markers, trees, shrubs, and property of all kinds.
- B. Surface Preparation:
 - 1. Before applying the asphaltic-rubber seal and fog coats to new asphalt surfaces, allow the surfaces to cure for a minimum of 4 weeks under ideal weather conditions, which means having a temperature above 70 degrees Fahrenheit and low humidity.
 - 2. Repair existing pavement surfaces using suitable hot or cold asphalt mix.
 - a. Fill cracks with hot-applied or cold-applied crack fillers.
 - b. Treat grease, oil, and gasoline spots using compounds specially formulated for the purpose.
 - 3. Apply a tack coat as directed by the Program/Project Manager.
 - 4. Immediately before applying the asphaltic-rubber seal, clean the asphalt surface so it is free from loose material, dirt, dust, and other objectionable material.
 - a. Clean the surface with a self-propelled pick up sweeper or power brooms.
 - b. When necessary, supplement the cleaning using hand brooms.
 - c. Water flushing will not be permitted in areas where cracks are present in the pavement surface.
 - d. Water Fogging:
 - 1) In hot weather, the asphalt surface may be pre-wetted by fogging with water prior to applying the asphaltic-rubber seal coat.

- 2) Perform the fogging so the entire surface is damp with no apparent flowing water or puddles.

3.03 APPLICATION

A. Asphaltic-Rubber Seal:

1. Mix the asphaltic-rubber seal materials until the consistency of the mixture approaches that of a semi-fluid material and the reaction is complete.
 - a. At the time of application, the viscosity of the mixed asphaltic-rubber seal must be in the range of 500 centipoises and 4000 centipoises when tested in accordance with ASTM D 2994.
2. As soon as the mixed asphaltic-rubber seal reaches the proper consistency, begin to apply the material.
 - a. Using squeegees, brushes, or spray equipment, apply 2 coats of the mixed asphaltic-rubber seal to the pavement surface in accordance with the manufacturer's installation recommendations and instructions.
 - b. Apply between 0.13 gallon and 0.15 gallon per square yard per coat depending on the pavement's age and porosity, and the method of application.
 - c. Before applying the second coat, allow the first coat of asphaltic-rubber seal to dry for a minimum of 2 to 4 hours under ideal weather conditions, which means having a temperature above 70 degrees Fahrenheit and low humidity.
 - 1) Allow additional drying time in shaded areas due to reduced ambient and surface temperatures.
 - d. Apply the second coat in a cross direction to the first coat.
 - e. Submit the manufacturer's installation recommendations and instructions to the Program/Project Manager for information.

B. Cover Material:

1. Apply the cover material as soon as practical after the asphaltic-rubber seal is applied.
 - a. Preheat and pre-coat the cover material with rubber modified asphalt cement so the quantity of asphalt cement used is not less than 0.30 percent or more than 0.70 percent of the combined weight of the rubber modified asphalt cement and aggregate, and ensure the rubber modified asphalt cement is present on the aggregate.
2. Roll the cover material within 1 hour after it has been applied to insure maximum embedment of the aggregate.
3. Where areas adjacent to the cover material are to receive an asphaltic-rubber seal coat, sweep the edges of these joints clean of cover material prior to applying the asphaltic-rubber seal coat.
 - a. Place building paper over the ends of the previous application to make transverse joints.
 - b. Begin the adjoining application on the building paper.

- c. Once the application process as progressed beyond the building paper, remove and properly dispose of the building paper.
 - d. Avoid skips and overlaps at joints.
- C. Sand Blotter:
 - 1. Where there is an excess of asphaltic-rubber seal, apply a sand blotter.
 - 2. At signalized intersections after rolling and prior to opening a lane to traffic, apply 2 to 5 pounds of sand per square yard through the intersection and for a distance of 200 feet each way from the near curb returns.
 - 3. After the treated area has been opened to traffic, cover excess asphaltic-rubber seal that comes to the surface with additional sand.
- D. Flush Coat:
 - 1. After sweeping, but prior to striping, apply a flush coat consisting of 0.05 to 0.10 gallons per square yard to the asphaltic-rubber seal treatment.
 - a. Application of the flush coat may be delayed to facilitate curing, or to avoid placemen under unfavorable high temperature conditions.
 - b. Do not apply the flush coat to the area 200 feet on either side of and through signalized intersections.

3.04 CLEANING

- A. Waste Management:
 - 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

3.05 PROTECTION

- A. Do not allow traffic on the surface until the cover aggregate has set.
- B. Protect the treated surface using barricades until the asphaltic-rubber seal will not be picked up by traffic.

SECTION 02805

PET WATER FOUNTAIN

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for pet water fountain.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 01732 - Cutting and Patching.
 - 4. Section 02316 - Trenching and Backfilling.
 - 5. Section 04810 - Unit Masonry Assemblies.
 - 6. Section 09960 - High-Performance Coatings.
 - 7. Section 02810 - Irrigation System

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. PVC: Polyvinyl-chloride.
- B. Reference Standards:
 - 1. American Society of Mechanical Engineers (ASME):
 - a. ASME A112.18.1/CSA B125.1 - Plumbing Supply Fittings.
 - b. ASME B1.20.7 - Hose Coupling Screw Threads, Inch.
 - 2. ASTM International (ASTM):
 - a. ASTM B 88 - Standard Specification for Seamless Copper Water Tube.
 - 3. United States Government:
 - a. United States Department of Agriculture (USDA):
 - 1) Animal and Plant Health Inspection Service:
 - a) 9 CFR 3.10 Watering.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate the installation of pet water fountain with the installation of the water lines provided by others, the supporting structures provided under Section 04810, Unit Masonry Assemblies.

B. Sequencing:

1. Prior to installing the pet water fountain, the adjacent surfaces where the pet water fountains are to be mounted and the water supply piping for the waterers must be completed.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Pet water fountain
 - b. Shop Drawings:
 - 1) Pet water fountain
 - c. Samples:
 - 1) Draw down Samples of the paint for use on the piping.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Pet water fountain manufacturer's published installation instructions.

1.05 QUALITY ASSURANCE

A. Site Samples:

1. Submit draw down Samples of the paint for use on the piping to the Program/Project Manager for approval.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Deliver all materials in the manufacturer's original packaging.
2. Thoroughly inspect the materials upon receipt, and report damaged material to the delivering carrier.

B. Storage and Handling Requirements:

1. Store materials in dry, protected, well-vented area.

C. Packaging Waste Management:

1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

PART 2 PRODUCTS

2.01 PET WATER FOUNTAINPET WATER FOPUNTAIN ASSEMBLIES

- A. Manufacturers:
 1. Manufacturer List:
 - a. Subject to compliance with the requirements specified herein, provide products manufactured by one of the manufacturers listed.
 2. Substitution Limitations:
 - a. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from manufacturers other than those listed herein may be provided.
- B. Design Criteria:
 1. Provide ground-mounted pet fountain designed to furnish dogs with fresh clean drinking water.
 2. Provide pet water fountain that comply with United States Department of Agriculture (USDA) standards.
 3. Product Data:
 - a. Obtain the manufacturer's Product Data for the pet water fountain provided under this Section, including the pet water fountain manufacturer's published installation instructions.
 - b. Submit pet water fountain manufacturer's Product Data to the Program/Project Manager for approval.
 4. Shop Drawings:
 - a. Prepare Shop Drawings for the pet water fountain s, including layout drawings.
 - b. Submit the pet water fountain Shop Drawings to the Program/Project Manager for approval.
- C. Materials:
 1. Pet water fountain s:
 - a. Unit shall be constructed of 14 gage type 304 stainless steel polished to a satin finish with 18 gage pet fountain bowl. Bottom plate shall be 3/16" thick and include three mounting holes with two additional mounting holes for pet fountain. 1/2" expansion anchor bolts shall be furnished. All other exposed fasteners shall be vandal resistant

stainless-steel screws. Stainless steel access panel shall be vandal resistant.

- b. Pet fountain push button shall be self closing requiring less than 5 pounds of force to activate the internally mounted valve.
- c. Bubbler shall be stainless steel with an anti-rotation, a non-squirt feature and operate on a water pressure range of 20-105 psig.
- d. Inlet strainer shall be 100 mesh.

2.02 ACCESSORIES

A. Copper Pipe and Tubing:

- 1. Provide new seamless Type K copper pipes and tubes conforming with the requirements for Type K copper as specified in ASTM B 88.
 - a. Fabricate the pipe or tubing from copper free from cuprous oxide when examined at a microscopic magnification of 75 diameters.
 - b. Anneal Type K tubing furnished in coils after coiling.
- 2. Pipe Fittings:
 - a. For copper pipe and tubing, provide copper or bronze fittings as required.

B. Connector Hoses:

- 1. Provide a 12 inch long braided connector hoses.
- 2. Manufacturers:
 - a. Model M-PM34 Stainless Steel Series Round Pedestal Push Button Pet Fountain Receptor <https://www.murdockmfg.com/home> Approved equal.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

- 1. Examine the elements and surfaces to receive the pet water fountain for compliance with the installation tolerances, required clearances, and other conditions affecting performance of the Work.

B. Evaluation and Assessment:

- 1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Protect adjacent areas from damage resulting from installation of the pet water fountain.
- B. Surface Preparation:
 1. If required, perform excavating, trenching, and backfilling operations for water piping in accordance with the requirements specified in Section 02316, Trenching and Backfilling.
- C. Demolition/Removal:
 1. If required, perform cutting and patching, if required, as specified in Section 01732, Cutting and Patching.

3.03 INSTALLATION

- A. Pet water fountain:
 1. Install the pet water fountain in accordance with the manufactures installation instructions at the locations indicated in the Contract Drawings.
 - a. Submit the pet water fountain manufacturer's published installation instructions to the Program/Project Manager for information.
- B. Interface with Other Work:
 1. Piping System Connections:
 - a. Connect the pet water fountain connector hose, and piping to the piping provided by others as indicated in the Contract Documents.
 - b. For piping and specialties adjacent to the equipment, install the piping and specialties to allow access for service and maintenance.
 2. Encase pipe that passes through concrete in Schedule 40 polyvinyl-chloride (PVC) pipe sleeves, or wrap the pipe with tape.

3.04 ADJUSTING

- A. Adjust the pet water fountains so the proper water level is maintained in the reservoir.

3.05 CLEANING

- A. Continuously keep the Site neat and orderly.
- B. Upon completion of the pet water fountain, remove all temporary structures, rubbish, waste material, tools, and equipment resulting from or used in the installation of the system from the Owner's property.
- C. Waste Management:

1. Properly dispose of the waste material generated by the installation of the pet water fountain.
2. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

SECTION 02810

IRRIGATION SYSTEM

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for landscape irrigation systems as shown or reasonably implied on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01410 - Regulatory Requirements.
 - 3. Section 01770 - Closeout Procedures.
 - 4. Section 01780 - Closeout Submittals.
 - 5. Section 02316 - Trenching and Backfilling.
 - 6.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. AC: Alternating electric current.
 - 2. AWG: American Wire Gauge.
 - 3. IPT: Inside pipe thread.
 - 4. NPT: National pipe thread tapered thread.

5. NSF International (NSF):
 - a. NSF/ANSI 14 - Plastics Piping System Components and Related Materials.
6. State of Arizona:
 - a. Arizona Revised Statutes (ARS):
 - 1) Chapter 2, Article 6.3, Underground Utilities, ARS 40-360.21 through 32.
 - 2) Chapter 2, Article 6.4, Overhead Powerline Safety Law, ARS 40-360.41, 45.
7. Maricopa Association of Governments (MAG):
 - a. Uniform Standard Specifications and Details for Public Works Construction January 2017
8. Institute for Sustainable Infrastructure:
Envision sustainable infrastructure rating system.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency and the City, prior to incorporating items requiring testing by them into the Work.
2. Coordinate the installation of irrigation materials so there will be no interference with utilities or other construction, and no future difficulty planting trees, shrubs, and ground covers.
 - a. Exercise extreme care when excavating and working near existing utilities.
 - b. Take responsibility for damages to utilities that are caused by Contractor operations or neglect.
3. Coordinate the installation of pipe sleeves with the paving and other contractors so that all required sleeves are installed prior to any paving operations and to so no conflicts occur with other utilities or structures.
4. Excavation Safety:
 - a. At least 3 days prior to the start of digging or excavation Work, contact Arizona 811 at 1-800-782-5348 to arrange for utility owners to locate and mark their underground utilities.
 - 1) Comply with applicable Arizona Revised Statutes (ARS), especially those regarding Underground Utilities and the Overhead Powerline Safety Law.
 - 2) If unexpected active underground facilities are encountered during the performance of the Work, notify the Program/Project Manager immediately.
 - b. Sole responsibility for making all excavations in a safe manner is the Contractor's.
 - c. Provide suitable protection against bodily injury.
5. Do not interfere with persons, firms, corporations, or utilities, removing, changing, replacing, or employing protective measures at their property or structures.
 - a. Allow these persons, firms, corporations, or utilities to take such measures as they may consider necessary or advisable under the circumstances.
 - b. Measures employed or not employed by these entities do not relieve the Contractor of his responsibilities.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:

- a. Product Data:
 - 1) Plastic pipe and fittings including sleeve piping.
 - 2) Copper pipe and fittings.
 - 3) Polyvinyl chloride (PVC) solvent cement.
 - 4) Polyvinyl chloride (PVC) cleaner and primer.
 - 5) Flexible tubing.
 - 6) Emitters.
 - 7) Gate valves
 - 8) Ball Valves.
 - 9) Automatic remote control valves.
 - 10) Valve access boxes.
 - 11) Automatic controllers.
 - 12) Flow meter.
 - 13) Pressure regulator assemblies.
 - 14) Strainers.
 - 15) Drip system flush plugs.
 - 16) Backflow preventers
 - 17) Backflow cages
 - 18) Control wiring.
 - 19) Gravel.
 - 20) Teflon tape.
 - 21) Warning tape
 - 22) Geotextile Fabric.
 - 23) Irrigation System Material List
 - 24) Grounding Equipment.
- b. Delegated Design Submittals:
 - 1) Completed controller charts.
- c. Special Procedure Submittals:
 - 1) Written evidence that the As-Built Drawings, accessories, charts, and equipment required have been provided or submitted prior to the Final Coverage Inspection of the irrigation system.

B. Informational Submittals:

- 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Irrigation system manufacturers' written installation recommendations and instructions.
 - 2) Valve manufacturers' installation recommendations, instructions, and wire charts.
 - b. Site Quality Control Submittals:
 - 1) Main Line Pressure Tests Report.
 - 2) Lateral Line Pressure Tests Report.
 - 3) Pressure Tests of Lines Under Paved Areas Report.
 - 4) Backflow Prevention Test Report

C. Closeout Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Maintenance Contracts:
 - 1) Irrigation System Maintenance Contract.
 - b. Operation and Maintenance Data:
 - 1) Operations and Maintenance Manuals for the irrigation system.
 - c. Warranty Documentation:
 - 1) Irrigation System Warranty.
 - d. Record Documentation:
 - 1) Weekly As-Built Drawings of the landscape irrigation system.
 - 2) Final As-Built Drawings of the landscape irrigation system.
 - e. Sustainable Design Closeout Documentation:
 - 1) Envision compliance documentation

D. Maintenance Material Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Spare Parts:
 - 1) Prior to Project Closeout, furnish spare irrigation parts matching the products installed, and packaged for storage by having a protective coverings and labels identifying the contents.
 - a) Where applicable and shown on the Contract Drawings, furnish 20 spare single emitters of each size and type of single emitter.
 - b) Where applicable and shown on the Contract Drawings, furnish 10 spare multi-emitters of each size and type of multi-emitter.
 - c) Two drip filter and regulators.
 - d) Two lids for each size valve box installed.
 - e) One gate valve operating tee handle for 2" square nut.
 - f) Two drip flush end valves.
 - g) Furnish 2 spare automatic control valves of each size and type.
 - 2) Store the spare parts on the Site where directed by the Program/Project Manager.
 - b. Tools:
 - 1) Prior to Project Closeout, furnish irrigation tools as follows:
 - a) Furnish 2 operating keys for Controller.
 - 2) Store the tools on the Site where directed by the Program/Project Manager.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky harbor International Airport will employ both an independent Testing and Inspection Agency and the City of Phoenix Testing Laboratory.
2. Dust Control Permit:
 - a. Comply with the requirements of the Maricopa County Dust Control Permit and air pollution control requirements, particularly Maricopa County Air Pollution Control Regulation Rules 310 and 310.01.
 - 1) Rule 310 requires maintaining daily logs recording the actual implementation of control measures identified in the Dust Control Permit.
 - b. Conspicuously post a copy of the Maricopa County Air Quality Department Dust Control Permits in a weather resistant location at the Site where it can be read by the workers.

B. Sustainability Standards Certifications:

1. Envision compliance documentation

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Follow the proper procedures for loading, unloading, and transporting the landscape irrigation system materials:

B. Storage and Handling Requirements:

1. Follow proper procedures for staking, storing, and handling the landscape irrigation system materials:
 - a. Avoid rough handling which could affect the useful life of the landscape irrigation equipment.
 - b. Polyvinyl Chloride (PVC) Pipe:
 - 1) Transport polyvinyl chloride (PVC) pipe in a vehicle that allows the length of pipe to lie flat so it is not subjected to undue bending or concentrated external loads at any point.
 - 2) Load, unload, and store the pipe as recommended by the pipe manufacturer.
 - 3) Furnish beds for storing the pipe that are the full length of the pipe stored.
 - 4) Protect polyvinyl chloride (PVC) pipe and related fittings from direct sunlight.
2. Keep the landscape irrigation system equipment in its original packaging until its installation.

C. Packaging Waste Management:

1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Do not lay pipe when the temperature is 40 degrees Fahrenheit or below.

1.08 WARRANTY

A. Manufacturer Warranty:

1. Furnish the irrigation system manufacturer's standard Irrigation System Warranty against defective material and workmanship covering the 1-year period occurring after the Date of Substantial Completion.
 - a. Submit the irrigation system manufacturer's standard Irrigation System Warranty to the Program/Project Manager.

PART 2 PRODUCTS

2.01 IRRIGATION SYSTEM COMPONENTS

A. Manufacturers:

1. Manufacturer List:

- a. Subject to compliance with the requirements specified herein, provide products manufactured by one of the manufacturers listed.

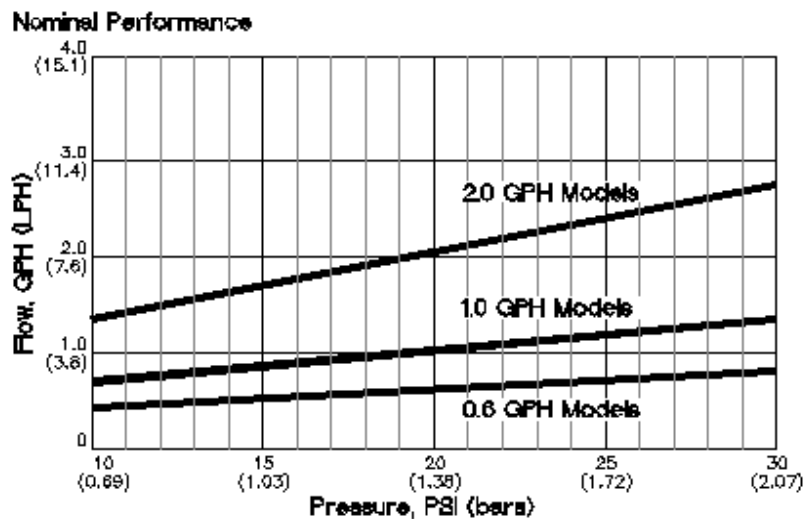

2. Substitution Limitations:

- a. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from manufacturers other than those listed may be provided.
 - 1) No substitutions for the articles, equipment, materials or processes specified by name in the Contract Documents will be allowed without prior written approval by the Program/Project Manager.
 - a) Equipment or material furnished or installed without the prior approval of the Program/Project Manager may be rejected, and the Contractor will be required to remove the rejected materials from the Site at no increase in the Contract Price.
 - b) The decision rendered by the Program/Project Manager when determining the quality and suitability of the materials and equipment to be provided is final.
 - b. Source Limitations:
 - 1) Unless otherwise approved by the Program/Project Manager, obtain similar materials from a single source and single manufacturer.

B. Description:

1. Regulatory Requirements:
 - a. Comply with the requirements of the State of Arizona regarding excavation and trenching.
 - b. Comply with the requirements of the Maricopa County air pollution control regulations.
 - c. Comply with the requirements of the AZPDES Construction General Permit (AZG2008-001) described in Section 01410, Regulatory Requirements.
 2. Institute for Sustainable Infrastructure:
 - a. Envision compliance requirements.
- C. Performance:
1. Emitters:
 - a. Provide emitters capable of performing within the following parameters:
 - 1) System Pressure Range: 15 psi to 35 psi.
 - 2) Flow Variation: 1.06 at 120 degrees Fahrenheit, and 1.07 at 150 degrees Fahrenheit.
 - 3) Manufacturing Variability: 0.05.
 - 4) Capacity:
 - a) Single Outlet Emitter:
 - (1) Provide single outlet emitters capable of performing as specified and shown for the 1 gallon per hour (gph) model in the following chart:

- a) 1.00 gallon per hour (gph) at 20 psi.
 - b) 1.14 gallons per hour (gph) at 24 psi.
 - c) 1.34 gallons per hour (gph) at 30 psi.
- b) Multi-Outlet Emitters, Type 1:

- (1) Provide multi-outlet emitters capable of performing the same as single-outlet emitters from each of 6 possible outlets.
 2. Pressure Regulator Assembly:
 - a. Provide pressure regulator assemblies capable of operating within the following parameters:
 - 1) Flow range: 0.5 to 18 gallons per hour.
 - 2) Inlet pressure: up to 110 psi.
 - 3) Outlet pressure: 30 psi.
- D. Design Criteria:
 1. The Contract Drawings are diagrammatic, and only indicate the general arrangement and routing of irrigation controls, equipment, piping, and fittings.
 - a. In the absence of details on the Contract Drawings, or Specifications pertaining to specific items required to complete the Work, perform the Work in accordance with the best standard of practice after obtaining the prior approval of the Program/Project Manager.
 - b. Where piping is shown under paved areas but running parallel and adjacent to non-paved areas, the intent of the Contract Drawings is to have the piping installed in the non-paved areas.
 - c. Provide the fittings and valves as required in accordance with the details on the Contract Drawings.
 - d. Do not provide excess piping or fittings which may increase pressure loss or potential blockage in the installed system.
 - e. Do not provide pipe in curving trenches that will cause excessive bending and stress on the pipe and fittings.
 - f. In the event of a conflict between the Contract Documents and the Phoenix Supplemental Standard Details for Public Works – Construction, the City's Standard Details take precedence.
 - g. Stations:
 - 1) Provide the number of stations as indicated in the Contract Documents.
 2. Control Valves:
 - a. Provide remote control valves capable of being activated manually from the satellite controller.
 3. Product Data:
 - a. Prepare Product Data for the articles, equipment, materials, or processes proposed to be provided under this Section.
 - b. Prior to performing any work, prepare a complete Irrigation System Material List, including the manufacturer, model number, size, and a description of each material to be used.
 - c. Submit the Product Data to the Program/Project Manager for approval.
 4. Record Documentation:

- a. Maintain a complete, up to date set of As-Built Drawings at the Site for reference.
 - 1) Prepare accurate and to scale As-built Drawings showing the entire completed landscape irrigation system as actually installed.
 - a) Prepare the as-built drawings of the landscape irrigation system electronically on AutoCAD file bases provided by the Program/Project Manager.
 - b) Prepare revisions in accordance with the Phoenix Sky Harbor International Airport standards.
 - (1) Use symbols for valves, emitters, piping, and similar items the same as originally shown by the Program/Project Manager.
 - c) Date and clearly label each final drawing as "AS-BUILT DRAWING".
 - d) Modify the legends as appropriate to designate any "As-built" changes.
 - 2) Correct the As-Built Drawings daily to show all changes in the location of irrigation emitters, controllers, backflow preventers, valves, drains, meters, points of connection, pull boxes and wire splice boxes, pipe and wire routing, sensors, and other changes that may have been made from the original Contract Documents as provided.
 - 3) Provide dimensions from 2 permanent points of reference, such as building corners, sidewalk intersections, or road intersections, to the location of the following items:
 - a) Connections to existing water lines.
 - b) Connections to existing electrical power.
 - c) Gate valves.
 - d) Routing of irrigation lines.
 - (1) Provide dimensions for points a maximum 100 feet apart along the routing.
 - e) Irrigation control valves.
 - f) Routing of control wiring.
 - g) Other related equipment as directed by the Program/Project Manager.
- b. Submit the As-Built Drawings to the Program/Project Manager weekly for review.

E. Materials:

1. Pipe:

a. Plastic Pipe:

- 1) For mainline and lateral pipe, either of the following types of rigid polyvinyl chloride (PVC) plastic pipe may be indicated to be provided on the irrigation plans and details in the Contract Drawings:

- a) For mainline pipe use schedule 40 PVC complying with the requirements specified in ASTM D 1785.
 - b) For lateral and sub-mainline piping use 40 PVC complying with the requirements specified in ASTM D 1785.
 - c) For sleeve piping use schedule 40 pipe complying with the requirements specified in ASTM D 1785.
 - b. Copper Pipe:
 - 1) Provide Type K, Standard weight copper pipe complying with the requirements for hard tempered copper tubing specified in ASTM B 88.
 - 2) Provide new, seamless copper pipe designed for underground water service, plumbing purposes, and similar applications.
 - c. Provide pipe continuously and permanently marked with the following information:
 - 1) Manufacturer's name or trademark.
 - 2) Size.
 - 3) Schedule.
 - 4) Type of pipe.
 - 5) Working pressure at 73 degrees Fahrenheit.
 - 6) NSF certification.
- 2. Pipe Fittings:
 - a. Plastic Fittings:
 - 1) For pipe having nominal pipe sizes of 2-1/2 inches and smaller, provide Schedule 40 solvent weld type fittings.
 - a) For mainlines fittings and all other fittings before the remote control valve, provide Schedule 80, Type 1, polyvinyl chloride (PVC) solvent weld slip connector fittings complying with the requirements specified in ASTM D 2466 and ASTM D 1784.
 - b) For lateral line fittings and all other fittings after the remote control valve, provide ultraviolet (UV) radiation resistant Schedule 40, Type 1, polyvinyl chloride (PVC) solvent weld slip connector fittings complying with the requirements specified in ASTM D 2466 and ASTM D 1784 for polyvinyl chloride (PVC) pipe.
 - b. Copper Fittings:
 - 1) Provide wrought copper, bronze, or brass solder end type fittings rated for a working water pressure class of 150 pounds.
- 3. Solvent Cements, Primers, and Lubricants:
 - a. Provide only solvent cements, primers, or lubricants recommended or supplied by the pipe manufacturer.
 - b. Polyvinyl Chloride (PVC) Solvent Cement:
 - 1) Provide polyvinyl chloride (PVC) solvent cement complying with the requirements specified in ASTM D 2564, and of the proper type for the conditions of use.
 - 2) Manufacturers:

- a) Industrial Polychemical Service, Weld-On 711, <http://www.ips-plastics.com>.
 - b) Approved equal.
 - c. Polyvinyl Chloride (PVC) Cleaner and Primer:
 - 1) Provide polyvinyl chloride (PVC) cleaner and primer of the proper type approved by the pipe manufacturer for the conditions of use.
 - 2) Manufacturers:
 - a) Industrial Polychemical Service, Weld-On P-70, <http://www.ips-plastics.com>.
 - b) Approved equal.
 - 4. Flexible Tubing:
 - a. Provide flexible distribution tubing (spaghetti tubing) manufactured from a black vinyl blend; and having an inside diameter of 0.160 inch, an outside diameter of 0.220 inch, and a minimum wall thickness of 0.030 inch.
- F. Manufactured Units:
- 1. Emitters:
 - a. Provide pressure compensating single and multi-outlet assemblies.
 - 1) Provide emitters having the number of manufacturer-supplied outlets required to be opened.
 - b. Emitter Assembly:
 - 2) Provide emitter assemblies consisting of an emitter unit, a 1/2-inch diameter flexible polyvinyl chloride (PVC) riser, and necessary fittings.
 - b. Case:
 - 1) Provide a durable black acetyl plastic case resistant to heat and temperature variations, smog, ozone, ultraviolet radiation, liquid fertilizer, and weed spray.
 - c. Diaphragm:
 - 1) Provide a self-flushing, 150 minimum filtration mesh diaphragm that is completely enclosed to protect it against harmful environmental factors.
 - 2. Gate Valves:
 - a. Gate valves shall be resilient seat, epoxy coated ductile iron with 2" square operating nuts, 250 psig and meet the requirements of ANSI/AWWA C515. American Flow Control 2500 series or approved equal.
 - 3. Ball Valves:
 - a. Ball valves 2-inch and smaller shall be of the brand, size and type indicated on the irrigation plans.
 - b. Ball valves shall have a one-piece body constructed of 600-lb WOG Bronze material conforming to ASTM B-584 alloy 844. Ball valve shall have a vented ball with a blowout proof system. Ball valves shall have a working pressure of not less than 150 P.S.I. and shall conform to

- AWWA standards. Ball valves shall include a stainless-steel handle. Type: Wilkins 850 or approved equal.
- c. Ball valves for use with remote control valves shall be Spears True Union or approved equal. The valves shall be manufactured of schedule 80 PVC and feature Teflon seats capable of two-way blocking. The valve shall have threaded end connections. Valves shall be sized to match the remote control valve.
4. Automatic Remote Control Valves:
- a. Provide slow-acting hydraulic diaphragm, globe screw pattern control valves sized as indicated on the Contract Drawings.
 - 1) Provide electric control valves that are compatible with the automatic controllers.
 - b. Actuation:
 - 1) To prevent damage from surge pressures, provide slow opening and closing electric solenoid actuation facilitated by a potential shunt resistor.
 - a) Provide solenoids having an opening and closing speed not less than 5 seconds.
 - b) Provide solenoids designed to operate on a 24-Volt, 60-Hertz power supply delivering 2 Watts of power.
 - c. Waterproofing:
 - 1) Ensure positive waterproofing by providing valves completely encapsulated in epoxy with a stainless-steel shunt band.
 - d. Flow Adjustment:
 - 1) Provide electric control valves having a manual flow adjustment.
 - e. Manufacturers:
 - 1) Provide the manufacturer and-model listed in the details on the Contract Drawings.
 - 2) Approved equal.
5. Air/Vacuum Release Valves:
- a. Air/vacuum release valves shall be gravity type constructed of cast iron. Air/vacuum release valve shall have an O-ring sealing device that positively seals at 3 P.S.I. and releases air once the water pressure inside the tubing drops below one P.S.I.
 - b. Ball valve shall be bronze with stainless steel handle. Size shall be 1".
 - c. The mainline tee shall be schedule 80 for sizes 2 ½" and smaller, ductile iron 3" and larger.
 - d. Valve boxes shall be Carson 1324-15 with Drop –N-Lock T-Style cover or equal. Include geo-textile fabric and 6" gravel sump.
 - e. Place air/vacuum release valves at the high point on the irrigation mainline.
 - f. Manufacturers:
 - 1) Provide the manufacturer and-model listed in the details on the Contract Drawings.
 - 2) Approved equal.

6. Valve Access Boxes:
 - a. Provide standard round or rectangular valve access boxes complying with the requirements specified in ASTM D 628, ASTM D 648, and ASTM D 790, and fabricated from plastic or as called for in the Contract Drawings.
 - 1) Provide valve boxes complete with bolt locking cover or lid, and locking cover keys for the locking covers.
 - b. Sizes:
 - 1) For gate valves and flush cap plugs, provide valve access boxes approximately 9 to 10 inches in diameter, and 12 inches deep. Type: Carson 910-12 or approved equal.
 - 2) For ball valves, master valves & flow meters, provide valve access boxes approximately 12 inches wide by 18 inches long, and 12 inches deep. Type: Carson 1220 or approved equal.
 - 3) For drip valve assemblies where the valve, filter & pressure regulator are in the same location, provide valve access boxes approximately 13 inches wide by 24 inches long, and 12 inches deep. Type: Carson 1324 or approved equal.
 - 4) For drip valve assemblies where the valve and the filter/ regulator are located in separate locations, provide valve access boxes for both the valve & filter/ regulator in approximately 12 inches wide by 20 inches long, and 12 inches deep. Type: Carson 1220 or approved equal.
 - 5) For drip emitters, provide emitter access boxes approximately 6 inches in diameter and 9 inches deep. Type: Carson 708 or approved equal.
 - c. Valve Access Box Extensions:
 - 1) Wherever required to bring the valve boxes level with the finish grade or to comply with details shown on the Contract Drawings, provide valve access box extensions of the proper length and size.
 - 2) Provide valve box extensions compatible with the valve boxes and as necessary to ensure the valve box rests on a continuous soil base.
 - 3) Provide valve box extensions fabricated from the same material and manufactured by the same manufacturer as the valve box.
 - d. Identification:
 - 1) Imprint the valve box lids with the words "IRRIGATION CONTROL VALVE" and the valve number.
7. Automatic Controllers:

- a. Irrigation controllers shall be RainMaster DX3 Laguna models which shall be compatible with the Sky Harbor irrigation central control system.
- b. Controllers shall be stainless steel pedestal mounted on a poured in place concrete base per plan details.
- c. Controllers shall be conventional wire models furnished with the number of stations as shown on the project plans.
- d. The controller shall use Ethernet communication provided by the electrical contractor.
- e. The controller shall include a PMR KIT radio receiver for remote controls. Provide one PROMAX complete remote control kit.
- f. The contractor shall have RainMaster upgrade the central control system software to work with the new DX3 Laguna operating system. This is a no cost operation provided by RainMaster. The contractor shall provide coordination between RainMaster and Sky Harbor Irrigation.
- g. Controller Charts:
 - 1) For each automatic controller, provide a controller chart showing the area controlled by the automatic controller.
 - a) Provide controller charts consisting of a drawing of the actual system reduced to the maximum size that will fit on the controller enclosure's door.
 - (1) In the event the controller sequence drawing is illegible when the drawing is reduced, enlarge the labels on the controller sequence drawing to a size that will be legible when the drawing is reduced to fit the door.
 - (2) Use a different color to indicate the coverage area for each station.
 - 2) Do not prepare the controller charts before the As-built Drawings required elsewhere in this Section are submitted to the Program/Project Manager and approved.
 - 3) Prior to the final coverage observation of the irrigation system, submit the completed controller charts to the Program/Project Manager for approval.
 - a) When the controller charts are completed and approved, provide a print of the chart on bond paper hermetically sealed between two pieces of plastic at least 10 mils thick.
8. Flow Meters:
 - a. Provide flow meters compatible with the automatic irrigation controller selected for the Contract.
9. Pressure Regulator Assemblies:
 - a. Provide pressure regulator assemblies fabricated from polyvinyl chloride (PVC), and having 3/4-inch minimum female NPT inlet and outlet connections.
10. Strainers:

- a. Provide “Y” (WYE) type strainers fabricated from bronze or brass; and having 1-inch female inside pipe thread (IPT) connections.
 - b. Provide strainers having a 100 mesh strainer fabricated from stainless steel or another material as indicated in the details on the Contract Drawings.
11. Drip System Flush Plugs:
- a. Provide drip system flush plugs as detailed on the Contract Drawings.
12. Backflow Preventers:
- a. Provide brass reduced pressure type backflow preventers as indicated on the Contract Drawings, that automatically reduce water pressure in the zone between the check valves to a pressure differential of 3 psi, and that are designed for maintenance and service without removal from the line.
 - 1) Check Valves:
 - a) For each backflow preventer, provide 2 separate spring-loaded “Y” type check valves.
 - 2) Pressure Relief Valves:
 - a) For each backflow preventer, provide 1 differential type pressure relief valve with 2 diaphragms that are separated by spaces.
 - 3) Shut-Off Valves:
 - a) For each backflow preventer, provide 2 ball valves.
 - 4) Test Cocks:
 - a) For each backflow preventer, provide test cocks for field-testing.
 - 5) Enclosure:
 - a) For each backflow preventer, provide an enclosure with a locking device over the backflow preventer assembly in accordance with the detail on the Contract Drawings.
 - b) Finish:
 - (1) Paint the enclosure with the color approved by the Program/Project Manager to match the City’s requirements, or as described in the detail on the Contract Drawings.

2.02 ACCESSORIES

- A. Control Wiring:
- 1. Provide control wiring complying with the requirements and sized as required or shown on the Contract Drawings, but in no case less than AWG 14.
 - 2. Direct Burial Wire:
 - a. For direct burial wire, provide 600-Volt AWG-UF copper wire.
 - 3. Pilot Wires:
 - a. Provide a different color pilot wire for each automatic controller.
 - 4. Common Wires:

- a. Provide white AWG 12 wire having a different color stripe for each automatic controller.
- 5. Wire Splices:
 - a. Make all splices using wire connectors with same manufacturer's sealant, or an approved equal.
- B. Gravel:
 - 1. Provide pea gravel complying with the requirements specified in MAG Section 310, Placement and Construction of Aggregate Base Course
- C. Teflon Tape:
 - 1. Provide Teflon tape manufactured as a thread sealing compound.
- D. Warning Tape:
 - 1. Provide solid detectable foil core warning tape encased in a protective plastic jacket that is resistant to alkalis, acids, and other destructive elements commonly found in soil.
 - a. Provide a foil/plastic lamination having sufficient strength so the layers cannot be separated by hand.
 - b. Provide warning tape having a 0.35-mil thick foil core, and a total composite thickness of at least 4.3 mils.
 - c. Insure that the foil core is visible to ensure continuity.
 - 2. Tensile Strength:
 - a. Provide warning tape having the minimum tensile strengths for a 3-inch wide strip of 63 pounds in the machine direction and 68 pounds in the traverse direction.
 - 3. Warning Message:
 - a. Provide warning tape having a continuous warning message reading "CAUTION IRRIGATION LINE BELOW" imprinted on the tape's surface and repeated every 16 to 36 inches.
 - 4. Tape Color:
 - a. Provide warning tape having the color code appropriate for the type of line that the tape is protecting.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Carefully check all grades to ensure that the Work on the irrigation system can proceed safely.
- B. Evaluation and Assessment:
 - 1. Do not use any pipe or fitting that has been damaged or dented.
 - a. Discard any section of pipe that has been dented or damaged; and, if installed, replace the dented or damaged pipe with new piping.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Protect adjacent areas from damage resulting from installation of the landscape irrigation system.
- B. Surface Preparation:
 - 1. Stakeout of Irrigation System:
 - a. Prior to starting to install the landscape irrigation system, flag all planting areas, locating each plant species by different flag colors.
 - b. Lay out the entire system using powdered lime or stakes to indicate the locations of the various system components and the location of each run of pipe.
 - 1) At this time, make preliminary adjustments to conform to the actual site conditions.
 - c. Arrange for the Program/Project Manager to review the stakeout of the entire system prior to performing actual production Work.
 - 1) Obtain the Program/Project Manager's approval of the flagging and the stakeout prior to starting to install the landscape irrigation system.
- C. Demolition/Removal:
 - 1. Trenching under Existing Paving:
 - a. If any cutting or breaking of existing paving is necessary, prior to performing the work obtain permission to cut or break the paving from the Program/Project Manager.
 - 1) If the Program/Project Manager approves the demolition, cut and remove the pavement; and after the landscape irrigation system work under the paving is completed, replace the paving in kind to a condition equal to or greater than the condition existing before the removal of the paving at no increase in Contract Price.

3.03 INSTALLATION

- A. Carefully install all irrigation system pipes, fittings, valves, and similar items in trenches.
 - 1. Install irrigation system piping, fittings, and the various assemblies in accordance with the details shown on the Contract Drawings, and in accordance with the irrigation system manufacturers' installation recommendations and instructions.
 - 2. Submit the irrigation system manufacturers' written installation recommendations and instructions to the Program/Project manager for information.
- B. Excavation:

1. Size trenches and other excavations large enough to accommodate the irrigation system components, conduit, and other required facilities.
 - a. Follow the layout for trenching excavation indicated on the Contract Drawings and as noted.
 - b. Dig trenches straight, and support pipe continuously on the bottom of the trench.
 - c. Provide additional space in trenches to assure proper installation and access for inspection.
2. Provide trenches sufficiently deep to furnish the minimum earth cover from finish grade in accordance with the details shown on the Contract Drawings.
3. Soil Conditions:
 - a. Rocky Soil:
 - 1) If the trenching must extend through rocky soil, bed the irrigation piping in 2 inches of sand or other approved backfill material, and extend the sand or other approved material a minimum of 2 inches over the top of pipe.
 - b. Other Unsuitable Soil Conditions:
 - 1) If the bottom of a pipe trench excavation is found to consist of rock, caliche, or another unsuitable material, notify the Program/Project Manager.
 - 2) Remove this material at least 3 inches below the specified trench depth.
 - 3) Refill the trench with sand or similar material approved by the Program/Project Manager, and thoroughly tamp and compact the sand or similar material into place.
4. Excavation Adjacent to Existing Trees:
 - a. If it is necessary to excavate adjacent to existing trees, avoid injuring to the trees and tree roots.
 - b. In areas where roots having diameters of 2 inches or larger occur, excavate by hand.
 - 1) Tunnel under roots having diameters of 2 inches or larger, except where the roots lie directly in the path of the pipe or conduit.
 - 2) Heavily wrap the roots that lie directly in the path of the pipe or conduit with burlap to prevent scarring or excessive drying.
 - c. In areas where roots having diameters smaller than 2 inches are encountered, hand trim the roots by making clean cuts through root.
 - d. Where possible close trenches adjacent to trees within 24 hours; but when this is not possible, keep the side of the trench adjacent to the tree shaded with moistened burlap canvas.

C. Sleeves:

1. Sleeves:

- a. Before paving work begins, provide sleeves under sidewalks, driveways, roadways, curbs, and elsewhere as shown on the Contract Drawings and as required to install the irrigation system.

- 1) Unless otherwise specified, provide sleeves for piping under paving.
- 2) For control wire under paving or structures, provide pipe sleeves separate from the water piping sleeves.
- 3) Install sleeves required under new paving prior to constructing the pavement.
- 4) Install sleeves that are required below existing paving by jacking, boring, or hydraulic driving.
- 5) Replace and re-compact fill around sleeves.
- b. Provide sleeves consisting of Schedule 40 polyvinyl chloride (PVC) pipe sized to be at least twice the diameter of the wire bundle or pipe(s) being sleeved, or larger if so indicated on the Contract Drawings.
- c. Immediately following installation of a sleeve, plug both ends of the sleeve.
- d. Where sleeve ends are concealed, provide visible and identifiable markers on the surface at both ends of the sleeve.
 - 1) Provide a number 4 steel reinforcement bar marker having the 6-inch length at one end painted red.
 - 2) Cut the steel reinforcement bars so that if the bar is set or pounded vertically into the ground and the bottom of the bar is at the depth of the bottom of the sleeve and a horizontal distance of approximately 6 inches away from the sleeve, the top of the bar will be flush with the finish grade.
 - 3) Mark the final location of the steel reinforcement bar marker by providing a red whisker marker set into the finish grade.
 - a) If alternate marking methods are proposed, they must be approved by the Program/Project Manager prior to their installation.

D. Piping:

1. Before installing the pipe, remove rubbish, large rocks, and water from the trenches.
 - a. Do not lay pipe in trenches with standing water, or when the trench or weather conditions are unsuitable for the Work.
 - b. Pump out or otherwise remove any water that may be encountered or may accumulate in the trenches or excavation as necessary to keep the bottom of the trench or excavation free and clear of water during the progress of the Work.
2. Thoroughly clean the pipe and fittings to remove dirt, dust, and moisture before installation.
3. Use the installation methods recommended by the pipe and fitting manufacturers.
 - a. For piping to be provided under existing walks, install the piping by jacking, boring, or hydraulic driving.

- b. For piping to be provided under concrete paving where no conflicts with other piping or utilities exist, hydraulic driving is permitted provided an 18 inch minimum depth is maintained.
 - c. Submit the installation methods recommended by the pipe and fitting manufacturers to the Program/Project Manager for information.
 4. For the below-grade mainline pipe, provide plastic pipe.
 - a. Install copper pipe from the water meter through a backflow preventer device to the below-grade plastic mainline pipe.
 - b. Assemble polyvinyl chloride (PVC) pipe and fittings so they are jointed at the true parallel position of the fitting.
 - c. For mainline pipe with a nominal diameter 3 inches or less, or where a pipe connection occurs in a sleeve, install solvent weld pipe.
 - 1) Comply with the pipe manufacturer's recommended procedures for making solvent weld fittings.
 - 2) Use primer on all solvent weld joints.
 5. Lay pipe to an even grade.
 - a. Rest the full length of each section of the pipe solidly upon the pipe bed, with recesses excavated to accommodate bells, joints, and couplings.
 6. Piping Connections:
 - a. Connecting Different Materials:
 - 1) Whenever connecting different materials using threaded connections, provide metal female connections.
 - 2) For polyvinyl chloride (PVC) to metal piping connections, install the metal piping first.
 - b. Threaded Connectors:
 - 1) Where threaded polyvinyl chloride (PVC) connections are required, use threaded polyvinyl chloride (PVC) male adapters into which the pipe may be welded.
 - 2) For polyvinyl chloride (PVC)-to-polyvinyl chloride (PVC) threaded joints, for polyvinyl chloride (PVC) to metal threaded joints, and for metal to metal threaded joints, provide Teflon tape thread sealing compound or an approved equal.
 - 3) Do not use thread sealing compound on threaded connections between a sprinkler and a nipple, a bubbler and a nipple, or an emitter and a riser.
 7. Warning Tape:
 - a. Apply detectable tape to all pressurized main lines and at the ends of lateral runs.
 8. For piping to be installed under new paving, prior to performing the paving work set the piping in place, and cap and pressure test the piping.

E. Valves:

1. Valve Access Boxes:
 - a. Unless otherwise indicated, install the electric remote control valves, zone shut-off valves, gate valves, quick coupler valves, and isolation

valves in suitable valve access boxes having the proper size to facilitate easy access for manually operating or maintaining the valve housed.

- 1) Provide a sump of pea gravel at least 6 inches deep, or as otherwise detailed on the Contract Drawings, below each valve body in the valve access box.
- b. Provide a control valve box for each electric remote control valve.
2. Pressure Regulator Assemblies:
 - a. Provide complete pressure regulator assemblies, including a valve box, pressure regulator, and other appurtenances at the location and in accordance with the details on the Contract Drawings.
3. Backflow Preventers:
 - a. Install backflow preventers on poured in place concrete slab per plan details.
 - b. Install backflow enclosure per plan details and secure to concrete base. Enclosures shall include a lock guard. Enclosure color shall be Woodland Tan.
4. Gate Valves:
 - a. Provide gate valves in accordance with the details on the Contract Drawings.
5. Ball Valves:
 - a. Provide ball valves in accordance with the details on the Contract Drawings.
6. Flow Meter Valve Assemblies:
 - a. Provide a flow meter valve assembly where shown on the Contract Drawings.
- F. Emitter Assemblies:
 1. Provide emitter assemblies consisting of an emitter unit with a strainer, lengths of flexible polyvinyl chloride (PVC) supply piping suitable for the pressure application required, and appropriate molded adapters for connecting the emitter assembly to supply laterals.
 2. Unless otherwise indicated, at each shrub and cacti provide single-outlet type emitters connected to the rigid polyvinyl chloride (PVC) emitter lateral as detailed on the Contract Drawings.
 3. At each tree, provide the quantity and type of multi-outlet type emitters having spaghetti tubing as indicated in the Emitter Schedule and Multi-Port Emitter Detail on the Contract Drawings.
 4. Whenever possible, provide each emitter assembly with its own outlet.
- G. Drip System:
 1. Provide drip system flush plugs on every dead end run to allow flushing all emitter pipes or tubing downstream of the last emitter.
 2. Install each drip system flush plug in a valve access box.
- H. Electric Control Wiring:

1. Connect the automatic controller to the electric control using direct burial wire. The electrical contractor shall provide the 120V protected circuit and conductors to the new irrigation controller.
2. Provide the control wiring in the same trench, and along the same route, as the pressurized mainline piping.
 - a. Before installing the wire, partially backfill the pipe trench to provide bedding for the wire adjacent to the pipe.
 - b. If it is necessary to run wire in a trench separate from the pipe trench, provide a minimum of 12 inches of cover for the wire, or the depth indicated on the Contract Drawings.
3. For control wire under paving or structures, provide Schedule 40 polyvinyl chloride (PVC) sleeves separate from water piping sleeves.
4. Laying the Wires in the Trench:
 - a. Lay the control wires loosely in the trench without stressing or stretching the conductors in accordance with the detail shown on the Contract Drawings.
 - b. For each wire run, provide a spare wire left open.
 - c. When more than 1 wire is placed in a trench, tape the wiring together at 10-foot intervals.
 - d. Lay warning tape 6 inches above the wire bundles in trenches.
5. Control Valve Wire Splices:
 - a. Field splices between the automatic controller and electrical control valves are not allowed without the prior approval of the Program/Project Manager.
 - b. Provide spliced wire having one continuous color; do not splice wires of different colors together.
 - c. Use no more than 1 wire splice per connector.
6. Splices of Wire Other Than Control Valve Wire:
 - a. Except at valve box locations, keep wire splices to a minimum and not more frequently than 2500 feet.
 - b. If required, provide wire splices only at common splice points, and place the splice in a wire splice box as shown in the detail on the Contract Drawings.
 - 1) Provide splice connectors and sealant to make the wire splice boxes waterproof.
7. Wire Expansion and Slack Provisions:
 - a. For control wiring, provide 12-inch expansion loops at every ninety-degree change of direction and at 100-foot intervals along the wire.
 - b. Expansion Joints (Curls):
 - 1) Provide expansion joints, or curls, in the wire at 200-foot intervals by making 5 or 6 turns of the wire around a piece of ½-inch pipe.
 - 2) Within 3 feet of each wire connection, provide an expansion curl.
 - 3) For each splice connection at electric controls, provide an expansion curl sufficiently long so the valve bonnet may be brought to the surface for repairs without disconnecting the control wires.

- c. Control Valve Splices:
 - 1) At control valve splices, provide a 36-inch wire expansion coil to facilitate raising the splices out of the splice box for observation or repair.
 - d. Locate wire connections at remote control valves and at wire splices in a valve box, and provide 24 inches of slack so the valve bonnet or splice may be brought to the surface for repair without disconnecting the wires.
- 8. Electrical Wire Connections:
 - a. Provide absolutely waterproof joints so there is no chance of water leakage or corrosion buildup on the joint.
 - b. Install common wires for the automatic controller and electric remote control valves in accordance with the valve manufacturer's recommendations, instructions, and wire chart.
 - 1) Submit the valve manufacturer's installation recommendations, instructions, and wire chart to the Program/Project Manager for information.
- 9. Wiring of Existing Controllers:
 - a. Several existing controllers are to be utilized for operation of the new irrigation system. The contractor shall protect in place all existing 120V power supply wiring and grounding for the controllers. The contractor shall run new 24V control, common and spare wiring from the existing controllers to the new valves shown on the plans. The new 24V wiring shall be orange control wire, yellow common wire and green spare wire colors to distinguish the new wiring from the existing wiring that may remain in the ground. The contractor shall remove all existing 24V wiring from previous irrigation systems which will not remain in service as can be reasonably pulled from the ground by mechanical methods.
- I. Flushing:
 - 1. After all landscape irrigation system piping, risers, valves, thrust blocks, and similar items have been installed and partially backfilled, but prior to installation of the heads, open the control valves and use a full head of water to flush out the system.
 - 2. Flush the system for 3 minutes through the furthestmost head from the valve.
- J. Backfill and Compaction:
 - 1. Backfilling:
 - a. Do not backfill piping until it has been inspected, hydrostatically tested, and accepted by the Program/Project Manager in writing.
 - b. After the irrigation system is operating, and all required tests and inspections have been made, backfill the excavations and trenches with clean soil free of debris and rocks in accordance with the requirements specified in Section 02316, Trenching and Backfilling.

- 1) Initially, place fine granular material backfill on all lines to a depth of 3 inches.
 - a) Do not place foreign matter larger than ½ inch in the initial backfill.
 - b) For flexible distribution tubing (spaghetti tubing) provide gravel bedding.
- 2) Backfill the trenches with suitable material excavated from the trench or in accordance with the details shown on the Contract Drawings.
- 3) Backfill trenches in 6-inch lifts with the excavated materials consisting of earth, loam, sandy clay, sand, or other approved materials, free from large clods of earth or stones.
- c. Backfilling Trenches under New Paving:
 - 1) If the trenches will be located under areas where new paving will be constructed, backfill the trench ensuring that a layer of sand or approved material is placed from 6 inches below the buried pipe to 3 inches above the pipe.
 - 2) Compact the backfill for these trenches in layers using manual or mechanical tamping devices that produce a firm, unyielding condition; and so the compaction of the backfill equals the compaction of the existing adjacent undisturbed soil or compaction required by an approved Geotechnical Engineer registered in the State of Arizona and by the Program/Project Manager.
- d. Backfill trenches flush with the adjoining grade.
 - 1) After backfilling the trench, use water to settle and level the trench to the grade of the adjacent ground.
2. Compaction:
 - a. Mechanically compact the backfill in landscaped areas to a dry density equal to the compaction of adjacent undisturbed soil in planting areas.
 - b. Compact the backfill to conform to adjacent grades without dips, settlement areas, humps, or other surface irregularities.

3.04 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. During the period when the irrigation system is being installed, the Testing and Inspection Agency must perform routine and other testing and inspection of materials.
 - a. Notify the Program/Project Manager sufficiently in advance of irrigation system construction activities so appropriate Testing and Inspection Agency personnel can be scheduled with sufficient time to inspect and test the Work as follows:
 - 1) Pressurized main line installation and testing: 48 hours advance notice.
 - 2) Flushing: 48 hours advance notice.

- 3) Hydrostatic Testing: 48 hours advance notice.
 - 4) Automatic controller installation: 48 hours advance notice.
 - 5) Control wire installation: 48 hours advance notice.
 - 6) Lateral line and sprinkler installation: 48 hours advance notice.
 - 7) Emitter lateral and extension line placement: 48 hours advance notice.
 - 8) Emitter operation: 48 hours advance notice.
 - 9) Final coverage observation: 1 week advance notice.
 - 10) Test operation of all controllers from the maintenance central control facility.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Pressure Test:
- a. After the flushing specified herein is completed, cap the risers and hydrostatically pressure test the irrigation system.
 - 1) Perform the hydrostatic pressure tests with the Program/Project Manager present to observe the testing.
 - 2) Test the irrigation lines in place, before backfilling, and only under dry conditions.
 - 3) To prove piping that is installed under areas to be paved is watertight, test the piping prior to paving the area.
 - b. Main Line Testing:
 - 1) Prior to installing the electric control valves, hydrostatically test the main line upstream from the control valve locations.
 - c. Lateral Line Testing:
 - 1) Hydrostatically test lateral lines downstream from the control valves at the available system pressure.
 - d. Test Procedure:
 - 1) At least 4 hours before the testing the pressure, fill the line with water and thoroughly bleed the air out of the line.
 - 2) Center load the pipe sections, and expose all couplings.
 - a) Test the polyvinyl chloride (PVC) lateral line pipes at the existing line pressure with the couplings exposed and all outlets capped.
 - 3) Test all pressure lines under a hydrostatic pressure of 120 psi.
 - a) During the test period, maintain a minimum pressure of 100 psi at the highest point of the section being tested.
 - 4) Record the pressure in the irrigation lines for not less than 2 hours.

- 5) Submit the following certified Pressure Test reports demonstrating compliance with the requirements to the Program/Project Manager for information:
 - a) Main Line Pressure Tests Report for the hydrostatic testing of the main lines upstream from the control valves.
 - b) Lateral Line Pressure Tests Report for the hydrostatic testing of the lateral lines downstream from the control valves.
 - c) Pressure Tests of Lines Under Paved Areas Report for the hydrostatic testing of the piping under paved areas.
 - e. Acceptance Criteria:
 - 1) Main Lines:
 - a) The maximum permissible pressure drop is 2 psi after the temperature has stabilized.
 - 2) Lateral Lines:
 - a) The maximum permissible leakage is 0 gallon per hour per 1,000 feet of pipe.
 - 3) Lines having no evident leakage or loss of pressure as specified pass the Pressure Test.
 3. Inspections:
 - a. Periodic Site inspections will be performed by the Testing and Inspection Agency after the weekly As-Built Drawings for the items have been submitted.
- B. Non-Conforming Work
1. Rework any items found to be unacceptable by the Program/Project Manager during the Final Coverage Inspection to his complete satisfaction and at no increase in Contract Price.

3.05 ADJUSTING

- A. Settlement:
1. If settlement occurs, and subsequent adjustments in piping, valves, sprinkler heads, lawn or planting, or other construction are necessary, make the required adjustments at no increase in Contract Price.

3.06 CLEANING

- A. Continuously keep the Site neat and orderly.
- B. Keep the interior of pipes free from dirt and debris; and when pipe laying is not in progress, cap the open ends of the pipe using an approved means.
- C. Upon completion of the landscape irrigation system, remove all temporary structures, rubbish, waste material, tools, and equipment resulting from or used in the installation of the system from the Owner's property.
- A. Waste Management:

1. Properly dispose of the waste material generated by the installation of the irrigation system.
2. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

3.07 CLOSEOUT ACTIVITIES

A. Demonstration:

1. Final Coverage Inspection:

- a. Before requesting the Final Coverage Inspection of the irrigation system, submit written evidence to the Program/Project Manager that the As-Built Drawings, accessories, charts, and equipment required have been provided or submitted.
- b. Prior to final acceptance, arrange with the Program/Project Manager to have the Final Coverage Inspection performed by the following entities together:
 - 1) Program/Project Manager.
 - 2) Landscape Architect.
 - 3) City Representative.
 - 4) Contractor.
 - 5) Landscape Subcontractor.
- c. During the Final Coverage Inspection, operate each system in its entirety for the Program/Project Manager and others present to observe.

B. Record Documentation:

1. Prior to start of the warranty period, electronically submit the AutoCAD files and pdf files of the Final As-Built Drawings of the landscape irrigation system to the Program/Project Manager.
 - a. Delivery of the electronic file does not relieve the Contractor of responsibility for furnishing required information that may have been omitted.

3.08 PROTECTION

- #### A. Protect the landscape irrigation system Work and materials from damage during construction and storage.

3.09 MAINTENANCE

A. Operation and Maintenance Manuals:

1. Submit Operations and Maintenance Manuals for the irrigation system to the Program/Project Manager in accordance with the requirements specified in Section 01780, Closeout Submittals.

B. Maintenance Service:

1. Furnish an executed Irrigation System Maintenance Contract to the Owner for keeping the irrigation system in perfect operating condition during the warranty period at no increase in the Contract Price.

SECTION 02821

CHAIN LINK FENCES AND GATES

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for chain link fence and gate components.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. AC: Alternating (electric) current.
 - 2. EEPROM: Electrically erasable programmable random-access memory.
 - 3. VA: Voltamperes.
 - 4. VAC: Volts of alternating (electric) current.
- B. Reference Standards:
 - 1. ASTM International (ASTM):
 - a. ASTM A 121 - Standard Specification for Metallic-Coated Carbon Steel Barbed Wire.
 - b. ASTM A 392 - Standard Specification for Zinc-Coated Steel Chain-Link Fence Fabric.
 - c. ASTM A 641/A 641M - Standard Specification for Zinc-Coated (Galvanized) Carbon Steel Wire.
 - d. ASTM A 824 - Standard Specification for Metallic-Coated Steel Marcellled Tension Wire for Use with Chain Link Fence.
 - e. ASTM F 567 - Standard Practice For Installation of Chain-Link Fence.
 - f. ASTM F 626 - Standard Specification for Fence Fittings.
 - g. ASTM F 900 - Standard Specification for Industrial and Commercial Swing Gates.
 - h. ASTM F 1083 - Standard Specification for Pipe, Steel, Hot Dipped Zinc-coated (Galvanized) Welded, For Fence Structures.
 - i. ASTM C 1077 - Standard Practice for Laboratories Testing Concrete and Concretes for Use in Construction and Criteria for Laboratory Evaluation.
 - j. ASTM D 2582 - Standard Test Method for Puncture-Propagation Tear Resistance of Plastic Film and Thin Sheeting.
 - 2. Chain Link Fence Manufacturers Institute (CLFMI):
 - a. CLFMI Step-By-Step Installation Guide.
 - 3. National Electrical Manufacturers Association (NEMA):

- a. NEMA ICS 2 – Industrial Control and Systems: Controllers, Contactors, and Overload Relays Rated 600 Volts.
- 4. U. S. Government:
 - a. Federal Aviation Administration (FAA):
 - 1) Aviation Administration Advisory Circulars (FAA AC):
 - a) FAA AC 150/5370-10C – Standards for Specifying Construction of Airports.
 - 2) United States General Services Administration (GSA):
 - a) Federal Specifications:
 - (1) Federal Specification RR-F-191/3E - Fencing, Wire and Post, Metal (Chain-Link Fence Posts, Top Rails and Braces) (Detail Specification).

1.03 SUBMITTALS

A. Action Submittals:

- 1. Submit the following to the Construction Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Chain link fence framing members.
 - 2) Chain link fence framing accessories.
 - 3) Chain link fence fabric and wire.
 - b. Shop Drawings:
 - 1) Proposed chain link fence layout.
 - c. Certificates:
 - 1) Certified mill certificates.
 - d. Qualification Statements:
 - 1) Chain link fence fabricator qualifications.
 - 2) Chain link fence erector qualifications.

B. Informational Submittals:

- 1. Submit the following to the Construction Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Chain link fence manufacturer's installation information.

1.04 QUALITY ASSURANCE

A. Qualifications:

- 1. Fabricator Qualifications:
 - a. Employ a fabricator that is a continuing member of the Chain Link Fence Manufacturer Institute (CLFMI).
 - b. Submit the qualifications of the Fabricator to the Program/Project manager for approval.

2. Erector Qualifications:
 - a. Employ an erector that has at least one person in a supervisory capacity, who is skilled and experienced in erecting chain link fence, readily understands the proposed layout, and is completely familiar with current erection practices of the Chain Link Fence Manufacturers Institute (CLFMI).
 - 1) Have this person present during the chain link fence installation.
 - b. Submit the qualifications of the Erector to the Program/Project manager for approval.

B. Certifications:

1. Submit certified mill certificates indicating material conformity to the specified yield strengths to the Program/Project Manager for approval.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Identify each shipment of fence fabric as to the size of the mesh, the size of the wire, the height and length of the fabric in each roll, ASTM designation ASTM A 392, and the name or mark of the manufacturer.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers offering chain link fence and gate products which can comply with the requirements of this Section include, but are not limited to, the following:
1. Merchant Metals, Inc., www.merchantmetals.com.
 2. Master Halco, www.fenceonline.com.
 3. Approved equal.

2.02 DESIGN CRITERIA:

A. Chain Link Fences:

1. For airside applications, provide chain link fences complying with the requirements specified for Item F-162 in FAA AC 150/5370-10C where those requirements are more stringent than specified herein.

B. Configuration:

1. Install chain link fence and gates at the locations indicated on the Contract Drawings in accordance with the requirements of ASTM F 567.
 - a. Submit Shop Drawings of the proposed layout, and include the manufacturer's published details as modified to suit design and field conditions.

2. Provide chain link type fence with a top rail, bottom rail, and single extension arms carrying 3 strands of barbed wire unless otherwise indicated on the Contract Drawings.
3. Fabric Height: 8 feet unless otherwise indicated on the Contract Drawings.
4. Overall Height (Including barbed wire extensions): 9 feet unless otherwise indicated on the Contract Drawings.

C. Product Compatibility:

1. Provide all chain link fence components from one manufacturer.
 - a. Submit the manufacturer's Product Data for the products specified including descriptive literature, specifications, and installation information.

2.03 FENCE COMPONENTS

A. Framing Members:

1. Provide steel pipe complying with the requirements for Class 1 (steel pipe), Grade A (Standard Weight (schedule 40) pipe complying with the requirements specified for Regular Grade pipe in ASTM F 1083) as specified in Federal Specification RR-F-191/3E, and having a minimum yield strength of 30,000 psi and the following additional features:
 - a. Intermediate (Line) Posts:
 - 1) Provide fabricated tubular members.
 - 2) Nominal Size: 2 inches.
 - 3) Weight: 3.65 pounds per foot.
 - b. End, Pull, and Corner Posts:
 - 1) Provide tubular members.
 - 2) Nominal Size: 2-1/2 inches.
 - 3) Weight: 5.79 pounds per foot.
 - c. Gate Posts:
 - 1) Provide steel pipe or tubular members.
 - 2) Nominal Size:
 - a) For gate leaf widths up to 6 feet: 2-1/2 inches in diameter.
 - b) For gate leaf widths up to 13 feet: 3-1/2 inches in diameter.
 - c) For gate leaf widths up to 18 feet: 6 inches in diameter.
 - d) For gate leaf widths up to 23 feet: 8 inches in diameter.
 - 3) Weight:
 - a) For gate leaf widths up to 6 feet: 5.79 pounds per foot.
 - b) For gate leaf widths up to 13 feet: 9.11 pounds per foot.
 - c) For gate leaf widths up to 18 feet: 18.97 pounds per foot.
 - d) For gate leaf widths up to 23 feet: 28.55 pounds per foot.
 - d. Post Braces:
 - 1) Provide brace assemblies, each consisting of a steel pipe brace with a 3/4-inch diameter truss rod and an adjustable take-up device.

- 2) Nominal steel pipe Size: 1-1/4 inches.
 - 3) Weight: 2.27 pounds per foot, minimum.
 - e. Top Rail:
 - 1) Provide steel pipe.
 - 2) Nominal Size: 1-1/4 inches.
 - 3) Weight: 2.27 pounds per foot, minimum.
 2. Galvanize the pipe inside and outside using the hot dipped method to provide a minimum zinc coating of 1.8 ounce per square foot.
- B. Framing Accessories:
 1. Provide the following hot-dip zinc galvanized framing accessories conforming to the requirements of ASTM F 626:
 - a. Post Tops:
 - 1) Where barbed wire supporting arms are not required, provide pressed steel or malleable iron weather tight caps designed to cover the post ends and permit passage of the top rail.
 - b. Flat Tension Bars:
 - 1) Provide a 3/16-inch by 3/4-inch aluminum or galvanized steel one-piece stretcher bar equal in length to the full height of the fence fabric.
 - 2) Provide 1 stretcher bar for each gate and end post, and 2 bars for each corner and pull post.
 - 3) Provide 3/4 inch wide stretcher bar bands spaced not over 15 inches on center to secure the stretcher bars to the posts.
 - c. Bar Bands:
 - 1) Provide bar bands fabricated from steel plate and strip.
 - d. Barbed Wire Supporting Arms:
 - 1) Provide barbed wire supporting arms fabricated from formed steel shapes, and designed for 3 strands of barbed wire
 - 2) Provide barbed wire supporting arms of sufficient strength to withstand, without failure, a 250-pound downward pull at one end of the arm.
 - 3) Set the barbed wire supporting arms at a 45-degree angle toward the outside of the Site.
- C. Fabric and Wire:
 1. Fabric:
 - a. Provide wire fabric complying with the requirements for Class 2 fabric specified in ASTM A 392, and with the following:
 - 1) Wire Fabric: No. 9 gauge galvanized steel.
 - 2) Galvanizing: 2.0 ounces per square foot zinc coating, minimum.
 - b. Mesh Size and Style:
 - 1) Provide fabric interwoven in a 2-inch mesh with top knuckled selvage and bottom twisted selvage.
 2. Galvanized Barbed Wire:

- a. Provide barbed wire consisting of two 12-1/2-gauge stranded line wires, with 14-gauge round wire barbs in a four-point pattern on 5-inch centers.
 - b. Provide steel wire with a Class 3 galvanized coating complying with the requirements of ASTM A 121.
3. Tension Wire and Tie Wires:
 - a. Tension Wire:
 - 1) Provide 7-gauge galvanized steel wire.
 - 2) Galvanize tension wires in accordance with the requirements for Class 1 coating as specified in ASTM A 641/A 641M.
 - b. Tie Wires:
 - 1) Tie wire for fabric to line posts, rails, and braces; minimum 9 gauge and have the same wire and coating as tension wire.

D. Concrete:

1. Provide concrete complying with the requirements of Section 03300, Cast-In-Place Concrete.

2.04 GATES

A. Swing Gates:

1. Gate Frames:
 - a. Fabricate the swing gate frame in accordance with ASTM F 900.
 - b. Provide a swing gate frame consisting of nominal 2 inch tubular horizontal and vertical members, and if required truss members assembled by welding.
 - c. Galvanize the swing gate frame the same as the fence frame members.
 - d. Provide the same fabric as provided for the fence, and install it with stretcher bars and bar ties at 15 inches on center.
 - e. Provide diagonal cross bracing consisting of 3/8-inch diameter adjustable length truss rods.
 - f. Provide gate hardware attached using rivets or other means to provide security against its removal.
2. Gate Hardware:
 - a. Hinges:
 - 1) Provide pressed steel or malleable iron hinges to suit the gate size, of the non-lift-off type, and offset to permit 180-degree swing in or out.
 - 2) Provide 1 pair (top and bottom) per gate leaf.
 - b. Latch:
 - 1) Provide a forked or plunger bar type latch to permit operation from either side of the gate.
 - 2) Provide a padlock eye as an integral part of the latch.
 - 3) Provide gate stops for the pair of gates designed to accept a drop rod or plunger bar.

- c. Keeper:
 - 1) Provide keeper for each gate leaf to hold gate leaf in open position until manually released.
 - d. Barbed wire topping:
 - 1) Extend vertical members of the gate frame 12 inches, and attach barbed wire to the frame using tension bands to prevent the wire from moving out of position.
 - e. Padlocks:
 - 1) Provide padlocks having a corrosion resistant brass case and brass cylinders designed for outdoor use, a hardened steel shackle, and a 4-pin tumbler locking mechanism.
 - 2) Provide padlocks keyed alike and master keyed.
 - a) Provide 2 keys per padlock.
- B. Cantilever Slide Gates:
- 1. Provide cantilever slide gates designed for the opening dimensions indicated on the Contract Drawings and to be operated by a mechanical operator, and having a frame/enclosed track which slides along guide wheel assemblies attached to gate fence posts to guide the movement of the gate.
 - 2. Cantilever Slide Gate Frames:
 - a. Provide cantilever slide gate frames fabricated from 2-inch square 6063-T6 aluminum alloy tubing that weighs 0.94 pounds per lineal foot.
 - 1) Weld the corners of all frame members to form a rigid one-piece unit.
 - 2) The cantilever slide gate frames may be an integral part of the enclosed track in some configurations, depending on the manufacturer's design for the gate opening dimensions.
 - 3. Cantilever Slide Gate Enclosed Track:
 - a. The exact configuration of the enclosed track depends on the manufacturer and the opening dimension of the gate, but for most applications will be as follows:
 - 1) Provide an upper frame/guide track consisting of either 1 or 2 combination track and frame aluminum extrusions, depending on the manufacturer's design for the gate opening dimensions, each extrusion weighing 3.72 pounds per foot.
 - a) Weld dual extrusions into a single top member unit with a combined weight of 7.44 pounds per foot.
 - 2) Provide each track with the capacity to withstand a 2,000-pound reaction load.
 - b. Provide a lower rail consisting of either a 1-inch square or a 1-inch by 2-inch aluminum, depending on the manufacturer's design for the gate opening dimensions.
 - 4. Cantilever Slide Gate Fence Fabric:

- a. Provide the same fabric for the cantilever slide gates as provided for the adjacent fence.
 - 1) Securely stretch the fence fabric within the frame, and attach the fabric to the 2 inch square tubing on all four sides of the frame by using tension rods and hook bolts spaced 15 inches apart on center.
5. Cantilever Slide Gate Posts:
 - a. Provide 4-inch outside diameter Schedule 40 galvanized steel gate posts weighing 9.1 pounds per foot.
 - 1) Provide 3 gate posts for gates having a single enclosed track.
 - 2) Provide 5 gate posts for gates having dual enclosed tracks.
6. Cantilever Slide Gate Guide Wheel Assemblies:
 - a. Upper Roller Assembly:
 - 1) For each gate, provide at least 2 upper roller assemblies consisting of a swivel type zinc die cast truck, each having 4 vertical load bearing wheels, and to insure alignment of the truck in enclosed track 2 additional horizontal (side rolling) wheels.
 - a) Provide 2-inch diameter by 9/16-inch wide sealed lubricant, ball bearing wheels.
 - 2) Attach an upper roller assembly mounting bracket to the each supporting gate post using 7/8-inch diameter ball bolts with 1/2-inch shanks.
 - 3) Design the upper roller assembly to withstand the same reaction load as the enclosed track.
 - b. Lower Roller Assembly:
 - 1) For each gate, provide lower roller assemblies consisting of a steel angle-like bracket having 2 horizontal (side rolling) wheels that roll on either side of the lowest member of the cantilever slide gate frames to retain and align the gate.
 - a) Provide 4-inch diameter rubber wheels.
 - 2) Attach a lower roller assembly to the each supporting gate post using hardware similar to that used to attach the upper roller assemblies to the gate posts.
 - 3) Provide provisions to adjust the lower roller assemblies to maintain the gate frame plumb and in proper alignment.
7. Fabricate all gate hangers, latches, brackets, guide assemblies, and stops from malleable iron or steel, and galvanize them after fabrication.
8. Provide a mechanical operator to open and close the gate.
9. Provide a latch capable of positive latching and having provisions for padlocking.
10. Slide Gate Mechanical Operators:
 - a. Provide mechanical operators for slide gates each capable of operating a single gate and producing a gate speed of 60 feet per minute.

- 1) To prevent excessive wear on integral components in the event the gate becomes obstructed during the open or close cycle, provide an adjustable internal timer to limit the run time of the operator to a maximum of 90 seconds in any one direction.
- 2) To reduce the shock load on the operator, design the operator so a signal to reverse gate movement from any opening device delays reversal by 1.5 seconds.
- 3) Design the operator so any opening control device is capable of overriding the close circuit and can reverse the gate to the open position.
- 4) Design the operator with full systems capabilities so that additional control systems may be easily added in the field.
- b. Drive:
 - 1) Provide a rotary type drive capable of limiting gate travel in the open and close position.
 - 2) Provide accurate limit switches that are readily adjustable without the use of tools, and that can be securely locked in place after adjustment.
 - a) Provide switch contacts rated at 10 Amps.
- c. Motor:
 - 1) Provide a minimum 1 HP, 460-Volt, 3 phase, high torque, and heavy-duty reversible motor, separate from the reduction mechanism for easy maintenance.
 - 2) Protect the motor against overloads and under voltage by providing an external overload in the control panel, which is manually reset.
- d. Motor Starter:
 - 1) Provide a motor starter complying with the requirements for NEMA size "0" specified in NEMA ICS 2, and having a mechanical interlock.
 - 2) Pre-wire control circuits to a terminal block for ease of field installation.
 - 3) Include an open override design to provide complete control of the gate while it closes.
- e. Transformer:
 - 1) Provide a transformer having a primary rated 70 VA and a 24-Volt AC secondary.
 - 2) Wire all control devices to the 24-volt control.
 - 3) Provide control relays having silver cadmium oxide contacts rated at 10 Amps, 120 VAC.
- f. Reduction Mechanism:
 - 1) Provide a 20:1 "C" face worm gear speed reducer to reduce output speed capable of achieving a final output speed of 36 rpm via a number 50 nickel-plated drive chain and sprockets assembly.

- g. Brake:
 - 1) Provide a solenoid activated, disc type, adjustable locking brake.
- h. Gate Disconnect:
 - 1) To allow the gate to be operated manually in case of power failure, provide a means of disconnecting the mechanical operator from the gate without the use of tools.
 - 2) Use the operator cover to also protect the gate disconnect mechanism.
 - 3) In manual operation, provide a 1:1 drive ratio to allow fast operation of the gate.
- i. Mounting Pad:
 - 1) Mount the mechanical operator on a concrete pad having a minimum depth of 42-inches or below the local frost line.
 - 2) Install the mechanical operator on pad level and parallel to the fence line.
- 11. Sliding Gate Operating System:
 - a. Sliding Gate Controls:
 - 1) Provide a complete keyless entry system, including detector loops, conduits, and wiring as shown on the Contract Drawings and as necessary for a complete and satisfactory installation.
 - 2) Provide inner and outer detector loops embedded below grade as shown on the Contract Drawings, and associated timer controls, at each gate entrance.
 - a) Provide the inner loop at exits to activate the gate to open and allow free exit when a vehicle approaches to exit.
 - b) Provide the remaining loops to assure that the gate does not close when a vehicle is in contact with the loop area.
 - 3) Provide a cut out switch to override timer control of gate closing.
 - 4) Provide a lockable three button "Open", "Stop", and "Close" pushbutton inside the fence in the vicinity of each operator.
 - 5) Manufacturers:
 - a) Door King, Inc., www.doorking.com.
 - b) Approved equal.
 - b. Keyless Entry System:
 - 1) Card Reader:
 - a) Provide a slot less touch card reader in a pedestal-mounted, weather resistant, painted steel enclosure with stainless steel faceplate, weather shield, and lighted housing.
 - (1) Power:
 - (a) Provide a 12 Volt AC, 20 VA transformer to provide power.
 - (2) Memory:
 - (a) Provide non-volatile, EEPROM memory, not requiring reprogramming after a power loss.
 - (3) Relay Outputs:

- (a) Provide an 8 Amp/250 Volt AC entry control relay, and a 0.6 Amp/125 Volt AC alarm shunt relay.
- (4) Time Clock:
 - (a) Provide a time clock that adjusts for daylight savings time and leap year.
- b) Provide a programmable card reader, accessed through the use of a field changeable 6-digit security code entered via a keypad.
 - (1) Provide a system capable of accepting up to 100 cards.
 - (2) Provide a system allowing entry of 4 million possible codes.
 - (3) Anti-Pass back: Provide a system programmable from 1 to 30 minutes.
- c) Manufacturers:
 - (1) SecuraKey, www.securakey.com.
 - (2) Approved equal.

PART 3 EXECUTION

3.01 PREPARATION

- A. Surface Preparation:
 - 1. Do not begin installing chain link fences and gates prior to completing Site grading operations.

3.02 INSTALLATION

- A. Post Excavation:
 - 1. Drill holes for post footings in firm, undisturbed or compacted soil to a diameter equal to 4 times the diameter of the post
 - 2. Excavate holes to depths approximately 4 inches deeper than the post bottom, with the bottom of posts set not less than 36 inches in a concrete base.
- B. Fence Post Installation:
 - 1. Space posts a maximum of 10 feet apart on center.
 - 2. Install fence posts in the excavated holes.
 - 3. Check each post for vertical and top alignment.
 - 4. Place concrete in the holes around the posts in a continuous pour.
 - a. Set keepers, stops, sleeves, and other accessories as required into the concrete.
 - b. Tamp the concrete to consolidate.
 - c. Crown the tops of post footings to shed water or as detailed.
- C. Brace Installation:

1. Install braces so posts are plumb when diagonal rods are under proper tension.
2. Provide 2 brace assemblies at each corner post and 1 brace assembly at each end and gatepost.

D. Fence Fabric Installation

1. Install tension wires before stretching fabric, and tie the tension wires to each post with ties or clips.
2. Install fabric on the security side of the fence, and anchor the fabric to the framework so the fabric remains in tension after the pulling force is released.
 - a. Thread stretcher bars through the fabric, and secure it to the posts with metal bands spaced not over 15 inches on center.
 - b. Pull the fence fabric taut and tie it to braces, rails, and tension wires with wire ties spaced not over 24 inches on center.
3. Leave approximately 2 inches between the finished grade and the bottom selvage.

E. Barbed Wire Installation:

1. Install 3 parallel strands of barbed wire on each extension arm on the security side of the fence.
2. Pull the barbed wire taut, and firmly anchor the barbed wire in the slots of the line post extension arms.

F. Gate Installation:

1. Install gates plumb, level, and secure for the full opening without interference.
2. Install ground set items in concrete for anchorage, as recommended by fence gate manufacturer and as detailed.
3. Adjust hardware for smooth operation, and lubricate it where necessary.

G. Gate Operator Installation:

1. Install each gate operator in accordance with manufacturer's instructions and as indicated in Contract Documents.

H. Keyless Entry System/Card Reader Installation:

1. Install the keyless entry system/card reader in accordance with manufacturer's instructions.
2. The Owner will provide a list of cardholder's names.
3. Furnish cards from the system supplier coded to the list of cardholder's names provided, and program the system to accept the coded cards.

3.03 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. Sliding Gate Test:

- a. Test Procedure:
 - 1) Test sliding gates to ensure they operate freely and properly prior to connecting the mechanical operator to the gate.
- b. Acceptance Criteria:
 - 1) Sliding gates that operate freely and properly are acceptable.

B. Manufacturer Services:

- 1. Furnish a representative from the keyless entry system/card reader system Supplier to verify correct operation of the coded cards.

3.04 CLEANING

- A. Clean up debris and unused material and remove it from the Site.

3.05 TRAINING:

- A. Furnish a representative from the keyless entry system/card reader system Supplier to instruct the Owner's personnel on the use of the system.

3.06 MAINTENANCE

- A. During the 1-year warranty period for the system, direct the fence Installer to perform quarterly (3 months) preventive maintenance checks using factory-trained technicians.

SECTION 02823

ORNAMENTAL METAL FENCES AND GATES - COATED

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for ornamental picket fencing and gates at the locations indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01780 - Closeout Submittals.
 - 3. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCE STANDARDS:

- A. American Society for Testing and Materials (ASTM):
 - 1. ASTM A 653/A 653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - 2. ASTM A 787 - Standard Specification for Electric-Resistance-Welded Metallic-Coated Carbon Steel Mechanical Tubing.
 - 3. ASTM A 1008/A 1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low Alloy, High-Strength Low Alloy With Improved Formability Solution Hardened and Bake Hardenable.
 - 4. ASTM B 86 - Standard Specification for Zinc and Zinc-Aluminum (ZA) Alloy Foundry and Die Castings.
 - 5. ASTM B 695 - Standard Specification for Coatings of Zinc Mechanically Deposited on Iron and Steel.

1.03 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Construction Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Product Data for the ornamental fence.
 - 2) Color selections for polyester finishes.
 - b. Shop Drawings:
 - 1) Shop Drawings of the proposed ornamental fence layout.
 - c. Samples:
 - 1) Samples of ornamental fence materials (e.g. finials, caps, and other accessories).

- d. Qualification Statements:
 - 1) Ornamental fence and gate manufacturer's qualifications.
- B. Informational Submittals:
 - 1. Submit the following to the Construction Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Ornamental fence and gate manufacturer's installation instructions.
- C. Closeout Submittals:
 - 1. Submit the following to the Construction Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Warranty Documentation:
 - 1) Ornamental fence and gate manufacturer's standard limited warranty.

1.04 QUALITY ASSURANCE

- A. Qualifications:
 - 1. Manufacturer's Qualifications:
 - a. Procure ornamental fences and gates from a manufacturer having a minimum of 5 years' experience manufacturing ornamental picket fencing following the design, size, gauge of metal parts and fabrication specified.
 - b. Submit the ornamental fence and gate manufacturer's qualifications to the Program/Project Manager for approval.
- B. Site Samples:
 - 1. If requested by the Owner, provide Samples of materials (e.g. finials, caps, and other accessories).

1.05 MANUFACTURER WARRANTY:

- A. Provide manufacturer's standard limited warranty that its ornamental fence system is free from defects in material and workmanship including cracking, peeling, blistering, and corroding for a period of 15 years from the date of purchase.
- B. Submit the ornamental fence and gate manufacturer's standard limited warranty to the Program/Project Manager for approval.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers offering ornamental metal fence and gate products which can comply with the requirements of this Section include, but are not limited to, the following:
 - 1. Merchant Metals, Inc., www.merchantmetals.com.
 - 2. Master Halco, www.fenceonline.com.
 - 3. Approved equal.

2.02 DESIGN CRITERIA:

- A. Configuration:
 - 1. Install ornamental metal fence and gates at the locations indicated on the Contract Drawings.
 - a. Submit Shop Drawings of the proposed layout, and include the manufacturer's published details as modified to suit design and field conditions, and the layout of fence and gates with dimensions, details, and finishes of the component, accessories, and post foundations.
- B. Product Compatibility:
 - 1. Provide all ornamental metal fence components from one manufacturer.
 - a. Submit the manufacturer's Product Data for the products specified, including descriptive literature indicating material compliance and specified options, specifications, and installation information.
 - b. Submit color selections for polyester finishes.

2.03 COMPONENTS

- A. Rails:
 - 1. Provide 1-1/2-inch by 1-3/8-inch by 1-1/2-inch steel "U" channel rail members complying with the requirements of ASTM A 653/A 653M or ASTM A 1008/A 1008M.
 - a. Yield Strength: 50,000 psi.
 - b. Minimum Wall Thickness: 11 gauge (0.120 inch).
- B. Pickets:
 - 1. Provide square tubular steel picket members complying with the requirements of ASTM A 787.
 - a. Yield Strength: 45,000 psi.
 - b. Minimum Wall Thickness: 14 gauge.
 - 2. Minimum Size Picket: 3/4 inch.
 - 3. Picket Spacing: 4 inches on center.
- C. Posts:

1. Provide square tubular steel post members complying with the requirements of ASTM A 787.
 - a. Yield Strength: 45,000 psi.
 - b. Minimum Wall Thickness: 12 gauge (0.105 inch).
 - c. Minimum Post Size: 3 inches.
 - d. Post Weight: 4.286 pounds per foot.
- D. Flanged Posts:
 1. Provide flange type base plates with 4 holes for surface mounting posts where indicated or required.
- E. Rail Attachment Brackets:
 1. Provide die cast zinc ball and socket design rail attachment brackets complying with the requirements for alloy Z33520 as specified in ASTM B 86.
 2. Provide brackets that fully encapsulate the rail ends to provide complete security and be aesthetically pleasing.
 3. Provide brackets that are capable of swiveling 30 degrees to the left and right.
- F. Post Caps:
 1. Provide weathertight closure caps fabricated from formed steel, cast malleable iron, or aluminum alloy.
 2. Provide 1 ball style post cap for each post.
- G. Picket Tops:
 1. Provide flat picket tops having a polymer plug.
- H. Concrete:
 1. Provide concrete in accordance with the requirements of Section 03300, Cast-In-Place Concrete, and having a minimum 28-day compressive strength of 3000 psi.

2.04 FACTORY ASSEMBLY

- A. Assemble ornamental fence panels with ornamental accessories attached via tack welding, as shown on drawings.

2.05 FINISHES:

- A. Finish Materials:
 1. Galvanize the steel, applying a 0.90 ounce per square foot zinc coating in accordance with the requirements for a G90 Coating Designation as specified in ASTM A 653/A 653M.
 2. Finish Coat: Polyester resin based powder coating.
 - a. Color: Black.

B. Shop Finishing Methods:

1. After all steel components have been galvanized, clean and prepare the surface of all components to assure complete adhesion of finish coat.
2. Apply 2.5 mil thickness of polyester resin based powder coating by electrostatic spray process.
3. Bake the finish for 20 minutes at 450 degrees Fahrenheit metal temperature.
4. Galvanize each ferrous metal accessory item in accordance with ASTM B 695, and finish to match the framing.

2.06 ACCESSORIES

A. Industrial Drive Rivets:

1. Provide industrial drive rivets long enough to attach items in a secure non-rattling position.
2. Provide industrial drive rivets having a minimum holding power of 1100 pounds and shear strength of 1500 pounds.

B. Ornamental Picket Fence Accessories:

1. Provide indicated items required to complete the fence system.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Verify that the areas to receive fencing are completed to the final grades and elevations indicated on the Contract Drawings.
2. Ensure property lines and legal boundaries of work are clearly established.

3.02 INSTALLATION

A. Install fence in accordance with manufacturer's installation instructions.

1. Submit the manufacturer's installation instructions to the Program/Project Manager for information.

B. Space posts uniformly at the face to face dimension indicated in the approved Shop Drawings.

C. Set Concrete Posts:

1. Drill a hole on firm, undisturbed or compacted soil.
2. Drill holes to have a diameter 4 times greater than nominal outside dimension of the post, and to a depth approximately 6 inches deeper than post bottom.
 - a. Excavate deeper as required for adequate support in soft and loose soils, and for posts with heavy lateral loads.

3. Set the post bottom 36 inches below the surface when in firm, undisturbed soil.
 4. Place concrete around the post in a continuous pour.
 5. Trowel finish around posts and slope to direct water away from posts.
- D. Check each post for vertical and top alignment, and maintain them in position during placement and finishing operations.
- E. Align fence panels between posts.
- F. Firmly attach rail brackets to post using 1/4-inch bolt and lock nut, ensuring panels and posts remain plumb.
- G. Install post caps and other accessories to complete the fence installation
- H. Gate Posts and Hardware:
1. Set keepers, stops, sleeves, and other accessories into concrete.
- I. Wall Mounted Posts:
1. Surface mount (wall mount) posts with mounting plates where indicated.
 2. Fasten mounting plates with lag bolts and shields.

3.03 CLEANING

- A. Clean up debris and unused material, and remove them from the Site.

END OF SECTION

REV. NO.	REV. DATE	RFC/CN/CO	Section(s) Affected	Comments
0	11/03/2017	N/A	All	First Edition
1	04/19/2018	N/A	All	Name Change to include descriptor "Coated". Specification has been modified to delete Stainless Steel references, clarifies coating requirements.

SECTION 02824

ORNAMENTAL METAL FENCES AND GATES – STAINLESS-STEEL

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for ornamental picket fencing and gates at the locations indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 02300 – Earthwork.
 - 5. Section 03300 - Cast-In-Place Concrete.
 - 6. Section 04810 Unit Masonry Assemblies

1.02 REFERENCE STANDARDS:

- A. American Society for Testing and Materials (ASTM):
 - 1. City of Phoenix Building Construction Code
 - 2. ASTM A 36/A 36M - Standard Specification for Carbon Structural Steel.
 - 3. ASTM A 123/A 653M - Standard Specification for Zinc (Hot-Dip Galvanized) Coating on Iron and Steel Products.
 - 4. ASTM A 500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
 - 5. ASTM A 513 - Standard Specification for Electric-Resistance-Welded Carbon and Alloy Steel Mechanical Tubing.
 - 6. ASTM A 653/A 653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - 7. ASTM B 695 - Standard Specification for Coatings of Zinc Mechanically deposited on Iron and Steel.
 - 8. ASTM A 787 - Standard Specification for Electric-Resistance-Welded Metallic-Coated Carbon Steel Mechanical Tubing.
 - 9. ASTM A 1008/A 1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low Alloy, High-Strength Low Alloy With Improved Formability Solution Hardened and Bake Hardenable.
 - 10. ASTM B 86 - Standard Specification for Zinc and Zinc-Aluminum (ZA) Alloy Foundry and Die Castings.
 - 11. ASTM B 695 - Standard Specification for Coatings of Zinc Mechanically Deposited on Iron and Steel.
 - 12. ASTM A554-Standard Specification for Welded Stainless Steel.

13. ASTM A276-Standard Specification for Stainless Steel Bars and Shapes
14. ASTM A 240 Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications
15. ASTM A 666 Annealed or Cold Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar

1.03 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Construction Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Product Data for the Ornamental fence and Gates.
 - 2) Color selections for finishes.
 - b. Shop Drawings:
 - 1) Shop Drawings of the proposed Ornamental fence and Gates layout.
 - c. Samples:
 - 1) Samples of Ornamental fence and Gates materials (e.g. finials, caps, and other accessories) components.
 - d. Qualification Statements:
 - 1) Ornamental fence and Gate manufacturer's qualifications.

B. Informational Submittals:

1. Submit the following to the Construction Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Ornamental fence and Gate manufacturer's installation instructions.

C. Closeout Submittals:

1. Submit the following to the Construction Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Warranty Documentation:
 - 1) Ornamental fence and Gate manufacturer's standard limited warranty.

1.04 QUALITY ASSURANCE

A. Qualifications:

1. Manufacturer's Qualifications:
 - a. Procure Ornamental fences and Gates from a manufacturer having a minimum of 5 years' experience manufacturing Ornamental fencing

and Gates following the design, size, gauge of metal parts and fabrication specified.

- b. Submit the Ornamental fence and Gate manufacturer's qualifications to the Program/Project Manager for approval.

B. Site Samples:

1. If requested by the Owner, provide Samples of materials (e.g. finials, caps, and other accessories).

1.05 MANUFACTURER WARRANTY:

- A. Provide manufacturer's standard limited warranty that its Ornamental fence and Gate system is free from defects in material and workmanship including cracking, peeling, blistering, and corroding for a period of 15 years from the date of purchase.
- B. Submit the Ornamental fence and Gate manufacturer's standard limited warranty to the Program/Project Manager for approval.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers offering Ornamental metal fence and Gate products which can comply with the requirements of this Section include, but are not limited to, the following:
 1. Brooklyn Stainless Steel <http://www.brooklynstainlesssteel.com>
 2. Quality Stainless Steel www.qualitystainlesssteel.com
 3. Approved equal.

2.02 DESIGN CRITERIA:

- A. Configuration:
 1. Fabricate and install Ornamental metal fence and Gates at the locations indicated on the Contract Drawings.
 - a. Submit Shop Drawings of the proposed layout, and include the manufacturer's published details as modified to suit design and field conditions, and the layout of fence and gates with dimensions, details, and finishes of the component, accessories (including but not limited to Automatic Gate Opener, Automatic Gate Controller and Wireless Push Pad Opener), and post foundations.

Note: all work associated with the Ornamental Fence and Gate construction shall be designed to be in compliance with City of Phoenix Building Construction Code and any issued amendments to this code.
- B. Product Compatibility:

1. Provide all Ornamental metal fence and Gate components from one manufacturer.
 - a. Submit the manufacturer's Product Data for the products specified, including descriptive literature indicating material compliance and specified options, specifications, and installation information.
 - b. Submit color selections for all finishes.
 - c. Submit all data to the Program/Project Manager for review and approval.

2.03 COMPONENTS

- A. Materials:
 1. Post and Caps: Stainless Steel Posts and Caps shall be 2" Schedule 80
 2. Rails: Stainless Steel Rails shall be 2" Schedule 80
 3. Intermediate Rails: Stainless Steel Intermediate Rails shall be ½" Schedule 80
 4. Flat Bar Intermediate Post: Stainless Steel Flatbar ½" Thick
 5. Flat Bar Weld Plate: Stainless Steel ½" x 7 1/2" Flat Bar Wall Cap/Weld Plate
- B. Concrete:
 1. Provide concrete in accordance with the requirements of Section 03300, Cast-In-Place Concrete, and having a minimum 28-day compressive strength of 3000 psi.

2.04 ASSEMBLY

1. Fence and Gate Components Rails:
 - a. Provide rails fabricated from Stainless Steel tubing complying with the requirements as indicated on the Contract Drawings
2. Pickets:
 - a. Provide pickets fabricated from Stainless Steel tubing complying with the requirements as indicated on the Contract Drawings
3. Gates:
 - a. Provide frames for gates having sufficient size and thickness to provide adequate support without sag.
 - a) Adjustable trussing may be required.
 - b. Provide gate hardware from the manufacturer of sufficient size and capacity to support the gate specified.
 - c. Provide all required materials and electrical connections for the specified automatic gate opener, control panel, and wireless push pad openers.
4. Posts:
 - a. Provide fence posts and caps fabricated from Stainless Steel tubing complying with the requirements as indicated in the Contract Drawings

2.05 FABRICATION

1. Shop Fabrication:
 - a. Fabricate the panels, gates, and posts using Stainless steel complying with the requirements in the ASTM standards specified, and from new prime material.
 - b. Welded Construction:
 - 1) Provide panels, gates, and flanged posts fabricated using the gas metal arc welding method.
 - a) No wire rods, screws, or rivets are acceptable for attaching the pickets to the rails.
 - 2) Have experienced craftsmen perform the layout and welding.
 - 3) Provide welds that are neat, clean and of the sizes indicated on the Contract Drawings.
 - a) Grind flush welds smooth.

2.06 FINISHES:

- A. Finish Materials:
 1. Stainless Steel Finish Shall be Brushed Number 04 for all components.

2.07 ACCESSORIES

- A. Ornamental Fence and Gate Accessories:
 1. Provide indicated items required to complete the Ornamental fence and Gate system including the automatic gate opener, automatic gate controller, and wireless push button gate openers.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Verify that the areas to receive fencing are completed to the final grades and elevations indicated on the Contract Drawings.
 2. Ensure property lines and legal boundaries of work are clearly established.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 1. Protect adjacent areas from damage resulting from installation of the Ornamental Metal Fences and Gates.
- B. Surface Preparation:
 1. Perform excavations for Ornamental Metal Fence and Gate posts in accordance with the requirements specified in Section 02300, Earthwork.

3.03 INSTALLATION

- A. Install fence in accordance with manufacturer's installation instructions and as indicated on the Construction Documents.
 - 1. Submit the manufacturer's installation instructions to the Program/Project Manager for information.
- B. Space posts uniformly at the face to face dimension indicated in the approved Shop Drawings.
- C. Set Concrete Posts:
 - 1. As indicated on the construction documents
 - 2. Align all fence panels between the Ornamental Fence Posts as shown on the construction documents
- D. Check each post for vertical and top alignment, and maintain them in position during placement and finishing operations.
- E. Weld fence panels to the Ornamental fence posts.
 - 4. When field welding a rail to a post, provide a complete 360 degree weld (all four sides) of the size indicated on the Contract Drawings.
- F. Install post caps and other accessories to complete the fence installation
- G. Gate Posts and Hardware:
 - 1. Set keepers, stops, sleeves, and other accessories into concrete. Note install Gate Stops if required by PSHIA.
 - 2. Install gates plumb and level, and of the sizes and style indicated on the Contract Drawings.
 - 3. Field-attach padlock provisions or strikes to assure alignment.
 - 4. Lubricate the hinges, rollers, and other gate hardware after installation
- H. Wall Mounted Posts:
 - 1. Surface mount (wall mount) posts as indicated on the contract drawings.

3.04 CLEANING

- A. Clean all concrete residue from all exposed Ornamental Fencing and Gate materials
- B. Waste Management
 - 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.
 - 2. Scatter or remove post hole excavations uniformly away from the posts as directed by the Program/Project Manager.
- C. Clean up debris and unused material, and remove them from the Site.

SECTION 02825

WIRE ROPE SECURITY FENCE

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for wire rope security fence (WRSF).
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 03100 - Concrete Forms and Accessories.
 - 4. Section 03200 - Concrete Reinforcement.
 - 5. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. MBL: Minimum breaking load.
 - 2. WRSF: Wire rope security fence.
- B. Definitions:
 - 1. Tufftride Process: Nitride hardening, a chemical process using a salt bath to change the surface characteristics of metals.
- C. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO M 30 - Standard Specification for Zinc-Coated Steel Wire Rope and Fittings for Highway Guardrail.
 - 2. American National Standards Institute (ANSI):
 - a. ANSI B1.13M – Metric Screw Threads – M Profile.
 - 3. American Welding Society (AWS):
 - a. AWS D1.1/D1.1M - Structural Welding Code - Steel.
 - 4. ASTM International (ASTM):
 - a. ASTM A 36/A 36M - Standard Specification for Carbon Structural Steel.
 - b. ASTM A 123/A 123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
 - c. ASTM A 153/A 153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
 - d. ASTM A 741 - Standard Specification for Zinc-Coated Steel Wire Rope and Fittings for Highway Guardrail.
 - 5. City of Phoenix (COP):

- a. Aviation Department:
 - 1) S.O.P. Number 4.19.00 – Standard Operating Procedures: Perimeter Fence, Gates, and Doors.
- 6. State of Arizona:
 - a. Arizona Revised Statutes (ARS):
 - 1) ARS 40-360.21 through 32 - Chapter 2 Public Service Corporations Generally, Article 6.3, Underground Utilities,
 - 2) ARS 40-360.41 through 45 - Chapter 2 Public Service Corporations Generally, Article 6.4, High Voltage Power Lines and Safety Restrictions.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Excavation Safety:
 - a. At least 3 days prior to the start of digging or excavation Work, contact Arizona Blue Stake at (602) 263-1100 to arrange for utility owners to locate and mark their underground utilities.
 - 1) Comply with applicable Arizona Revised Statutes (ARS), especially those regarding Underground Utilities and the Overhead Powerline Safety Law.
 - 2) If unexpected active underground facilities are encountered during the performance of the Work, notify the Program/Project Manager immediately.
 - b. Sole responsibility for making all excavations in a safe manner is the Contractor's.
 - c. Provide suitable protection against bodily injury.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Wire rope security fence concrete mix design.
 - 2) Wire rope security fence concrete reinforcement.
 - 3) Wire rope security fence fittings.
 - 4) Wire rope security fence posts.
 - 5) Wire rope security fence sockets.
 - 6) Wire rope security fence wire rope.
 - b. Shop Drawings:
 - 1) Wire rope security fence layout and anchorage details.
 - c. Certificates:
 - 1) Manufacturers' Certificates of Compliance for wire rope, anchor posts, corner posts, and line posts.

- d. Qualification Statements:
 - 1) Welding procedure specifications (WPS) test records.
 - 2) Welding Certificates.
 - 3) Wire rope security fence installer's qualifications.

B. Informational Submittals:

- 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Wire rope safety fence manufacturer's installation instructions.
 - 2) Wire rope safety fence manufacturer's wire rope placing and tensioning recommendations.
 - b. Manufacturer's Reports:
 - 1) Wire rope, anchor post, corner post, and line post manufacturers' material test reports.

1.05 QUALITY ASSURANCE

A. Qualifications:

- 1. Welding Qualifications:
 - a. Welding Procedure Specifications (WPS):
 - 1) Prior to beginning work that requires welding, submit the pre-qualifying welding procedures to the Program/Project Manager for approval.
 - 2) For all procedures, other than those set forth in AWS D1.1/D1.1M, submit a copy of the welding procedure specifications (WPS) test records to the Program/Project Manager for approval.
 - b. Welders' Qualifications:
 - 1) Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders to the Program/Project Manager for approval.
 - a) Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed for the procedures in AWS D1.1/D1.1M.
 - 2) Submit Welding Certificates certifying the welders employed to fabricate and to erect the Work of this Section have been certified by the American Welding Society (AWS) within the previous 12 months to the Program/Project Manager for approval.
 - a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures and, if pertinent, has undergone recertification.

2. Wire Rope Security Fence Installer's Qualifications:
 - a. Employ an experienced wire rope security fence installer who has completed wire rope security fence installations that were similar in material, design, and extent to that indicated for this Contract at this or other airports, and which exhibits a record of successful in-service performance.
 - 1) Submit the wire rope security fence installer's qualifications to the Program/Project Manager for approval.

B. Certifications:

1. Manufacturers' Certificates of Compliance:
 - a. Submit certification from the manufacturers of the wire rope, anchor posts, corner posts, and line posts certifying compliance with the requirements specified to the Program/Project Manager for approval.
2. Manufacturers' Material Test Reports:
 - a. Submit material test reports from the manufacturers of the wire rope, anchor posts, corner posts, and line posts indicating compliance with the requirements specified to the Program/Project Manager for approval.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Delivery Requirements:
 - a. Ensure materials are delivered to the Site at times and intervals that facilitate uninterrupted progress of the Work and continuity of installation.
 - b. Wire Rope:
 - 1) Suitably wrap, package, and/or cover wire rope at the factory to prevent physical damage and deleterious corrosion during transportation.
 - c. Ship small parts, such as bolts, nuts, washers, and small connecting plates and anchors, in boxes, crates, or barrels.
 - 1) Plainly mark an itemized list and description of the contents on the outside of each container.
2. Acceptance Requirements:
 - a. Have the wire rope security fence installer inspect the components and accessories at the time of delivery to the Site and prior to placement.
 - 1) Notify the Program/Project Manager of observed damages immediately.
 - b. Surface Condition:
 - 1) If surface rust is present, remove it with a fine steel wool pad or by vigorously rubbing it with a cloth.
 - 2) Remove and discard lengths of wire rope containing broken or corroded wires.

B. Storage and Handling Requirements:

1. Store wire rope security fence components on platforms, skids, blocking, or other supports to prevent contact with dirt, debris, and moisture.
2. Protect fastener products from dirt and corrosion by placing them in closed containers.
 - a. Store fastener products in a protected shelter, remove fastener components only as necessary, and promptly return unused fasteners to protected storage.
3. Keep wire rope security fence components dry.
 - a. Place steel stored at the Site above the ground on elevated covered platforms.
 - 1) Do not expose steel materials to water and/or dirt.
4. Do not expose wire rope stored more than one month to direct sunlight.
5. Handle wire rope security fence components with special care so no posts are bent, broken, or otherwise damaged; and avoid damage to other material.
 - a. Replace damaged components, unless the Program/Project Manager authorizes repairs.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Do not perform excavating, backfilling, or compacting operations when either weather conditions or the condition of the materials are such, in the opinion of the Program/Project Manager, that the work cannot be performed satisfactorily.
2. Provide effective dust control measures on the Site to prevent the spread of dust during earthwork operations.
 - a. Thoroughly moisten excavation areas by dampening the soil, or employ other similar methods as approved by the Program/Project Manager.

B. Existing Conditions:

1. It is the Contractor's responsibility to satisfy itself regarding the actual soil classification and condition, the water table, and the amount of rock, gravel, sand, silt, clay, and water, to be encountered during the Work of this Section.
2. Assume the risks attending to the presence or proximity, if any, of overhead or underground public utility and private lines, pipes, conduits and their associated support work, and other structures and property of every kind and description, in or over the excavation, or in the vicinity of the work, whether above or below the surface of the ground.

PART 2 PRODUCTS

2.01 SYSTEMS

A. Manufacturer List:

1. Brifen USA, Inc., www.brifenusa.com.
2. Approved equal.

B. Description:

1. Provide interwoven 4-rope type wire rope security fence (WRSF) in which the ropes are each woven on alternating sides of sequential socked line posts for the entire length of the fence segment.
 - a. Provide interwoven wire rope security fence having each rope placed on the opposite side of the line posts as the next higher rope.
2. Regulatory Requirements:
 - a. If installation of the work under this Section involves an addition, alteration, or deletion of a fence or wall that forms part of the perimeter fence line between a public area and a restricted area at the Phoenix Sky Harbor International Airport, comply with the requirements of the City of Phoenix (COP) Aviation Department's S.O.P. Number 4.19.00.

C. Performance:

1. Threaded Terminals:
 - a. Provide threaded terminals so fully fitted ropes are capable of developing a minimum breaking load (MBL) of 36,800 pounds force (16.7tonne).
2. Turnbuckles/Rigging Screws:
 - a. Provide turnbuckles/rigging screws capable of developing a minimum tensile load of 36,800 pounds force (16.7tonne) without yielding.
3. Mechanical Anchor Fittings:
 - a. Provide mechanical anchor fittings capable of developing a minimum tensile load of 36,800 pounds force (16.7tonne) of the entire wire rope without yielding.

D. Design Criteria:

1. Post Foundations:
 - a. Determine the size of foundations for the anchor posts, the corner posts at changes of direction, and the line posts based on the classification and condition of the soil, the water table, and expected temperature extremes and other climatic conditions, at the Site.
2. Threaded Terminal Fittings:
 - a. Design threaded terminal fittings so their bodies engage a minimum depth of 5.9 inches (150mm) of wire rope.
3. Line Posts:
 - a. Design line posts to be capable of holding the wire ropes at the design height indicated on the drawings attached to the end of this Section.

- b. Provide line posts designed to be placed in a metal sleeve installed in a socketed foundation.
 - 4. Product Data:
 - a. Submit the manufacturer's Product Data for each product specified and provided under this Section to the Program/Project Manager for approval.
 - b. Submit the manufacturer's installation instructions for each product specified to the Program/Project Manager for information.
 - 5. Shop Drawings:
 - a. Submit detailed Shop Drawings showing the layout of wire rope security fence and anchorage details to the Program/Project Manager for approval.
- E. Components:
 - 1. Concrete:
 - a. Provide concrete complying with the requirements specified for Class AA concrete in Section 03300, Cast-In-Place Concrete.
 - 2. Concrete Reinforcement:
 - a. Provide concrete reinforcement complying with the requirements specified in Section 03200, Concrete Reinforcement.
 - 3. Wire Rope Security Fence Fittings:
 - a. Threaded Terminals:
 - 1) Provide galvanized swaged type M24 X 3 threaded terminals threaded in accordance with the requirements specified in ANSI B1.13M for the ends of the wire rope.
 - a) Nominal size coarse pitch: 3.
 - b) The threaded terminals may be either shop or field swaged.
 - c) Galvanize the threaded terminals in accordance with the requirements specified in ASTM A 153/A 153M after threading.
 - d) Provide right hand (RH) and left hand (LH) threaded terminals as required.
 - b. Turnbuckles/Rigging Screws:
 - 1) Provide galvanized turnbuckles, also known as rigging screws, of the sizes and shapes indicated on the drawings attached to the end of this Section that allow a minimum 6-inch penetration of wire rope on each end.
 - a) Provide either solid or closed body type turnbuckles having 2 inspection holes designed to allow the terminal penetration of the threaded rope to be determined.
 - b) Galvanize the turnbuckles in accordance with the requirements specified in ASTM A 153/A 153M after threading.
 - 2) Provide turnbuckles having one end threaded right hand and the other end threaded left hand with M24 X 3 threads complying with the requirements specified in ANSI B1.13M.

- c. Mechanical Anchor Fittings:
 - 1) Provide mechanical anchor fittings consisting of a cylindrical barrel with a tapered interior bore into which the wire rope can be inserted from the narrower end, a set of grooved wedges which can be inserted from the opposite end between the barrel and the wire rope, a coil spring, and a screw on cap.
 - 2) Design the mechanical anchor fittings so the coil spring is compressed against the grooved wedges when the cap is screwed onto the wider end of the barrel, thus exerting force on the wedges to prevent an accidental release of the wedges while tension in the wire rope pulls the wedges tighter around the wire rope.
 - a) Provide mechanical anchor fittings capable of infinite adjustment along the wire rope for proper length.
 - b) Provide mechanical anchor fittings capable of release and reuse.
 - 3) Coat the mechanical anchor fittings using the Tufftride process and wax oil for protection.
- 4. Fence Posts:
 - a. Line, End Anchor, and Corner Posts:
 - 1) Provide line posts of the sizes and shapes indicated on the drawings attached to the end of this Section, fabricated from domestic hot rolled steel complying with the requirements specified in ASTM A 36/A 36M, and galvanized in accordance with the requirements specified in ASTM A 123/A 123M or powder-coated after fabrication.
 - a) Pre-drill 17/64-inch holes in the posts to accept wire rope locating pegs as shown on the drawings.
 - b) After galvanizing, clean the holes in the posts for the wire rope locating pegs.
 - 2) For driven post assemblies only, provide soil plates fabricated from 3/16 inch thick steel welded to the driven post.
 - b. Wire Rope Locating Pegs:
 - 1) Provide the manufacturer's standard locating pegs.
 - c. Excluders:
 - 1) Provide a low-density polyethylene excluder profiled to fit tightly around each post to prevent debris from entering the sockets in the post foundations.
 - d. Post Caps:
 - 1) Provide black low-density polyethylene post caps designed to fit on the top of posts.
- 5. Sockets:
 - a. Provide sockets placed in concrete foundations as shown on the drawings attached to the end of this Section.

- 1) Fabricate the sockets placed in concrete foundations from 10 gage, minimum, hot rolled mild steel complying with the requirements specified in ASTM A 36/A 36M, and galvanized in accordance with the requirements specified in ASTM A 123/A 123M after fabrication.
 - a) Provide either steel or polyethylene bottom end closure for sockets.
 - b) Provide concrete reinforcement for the concrete foundations consisting of 8-inch (200mm) diameter reinforcing rings having a 4-inch overlap made from number 3 deformed rebar and other reinforcement as shown on the drawings attached to the end of this Section.
6. Wire Rope:
 - a. Provide galvanized wire rope complying with the requirements for Type I Guard Cable as specified in Table 1 in AASHTO M 30/ASTM A 741, and having a Class A Coating as specified in Table 2 in AASHTO M 30/ ASTM A 741, except as modified herein:
 - 1) Minimum Diameter: 3/4 inch (19mm).
 - 2) Construction: 3 by 7 (the number of strands by the number of wires per strand).
 - 3) Minimum Breaking Strength: 39,000 pounds force (17.7tonne).
 - b. Minimum Modulus of Elasticity:
 - 1) Provide wire rope that has been pre-stretched during its manufacture so that after the pre-stretching the rope exhibits a minimum modulus of elasticity of 11,805,090 pounds per square inch (8300 kg/mm²).
- F. Shop Fabrication:
 1. Perform all welding in accordance with the requirements specified in AWS D1.1/D1.1M.

2.02 ACCESSORIES

- A. Retroreflective Sheeting:
 1. If retroreflective sheeting is required on posts, provide sheeting of the color and spacing required by the Owner, and properly sized to fit the traffic approach side of the line post.
- B. Prismatic Reflectors:
 1. If prismatic reflectors are required, provide adhesive backed double sided reflectors of the color(s) selected by the Program/Project Manager suitable for field application.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Examine the area where the wire rope security fence is to be installed to verify it is relatively smooth, without drop-offs, holes, depressions, or abrupt slope changes.
 - 2. Determine actual soil conditions, which may differ from those anticipated or indicated by available soil logs and/or reports.
- B. Evaluation and Assessment:
 - 1. Notify the Program/Project Manager of unexpected subsurface conditions, and discontinue working in the affected area until notified to resume work.

3.02 PREPARATION

- A. Surface Preparation:
 - 1. Before starting to install the wire rope safety fence, grade the area smooth and perform necessary filling and compaction.

3.03 INSTALLATION

- A. Locate and align the wire rope security fence in accordance with the Contract Drawings and as directed by the Program/Project Manager.
- B. Foundations:
 - 1. Concrete Foundations:
 - a. Either excavate holes having vertical sides and flat bottoms for the foundations in natural, undisturbed ground to the size and shape indicated on the drawings attached to the end of this Section, install concrete reinforcement, and place concrete in the excavation completely filling the excavation; or alternatively form the foundation in accordance with the requirements of Section 03100, Concrete Forms and Accessories, install concrete reinforcement, cast the foundation, remove the forms, and backfill and compact the backfill to a minimum density of 95 percent.
 - 1) Provide concrete reinforcement as indicated on the drawings attached to the end of this Section.
 - b. Ensure that the sockets are installed flush with the top of the foundations.
- C. Posts:
 - 1. Provide posts of the type indicated on the Contract Drawings and on the drawings attached to the end of this Section.
 - a. Unless otherwise indicated, place line posts in sockets set in concrete foundations.

- 1) Install driven post assemblies only where specifically indicated on the Contract Drawings.
 - b. Space the posts as indicated on the Contract Drawings and/or on the drawings attached to the end of this Section.
 - c. Set the posts plumb and in line.
2. Ensure that the radiused edges of the posts are on the side of approaching traffic.
3. Install the excluders tight against the top of the sockets.

D. Wire Rope:

1. Place the wire rope and fittings and tension the wire rope as recommended by the wire rope safety fence manufacturer.
 - a. Submit the wire rope safety fence manufacturer's placing and tensioning recommendations to the Program/Project Manager for information.
2. Provide wire rope at the wire heights indicated on the drawings attached to the end of this Section so an aesthetically pleasing line of sight is produced.
3. When changes of direction are required, carry the ropes around corner posts.
4. At end anchor posts, secure the wire ropes inside the posts to prevent unauthorized access.
 - a. At the end anchor posts where threaded terminals on the end of the wire ropes are not feasible, provide mechanical anchor fittings.

3.04 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. Galvanized Coating Test:
 - a. Test Procedure:
 - 1) The galvanized components will be tested at the Site to determine the weight of the galvanized coating using a magnetic gage.
 - b. Acceptance Criteria:
 - 1) Galvanized components having at least the minimum specified weight of galvanized coating will pass the Galvanized Coating Test.
2. Inspections:
 - a. The wire rope will be visually inspected for its condition and conformance with dimensional and other requirements.

B. Non-Conforming Work

1. Promptly remove and replace materials or fabricated components that do not comply with specified requirements.

3.05 CLEANING

- A. Clean up debris and unused material, and remove them from the Site.
- B. Waste Management:
 - 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

3.06 ATTACHMENTS

- A. The following attachments are appended to this Section following the “END OF SECTION” marker:
 - 1. General Layout Wire Rope Security Fence.
 - 2. General Layout Four-Rope Security Fence (36 – 1/2”).
 - 3. Steel Post End Anchorage (Drilled Shaft) (3’ Dia X 8’ Deep).
 - 4. Wire Rope and Fittings.
 - 5. Socketed Post Detail.

END OF SECTION

NOTES:

1. Wire rope to be 3/4" (19mm) pre-stretched 3x7 construction meeting ASTM A-741-90 modified to Britten specifications.
2. Minimum breaking load of fitted ropes shall be 36,800 pounds (16.7 Tonne F metric).
3. Threaded terminal and rigging screw galvanized to A153. Threads to be metric 24 X 3 - 7H and develop minimum tensile load of 36,800 pounds (16.7 Tonne F metric) without yielding.
4. When segment lengths permit, right-hand threaded terminal with two (2) nuts may be used at end anchor in lieu of combination mechanical fitting.
5. Combination mechanical fitting shall develop minimum breaking load as Note 2.
6. Rigging screws shall not be tensioned after installation, per Tension Chart below.
7. Wire ropes are to be tensioned after installation, per Tension Chart below.

TENSION CHART

SECTION 02829

SWING GATE OPERATORS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for swing gate operators.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 01810 - Commissioning.
 - 5. Section 02823 - Ornamental Metal Fences and Gates.
 - 6. Section 04810 - Unit Masonry Assemblies.
 - 7. Section 16061 - Electrical Grounding and Bonding.
 - 8. Section 16120 - Conductors and Cables.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ABS: Acrylonitrile butadiene styrene.
 - 2. AC: Alternating electric current.
 - 3. DC: Direct electrical current.
 - 4. EMI: Electromagnetic interference.
 - 5. LED: Light emitting diode.
- B. Reference Standards:
 - 1. National Fire Protection Association (NFPA):
 - a. NFPA 70 – National Electrical Code® (NEC).
 - 2. Underwriters Laboratories, Inc. (UL):
 - a. UL 325 – Standard for Door, Drapery, Gate, Louver, and Window Operators and Systems.
 - b. UL 991 – Standard for Tests for Safety-Related Controls Employing Solid-State Devices.
 - 3. United States Government:
 - a. Department of Justice:
 - 1) 28 CFR 36 Nondiscrimination on the Basis of Disability by Public Accommodations and in Commercial Facilities.
 - b. Office of the Secretary of Transportation:
 - 1) 49 CFR 37 Transportation Services for Individuals with Disabilities (ADA).
 - c. Parks, Forests, and Public Property:

- 1) 36 CFR 1192 Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Architectural Barriers Act (ABA) Accessibility Guidelines.
- d. United States Code (U.S.C.):
 - 1) 42 U.S.C. Section 4151 et seq.
 - a) Architectural Barriers Act, Public Law 90-480.
 - 2) 42 U.S.C. Section 12101 et seq.
 - a) Americans with Disabilities Act (ADA), Public Law 101-336.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 1. Coordinate the installation of swing door operators with the installation of the gates and fences provided under Section 02823, Ornamental Metal Fences and Gates, the supporting structures provided under Section 04810, Unit Masonry Assemblies, and the power conduit and wiring provided by others.
- B. Sequencing:
 1. Prior to installing the swing gate operator, the gates to be operated and the adjacent surfaces where the gate operators are to be mounted must be completed.

1.04 SUBMITTALS

- A. Action Submittals:
 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Swing gate operators.
 - b. Shop Drawings:
 - 1) Swing gate operators.
 - c. Certificates:
 - 1) Swing Gate Operator Certificates of Compliance.
 - d. Qualification Statements:
 - 1) Swing gate operator manufacturer's qualifications.
 - 2) Swing gate operator installer's qualifications.
- B. Informational Submittals:
 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Swing gate operators.

C. Closeout Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Operation and Maintenance Data:
 - 1) Operation and maintenance data for the swing gate operators.
 - b. Warranty Documentation:
 - 1) Swing Gate Operator Warranty.

1.05 QUALITY ASSURANCE

A. Qualifications:

1. Swing Gate Operator Manufacturer's Qualifications:
 - a. Obtain the swing gate operators from a manufacturer that has been regularly engaged for the past 5 years in manufacturing gate operators similar in type to that specified as the Work of this Section.
 - b. Submit the swing gate operator manufacturer's qualifications to the Program/Project Manager for approval.
2. Swing Gate Operator Installer's Qualifications:
 - a. Employ a swing gate operator installer who has been regularly engaged for the past 3 years installing gate operators similar in type to that specified as the Work of this Section.
 - 1) Employ persons specifically trained to install gate operators.
 - b. Submit the swing gate operator installer's qualifications to the Program/Project Manager for approval.

B. Certifications:

1. Swing Gate Operator Certificates of Compliance:
 - a. For swing gate operator materials, submit the manufacturer's Certificates of Compliance, certifying that these items comply with the requirements specified and are suitable for intended application, to the Program/Project Manager for approval.
2. Listing and Labeling:
 - a. Provide swing gate operators and components that are listed and labeled as defined in Article 100 of NFPA 70 by Underwriters Laboratories, Inc. (UL) in accordance with the requirements specified in UL 325 and UL 991 for the location the product is installed in and the application intended.
 - 1) Provide products marked with their intended use or classification.
 - 2) Submit evidence with the Product Data that the products represented meet testing agency quality verification requirements, including agency listing and labeling requirements.
 - a) Such evidence may consist of either a printed mark on the data or a separate listing card.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Deliver the swing gate operator materials to the Site in the manufacturer's original, unopened containers and packaging, having labels clearly identifying the product by name and manufacturer.
- B. Storage and Handling Requirements:
 - 1. Store and handle the swing gate operator materials in accordance with the manufacturer's instructions.
 - 2. Keep the swing gate operator materials in the manufacturer's original, unopened containers and packaging until installation.
 - 3. Store the swing gate operator materials in a clean, dry area indoors.
 - 4. Protect swing gate operator materials during storage, handling, and installation to prevent damage.
- C. Packaging Waste Management:
 - 1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

1.07 WARRANTY

- A. Manufacturer Warranty:
 - 1. Swing Gate Operator Warranty:
 - a. Warrant the swing gate operator materials and workmanship against failures within the 2 year period after the Date of Substantial Completion:
 - b. Submit the written Swing Gate Operator Warranty on the swing gate operator manufacturer's standard form in which the swing gate operator manufacturer agrees to repair or replace components of the swing gate operators that fail in materials or workmanship within specified warranty period to the Program/Project Manager for approval.
 - 1) Have the manufacturer's standard form signed by the Contractor and manufacturer.

PART 2 PRODUCTS

2.01 SWING GATE OPERATOR EQUIPMENT

- A. Manufacturers:
 - 1. Manufacturer List:
 - a. Subject to compliance with the requirements specified herein, provide products manufactured by one of the manufacturers listed.
 - 2. Substitution Limitations:

- a. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from manufacturers other than those listed herein may be provided.
- B. Performance:
 - 1. Maximum Gate Weight:
 - a. Provide swing gate operators that are capable of operating gates that weigh up to 600 pounds.
 - 2. Maximum Gate Length:
 - a. Provide swing gate operators that are capable of operating gates that are up to 14 feet long.
 - 3. Maximum Aperture Angle:
 - a. Provide swing gate operators that are capable of opening 130 degrees.
 - 4. Operating Speeds:
 - a. Provide swing gate operators having operating speeds of no more than 13 seconds for each 90 degrees of gate movement.
 - 5. Operating Temperatures:
 - a. Provide swing gate operators that are capable of operating gates within a temperature range from minus 4 degrees Fahrenheit (minus 20 degrees Celsius) to 158 degrees Fahrenheit (70 degrees Celsius).
 - 6. Maximum Duty Cycle:
 - a. Provide swing gate operators that have a continuous duty cycle of 100 percent.
- C. Design Criteria:
 - 1. Provide swing gate operators that comply with the requirements for Class I, II, III, and IV vehicular gate operators and systems specified in UL 325.
 - 2. Provide swing gate operator logic boards to have redundancy designed into their hardware and firmware.
 - 3. Provide swing gate operators designed to automatically open the gate in case of a power failure.
 - 4. To protect gate users against entrapment, provide secondary protection devices, such as edge sensors and photo beams.
 - 5. Product Data:
 - a. Obtain the manufacturer's Product Data for the swing gate operators provided under this Section, including the swing gate operator manufacturer's published installation instructions.
 - b. Submit swing gate operator manufacturer's Product Data to the Program/Project Manager for approval.
 - 6. Shop Drawings:
 - a. Prepare Shop Drawings for the swing gate operators, including layout drawings and wiring diagrams.
 - b. Submit the swing gate operator Shop Drawings to the Program/Project Manager for approval.

D. Materials:

1. Swing Gate Operators:

a. Control Enclosure:

- 1) Provide swing gate operators having powder coated, aluminum control board enclosures.

b. Power:

1) Main Power Source:

- a) Provide swing gate operators capable of operating on single phase 120-Volt AC electrical power.
- b) Provide swing gate operators having a built-in power selector switch.

2) Current Consumption:

- a) Provide swing gate operators that consume no more than 3 Amperes at 120 Volts AC.

3) Electromagnetic Interference (EMI) Filter and Lightning Protection:

- a) Provide swing gate operators having an electromagnetic interference (EMI) filter and lightning protection for AC lines up to 6 kilovolts and 3 kiloamperes.

c. Logic Boards:

1) Lightning-Strike Protection:

- a) Provide swing gate operator logic boards having multiple-stage built-in lightning-strike protection for up to 20 kilovolts and 10 kiloamperes.

2) Short Circuit Protection:

- a) Provide swing gate operator logic boards having multiple-stage short circuit protection.

3) Logic Board Power:

- a) Provide swing gate operator logic boards having a regulated power supply for external accessories up to 1 Ampere.
- b) Provide swing gate logic boards having a built-in battery charger.

4) Controls:

a) Travel Controls:

- (1) Provide swing gate operator logic boards having a soft stop/start control.
- (2) Provide swing gate operator logic boards having self-adaptive and self-learn algorithms for controlling travel through the gate.

b) Magnetic Locks:

- (1) Provide swing gate operator logic boards having a 10 Ampere contact with a built-in 24-Volt DC power source for controlling magnetic locks.

c) Obstruction Controls:

- (1) Provide swing gate operator logic boards having multiple algorithms to supervise obstructions detected by an intelligent obstruction sensor, and a hold-open timer.
- 5) Connectors:
 - a) Provide swing gate operator logic boards having pluggable connectors.
- 6) Indicators:
 - a) Provide swing gate operator logic boards having light emitting diode (LED) indicators that indicate the status of external accessories and power.
- 7) Tandem Gates:
 - a) To synchronize the operation between 2 tandem gates, provide swing gate operator logic boards having a master-slave port.
 - b) Overlap Delay:
 - (1) Provide swing gate operator logic boards having an overlap delay adjustable from 0 seconds to 6 seconds to control master-slave operation or tandem gates, and to open 1 gate first and after few seconds open second gate.
- d. Motor/Gear Units:
 - 1) Provide swing gate operators having 1/2 horsepower 24-Volt DC motors.
 - 2) Cable for Motors:
 - a) Provide cable for the motors having the following features:
 - (1) 7 conductors.
 - (2) Direct burial type shielded with a drain wire.
 - (3) Sun resistant.
 - (4) Water resistant.
- e. Motor Gear Head Cover:
 - 1) Provide swing gate operators having acrylonitrile butadiene styrene (ABS) plastic motor gear head covers.
- f. Clutch Mechanism:
 - 1) Provide swing gate operators having a clutch mechanism that allows full and safe operation of the gate operator by using a key.
- g. Manufacturers:
 - 1) Viking Access Systems, Model "X-9",
<http://www.vikingaccess.com>.
 - 2) Approved equal.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Examine the areas and swing gates to receive the swing gate operators.

- a. Verify that the gates are installed as indicated on the Contract Drawings.
 - b. Verify that the gates are properly installed, and that they move freely in both directions.
 - c. Verify that the gates are plumb, level, square, and without sag or damage.
- B. Evaluation and Assessment:
1. Notify the Program/Project manager of conditions that would adversely affect installation or subsequent use of the swing gate operators.
 2. Do not begin installation of the swing gate operators until unacceptable conditions have been corrected.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
1. Protect adjacent areas from damage resulting from installation of the swing gate operators.
- B. Demolition/Removal:
1. Perform cutting and patching, if required, as specified in Section 01732, Cutting and Patching.

3.03 INSTALLATION

- A. Install the swing gate operators in accordance with swing gate operator manufacturer's instructions at the locations indicated on the Contract Drawings.
1. Install gate operators plumb, level, square, and secure.
 2. Install the swing gate operators so they are weathertight.
- B. Special Techniques:
1. Warning Signs:
 - a. Provide a minimum of 2 warning signs, one on each side of the gate.
- C. Interface with Other Work:
1. Firmly attach the articulated arm assembly to the gate being operated by the swing gate operator.
 2. Mount the electronic control panel on surfaces adjacent to the gate in accordance with swing gate operator manufacturer's instructions and as indicated on the Contract Drawings.
- D. Systems Integration:
1. Electrical Connections:
 - a. Ground the swing gate operators in accordance with the requirements specified in Section 16061, Electrical Grounding and Bonding.

- b. Connect the wiring to the swing gate operators in accordance with the requirements specified in Section 16120, Conductors and Cables.

3.04 SYSTEM STARTUP

- A. Commissioning:
 - 1. Have the Commissioning Authority (CA) perform the startup and checkout activities listed in Section 01810, Commissioning, for the pertinent systems Work of this Section.

3.05 ADJUSTING

- A. Adjust the swing gate operators for proper operation in accordance with swing gate operator manufacturer's instructions.
- B. Adjust the swing gate operators to operate smoothly, and to open and close the swing gates properly.

3.06 CLEANING

- A. Waste Management:
 - 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

3.07 CLOSEOUT ACTIVITIES

- A. Demonstration:
 - 1. Demonstrate the operation of the swing gate operators for the Program/Project Manager to show the gate operators function and operate properly.

3.08 PROTECTION

- A. Protect the installed swing gate operators to ensure that, except for normal weathering, the gate operators will be without damage or deterioration at time of Substantial Completion.

3.09 MAINTENANCE

- A. Operation and Maintenance Data:
 - 1. Furnish the manufacturer's operation and maintenance data for the swing gate operators for inclusion in operation and maintenance manuals as specified in Section 01780, Closeout Submittals
 - 2. Furnish detailed information required so the Owner can properly operate and maintain the swing gate operators, including the following information:
 - a. Operation instructions.
 - b. Troubleshooting guide.

- c. Parts list.
- d. Electrical wiring diagrams.
- 3. Submit the operation and maintenance data for the swing gate operators to the Program/Project Manager for information.

SECTION 02891

POST-MOUNTED SIGNS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for providing post-mounted roadside signs at the locations indicated on the Contract Drawings in accordance with the details shown on the Contract Drawings, Standard Drawings, and reference documents.
 - a. Required legends are indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01780 - Closeout Submittals.
 - 3. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCE STANDARDS:

- A. American Association of State Highway and Transportation Officials (AASHTO):
 - 1. AASHTO M 268 - Standard Specification for Retroreflective Sheeting for Traffic Control (*same as ASTM D 4956*).
- B. ASTM International (ASTM):
 - 1. ASTM A 1 - Standard Specification for Carbon Steel Tee rails.
 - 2. ASTM A 123/A 123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
 - 3. ASTM A 325 - Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.
 - 4. ASTM A 449 - Standard Specification for Hex Cap Screws, Bolts and Studs, Steel, Heat Treated, 120/105/90 ksi Minimum Tensile Strength, General Use.
 - 5. ASTM A 563 - Standard Specification for Carbon and Alloy Steel Nuts [Metric].
 - 6. ASTM A 572/A 572M - Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.
 - 7. ASTM A 588/A 588M - Standard Specification for High-Strength Low-Alloy Structural Steel, up to 50 ksi [345 MPa] Minimum Yield Point, with Atmospheric Corrosion Resistance.
 - 8. ASTM A 653/A 653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - 9. ASTM B 209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.

10. ASTM B 221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
 11. ASTM B 449 - Standard Specification for Chromates on Aluminum.
 12. ASTM B 633 - Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel.
 13. ASTM B 766 - Standard Specification for Electrodeposited Coatings of Cadmium.
 14. ASTM D 476 - Standard Classification for Dry Pigmentary Titanium Dioxide Products.
 15. ASTM D 523 - Standard Test Method for Specular Gloss.
 16. ASTM D 4956-04 - Standard Specification for Retroreflective Sheetting for Traffic Control.
 17. ASTM F 844 - Standard Specification for Washers, Steel, Plain (Flat), Unhardened for General Use.
- C. Arizona Department of Transportation (ADOT):
1. ADOT Arizona Supplement to the 2009 Manual on Uniform Traffic Control Devices.
 2. ADOT Traffic Engineering Manual of Approved Signs (MOAS).
 3. ADOT Standard Drawings –Signing and Marking Standards.
 4. ADOT Standard Specifications for Road and Bridge Construction:
 - a. Section 604 – Steel Structures.
 - b. Section 608 – Sign Panels.
 - c. Section 922 – Utility Concrete for Miscellaneous Construction.
 - d. Section 1006 – Portland Cement Concrete.
- D. City of Phoenix (COP):
1. City of Phoenix Supplement to the Maricopa County Association of Governments Uniform Standard Specifications.
 2. Phoenix Supplemental Standard Details for Public Works,
<https://www.phoenix.gov/streets/reference-material/2015maguniformstd>:
 - a. Detail No. P1023 Street Sign Base, Object Marker, and Delineator.
 3. City of Phoenix Street Transportation Department Design Procedure Manual, <http://phoenix.gov/STREETS/autocadhelp.html>.
- E. International Fasteners Institute (IFI):

 2. IFI 135 – Mechanical Testing of Blind Rivets.
- F. Maricopa Association of Governments (MAG):
1. MAG Uniform Standard Details for Public Works Construction.
 - a. Standard Detail 131 – Street Sign Base.
- G. Porcelain Enamel Institute, Inc. (PEI):
1. PEI-101 – Design and Fabrication of Metal of Porcelain Enamel.
 2. PEI-501 – Electrostatic Enamel Powder Application.

3. PEI-502 – Dipping and Flow Coating for Porcelain Enamel.
4. PEI-503 – Wet spraying for Porcelain Enamel.
5. PEI-601 – Drying and Firing.
6. PEI-801 – Alloy, Design and Fabrication Considerations for Porcelain Enamel Aluminum.
7. PEI-802 – Pretreatment of Alloys for Porcelain Enamel Aluminum.
8. PEI-803 – Enamel Preparation, Application and Firing for Porcelain Enamel Aluminum.
9. PEI-804 – Quality Control Procedures for Porcelain Enamel Aluminum.

H. Society of Automotive Engineers (SAE):

1. SAE J429 - Mechanical and Material Requirements for Externally Threaded Fasteners.

I. U. S. Government:

1. Department of Transportation (DOT):
 - a. Federal Highway Administration (FHWA):
 - 1) Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), as revised.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Depending on where the signing operations are to occur and the owner of the Right-of-Way, coordinate with and obtain the required approvals from the appropriate State and municipal departments, including but not limited to, the following:
 - a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Street Transportation Department.
 - c. Phoenix Sky Harbor International Airport.
2. If the owner of the right-of- way is other than the Phoenix Sky Harbor International Airport, the owner of the right-of- way will be provided on the Contract Drawings.

B. Sequencing:

1. Include provisions for traffic control during sign installation in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Post-mounted sign materials.

- b. Shop Drawings:
 - 1) Post-mounted signs.
 - 2) Sign panels.
 - 3) Standard punch details for demountable characters.
 - c. Certificates:
 - 1) Certificates of Analysis for breakaway sign post shapes.
 - 2) Certificate of Compliance for perforated sign posts.
 - 3) Certificate of Compliance for U-channel sign posts.
 - 4) Certificate of Compliance for round sign posts.
 - 5) Certificate of Compliance for sign panel materials.
 - 6) Certificate of Compliance for fluorescent orange sheeting.
 - d. Special Procedure Submittals:
 - 1) List of New Signs.
- B. Closeout Submittals:
- 1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Warranty Documentation:
 - 1) Demountable Character Sheeting, Ink, Film, and Adhesive Warranty.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
- 1. Depending on where the signs are to be placed and the owner of the right-of-way, coordinate with and obtain the required approvals from the appropriate State and municipal departments, including but not limited to, the following:
 - a. Arizona Department of Transportation (ADOT).
 - b. City of Phoenix Street Transportation Department.
 - c. Phoenix Sky Harbor International Airport.
- B. Certifications:
- 1. Certificates of Analysis:
 - a. Submit Certificates of Analysis providing the material composition and properties for breakaway sign post shapes to the Program/Project Manager for approval.
 - 2. Certificates of Compliance:
 - a. Sign Post Certificates of Compliance:
 - 1) For perforated sign posts, U-channel sign posts, and round sign posts materials, submit Certificates of Compliance certifying that these items comply with the requirements specified to the Program/Project Manager for approval.
 - b. Sign Panel Certificates of Compliance:
 - 1) For sign, channeling device, milepost, object marker, guard rail marker, delineator, and reference marker materials, submit Certificates of Compliance certifying that these items comply with

the requirements specified to the Program/Project Manager for approval.

- a) Identify the retroreflective sheeting type, backing class, make of sheeting, inks, and film.
- c. Fluorescent Orange Sheeting Certificates of Compliance:
 - 1) For fluorescent orange sheeting, submit Certificates of Compliance certifying that the sheeting to be used in fluorescent to the Program/Project Manager for approval.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

- 1. Nest U-channel sign posts for shipment, and fasten them together in a manner so they will not slip.
 - a. Take care to minimize posts rubbing together during shipping which will result in surface damage to the galvanized finished.
 - 1) Excessive damage to the finish of the posts during shipping or handling will result in rejection of the damaged posts.
 - b. Do not bundle U-channel sign posts in groups of more than 100.
- 2. Ship sign panels as recommended by the sign panel manufacturer.
 - a. Ship fabricated flat signs and overlay sheets on edge.
 - b. Rigidly brace shop-fabricated extruded sign panel sub-assemblies for shipping.
 - 1) Bent bolt channels on extruded sign panels are cause to reject the sign panel.
 - c. Damage to sign panels or legends resulting from banding, crating, or stacking may is cause for rejecting the sign.

B. Storage and Handling Requirements:

- 1. Store and handle sign panels as recommended by the sign panel manufacturer.
 - a. Rigidly brace shop-fabricated extruded sign panel sub-assemblies for erection.
- 2. Store fabricated signs indoors, and keep them dry during storage.
 - a. If packaged signs become wet, remove the package materials and allow the signs to dry.
 - b. Repackage the signs using new materials.
 - c. If outdoor storage is necessary, remove the packaging materials.
- 3. Store the signs on edge, aboveground, and in an area where dirt and water will not contact the sign face.
- 4. Do not allow materials used to support stored signs to contact the sign faces.

1.07 WARRANTY

A. Manufacturer Warranties:

- 1. Demountable Character Sheeting, Ink, Film, and Adhesive Warranty:

- a. Provide a manufacturer's warranty for the sheeting, inks, films, and adhesives against the defects listed in the Retroreflective Sheeting Durability Test as specified herein:
 - 1) Provide a manufacturer's warranty for the porcelain-enameled, powder-coated, or laminated opaque acrylic film provided for demountable characters.
- b. Provide a manufacturer's warranty for the sheeting, inks, films, and adhesives for the following periods:
 - 1) Warrant orange sign sheeting, ink, film, and adhesive for 3 years.
 - 2) Warrant Types I, II, III, V, VI, and VII sheeting, ink, film, and adhesive for 5 years.
 - 3) Warrant Types IV, VIII, IX, X, and XI sheeting, ink, film, and adhesive for 10 years.

PART 2 PRODUCTS

2.01 PRODUCT TYPES

A. Breakaway Sign Posts:

1. At the option of the Construction Manager at Risk, provide breakaway sign posts fabricated from structural steel conforming to the requirements of ASTM A 572/A 572M, Grade 50, or ASTM A 588/A 588M.
 - a. Fabricate breakaway sign posts, stub posts, and base plates in accordance with the requirements of Subsection 604-3.02 of the ADOT Standard Specifications for Road and Bridge Construction, except that Shop Drawings will not be required.
2. Provide base plates for the breakaway connections and friction fuse plates and back plates for the post hinge assembly fabricated from the same type of structural steel selected for the sign posts.
 - a. Drill plate holes.
 - b. Drill or sub-punch and ream flange holes.
 - c. Saw cut plate notches, except that flame cutting is permitted provided all edges are ground.
3. Galvanized posts and plates after fabrication in accordance with the requirements of ASTM A 123/A 123M.
4. Hardware:
 - a. Provide bolts, nuts, and washers conforming to the requirements of ASTM A 325.
 - b. Provide bolts, nuts and washers that have either been cadmium plated in accordance with the requirements of ASTM B 766, or zinc plated in accordance with the requirements of ASTM B 633.
5. Saw cut the posts for the hinge, and bolt the post and post hinge assembly together.

B. Perforated Sign Posts (Single and Telescoping):

1. Provide perforated square tube sign posts fabricated so they are straight and have a smooth, uniform finish; and so consecutive telescoping post

sizes freely telescope with one another for not less than 10 feet of their length without the necessity of matching any particular face to any other face.

- a. Fabricate the square tube sign posts from galvanized sheet steel conforming to the requirements of for either SQ Grade 40 or SQ Grade 50 Class 1 as specified in ASTM A 653/A 653M.
 - 1) Sheet Steel Thickness:
 - a) Provide 0.105-inch (12 gauge) or 0.135-inch (10 gauge) thick sheet steel as required by the Contract Documents.
 - 2) Weld the corner of the posts directly using high frequency resistance welding or equivalent means.
 - 3) Scarf the outside edges of the posts as necessary to produce standard corner radii of 5/32 plus or minus 1/32 inch.
 - b. Galvanize the steel in accordance with the requirements of Coating Designation G-90.
 - 1) Re-galvanize external welded surfaces and scarfed areas after fabrication.
 - 2) Posts Wall Thickness Including Coating:
 - a) Provide 0.097-inch to 0.116-inch post walls for 12 gauge sheet steel, and 0.127-inch to 0.146-inch post walls for 10 gauge sheet steel.
2. Perforation Holes:
 - a. Provide 7/16-inch plus or minus 1/64 inch diameter holes on 1-inch centers on all four sides of the posts and along their entire length.
 - 1) Laterally center the holes on the longitudinal centerline of each face.
 - 2) Position and space the holes the same on all four faces, so the hole centerlines for each group of 4 holes pass through a common point on the longitudinal centerline of the tube.
 - 3) For telescoping posts, properly align the holes in each tube to allow 3/8-inch diameter bolts to pass through the entire telescoping post from one side to the other.
 3. Hardware:
 - a. Provide bolts, nuts and washers that have been either zinc coated in accordance with the requirements of ASTM B 633 or cadmium plated in accordance with the requirements of ASTM B 766.
 - b. Bolts:
 - 1) Provide bolts conforming to the requirements of SAE J429, Grade 5, or ASTM A 449, Type 1.
 - c. Nuts:
 - 1) Provide nuts conforming to the requirements of ASTM A 563, Grade A.
 - d. Washers:
 - 1) Provide washers conforming to the requirements of ASTM F 844.

C. U-Channel Sign Posts:

1. Provide U-channel sign posts consisting of a “sign post” and a “base post”, each “post” a uniform, modified, flanged channel-section, as shown in the Contract Drawings.
 - a. Fabricated the U-channel posts from rerolled rail steel or hot-rolled carbon steel bars:
 - 1) Provide rail steel having a minimum yield point of 80,000 pounds per square inch.
 - 2) Provide rail steel having a nominal weight of 91 pounds per yard prior to rerolling.
 - 3) Provide rail steel that complies with the quality assurance requirements of ASTM A 1.
 - 4) Provide rail steel having the cast heat analysis given in Table 02891-1.

Table 02891-1 U-Channel Sign Post Steel Analysis	
Element	Composition (Percent)
Carbon	0.67 – 0.82
Manganese	0.70 – 1.01
Phosphorous	0.04 maximum
Sulfur	0.05 maximum
Silicon	0.10 – 0.25

- b. Galvanize the U-channel sign posts after fabrication in accordance with the requirements of ASTM A 123/A 123M.
 - c. Post Weight:
 - 1) Provide posts weighing 3 pounds per lineal foot, plus or minus 5 percent.
2. Post Lengths:
 - a. Furnish “sign posts” in 6-inch increments of length up to 12 feet as required for the installation location.
 - b. Furnish 42-inch long “base posts” that are pointed at one end.
3. Perforation Holes:
 - a. Provide “sign posts” having 3/8-inch diameter holes punched continuously along the post on 1-inch centers.
 - 1) Locate the first and last holes 1 inch from the top and bottom of post.
 - b. Provide “base posts” having at least eighteen holes starting 1 inch from the top and continuing at one-inch increments along the post.
4. Hardware:
 - a. Provide bolts, nuts, washers, and spacers that have been either zinc coated in accordance with the requirements of ASTM B 633 or cadmium plated in accordance with the requirements of ASTM B 766.

D. Round Sign Posts:

1. Provide round sign posts fabricated from galvanized steel.
 - a. Outside Diameter: 2-7/8 inches.
 - b. Steel Thickness:
 - 1) Provide 0.105-inch (12 gauge) or 0.135-inch (10 gauge) thick steel as required by the Contract Documents.
1. Hardware:
 - a. Provide bolts, nuts and washers that have been either zinc coated in accordance with the requirements of ASTM B 633 or cadmium plated in accordance with the requirements of ASTM B 766.
 - b. Bolts:
 - 1) Provide bolts conforming to the requirements of SAE J429, Grade 5, or ASTM A 449, Type 1.
 - c. Nuts:
 - 1) Provide nuts conforming to the requirements of ASTM A 563, Grade A.
 - d. Washers:
 - 1) Provide washers conforming to the requirements of ASTM F 844.

E. Foundation Stub Posts:

1. Fabricated foundation stub posts from the same type of steel selected for the appropriate sign posts.

F. Flat Sign Panels:

1. Provide flat sign panels fabricated in one piece from flat sheet aluminum panels with direct applied or silk-screened characters.

G. Extruded Sign Panels:

1. Provide extruded sign panels fabricated from Aluminum Alloy 6063-T6 complying with the requirements specified in ASTM B 221, and consisting 12-inch wide aluminum extrusions having an aluminum side trim molding fastened to each with two 5/32-inch diameter self-plugging blind shoulder rivets located 2-1/2 inches from either edge.
 - a. Cover the panel facing with retroreflective sheeting of the color indicated on the Contract Drawings.
2. Provide aluminum extrusions flat within a tolerance of 1/4 inch in 8 feet, allowing proportionately greater tolerances on lengths greater than 8 feet.
 - a. The flatness tolerance across the face of each extrusion is 0.5 percent of the width.
3. Fasten the aluminum extrusions together using bolted connections as indicated on the Contract Drawings.
 - a. Bolt the aluminum extrusions together on 12-inch centers.
 - b. The allowable gap between extrusions is 1/32 inch.
4. Provide demountable characters for the extruded sign panels, including letters, numerals, symbols, borders, and other features of the sign message.

- a. Provide mounting holes within the frames for screws, rivets, or other common fasteners.
 - b. For framed demountable characters, provide 5/32-inch diameter self-plugging blind shoulder rivets set tight and at least 3/4 inch long to extend through the panel face.
 - 1) Size and space white reflectors so the legibility and visibility of the finished cut-out character is maximized.
 - 2) For black frames, provide black anodized self-plugging aluminum blind shoulder rivets or round head screws
 - c. For sheet aluminum demountable characters, provide 5/32-inch diameter self-plugging blind shoulder rivets set tight and at least 5/8 inch long to extend through the panel face.
5. Provide hardware for fastening the extruded sign panels to supports as recommended by the panel manufacturer.
 - a. Provide sufficient bolt clamps placed to install the sign panels on the sign posts as indicated on the Contract Drawings.

2.02 DESIGN CRITERIA

- A. If the signs are in Arizona Department of Transportation (ADOT) Right-of-Way, comply with signage requirements of the following documents:
 1. FHWA Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD).
 2. ADOT Arizona Supplement to the 2009 Manual on Uniform Traffic Control Devices.
 3. ADOT Manual of Approved Signs (MOAS).
 4. ADOT Standard Drawings –Signing and Marking Standards.
 5. ADOT Standard Specifications for Road and Bridge Construction:
- B. If the signs are in City of Phoenix or Phoenix Sky Harbor International Airport Right-of-Way, comply with applicable requirements of this Section.
- C. Submit Product Data for the sign materials and Shop Drawings for the signs provided under this Section to the Program/Project Manager for approval.
 1. List of New Signs:
 - a. Prepare a detailed list of the new signs installed under this Contract in a commonly used electronic spreadsheet format, such as Microsoft Excel®.
 - 1) Include the sign identification code; the date each sign was installed including the month and year; the sign's fabricator; and information regarding the materials including the material manufacturer, and type of sheeting, ink, and film.
 - 2) List the signs in numerical order by route, direction, and milepost; and if more than 1 sign is installed in the same general location, include a letter subscript.
 2. Submit the List of New Signs to the Program/Project Manager for approval.

2.03 MATERIALS:

A. Flat Sheet Aluminum:

1. For flat sheet signs, provide 0.125-inch thick flat aluminum sheet made of 5052-H38 aluminum alloy conforming to the requirements of ASTM B 209.
2. For demountable characters, provide flat aluminum sheet made of 3105-H14, 3003-H14, or 5052 aluminum alloy conforming to the requirements of ASTM B 209.
 - a. For letters and numbers, provide 0.032 inch thick sheets.
 - b. For symbols, route shields, and borders, provide 0.063 inch thick sheets.
 - c. Chemically treat the aluminum with a chromate acid conversion type coating, or equivalent, to form an oxidation-resistant barrier film suitable for long term outdoor use.
 - 1) Provide a coating that prevents oxidation responsible for causing streaking or discoloration on the sign.
 - 2) Apply a minimum 0.002-inch thick coating according to the manufacturer's instructions.

B. Concrete:

1. For Breakaway Sign Post Foundations:
 - a. Provide Class B concrete conforming to the requirements of Section 1006 of the ADOT Standard Specifications for Road and Bridge Construction.
 - b. For foundations using stub post sizes S 3 X 5.7 and S 4 X 7.7, utility concrete conforming to the requirements of Section 922 of the ADOT Standard Specifications for Road and Bridge Construction
2. For Perforated Sign Post and U-Channel Sign Post Foundations:
 - a. Provide concrete, when required, conforming to the requirements of Subsections 922-2 and 922-3 of the ADOT Standard Specifications for Road and Bridge Construction.
3. For Breakaway Sign Post Foundations:
 - a. Provide Class C concrete conforming to the requirements specified in Section 03300, Cast-In-Place Concrete.

C. Retroreflective Sheeting:

1. Retroreflective Sheeting Types and Classes:
 - a. For each application, provide the Type and Class of retroreflective sheeting indicated on the Contract Drawings.
 - b. Provide retroreflective sheeting complying with the criteria for the applicable Type and Class as specified in ASTM D 4956-04, for the applicable type and class unless otherwise specified.
 - 1) For all signs used for a particular application under this Contract, provide materials of the same ASTM material, manufacturer, and product type.
 - a) For letter and number text, provide sheeting of the same type and brand.

- 2) For applications where more than one type of sheeting is allowed, a higher grade of sheeting than indicated may be provided if at no increase in Contract Price.
 - 3) Provide a retroreflective sheeting system having a smooth outer surface and, except for self-supporting products having a Class 5 backing such as roll-up signs and some types of traffic cone collars, a pre-coated adhesive on the back side protected by an easily removable liner.
 2. Opaque Films:
 - a. Provide acrylic type opaque films for use with the sheeting.
 3. Adhesive System:
 - a. Provide either Class I or Class II adhesives complying with the requirements specified in ASTM D 4956, and that under all weather conditions form a tight and durable weatherproof bond to the sign background capable of enduring for the required durability time for the material.
 - 1) Provide an adhesive system that remains bonded to its surface without discoloring, cracking, crazing, peeling, blistering, or changing dimension or alignment.
 - b. Pressure Sensitive Adhesives:
 - 1) Provide aggressive tack type pressure sensitive adhesives that require no heat, solvent, or other pre-application preparation of sheeting or film for its adhesion to clean aluminum, plywood, or reflective sheeting surfaces.
 - 2) Pre-treat plastic surfaces as recommended by the sheeting manufacturer.
 - c. Heat-Activated Adhesives:
 - 1) Provide heat-activated adhesives capable of being positioned under normal working conditions and temperatures without damaging the materials or application surfaces, and that are activated by applying heat in excess of 150 degrees Fahrenheit to the material using a heat vacuum process.
 - 2) Provide heat-activated adhesives that do not require pre-treatment of the adhesive.
 4. Coefficient of Retroreflection:
 - a. Provide retroreflective sheeting having a coefficient of retroreflection complying with the requirements specified in ASTM D 4956 for the type of retroreflective sheeting specified.
 - b. For black films, provide film having a maximum coefficient of retroreflection of 1.0 at an observation angle of 0.2 degrees and an entrance angle of negative 4.0 degrees.
 - 1) For direct-applied and demountable black characters, provide non-reflective material.
 5. Color:
 - a. Provide retroreflective sheeting having the color required by the appropriate signage standard for the location and application.

- 1) Except as otherwise specified, provide sheeting, ink, and film colors complying with the requirements specified in the ADOT Traffic Engineering Manual of Approved Signs (MOAS), Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), ADOT Arizona Supplement to the 2003 Manual on Uniform Traffic Control Devices, and the Contract Drawings.
 - 2) For warning signs with yellow backgrounds, provide fluorescent yellow sheeting.
 - 3) For work zone signs with orange backgrounds, provide fluorescent orange sheeting.
 - a) For temporary work zone signs clearly visible under available light, non-reflective materials may be furnished.
 - b. Provide uniformly colored sheeting, inks, and film so no visual variation in appearance on the same sign or from sign to sign of the same color is apparent.
 - c. Where standard colors are specified for sheeting, inks, and films, provide colors that visually match the color standard and are within the color tolerance limits required by the FHWA Highway Tolerance Charts.
 - d. Unless otherwise indicated, provide sheeting having Luminance Factor (Daytime Luminance) and Color Specification Limits (Daytime) complying with the requirements specified in ASTM D 4956.
 - 1) For fluorescent orange sheeting, provide sheeting having the capacity to effectively fluoresce outdoors under low light conditions.
6. Color Processing:
- a. For both transparent and opaque inks used for post-screen or pre-screen printing of signs, provide a type and quality specified by the sheeting manufacturer, and complying with the requirements of the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), the ADOT Arizona Supplement to the 2003 Manual on Uniform Traffic Control Devices, and the Federal Highway Administration for highway signs.
 - 1) Apply inks using equipment and in the manner recommended by the ink manufacturer.
 - 2) Ensure that the signs produced have a uniform legend of consistent stroke width and sharply defined edges without blemishes that negatively impact appearance, color, or required reflectivity.
7. Specific Intensity Per Unit Area (SIA):
- a. Provide retroreflective sheeting having at least the minimum Specific Intensity Per Unit Area (SIA) requirements of ASTM D 4956 for the type of sheeting provided.

D. Hardware and Fasteners:

1. Blind Rivets:

- a. Provide self-plugging, protruding, regular head blind rivets, complying with the requirements specified for either Grade 10 or 11 aluminum alloy break mandrel blind rivets in IFI 114.
- b. Provide rivets having ultimate shear and tensile strengths that meet or exceed the values specified in Table 6 of IFI 114 for a Grade 10 or 11 rivet having a nominal rivet diameter of 5/32 (0.1562) inch when tested in accordance with the requirements specified in Specifications 2.1 and 2.2 in IFI 135.
 - 1) Rivets having higher strengths or grades than specified herein may be substituted for the rivets specified.
- c. Color:
 - 1) Color the protruding head and shaft of the rivets to closely match the color of the character on which they are being applied, except aluminum colored rivets may be used to mount white characters
 - 2) Provide a factory-applied anodized type finish, or equivalent coating, suitable for long term outdoor applications to color the rivets.
 - a) Provide durable colorfast coatings capable of preventing oxidation that may cause streaking or discoloration of the sign.
 - b) Non-factory painting of the rivets' protruding heads is unacceptable.

2.04 SHOP FABRICATION:

A. Sign Panel Fabrication:

1. Fabricate the sign panels in accordance with the details on the Contract Drawings and the requirements herein.
 - a. If additional details are required, prepare Shop Drawings for the sign panels, and submit them to the Program/Project Manager for approval.
2. Cut panels to size and shape and free of buckles, warps, dents, cockles, burrs, and other defects resulting from fabrication.

B. Flat Sign Panel Fabrication:

1. Fabricate sign panels in one piece from flat sheet aluminum.
2. To reduce glare from reflected sunlight, etch the surfaces of the sign panels not to be covered
3. Prepare and cover the sign panel facing with retroreflective sheeting.
4. Provide sign messages either by silk screening or direct-applying the lettering indicated on the Contract Drawings and shown in the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), ADOT Arizona Supplement to the 2003 Manual on Uniform Traffic Control Devices, ADOT Traffic Signing and Marking Standard Drawings, and/or ADOT Traffic Engineering Manual of Approved Signs (MOAS) as applicable.

C. Extruded Sign Panel Fabrication:

1. To reduce glare from reflected sunlight, etch the exposed surfaces of the side trim molding on the sign panels in accordance with the extrusion manufacturer's recommendations.
2. After the sign structure has been fabricated, including cutting and punching all holes required except those holes for demountable letters, numerals, symbols, and borders, degrease the structure and apply retroreflective sheeting.
3. Prepare and cover the sign panel facing with retroreflective sheeting.
4. Provide sign messages either by silk screening or direct-applying the lettering as indicated on the Contract Drawings and shown in the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), ADOT Arizona Supplement to the 2003 Manual on Uniform Traffic Control Devices, ADOT Traffic Signing and Marking Standard Drawings, and/or ADOT Traffic Engineering Manual of Approved Signs (MOAS) as applicable.

D. Applying Retroreflective Sheeting:

1. Apply sheeting, inks, and, if required, clear coats, in accordance with the manufacturer's instructions; and so no bubbles, wrinkles, or foreign material are beneath the sheeting, ink, or film.
 - a. Do not splice retroreflective sheeting on sign panels having a minimum dimension up to and including 4 feet.
 - b. Provide retroreflective sheeting of the color indicated on the Contract Drawings or shown in the Manual on Uniform Traffic Control Devices for Streets and Highways (MUTCD), ADOT Arizona Supplement to the 2003 Manual on Uniform Traffic Control Devices, ADOT Traffic Signing and Marking Standard Drawings, and/or ADOT Traffic Engineering Manual of Approved Signs (MOAS) as applicable.
2. Install retroreflective sheeting so it has a zero-degree orientation.

E. Silk Screened Lettering:

1. Apply silk-screened letters, numerals, arrows, symbols, and borders on the retroreflective background of the sign by direct or reverse screen processes.
 - a. Apply messages and borders of a color darker than the background using the direct process.
 - b. Apply messages and borders of a color lighter than the background using the reverse screen process.
2. Provide opaque or transparent colors, inks, and paints to fabricate signs of the type and quality recommended by the reflective sheeting manufacturer.
3. Apply inks and paints using a screen process resulting in a uniform color and tone, and producing sharply defined legend and border edges without blemishes on the sign background that affect the intended use.

- a. After the ink has been applied, the inked colors must comply with the minimum Specific Intensity Per Unit Area (SIA) requirements for the basic color and the type of sheeting used.
 4. After screening, air-dry or bake the signs in accordance with the manufacturer's recommendations to provide a smooth hard finish.
 - a. Signs on which blisters appear during the drying process are unacceptable.
- F. Direct-Applied Lettering:
 1. Cut direct-applied letters, numerals, arrows, symbols, borders, and other features of the message from black opaque or retroreflective sheeting of the color specified, and apply these characters to the retroreflective sheeting of the sign background in accordance with the instructions of the retroreflective sheeting manufacturer by heat activating the sheeting's adhesive.
 2. The retroreflective sheeting used for the characters must comply with the minimum Specific Intensity Per Unit Area (SIA) requirements of the background sheeting.
- G. Demountable Character Fabrication:
 1. Sign Messages:
 - a. Provide sign messages consisting of letters, numerals, symbols, route shields, borders, and other features that are cut out of flat sheet aluminum having direct-applied sign sheeting or other finishes, and riveted to the sign panel.
 - b. Place the characters on the sign panel in a straight and true fashion.
 - c. Provide characters that fit flat on the sign panel face with no visible gap or deformation.
 2. Characters and Borders:
 - a. Provide letters and numbers as indicated in the Contract Documents.
 - 1) Fabricate character corners and edges to be clean and well-defined without apparent waviness, tears, delamination, deformation, or flaws.
 - 2) Remove burrs and waste material so the characters have a clean, flat, and correct appearance.
 - b. Unless otherwise indicated, fabricate the borders on signs having demountable characters from aluminum substrate panels.
 - 1) Always fabricate the borders from the same material as the sign legend.
 3. Splices:
 - a. Aluminum Panels:
 - 1) Aluminum panel splices are acceptable only for diagrammatic arrows or other large symbols and shields exceeding 48 inches in more than one direction.
 - a) Provide a continuous, 4-inch to 6-inch wide aluminum back plate that overlaps the splice joint, and prevents a formation of

a gap at the splice joint when the symbol is assembled and attached to the sign.

b. Sheeting:

- 1) Provide sheeting or applied film for demountable characters consisting of a continuous monolithic piece without splices or patches covering the entire front face of the character.
 - a) Sheeting splices are permitted only for demountable characters or borders that have a dimension larger than 48 inches in more than one direction.
 - (1) Only 1 splice for every 4 feet is permitted.
 - (2) Where splices are permitted, abut adjoining edges to prevent visible gaps.

c. Colors:

- 1) Demountable Sign Legends:
 - a) For green, blue, and brown background signs, provide white demountable letters, numbers, symbols, and route shields complying with the requirements specified in Paragraph 2.03.G.
 - b) For white and yellow background signs, provide opaque and non-reflective black demountable legends.
 - (1) Acceptable finishes for black characters include porcelain-enameled black, powder-coated black, or laminated black opaque acrylic film applied in accordance with manufacturer's recommendations.
- 2) Demountable Sign Borders:
 - a) For green, blue, or brown sign backgrounds, provide white borders complying with the requirements specified in Paragraph 2.03.G.
 - b) For white or yellow sign backgrounds, provide black borders.
 - (1) Acceptable finishes for black borders include porcelain-enameled black, powder-coated black, or laminated black opaque acrylic film applied in accordance with manufacturer's recommendations.
- 3) For combination signs having differing colored panels, such as a sign having one portion with a green background and white characters and another portion with a yellow background and black characters, provide the border color schemes described in Subparagraph 2.04.G.3.c.1.a or Subparagraph 2.04.G.3.c.1.b for each portion of the sign.

d. Attachment:

- 1) Secure demountable characters to sign panels with 5/32 inch diameter blind rivets of sufficient length to ensure a secure attachment, and complying with the appropriate grip length requirements of the manufacturer.
 - a) When determining the grip length of the rivet, include the total thickness of the joint, including the sheeting and aluminum of

- the character, the spacer if applicable, and the sheeting and aluminum extrusion of the sign back panel.
- 2) Size the holes for installing the rivets in accordance with the recommendations or the rivet manufacturer and Table 2 in IFI 114.
 - 3) Insure that a minimum distance of 4 times the diameter of the rivet exists between the outside of the rivet head and the edge of the character being attached.
 - 4) Place rivets in a defined, evenly spaced pattern which is consistent from character to character, and does not interfere with the appearance of the sign from normal drive-by viewing distance.
 - 5) Attach demountable characters in accordance with the following minimum requirements:
 - a) For straight numerals and letters, provide 3 rivets each including 1 at the top, 1 in the middle and 1 at the bottom.
 - b) For more complex numerals and letters, provide from 4 to 7 rivets each.
 - (1) Letters such as "W" and "M" typically require 7 rivets each.
 - (2) Letters and numerals such as "P", "H", and "9" typically require 6 rivets each.
 - (3) Letters and numerals such as "G", "S", "2", "3", and "7" typically require 5 rivets each.
 - c) For letters or numerals, provide rivets to secure each corner.
 - d) For shields and symbols, space rivets evenly around the entire perimeter, and provide additional rivets in the middle of the shield or symbol as necessary to eliminate bowing.
 - e) For borders, space rivets evenly around each border.
 - 6) The actual number of rivets required depends on the thickness, configuration, weight, position with or without spacers, the size of the character being attached, and the recommendations of the rivet manufacturer.
 - a) Provide a sufficient number of rivets to secure the character to the panel so it does not become misaligned, bend, or move when subjected to wind loading.
 - b) Provide a sufficient number of rivets to ensure that the character does not bow or pull away from the back panel for the life of the sign.
 - 7) Prior to fabricating demountable characters, submit standard punch details for the demountable characters to the Program/Project Manager for approval.

2.05 SOURCE QUALITY CONTROL

A. Tests and Inspections:

1. Retroreflective Sheeting Durability Test:
 - a. ADOT Approved Products List:

- 1) Sheeting products preapproved by being listed on the ADOT Approved Products List will be accepted without further testing; other products must be subjected to the accelerated Retroreflective Sheeting Durability Test procedure specified herein.
 - a) The test method is considered to produce a 2 to 1 time-acceleration ratio for equivalent vertical exposure.
- b. Test Procedure:
 - 1) Install sheeting products in a south-facing orientation, and subject them to an outdoor desert environment for the following durations:
 - a) Test Types I, II, III, V, VI, and VII sheeting for 30 months.
 - b) Test Types IV, VIII, IX, X, and XI sheeting for 60 months, except test orange sheeting used for construction zone signing, barricades, and channeling devices for 18 months.
 - c) Test each ink and film to the same durability requirements as the related sheeting.
 - 2) Examine the sheeting, ink, film, and adhesive for the following defects, and record the results:
 - a) Bubbles, wrinkles, cracks, or breaks on any portion of the applied materials greater than 3 inches in length that result in a negative appearance or concerns of degradation.
 - b) Significant shrinkage causing material to curl or to pull away from the background.
 - c) Significant delaminating of any material or layer, whether sheeting to substrate, sheeting to sheeting, sheeting to film, ink to sheeting, film to sheeting, or film to film.
 - d) Significant visible discoloration, including clouding or chalking.
 - e) A loss of transparency of any transparent sheeting, ink, or film.
 - f) A loss in opaqueness of any opaque ink or film.
 - g) Significant cracking, blistering, ripping, flaking, curling, or chipping of any sheeting, ink, or film.
 - h) A loss of nighttime retroreflectivity as observed at night under normal conditions, or as defined and measured with a portable retroreflectometer at an observation angle of 0.2 degrees and entrance angle of -4.0 degrees.
 - (1) The measured coefficient of retroreflection must be consistent with what would be expected of the type of material being measured, normal manufacturing variations, the time that the material has been in the field, and FHWA requirements.
 - 3) The durability rating of each product is calculated by multiplying by 2 the testing period during which the material does not exhibit significant degradation, reduced performance, and the defects listed.
- c. Acceptance Criteria:

- 1) Sheeting, ink, film, and adhesive that after the specified test period ends do not exhibit significant degradation, reduced performance, and the defects listed will be acceptable:
 - a) Orange sign sheeting, ink, film, and adhesive achieving a durability rating of 3 years will be acceptable.
 - b) Types I, II, III, V, VI, and VII sheeting, ink, film, and adhesive achieving a durability rating of 5 years will be acceptable.
 - c) Types IV, VIII, IX, X, and XI sheeting, ink, film, and adhesive achieving a durability rating of 10 years will be acceptable.
- B. Non-Conforming Work:
 1. Do not provide sheeting, ink, film, and adhesive products not passing the Retroreflective Sheeting Durability Test.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. At the time construction staking is performed, the Program/Project Manager will determine the required lengths for breakaway sign posts.
 - a. The Program/Project Manager will furnish the required lengths to the Construction Manager at Risk so the Construction Manager at Risk can then order fabrication of the sign posts.
 2. At the time construction staking is performed, the Construction Manager at Risk must determine the lengths required for perforated, U-channel, and round sign posts.
 - a. Cut perforated, U-channel, and round sign posts to length in the field.
 - b. Splicing single perforated posts is not permitted.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 1. Existing signs not shown on the Contract Drawings that do not need to be removed are to remain.
- B. Surface Preparation:
 1. Excavate as required to erect the sign posts in accordance with the requirements of Subsection 203-5.03(A) of the ADOT Standard Specifications for Road and Bridge Construction.
- C. Demolition/Removal:
 1. If signs need to be moved due to construction activities, place the signs as directed by the Program/Project Manager to be as near as possible to their previous location until new signs are installed.

3.03 INSTALLATION

A. Sign Posts:

1. Install the sign posts plumb, and bolted to the foundation stub or base posts, at the locations indicated on the Contract Drawings.
 - a. Affix the sign panels to the posts oriented in the proper direction using the specified hardware.
2. Breakaway Sign Posts:
 - a. Assemble the breakaway sign posts as detailed in the applicable ADOT Standard Drawings.
3. Perforated Sign Posts (Single and Telescoping):
 - a. Construct the foundations for perforated sign posts in accordance with the details and dimensions shown on the Contract Drawings.
 - 1) Place concrete in accordance with the requirements of Section 922 of the ADOT Standard Specifications for Road and Bridge Construction.
4. U-Channel Sign Posts:
 - a. Construct the foundations for U-channel sign posts in accordance with the details and dimensions shown on the Contract Drawings.
 - b. Drive U-channel base posts to a depth of 38 inches into the ground.
 - 1) Where rock is encountered, core, drill, or remove the rock around the post to a minimum diameter of 8 inches and a depth 2 inches below the bottom of the base post
 - a) Solid rock coring and drilling is not required beyond 24 inches in depth regardless of the depth at which the rock is encountered.
 - b) Place Portland cement concrete into the hole in accordance with the requirements of Section 922 of the ADOT Standard Specifications for Road and Bridge Construction, filling it to within 1 inch of the top.
 - c) The base post may be cut at the bottom prior to being set in Portland cement concrete where rock does not permit use of full length base post.
5. Round Sign Posts:
 - a. Construct the foundations for round sign posts in accordance with Detail No. P1023 of the Phoenix Supplemental Standard Details for Public Works.

B. Sign Panels:

1. Install sign panels on overhead sign structures and roadside sign supports in accordance with the details shown on the Contract Drawings and the recommendations of the manufacturers of the sign panel components.
 - a. To prevent damage to the sheeting surface, tighten bolts from the back of the sign by holding the bolt head stationary on the face of the panel.
 - 1) Twisting the bolt head on the panel face is unacceptable.

2. Place signs at the same orientation along the roadway so the entire legend of each sign appears uniform under normal viewing conditions, both day and night.
3. Anodize or paint the heads of bolts on the panel face to match the background color or legend in which they are placed.
4. If the nylon washers on the panel face do not match the background or legend color in which they are placed, paint the washers to match the background or legend color.
5. Using 1-inch high black lettering made from a long life material, such as opaque acrylic film, on the back of each sign, place the sign identification code, the sign fabricator's identification information, the manufacturer of the sheeting used, and the month and year of installation.
 - a. Format the required information as indicated on the Contract Drawings.
 - b. Position the information to be readily visible from a vantage point outside the flow of traffic, and not obstructed by sign posts, extrusions, stringers, or brackets.
 - c. Unless indicated otherwise on the Contract Drawings, construction signs are exempt from the installation information requirement.
 - d. The use of felt markers for this purpose is unacceptable.
6. Where indicated on the Contract Drawings, relocate exit panels to the correct side of the parent sign panel; remove, cut, and install side trim and new or salvaged aluminum extrusions on existing sign panels; relocate large guide and exit gore signs; and cut post tops on existing installations.

3.04 REPAIR/RESTORATION

- A. Minor scratches and abrasions on sign panels resulting from fabrication, shipping, and installation may be patched, but patching is limited to 1 patch for each 50 square feet of sign area and to a total patched area less than 5 percent of the sign area.
 1. Panels requiring more patching than the specified limit are unacceptable.
 2. Seal the edges of patches using a method approved by the retroreflective sheeting manufacturer.

3.05 SITE QUALITY CONTROL

- A. Inspections:
 1. The Program/Project Manager will inspect completely installed sign panels during both daytime and at night for proper appearance, visibility, color, specular gloss, and proper installation.
- B. Non-Conforming Work
 1. Correct apparent sign panel defects disclosed by the Program/Project Manager's inspection at no increase in Contract Price.

- a. If color variations or blemishes between sign panel increments are visible from a distance of 50 feet either during the day or at night, remove the defective panels and replace them with new panels.

3.06 CLEANING

- A. Just prior to inspection of the signs by the Program/Project Manager, thoroughly clean the sign panel faces using a method recommended by the manufacturer.
 1. Furnish cleaning solvent and cleaning materials that do not scratch, deface, or cause adverse effects on the sign panel components.

3.07 PROTECTION

- A. Preserve all roadway signs and sign supports, and replace new roadway signs and sign supports damaged as a result of construction at no increase in Contract Price.

REV. NO.	REV. DATE	RFC/CN/CO	Section(s) Affected	Comments
0	11/03/2017	N/A	All	First Edition

SECTION 02892

STRUCTURE MOUNTED SIGNS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for overhead sign structures, including the following types:
 - a. Bridge truss.
 - b. Cantilever truss.
 - c. Tubular overhead.
 - d. Tubular cantilever.
 - e. Bridge tapered tube single beam.
 - f. Cantilever tapered tube double arm.
 - g. Sign attachment structures for existing bridges.

B. Products Supplied But Not Installed Under This Section:

1. Sign Panels:
 - a. Furnish sign panels complying with the requirements for sign panels specified in Section 02891, Post-Mounted Signs, for the structures provided under this Section.
 - b. Install the sign panels under Section 02891, Post-Mounted Signs, as specified therein.

C. Related Requirements:

1. Section 01316 - Project Meetings.
2. Section 01330 - Submittal Procedures.
3. Section 01780 - Closeout Submittals.
4. Section 02473 - Drilled Concrete Shafts.
5. Section 02891 - Post Mounted Signs.

1.02 REFERENCES

A. Abbreviations and Acronyms:

1. ANSI: An acronym for the American National Standards Institute.
2. CVN: Charpy V-notch.

B. Reference Standards:

1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO LRFD Bridge Design Specifications.

- b. AASHTO Standard Specifications for Highway Bridges.
- 2. American Welding Society (AWS):
 - a. AWS D1.1/D1.1M - Structural Welding Code-Steel.
 - b. AWS D1.5/D1.5M – Bridge Welding Code.
- 3. ASTM International (ASTM):
 - a. ASTM A 36/A 36M - Standard Specification for Carbon Structural Steel.
 - b. ASTM A 53/A 53M – Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
 - c. ASTM A 82/A 82M – Standard Specification for Steel Wire, Plain, for Concrete Reinforcement.
 - d. ASTM A 123/A 123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
 - e. ASTM A 153/A 153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
 - f. ASTM A 307 – Standard Specification for Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength.
 - g. ASTM A 325 - Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.
 - h. ASTM A 514/A 514M - Standard Specification for High-Yield strength, Quenched and Tempered Alloy Steel Plate, Suitable for Welding.
 - i. ASTM A 572/A 572M - Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.
 - j. ASTM A 588/A 588M - Standard Specification for High-Strength Low-Alloy Structural Steel, up to 50 ksi [345 MPa] Minimum Yield Point, with Atmospheric Corrosion Resistance.
 - k. ASTM A 595/A 595M - Standard Specification for Steel Tubes, Low-Carbon or High-Strength Low-Alloy, Tapered for Structural Use.
 - l. ASTM A 615/A 615M - Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
 - m. ASTM A 673/A 673M - Standard Specification for Sampling Procedure for Impact Testing of Structural Steel.
 - n. ASTM A 780 – Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
 - o. ASTM B 633 – Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel.
 - p. ASTM B 766 - Standard Specification for Electrodeposited Coatings of Cadmium.
 - q. ASTM E 23 – Standard Test Methods for Notched Bar Impact Testing of Metallic Materials.
- 4. City of Phoenix (COP):

 - 1) Arizona Test Method 314 – Portland Cement Concrete.
 - 2) ADOT Standard Drawings – Traffic Signing and Marking.
 - 3) ADOT Standard Specifications for Road and Bridge Construction.
- 7. United States Government:
 - a. U.S. Army Corps of Engineers (COE):
 - 1) COE Handbook for Concrete and Cement (Standards).
 - a) COE CRD-C 621 – Standard Specification for Packaged, Dry, Hydraulic-Cement Grout (Nonshrink) (ASTM C 1107-91a).
- 8. Institute for Sustainable Infrastructure (ISI):
 - a. ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Pre-Installation Meetings:
 - 1. Attend the pre-installation meeting at the Site held in compliance with the requirements of Section 01316, Project Meetings, to discuss the requirements for constructing the drilled concrete shafts under this Contract.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Nonshrink grout.
 - b. Shop Drawings:
 - 1) Sign structures.
 - c. Certificates:
 - 1) Certificates of Analysis for Structural Steel.
 - d. Delegated Design Submittals:
 - 1) Structural analysis data.
 - e. Qualification Statements:
 - 1) Welding Certificates.
 - 2) Steel Fabricator Qualifications.

- 3) Steel Erector Qualifications.
- 4) Professional Engineer's credentials.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Mill test reports for structural steel shapes, plates, and bars.
 - b. Manufacturer's Instructions:
 - 1) Manufacturer's recommendations for mixing, handling, and placing grout.

C. Closeout Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Sustainable Design Closeout Documentation:
 - 1) Written affidavits from the steel manufacturer verifying that the recycled steel content provided complies with the specified requirements.
 - 2) ENVISION Credit RA 1.3 Use Recycled Materials.
 - 3) ENVISION Credit RA 1.4 Use Regional Materials.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Authority Having Jurisdiction:
 - a. Required approvals depend on who owns the right-of- way and where the structure mounted signs are to be constructed, but must be obtained before construction activities begin from the appropriate State and municipal departments, which may include but are not limited to, the following:
 - 1) Arizona Department of Transportation (ADOT).
 - 2) City of Phoenix Streets Department.
 - 3) Phoenix Sky Harbor International Airport Design and Construction Services.
 - b. If the owner of the right-of- way is other than the Phoenix Sky Harbor International Airport, the owner of the right-of- way will be provided on the Contract Drawings.
2. Special Inspections:

- a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by a code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - 1) Both continuous and periodic Special Inspections will be performed during the fabrication and erection of structural steel.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
 - 3. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ independent Testing and Inspection Agencies, including the City Building Official and the City of Phoenix Testing Laboratory.
- B. Qualifications:
- 1. Welding Qualifications:
 - a. Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders and welding procedures to the Program/Project Manager for approval.
 - 1) For all procedures, other than those set forth in AWS D1.1/D1.1M and AWS D1.5/D1.5M, submit a copy of the welding procedure qualification test records.
 - b. Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed in AWS D1.1/D1.1M and AWS D1.5/D1.5M for the procedures.
 - 1) Submit Welding Certificates certifying the welders employed to fabricate and to install the Work of this Section have been AWS certified within the previous 12 months to the Program/Project Manager for approval.
 - a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures and, if pertinent, has undergone recertification.
 - 2. Fabricator Qualifications:

- a. Employ a structural steel fabricator experienced in fabricating structural steel similar to that indicated for this Contract.
 - 1) The fabricator chosen must participate in the AISC Quality Certification Program, and must have the AISC "Certification Standard for Steel Building Structures".
 - 2) Use a structural steel fabricator exhibiting a minimum of 5 continuous years of successful in-service performance.
 - b. Employ a structural steel fabricator having sufficient production capacity to produce and deliver the materials in time to meet the approved construction schedule for this Contract.
 - c. Submit the structural steel fabricator's qualifications to the Program/Project Manager for approval, including a list of completed projects with project name, addresses, names of designers and owners, and other information applicable.
 - 3. Structural Steel Erector Qualifications:
 - a. Employ a structural steel erector experienced in erecting structural steel work similar to that required for this Contract who has a minimum of 5 continuous years of providing successful in-service performance.
 - b. Submit the structural steel erector's qualifications to the Program/Project Manager for approval.
 - 4. Professional Engineer Qualifications:
 - a. Engage a qualified Professional Engineer registered in the State of Arizona to perform structural analysis required for the structural systems.
 - b. Submit the Professional Engineer's credentials to the Program/Project Manager for information.
- C. Certifications:
- 1. Certificates of Analysis for Structural Steel:
 - a. Prior to providing the structural steel for the structure mounted signs provided under this Section, submit Certificates of Analysis for the structural steel to the Program/Project Manager for approval.
 - b. Include the following information in each Certificates of Analysis:
 - 1) A description of the material supplied.
 - 2) The quantity of material represented by the Certificates of Analysis.
 - 3) The means of identifying the material, such as a label, lot number, or other marking.
 - 4) Results of the tests specified in this Section to validate the quality of the materials.

- 5) A statement certifying that the material complies in all respects with the requirements specified, such as reference standards, tables, or Specification Sections.
 - 6) The name, title, signature, and date of the signature of a person having legal authority to bind the manufacturer or Supplier of the material or manufactured assembly.
 - c. Do not have the person having the legal authority sign the Certificates of Analysis sign it before all other required information has been inserted on the Certificate.
 - 1) Do not alter, add to, or change in any way a Certificates of Analysis after the authorized signature has been affixed to the original Certificate, except notations of a clarifying nature, such as the Project number, which do not affect the basic requirements of the Certificate.
 - 2. Mill Test Reports for Structural Steel Shapes, Plates, and Bars:
 - a. Submit structural steel mill test reports for structural steel shapes, plates, and bars signed by the manufacturer of the structural steel products, and certifying the products provided comply with the specified requirements, to the Program/Project Manager for information
 - 1) Include the results of the Charpy V-notch impact tests.
 - 2) Certify the material provided conforms to the appropriate ASTM specification.
- D. Sustainability Standards Certifications:
- 1. Recycled Steel:
 - a. Provide steel with the average recycled content of steel products includes a postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
 - b. Submit written affidavits from the steel manufacturer verifying that the recycled steel content provided complies with the specified requirements.
 - 2. Recycled Content ENVISION Submittals:
 - a. Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - b. Because these credits are based on costs, include a statement indicating the costs for each product having recycled content.

PART 2 PRODUCTS

2.01 STRUCTURE MOUNTED SIGN ASSEMBLIES

- A. Description:
 - 1. Regulatory Requirements:
 - a. Phoenix Building Construction Code:
 - 1) Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments [ICC International Building Code (IBC) as Amended by the City of Phoenix].
 - 2. Sustainability Requirements:
- B. ENVISION Credit RA 1.3 - Use Recycled Materials
 - 1. Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials
- C. Design Criteria:
 - 1. Shop Drawings:
 - a. Prior to fabrication of the sign structures, prepare Shop Drawings of the structures showing fabrication and installation details for the proposed sign structures.
 - 1) Include a complete design of the structure.
 - 2) Prepare Shop Drawings on 36-inch by 22-inch sheets having a 2-inch margin on the left side and 1/2-inch margins on the 3 remaining sides.
 - a) Furnish a 4-inch wide by 3-inch high blank space in the lower right hand corners of the sheets.
 - 3) Furnish details as required to represent the Work adequately, including details of the components and connection details.
 - 4) Shop Drawings containing drawings for falsework, shoring, soldier piles, and other major temporary structures must be sealed and signed by the Professional Engineer.
 - b. Submit the Shop Drawings to the Program/Project Manager for approval.
- D. Materials:
 - 1. Concrete:
 - a. For sign foundations, provide concrete complying with the requirements for Class A concrete (ADOT Class S concrete) having a

28-day compressive strength of 3000 psi specified in Section 03300, Cast-In-Place Concrete.

2. Fasteners
 - a. Bolts, Nuts, and Washers:
 - 1) For high strength bolts, nuts, and washers, provide steel bolts, nuts, and washers complying with the requirements specified in ASTM A 325.
 - 2) For other than high strength bolts, nuts, and washers, provide steel bolts and nuts complying with the requirements specified in ASTM A 307, and provide commercial quality washers.
 - b. Anchor Bolts:
 - 1) For the sign foundations, provide anchor bolts complying with the requirements specified in ASTM A 36/A 36M.
 - c. Except for the high strength bolts and the anchor bolts, either cadmium plate the fasteners in accordance with the requirements specified in ASTM B 766, or zinc plate the fasteners in accordance with the requirements specified in ASTM B 633.
3. Nonshrink Grout:
 - a. Provide nonshrink grout complying with the requirements specified in COE CRD-C 621.
 - 1) Submit Product Data for the nonshrink grout to the Program/Project Manager for approval.
4. Reinforcing Steel:
 - a. Reinforcing Steel Bars:
 - 1) Provide reinforcing steel bars complying with the requirements for Grade 40 steel specified in ASTM A 615/A 615M.
 - b. Reinforcing Steel Wire:
 - 1) Provide reinforcing steel wire complying with the requirements specified in ASTM A 82/A 82M.
5. Sign Panels:
 - a. Furnish sign panels complying with the requirements for sign panels specified in Section 02891, Post-Mounted Signs.
6. Structural Steel:
 - a. Structural Shapes, Plates, and Bars:
 - 1) Provide structural shapes, plates, and bars conforming to the requirements of ASTM A 36/A 36M.
 - 2) For column or girder flanges, web plates, and truss cord angles, provide structural steel complying with the minimum longitudinal Charpy V-notch (CVN) impact test values indicated in Table 02892-1, when tested in accordance with the following requirements:

- a) Employ sampling procedures complying with the requirements specified in ASTM A 673/A 673M.
- b) For structural steels complying with the requirements specified in ASTM A 36/A 36M, ASTM A 572/A 572M, and ASTM A 588/A 588M, employ the H (heat) testing frequency.
- c) For structural steels complying with the requirements specified in ASTM A 514/A 514M, employ the P (piece) testing frequency.
- d) Determine the Charpy V-notch (CVN) impact values in accordance with the requirements specified in ASTM E 23.

Table 02892-1 Minimum Charpy V-Notch Values for Structural Steel Shapes, Plates, and Bars		
Material Specification	Thickness	Impact Value (Foot-pounds at the Temperature Indicated)
ASTM A 36/A 36M	All	15 at 40 degrees Fahrenheit
ASTM A 572/A 572M ⁽¹⁾	All	15 at 40 degrees Fahrenheit
ASTM A 588/A 588M ⁽¹⁾	2 inches and under	15 at 40 degrees Fahrenheit
	Over 2 to 4 inches	20 at 40 degrees Fahrenheit
ASTM A 514/A 514M	2-1/2 inches and under	25 at 0 degrees Fahrenheit
	Over 2-1/2 to 4 inches	35 at 0 degrees Fahrenheit
1. If the yield point of the material exceeds 65,000 psi, reduce the temperature for the acceptable CVN impact value 15 degrees Fahrenheit for each increment of 10,000 psi above 65,000 psi.		

b. Tapered Tubes:

- 1) For the bridge single beam sign structures and for the cantilever double arm sign structures, provide tapered tube beams, arms, and poles fabricated from structural steel complying with the requirements specified for Grade A steel in ASTM A 595/A 595M.
- c. Pipe Poles:
 - 1) For cantilever truss, provide welded or seamless steel pipe poles complying with the requirements for Type E or Type S, Grade B steel specified in ASTM A 53/A 53M.
- E. Shop Fabrication:
 1. Fabricate component parts of the sign structures in accordance with the approved Shop Drawings and the requirements specified in Division II Construction, Section 11 Steel Structures, of the AASHTO Standard Specifications for Highway Bridges.
 2. Drill and tap structure components for mounting hardware as shown on approved Shop Drawings prior to installation.
 3. Welding:
 - a. Weld tubular structural steel in accordance with the requirements specified in Section 10 of AWS D1.1/D1.1M.
 - b. Weld structural steel other than tubular structural steel in accordance with the requirements specified in AWS D1.5/D1.5M.
 - c. The electro-slag welding process is unacceptable for welding structural steel.
 - d. In addition to the above requirements, weld Fracture Critical Members (FCMs) in accordance with the requirements specified in the AASHTO LRFD Bridge Design Specifications and AWS D1.1/D1.1M.
- F. Shop Finishing Methods:
 1. After sign structures have been fabricated, but before they have been assembled, galvanize all steel surfaces in accordance with the requirements specified in ASTM A 123/A 123M and ASTM A 153/A 153M.

2.02 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 1. Materials specified in this Section require advance examination or laboratory testing according to the methods referenced herein, or as required by the Program/Project Manager.
- B. Non-Conforming Work:
 1. Failure of the Testing and Inspection Agency and/or the code-required Approved Agency to detect defective work will not prevent its rejection

later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.

C. Manufacturer Services:

1. Arrange for the producer to cooperate with and assist the Testing and Inspection Agency and code-required Approved Agency to inspect the materials at the source.

D. Coordination of Other Tests and Inspections:

1. Notify the Testing and Inspection Agency and the code-required Approved Agency responsible for performing special inspections sufficiently in advance of when structural steel for this Contract is being fabricated and/or tested to allow testing and inspection personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - a. Do not begin fabrication of steel components until arrangements to allow inspection of these components in the shop have been completed.
 - 1) Furnish written notice to the Program/Project Manager at least 3 months prior to beginning shop fabrication of the steel components.
 - 2) Furnish verbal notice to the Program/Project Manager at least 24 hours prior to beginning shop fabrication of the steel components.
 - b. The Testing and Inspection Agency and the code-required Approved Agency may perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
2. Cooperate with and assist the Testing and Inspection Agency and code-required Approved Agency when they are performing required material verifications and other special inspections at the source.
 - a. Provide full access to the places where structural steel work is being fabricated or produced so the required inspections and testing can be performed before the material is shipped.
 - b. Furnish and maintain adequate safety measures when the materials being furnished as the Work of this Section are being manufactured or produced and inspected.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Prior to scheduling installation of the sign structures, verify that the Work performed by other trades at the locations for the sign structures is complete, and these locations are ready for installation of the sign structures.

3.02 INSTALLATION

A. Foundation Installation:

1. Construct reinforced concrete foundations for the sign structures as shown on the ADOT Standard Drawings and the Contract Drawings.
 - a. Form and construct foundations within drilled shaft excavations as specified in Section 02473, Drilled Concrete Shafts.
 - b. Set each foundation at the elevation indicated on the Contract Drawings.
 - c. Place, finish, and cure concrete in accordance with the requirements specified in Section 03300, Cast-In-Place Concrete.
2. Grade embankment to match the top of the foundation as directed by the Program/Project Manager.

B. Sign Structure Installation:

1. Erect sign structures in accordance with the Contract Drawings; ADOT Standard Drawings; Division II Construction, Section 11 Steel Structures, in the AASHTO Standard Specifications for Highway Bridges, and as noted in this Section.
2. Provide temporary shores, guys, braces, and other supports during erection to keep sign structure secure, plumb, and in alignment.
 - a. Use temporary bracing to resist loads to which the structures may be subjected, including loads from erection equipment or its operation.
 - b. Leave temporary bracing in place as long as may be required for safety.
3. Erect steel structures true and plumb in accordance with the Contract Drawings, match marks, and pertinent regulations.
 - a. Do not field cut or alter structural members.
 - b. Do not straighten bent members unless approved by the Program/Project Manager.

C. Bolt Installation:

1. Lubricate galvanized nuts with a lubricant containing a visible dye so a visual check for the lubricant can be made during field installation.
2. Black bolts must be oily to the touch when installed.
 - a. Clean and re-lubricate weathered or rusted bolts prior to installation.

3. Install high-strength bolts, nuts, and washers in accordance with paragraph 11.5.6.4 Installation of the AASHTO Standard Specifications for Highway Bridges.
 - a. For all final tightening methods, obtain a “snug tight” condition as defined in paragraph 11.5.6.4.4 of the AASHTO Standard Specifications for Highway Bridges.

D. Welding:

1. Weld tubular structural steel in accordance with the requirements specified in Section 10 of AWS D1.1/D1.1M.
2. Weld structural steel other than tubular structural steel in accordance with the requirements specified in AWS D1.5/D1.5M.
3. The electro-slag welding process is unacceptable for welding structural steel.
4. In addition to the above requirements, weld Fracture Critical Members (FCMs) in accordance with the requirements specified in the AASHTO LRFD Bridge Design Specifications and AWS D1.1/D1.1M.

E. Grouting:

1. Mix, handle, and place grout in accordance with the manufacturer’s recommendations.
 - a. Submit the manufacturer’s recommendations for mixing, handling, and placing grout to the Program/Project Manager for information.

3.03 REPAIR

A. Galvanized Surfaces:

1. Clean field welds, bolted connections, and abraded areas, and repair galvanizing in accordance with the requirements specified in ASTM A 780.

B. Repair damage to structural components resulting from the Contractor’s operations at no increase in the Contract Price.

1. If the damage cannot be repaired, replace the damaged components with new, sound components in part or the whole of the structure at no increase in the Contract Price.

3.04 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. Site Testing:
 - a. Bolt Tension Test:
 - 1) Test Procedure:

- a) As-installed bolt/nut/washer assemblies will be periodically tested of using a Skidmore-Wilhelm Calibrator or other acceptable bolt tension indicating device to ensure the assemblies comply with the specified requirements.
 - (1) Calibrated wrench tightened assemblies will be tested on a daily basis.
 - (2) For short grip bolts, a direct tension indicator (DTI) that has been first checked with a longer bolt in the Skidmore-Wilhelm Calibrator may be used to verify compliance.
 - 2) Acceptance Criteria:
 - a) Bolt/nut/washer assemblies complying with the specified bolt tensions will pass the bolt tension test.
 - b. Weld Test:
 - 1) Test Procedure:
 - a) Column to base plate welds and pipe flange to elbow and mast arm welds will be tested using ultrasonic methods.
 - 2) Acceptance Criteria:
 - a) Welds complying with the acceptance criteria specified in the welding standards for the type of weld tested will pass the weld test.
 - 2. Inspections:
 - a. The Program/Project Manager will inspect completely installed signs for proper appearance, visibility, color, specular gloss, and proper installation.
- B. Non-Conforming Work
- 1. Correct apparent sign panel defects disclosed by the Program/Project Manager's inspection at no increase in Contract Price.
 - a. If color variations or blemishes between sign panel increments are visible from a distance of 50 feet either during the day or at night, remove the defective panels and replace them with new panels.

3.05 CLEANING

- A. Just prior to inspection of the signs by the Program/Project Manager, thoroughly clean the sign panel faces using a method recommended by the manufacturer.
 - 1. Furnish cleaning solvent and cleaning materials that do not scratch, deface, or cause adverse effects on the sign panel components.

3.06 PROTECTION

- A. Preserve all roadway signs and sign supports, and replace new roadway signs and sign supports damaged as a result of construction at no increase in Contract Price.

SECTION 02893

TRAFFIC SIGNAL SUPPORTS AND EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for providing traffic signal equipment at the locations indicated on the Contract Drawings.
 - a. The Work of this Section includes the labor, incidental materials, and transportation and storage associated with the completion of the installation as shown on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01555 - Traffic Control.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. AWG: American Wire Gage.
 - 2. DCS: City of Phoenix Design and Construction Services Division.
 - 3. LED: Light Emitting Diode.
- B. Definitions:
 - 1. Authority Having Jurisdiction (AHJ): Building Code officials, zoning officials, inspectors, and government and regulatory agencies given the authority to protect the public's health, safety, and welfare.
- C. Reference Standards:
 - 1. American Welding Society (AWS):
 - a. AWS D1.1/D1.1M – Structural Welding Code-Steel.
 - 2. Arizona Department of Transportation (ADOT):
 - a. ADOT Standard Specifications for Road and Bridge Construction.
 - 3. ASTM International (ASTM):
 - a. ASTM A 36/A 36M – Standard Specification for Carbon Structural Steel.
 - b. ASTM A 123/A 123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
 - c. ASTM B 3 - Standard Specification for Soft or Annealed Copper Wire.
 - d. ASTM B 85 - Standard Specification for Aluminum-Alloy Die Castings.
 - e. ASTM D 4066 - Standard Specification for Nylon Injection and Extrusion Materials.

4. City of Phoenix (COP):
 - a. City of Phoenix Supplement to Maricopa Association of Governments Uniform Standard Specifications.
 - b. City of Phoenix Street Transportation Department:
 - 1) Traffic Signal Standard Details:
 - a) File No.7690, Sheet 1 of 6 – General Notes Signal Location.
 - b) File No.7690, Sheet 2 of 6 – General Notes Signal Location.
 - c) File No.7690, Sheet 3 of 6 – General Notes Signal Location.
 - d) File No.7690, Sheet 4 of 6 – Type ‘SM’ for 15’ – 20’ Mast Arms Signal Location.
 - e) File No.7690, Sheet 5 of 6 – Type ‘SM’ for 25’ – 30’ Mast Arms Signal Location.
 - f) File No.7690, Sheet 6 of 6 – Type ‘SR’ (Spec. Comb. Pole) for 40’ – 55’ Mast Arms Signal Location.
5. Institute of Transportation Engineers (ITE):
 - a. ITE Interim LED Purchase Specification (1998).
6. International Municipal Signal Association (IMSA):
 - a. IMSA Specification No. 19-1 1991 Polyethylene insulated, Polyethylene Jacketed Communication Cable.
 - b. IMSA Specification No. 50-2 Polyethylene Insulated, Polyethylene Jacketed Loop Detector Lead-In Cable.
 - c. IMSA Specification No. 51- 3 Cross Linked Polyethylene Insulated Loop Detector Wire.
7. Maricopa Association of Governments (MAG):
 - a. MAG Uniform Standard Specifications for Public Works Construction.
8. Underwriters Laboratories Inc.
 - a. UL 83 - Standard for Safety Thermoplastic-Insulated Wires and Cables.
9. United States Government:
 - a. U.S. Department of Transportation (USDOT).
 - 1) Federal Highway Administration (FHWA).
 - a) Manual on Uniform Traffic Control Devices (MUTCD).

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 1. Coordinate street closings and traffic control with the City of Phoenix Street Transportation Department Traffic Operations Division, the City of Phoenix Right-of-Way Management program, and with other appropriate government agencies.
 - a. Obtain all permits required by the City of Phoenix, and pay necessary fees.
 2. Coordinate all utility related work during traffic signal work activities with Aviation Facilities and Services at Phoenix Sky Harbor International Airport to avoid tapping into established utilities.

3. Forward all utility information to the Design and Construction Services Division (DCS) of the Phoenix Sky Harbor International Airport.
4. Obtain the approval of serving utilities and/or the Phoenix Sky Harbor International Airport as applicable to schedule shut downs of utilities and services
5. Obtain the approval of serving utilities and/or the Phoenix Sky Harbor International Airport as applicable to disconnect, relocate, and/or provide temporary or new utility service connections and lines as needed if these have not been previously completed.

B. Sequencing:

1. Include provisions for traffic control during installation of the traffic signal supports and equipment in the Traffic Control Plan required by Section 01555, Traffic Control, including provisions for the placement and maintenance of barriers required to protect the workers and the public during removal operations.
 - a. Prepare traffic control and walkway plans required by the City of Phoenix Special Traffic Regulations.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Conduit, couplings, and pull boxes.
 - 2) Signal faces and wiring, including loop detection.
 - 3) Internally Illuminated Street Name Signs (IISNS).
 - 4) Luminaires.
 - 5) Power service cabinet.
 - 6) Traffic signal controller and cabinet and cabinet contents.
 - b. Shop Drawings:
 - 1) Layout drawings.
 - 2) Sign and mounting details for the internally illuminated street name signs.
 - c. Qualification Statements:
 - 1) IMSA technician/electrician's qualifications.
 - 2) Electricians' qualifications.

B. Closeout Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Record Documentation:
 - 1) As-built information for traffic signal equipment.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. An International Municipal Signal Association (IMSA) Technician/Electrician must be onsite at all times during construction of the traffic signal supports and equipment.
- B. Qualifications:
 - 1. International Municipal Signal Association (IMSA) Technician/Electrician's Qualifications:
 - a. Employ a Level II IMSA-certified Technician/Electrician.
 - b. Submit the International Municipal Signal Association (IMSA) technician/electrician's qualifications to the Program/Project Manager for approval.
 - 2. Electricians' Qualifications:
 - a. Employ a qualified Journeyman Electrician, who has successfully completed a recognized 4-year electrical apprenticeship program or equivalent training, or a person enrolled in a recognized 4-year electrical apprenticeship program under the direct supervision of a Journeyman Electrician.
 - b. Submit the electricians' qualifications to the Program/Project Manager for approval.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA

- A. Product Data:
 - 1. Submit Product Data for the products and materials proposed for the Work of this Section to the Program/Project Manager for approval.
 - 2. All products and materials must be approved by the Program/Project Manager prior to ordering.
- B. Shop Drawings:
 - 1. Submit layout drawings for traffic signal poles and mast arms, including structural calculations, to the Program/Project Manager for approval.

2.02 MATERIALS

- A. Foundations for Poles, Power Service Pedestals and Cabinets:
 - 1. Provide foundations and associated hardware conforming to COP Street Transportation Department File No.7690.
 - 2. For foundations, provide Class A, 3000 psi concrete complying with the requirements specified in Section 03300, Cast-In-Place Concrete, and having a 6 inch slump.
- B. Traffic Signal Conduit

1. Provide schedule 40 rigid polyvinyl chloride (PVC traffic signal conduit) complying with the requirements specified in Section 732-2.02 of the ADOT Standard Specifications for Road and Bridge Construction.
- C. Junction Boxes
1. Provide junction boxes complying with the requirements specified in Section 732-2.03 of the ADOT Standard Specifications for Road and Bridge Construction, except as modified herein.
 - a. Provide lids embossed in minimum 1 inch tall lettering parallel to the longest side to read "TRAFFIC SIGNAL".
- D. Poles and Mast Arms
1. Provide traffic signal poles, mast arms, and the associated hardware in conformance with COP Street Transportation Department File No.7690.
- E. Twelve (12) Inch Signal Heads
1. Provide twelve Inch traffic signal head assemblies consisting of Light Emitting Diode (LED) vehicle signal displays of Red, Yellow, and Green Ball or Arrow sections equipped with a back plate, visor, and associated mounting hardware for pole or mast arm mounting, as indicated on the Contract Drawings.
 - a. Traffic signal head assemblies consist of individual sections, fastened together to produce a single unit.
 - b. Provide sections that fit securely together to prevent the entrance of dirt and moisture into the assembly.
 2. 12-inch signal head sections each require the following:
 - a. Section Housing:
 - 1) Provide one-piece, polycarbonate housings for each section, complete with a top, a bottom, and sides and with black color impregnated into the material.
 - 2) Equip each section housing with a rectangular polycarbonate door meeting the minimum requirements of ASTM B 85.
 - 3) Provide 2 hinge lugs on the left of each housing section, and latch screw lugs on the right side of the housing.
 - 4) Provide an opening on the top and bottom of the housing to accommodate standard 1-1/2 inch pipe fittings.
 - 5) Provide a Shurlock boss in the bottom opening of the signal housing having 72 clean, sharp clean teeth that provide full engagement, angled at 90 degrees with a depth of 5/64 inch.
 - 6) The radial angular grooves of the Shurlock boss, when used with Shurlock fittings must provide positive positioning of the entire signal head and eliminate rotation or misalignment of the signal.
 - 7) Provide the top of the section housing with two indentations in the opening designed to receive a Shurlock ring to provide positive positioning of the head when mounted from a mast arm.

- 8) Provide each housing section with a minimum of 4 mounting points, 2 on each side, to secure the back plate to the signal head.
- b. Housing Doors:
 - 1) Provide housing door, each consisting of a one-piece, polycarbonate housing door for each signal section with black color impregnated into the material.
 - 2) Provide 2 hinge lugs on the left of each door, and latch paws on the right side of each door.
 - 3) Provide hinge pins easily removable without the need for special tools.
 - 4) Provide a corrosion resistant, stainless steel latch screw and wing nut on the right side of the housing to allow opening and closing the signal door without the use of any tools.
 - 5) Form the inside of the door with a gasket groove having a weather-proof and mildew resistant resilient polyethylene gasket which, when the door is closed, seats against a raised bead on the housing to make a positive weather proof and dustproof seal.
 - 6) On the outer face of the door and equally spaced about the circumference of the lens opening, provide 4 tapped holes to accommodate the signal head visor.
 - a) Include four 18-8 Type 304 stainless steel truss head screws to accommodate the signal head visor.
- c. Signal Head Visors:
 - 1) Equip each signal place with a tunnel style (open bottom) visor that is approximately 7 to 10 inches long.
 - 2) Provide visors blanked, formed, and welded from .050 inch 31 05-H25 aluminum alloy or polycarbonate.
 - 3) Design and fabricate visors with attaching ears (slotted tabs) to facilitate installation.
 - 4) Construct the visor so it can be installed or removed from the signal head without removing the attaching screws or opening the housing door.
 - 5) The axis of the visor may not deviate more than 3.5 degrees or less than 3 degrees downward from horizontal.
- d. Light Emitting Diode (LED) Vehicle Signal Module:
 - 1) Equip each signal section with an LED vehicle signal module for each signal head section, including balls and arrows.
 - 2) Provide LED traffic signal modules meeting the requirements identified in the 1998 interim LED Purchase Specification of the institute of Transportation Engineers except as may be herein listed.
 - a) Provide LED traffic signal modules of a design that will fit traffic signal housings complying with the Specifications established herein.

- b) Provide weather tight modules that fit securely in the housing and that will connect to the traffic signal head wire terminal block.
- c) Provide wiring having only crimped on terminal connectors.
- d) Provide a single, self-contained LED signal module.
 - (1) Provide a power supply integral to the sealed LED module.
- 3) Module identification:
 - a) Affix the manufacturer's label to each LED module.
 - b) Provide labels containing all information listed in Section 3.6 of the ITE Interim LED Purchase Specification, and containing the date of manufacture.
- 4) LED Environmental Requirements:
 - a) Provide LED signal modules rated for use in the ambient operating temperature range of – 40 degrees Celsius (- 40 degrees Fahrenheit) to +74 degrees Celsius (164 degrees Fahrenheit).
- 5) LED Module Photometric Requirements:
 - a) Provide LED modules having a light output complying with the requirements of Section 4 of the ITE Interim LED Purchase Specification, the 44-point test identified in paragraph 6.4.2.1, and the single point test identified in paragraph 6.4.2.2.
- 6) LED Module Electrical Requirements:
 - a) Provide an LED module that uses 2 color-coded copper wires
 - (1) Provide No. 20 AWG wire with 30 mil jacketed insulation.
 - (2) Provide wires a minimum of 36 inches long with crimped-on fork connectors.
 - (3) Provide wire rated for 600 volt AC.
 - (4) Provide insulation rated for 105 degrees Celsius (220 degrees Fahrenheit).
- 7) LED Dimming:
 - a) Do not equip the LED modules with dimming circuitry.
- 8) Failed State Impedance:
 - a) Have the LED module manufacturer include the option listed in Section 5.8 of the ITE Interim LED Purchase Specification.
- 9) LED Module Compatibility:
 - a) The recommendation stated in Technical Note #2 of the Institute of Transportation Engineers 1998 Interim LED Purchase Specification is adopted.
 - b) Provide LEDs compatible with approved load switches and conflict monitors.
 - (1) Include in the material submittal a list of all control equipment known to be incompatible with the submitted LED module.

- (a) This list is to include all known equipment as well as that employed in this Contract.
 - c) Currently the following brand and model load switches and conflict monitors are to be known to be compatible with the submitted module.
 - (1) Load Switches
 - PDC model SSS-83
 - PDC model SSS-87
 - PDC model SSS-88
 - IDC/SSD model 200K
 - IDC/SSD model 200K I/O
 - TSC C/N 82A049
 - TSC C/NSP 4300
 - EDI 510 m
 - (2) Conflict Monitors
 - Eagle model LT-222
 - Econolite model SSM-12E
 - EDI model NSM-12L
 - EDI model SSM-18LE
 - Solid State Devices model NM(NP)-12L
 - Solid State Devices model Guardian LCD 18P
- e. Wiring:
 - 1) Provide each LED module with color coded wiring.
 - 2) Relate the color code to the display provided by the module as follows:

Function	Color
Red Ball or Arrow Driver	Red
Yellow Ball or Arrow Driver	Yellow
Green Ball or Arrow Driver	Green
- 3. Terminal Blocks:
 - a. Equip each complete signal head with a 6-position, 12 terminal, barrier type strip terminal block phenolic terminal block.
 - b. Locate the terminal blocks in the in the bottom section of vertically arrayed signal head assemblies, and in the bottom green ball section of 5 section mast arm mounted side by side arrayed signal head assemblies.
 - c. Attach the red, yellow, and green signal section leads to the same side of the terminal strip.
- 4. Colors and Finishes:
 - a. Signal Head Color:
 - 1) Color the vehicle signal heads with black color impregnated into the material of the polycarbonate surfaces, including the inside and outside of the signal housing, the door, and the visors.
 - b. Back Plate Finish:

- 1) Finish the back plates with a low-gloss two-part high solids enamel paint with ultraviolet inhibitors.
- 2) Powder coating is an acceptable alternative.
5. Mounting Hardware:
 - a. For mast arm mounted signal head assemblies, install an elevator plumbizer below the red section of the signal head.
 - 1) When so equipped, provide the top and bottom sections of the assemblies with a gasketed closure in the 1-1/2-inch openings.
 - 2) Provide cast bronze elevator plumbizers cast smooth or machined to remove all sharp edges.
 - 3) When required, equip the signal head with a mast arm mounting bracket assembly consisting of a banded pole plate and 1-1/2-inch support tube designed for rigid mast arm mounting of a signal head equipped with an elevator plumbizer
 - b. For pole mounted signal heads, mount each signal head assembly with a set of brackets that includes the following:

Item	Quantity per Set
1 1/2 Pipe Elbow with serrated surface (72 teeth)	2
1 A" Chase Nipple with 2 1/2" Hex head	2
1 1/2" Schedule 40 Pipe arms	2
Band-on style pole brackets	2

- F. Traffic Signal Loop Detectors:
 1. Provide 5 feet by 40 feet inductive loop detectors at the locations indicated on the Contract Drawings.
 2. Size the inductive Loop Wire as indicated on the Contract Drawings and consistent with IMSA 51-3.
 3. Size the loop lead-in cable as indicated on the Contract Drawings and consistent with IMSA 50-2.
- G. Controllers and Cabinets:
 1. Provide a MPS 12 phase dual ring traffic signal controller conforming to the requirements specified in Section 734 of the ADOT Standard Specifications for Road and Bridge Construction for Road and Bridge Construction.
 2. Coordinate with the City of Phoenix Traffic Signal staff to determine the preferred traffic signal controller model and cabinet type.
 3. Provide a power service pedestal cabinet in accordance with the requirements specified in Section 734-2.03 (G) of the ADOT Standard Specifications for Road and Bridge Construction for Road and Bridge Construction.
 4. Verify that the cabinet to be installed is compatible with the cabinet foundations shown on the COP Street Transportation Department File No.7690.

H. Wire and Cable:

1. Signal Conductor Traffic Signal Cable:
 - a. Size traffic signal cable as indicated on the Contract Drawings and complying with the requirements specified in IMSA Specification 19-1.
 - b. For 5, 7, 20 or 42 conductor cable, provide AWG 14 solid copper conductors.
2. Single Conductor Signal Wire:
 - a. Provide single conductor signal wire consisting of a solid copper conductor insulated by a polyvinyl chloride compound, and sized as indicated on the Contract Drawings.
 - 1) Completely enclose the insulated conductor in a nylon jacket.
 - b. Provide copper conductor conforming to the requirements of ASTM B 3 before insulation is applied.
 - c. Insulate the conductor using polyvinyl chloride.
 - d. Apply the insulation concentrically about the conductor.
 - 1) Provide insulation for AWG 14 conductors not less than 13 mils thick.
 - 2) Provide insulation for AWG 10 conductors not less than 18 mils thick.
 - e. Provide insulation of the finished conductor capable of withstanding a 60 Hertz or 3,000 Hertz, 7,500 volt essentially sinusoidal spark test potential (RMS) before the jacket is applied without breakdown when tested in accordance with the method and using the equipment specified in UL 83.
 - f. Apply a tight fitting nylon compound jacket over the conductor complying with the requirements specified in ASTM D 4066.
 - g. Provide jacket not less than 0.003 inches thick on all conductors.

I. High Pressure Sodium Luminaries:

1. Provide 250 watt, high pressure sodium luminaries of the horizontal burning type complying with the requirements specified in Section 736-2.01 (A) of ADOT Standard Specifications for Road and Bridge Construction.

J. Internally Illuminated Street Name Sign:

1. Provide luminated sign fixtures having double face illuminated street sign cabinets.
 - a. Provide cabinets consisting of an aluminum extrusion with mill finish, and measuring approximately 96 inches wide, by 36 inches high, by 12 inches deep.
 - b. Provide cabinets having a top-hinged retainer system with prop rod for access and service.
 - c. To prevent vertical sagging of the cabinet, install 3/8-inch support rods in a double "X" pattern on each of the 2 display sides.
2. Provide white polycarbonate faces with 3M vinyl graphics:

- a. Provide a #3990 reflective diamond grade background with EC Film#1177 green.
- b. Font: HWY Gothic Series B, C, and/or D (2002) with standard spacing.
- c. Provide City of Phoenix logos consisting of printed vinyl graphics.
3. Provide faces consisting of the street name, the block, and direction number in the upper right hand corner above the City of Phoenix logo.
4. Where street name is different on each side of the intersection, display both street names, with arrows indicating the direction for each street name.
5. Have the City of Phoenix Street Transportation Department approve sign legends and layouts prior to ordering.
6. Provide illumination using two F96T12 CWHO 800mA fluorescent lamps on 10-inch centers horizontally, with an EESB-424-13L electronic ballast attached to an extruded wireway.
7. Hot-dip galvanize the steel bracket and mounting hardware components in accordance with ASTM A 123/A 123M.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Prior to beginning construction operations, perform a field investigation with the Program/Project Manager.
 2. Prior to beginning excavation operations, mark in the field the foundation locations for poles, controller cabinets, and other foundations shown on the traffic signal plans in the Contract Drawings.
- B. Evaluation and Assessment:
 1. At the time of the inspection, the Program/Project Manager may adjust pole locations from the planned or marked locations to accommodate circumstances found at the Site.
 2. Before the excavation of any foundation may proceed, the Program/Project Manager must approve the foundation locations in writing.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 1. Ensure minimum interference with roads, streets, walks, and other adjacent occupied or used facilities by construction operations.
 - a. Do not close or obstruct streets without permission from the Authorities Having Jurisdiction.
 - b. Provide alternate routes around closed or obstructed traffic ways if required by governing regulations.

- 1) Ensure safe passage of persons around the area of construction.

3.03 CONSTRUCTION

- A. Foundations for Poles, Power Service Pedestals and Cabinets:
 1. Provide foundations installed in accordance with the requirements specified in Section 731-3.01 of the ADOT Standard Specifications for Road and Bridge Construction, except as modified herein.
 2. The Contractor may employ the alternative foundation design for disturbed material only with prior approval of the Program/Project Manager.
 3. Cast foundations in a single continuous pour using the concrete specified.
 - a. Cold joints are not permitted.
 4. Pole Foundations:
 - a. The minimum curing time before loading is 10 days.
 - b. Quick curing compounds are unacceptable.
 - c. Provide conduits finished so they extend 6 inches above the finished grade of the foundation.
 - d. Provide anchor bolts extending above the finished grade of the foundation to the height specified for the specific pole type, as shown on COP Street Transportation Department File No.7690.
 5. Cabinet Foundations:
 - a. The minimum curing time before loading is 7 days.
 - b. Quick curing compounds are unacceptable.
 - c. Provide conduits finished flush with the finished grade of the top of the foundation.
 - d. Provide anchor bolts extending 4 inches above the finished grade of the foundation.
- B. Traffic Signal Conduit:
 1. Provide traffic signal conduit in accordance with the requirements specified in Section 732-3.01 of the ADOT Standard Specifications for Road and Bridge Construction, except as modified herein.
 2. Install traffic signal conduit a minimum of 30 inches below finished grade, except locate loop stub out conduits 6 inches to 12 inches below the curb base.
 3. Except for loop stub out conduits, encase traffic signal conduit having less than 30 inches of cover in concrete so there is a minimum of 2 inches of cover on all sides.
- C. Junction Boxes:
 1. Provide junction boxes in accordance with the requirements specified in Section 732-3.01 of the ADOT Standard Specifications for Road and Bridge Construction.
- D. Poles and Mast Arms:

1. Provide poles and mast arms in accordance with COP Street Transportation Department File Drawing #7690, and with the requirements specified in Section 731-3.02 of the ADOT Standard Specifications for Road and Bridge Construction.
- E. Twelve Inch Signal Heads:
1. Provide twelve inch signal head assemblies in accordance with the requirements specified in Section 733-3 of the ADOT Standard Specifications for Road and Bridge Construction.
- F. Traffic Signal Loop Detectors:
1. Locate traffic signal loops as shown on the Contract Drawings.
 - a. Before installing the loops, mark the loops in the field at the locations approved in writing by the Program/Project Manager.
 2. Saw-cut and drill slots and cores into the final asphalt concrete base course lift as shown in the COP Street Transportation Department File No.7690.
 - a. Provide 1/4-inch wide slots of sufficient depth to allow 2 inches of sealant coverage.
 - b. Drill cores 2-1/2 inches in diameter, and 2-1/2 inches deep.
 3. Install loop conductors only in the presence of the Program/Project Manager.
 - a. Blow out and dry slots before installing wires.
 - b. Wind each loop in the direction and with the number of turns indicated on the COP Street Transportation Department File No.7690.
 - c. Wind loop lead-in's from the loop to the junction box at three turns per foot.
 4. Band the beginning conductor in the junction with the symbol "S", and identify the loop by a number of taped rings as shown on the COP Street Transportation Department File No.7690.
 5. Provide each loop with a minimum of 3 feet of slack in the twisted pair of conductors at the junction box when measured from the top of the junction box.
 6. Connect loop conductors to shielded loop lead-in cables with twist-on wire nuts sealed with a commercial grade of silicone sealant.
 7. Only seal loops after completion of successful testing as specified in Article 3.04.
 8. Inject sealant into the slots and drill cores, and strike it off flush with the roadway surface.
 - a. Remove excess sealant from the surface of the roadway.
- G. Controllers and Cabinets:
1. Provide controllers and cabinets in accordance with the requirements specified in Section 734-3 of the ADOT Standard Specifications for Road and Bridge Construction.

H. Wire and Cable:

1. Provide traffic signal wire and cable in accordance with the requirements specified in Section 734-3.02 of the ADOT Standard Specifications for Road and Bridge Construction.
2. Conductor splices and terminations may only be made by a qualified Journeyman Electrician.

I. High Pressure Sodium Luminaries:

1. Provide luminaries in accordance with the requirements specified in Section 736-3 of the ADOT Standard Specifications for Road and Bridge Construction.

J. Internally Illuminated Street Name Signs:

1. Mount sign cabinets on the luminaire extension of the traffic signal poles as indicated in the Contract Drawings.
2. Ensure that the base of the cabinet clears the traffic signal mast arm by a minimum of 8 inches at the cabinet's outer edge.
3. Ensure that the top of the cabinet clears the luminaire mast arm base by a minimum of 8 inches at the cabinet's outer edge.

3.04 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. Testing must be conducted in the presence of the Program/Project Manager.
 - a. Successful completion of tests will be documented in writing by the Program/Project Manager.
2. Meggar Test:
 - a. Test Procedure:
 - 1) Perform a 600 volt meggar test on the traffic signal loop detectors.
 - b. Acceptance Criteria:
 - 1) A 600 volt meggar test showing not less than 10 megohms resistance to ground is acceptable.
 - 2)
3. Continuity Test:
 - a. Test Procedure:
 - 1) Perform a continuity test on the traffic signal loop detectors.
 - b. Acceptance Criteria:
 - 1) A continuity test showing loop circuit resistance does not exceed 2 ohms is acceptable.
4. Inspections:
 - a. Record and prepare as-built information for traffic signal equipment both above and below ground.
 - 1) Submit the as-built information for traffic signal equipment to the Program/Project Manager for the record.

3.05 SYSTEM STARTUP

- A. Final acceptance of the traffic signal system will be determined by the Program/Project Manager after all discrepancies and/or modifications are completed.

3.06 ATTACHMENTS

- A. The following attachments are appended to this Section following the “END OF SECTION” marker:
 - 1. COP Street Transportation Department File No.7690.

SECTION 02900

PLANTING

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for landscape plantings, including, but not limited to, the following:
 - a. Furnishing and planting landscape plantings.
 - b. Selective pruning.
 - c. Mulching.
 - d. Fertilizing.
 - e. Watering.
 - f. Providing maintenance for deciduous trees, palms, shrubs, and cacti.
 - g. Decomposed granite replacement.
 - h. Disposal of extraneous landscaping materials.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01410 - Regulatory Requirements.
 - 3. Section 01500 - Temporary Facilities and Controls.
 - 4. MAG Section 401 - Traffic Control.
 - 5. Section 01568 - Temporary Tree and Plant Protection.
 - 6. Section 01571 - Temporary Erosion and Sediment Control.
 - 7. Section 01770 - Closeout Procedures.
 - 8. Section 02237 - Plant Salvage.
 - 9. Section 02919 - Topsoil.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. APS: Arizona Public Service, an electric utility.
 - 2. SRP: Salt River Project, a Utility Company
 - 3. PLS: Pure live seed.
- B. Definitions:
 - 1. Tackifier: A soil penetrating substance used to bind soil and fertilizer particles together, hold seed in place while the seed germinates, and allow water and nutrients to reach the root zone of plants.
- C. Reference Standards:

1. American Nursery and Landscape Association (ANLA™)/American National Standards Institute (ANSI):
 - a. ANSI Z60.1, American Standard for Nursery Stock.
2. American Joint Committee on Horticultural Nomenclature (AJCHN):
 - a. AJCHN Standardized Plant Names.
3. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO T 89, Standard Method of Test for Determining the Liquid Limit of Soils.
4. Arizona Nursery Association (ANA):
 - a. ANA Grower's Committee Recommended Tree Specifications.
5. Arizona State Department of Agriculture:
 - a. Regulations for nursery observations, rules, and ratings.
 - b. Regulations for native plants.
6. Association of Analytical Communities International (AOAC):
 - a. AOAC Official Methods of Analysis of AOAC International.
7. Maricopa County:
 - a. Air Quality Department (MCAQD):
 - 1) Guidance for Dust Control Permit for Application.
 - 2) Application for Dust Control Permit,
 - 3) Dust Control Logs.
 - b. Maricopa County Air Pollution Control Regulations:
 - 1) Regulation II – Permits and Fees:
 - a) Rule 200 – Permit Requirements, Section 305 – Dust Control Permit,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/200-0803.pdf.
 - b) Rule 280 – Fees,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/280-0803.pdf.
 - 2) Regulation III – Control of Air Contaminants:
 - a) Rule 300 – Visible Emissions,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/300-0803.pdf.
 - b) Rule 310 – Fugitive Dust from Dust-Generating Operations,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/310-0803.pdf.
 - c) Rule 310.01 - Fugitive Dust from Non-Traditional Sources of Fugitive Dust,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/310.01-0803.pdf.
8. U. S. Government:
 - a. Department of Agriculture (USDA):
 - 1) 7 CFR 201 – Federal Seed Act Regulations.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate planting activities with anticipated phasing and sequencing of other construction activities.
 - a. Coordinate transplanting plant materials that have been salvaged as specified in Section 02237, Plant Salvage, with the Work of this Section.
 - b. Submit methods for coordinating the planting operations with other construction activities to the Program/Project Manager for approval.

B. Sequencing:

1. Documentation of Plant Availability:
 - a. Verify and document the availability of plant materials.
 - 1) Submit written documentation to Program/Project Manager within 30 Days after the award of the Contract for review and approval showing that all plant material is available and secured in a wholesale nursery.
 - a) This verification will serve as proof of availability for all plant material required.
 - 2) Provide the documentation from each nursery supplier supplying plant material on the nursery's letterhead, and include the following information for each nursery item:
 - a) Plant botanical and common name.
 - b) Plant quantities and sizes.
 - c) Nursery name source.
 - d) Contact person.
 - e) Phone number.
 - f) Location of nursery supplier.
2. Documentation of Plant Procurement:
 - a. Verify and document the procurement of plant materials.
 - 1) Submit written documentation to Program/Project Manager within 90 Days of award of the Contract for review and approval showing that all plant material has been procured for the Contract.
 - 2) Provide the documentation from each nursery supplying plant material on the nursery's letterhead, and include the following information for nursery item:
 - a) Plant botanical and common name
 - b) Plant quantities and sizes
 - c) Nursery name
 - d) Contact person
 - e) Phone number
 - f) Location of nursery
3. Include provisions for traffic control during concrete paving operations in the Traffic Control Plan required by MAG Section 401, Traffic Control,

including provisions for the placement and maintenance of barriers required to protect the pavement from traffic for a minimum of 7 Days after concrete placement.

- a. Pay particular attention to regulations for the use of cranes or other equipment in the process of tree moving.
- b. Use adequate controls to protect the public and the safety of all involved.

C. Scheduling:

1. Plant Material Delivery Schedule:
 - a. Submit plant material delivery schedules to the Program/Project Manager at least 10 days prior to the intended date of the first delivery.
2. Do not deliver more plant material to the Site than can be planted within 3 days.
3. Proposed Landscaping Work Schedule:
 - a. Prior to the final acceptance inspection described in Subparagraph 3.06.A.3.d, submit a Proposed Landscaping Work Schedule to the Program/Project Manager for approval, and showing operations to be performed by month, including but not limited to the following:
 - 1) Dates of work to be completed.
 - 2) Weed control / herbicide use.
 - 3) Trash and debris pickup.
 - 4) Erosion control.
 - 5) Decomposed granite replacement.
 - 6) Pruning.
 - 7) Pesticide use.
 - 8) Irrigation

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Product Data substantiation that the materials comply with the requirements specified.
 - b. Certificates:
 - 1) Manufacturer's certified analysis of standard products.
 - 2) Certified analysis of non-standard products by a recognized laboratory.
 - 3) Certificates of inspection as required by governmental authorities.
 - c. Special Procedure Submittals:

- 1) Methods for coordinating the planting operations with other construction activities.
- 2) Landscaping Work Schedule.
- d. Qualification Statements:
 - 1) Testing laboratory's qualifications.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Date Palm (*Phoenix*) Observation Report.
 - b. Site Quality Control Submittals:
 - 1) Date initiating the Plant Establishment Period.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Comply with all local, State, and Federal laws pertaining to the observation, sale, and shipment of plant materials.
2. Dust Control Permit:
 - a. In accordance with Rule 200 of the Maricopa County Air Pollution Control Regulations, a Dust Control Permit issued by the Maricopa County Air Quality Department is required for Sites where more than 0.1 acre (4356 square feet) of soil will be disturbed.
 - b. If a Dust Control Permit is required for this Contract, follow the instructions in the Maricopa County Air Quality Department's "Guidance for Dust Control Permit for Application" and Section 01410, Regulatory Requirements, and file the "Application for Dust Control Permit and Dust Control Plan, and pay the permit fees in accordance with Maricopa County Air Pollution Control Regulation Rule 280.
 - 1) Comply with the requirements of the Maricopa County Dust Control Permit and air pollution control requirements, particularly Maricopa County Air Pollution Control Regulation Rules 310 and 310.01.
 - a) Rule 310 requires maintaining daily logs recording the actual implementation of control measures identified in the Dust Control Permit.
 - c. Conspicuously post a copy of the Maricopa County Air Quality Department Dust Control Permits in a weather resistant location at the Site where it can be read by the workers.

B. Qualifications:

1. Testing Laboratory Qualifications:

- a. Employ a recognized independent testing laboratory capable of performing the tests and analysis required in accordance with methods established in the AOAC Official Methods of Analysis of AOAC International.
 - b. Submit the testing laboratory's qualifications to the Program/Project Manager for approval.
 - 2. Arborist Qualifications:
 - a. Employ a licensed Arborist to perform tree branch and root pruning.
 - b. Submit the qualifications of the Arborist to the Program/Project Manager for approval.
 - 3. Pest Control Advisor Qualifications:
 - a. Employ a licensed Pest Control Advisor to recommend and apply herbicide and pesticide controls.
 - b. Submit the qualifications of the Pest Control Advisor to the Program/Project Manager for approval.
- C. Certifications:
- 1. Analysis and Standards:
 - a. For standard products, include the manufacturer's certified analysis of the contents with the package.
 - b. For other materials, submit a certified analysis of the contents performed by a recognized laboratory in accordance with methods established in the AOAC Official Methods of Analysis of AOAC International, wherever applicable.
 - 2. Plant and Planting Material Certifications:
 - a. Submit certificates of inspection as required by governmental authorities.
 - b. Submit other necessary Product Data substantiating that the materials comply with the requirements specified.

1.06 SOIL TESTING

- A. Agronomy Test:
- 1. Prior to planting operations, the contractor shall employ a Certified Agricultural Testing Laboratory to perform agronomy and bioassay tests on the soils where new planting will be performed. An agronomy or bioassay test (5 each) shall be taken at ten (10) locations specified on the plans and as approved by the Resident Engineer. Resident Engineer and The City's Arborist/Horticulturalist may select specific locations for the tests depending on the existing conditions and the potential soil issues.
 - 2. The contractor shall contract with a licensed soils lab to test the soil samples at 1-foot depths at locations mentioned above and as approved by the Resident Engineer of the existing in-situ soil and/or imported soil for use in agricultural fertility analyses.

- a. The soil analyses shall include all characteristics necessary to make fertility recommendations for ornamental landscape, lawn and garden applications.
- b. The report shall include analyses showing PPM of Ca, Mg, Na, K, Fe, Zn, Cu, S, Mn, B, nitrate, nitrogen, and phosphorus at the test locations. The report shall also include levels of salinity, pH, sodium, soluble salts, organic matter percentage, exchangeable sodium percentage, electrical conductivity, and free lime.
- c. The report shall also include recommendations for soil amendments to correct deficiencies, to eliminate conditions detrimental to plant growth, and to improve the soil fertility.

B. Bioassay Test:

1. The soil analysis shall also include Bioassay tests at one-foot depth for the site at previously paved locations mentioned above and as approved by the Resident Engineer.
 - a. Determine any possible toxic chemical contamination of the in-situ soils.
 - b. The soils report shall include recommendations for appropriate mitigation measures should contamination be present.

C. Test Results:

1. Provide the test results and recommendations to the Resident Engineer for review. If, in the opinion of the Resident Engineer, the test results warrant a change in the soil amendments from what is specified, the Resident Engineer will request a proposal for incorporating the additional amendments into the project.
2. Changes to soil amendments from those specified in the specifications will be covered by an adjustment in contract price for the affected items as approved by the Resident Engineer. The costs of the soils testing shall be included in the costs of contracted items. No separate measurement or payment will be made for soil testing.

1.07 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Review of Plant Material:
 - a. Plants procured are subject to review and approval by the Program/Project Manager for conformance with the requirements specified at the place of growth and/or upon delivery to the Site.
 - 1) For trees having 24 inch and greater box size, the Program/Project Manager will observe and tag the trees in the nurseries.

- a) The Program/Project Manager will tag 10 percent more than the required quantity of trees.
 - b) Clearly designate tagged material by botanical name to ensure that the proper plants will be delivered to the Site.
 - (1) Keep records showing this designation and furnish the records to the Program/Project Manager.
 - 2) Such approval does not limit the right of observation and rejection during the progress of the work.
 - 3) The Program/Project Manager will review the secured, tagged tree quantity and status quarterly to ensure continued availability.
 - b. Observation and tagging of plant material by the Program/Project Manager for design intent purposes does not necessarily constitute the Program/Project Manager's approval of the plant material in regard to their health and vigor as specified herein.
 - c. Request for Review of Plant Material:
 - 1) Submit a written request to the Program/Project Manager for a review of plant materials and quantities at the place of growth.
2. Preparation for Transporting Plants:
- a. Permits and Tags:
 - 1) Obtain the necessary permits and tags for transporting plant materials on public roadways.
 - 2) Make permits and tags available to the Program/Project Manager upon request.
 - b. Prior to shipping, and with care and skill, dig, handle, prepare, and pack the plants for shipment in accordance with recognized standard practice for the kind of plant involved.
 - 1) When temporary storage or heeling-in of plants is required prior to shipping the plant stock, provide and prepare a suitable heeling-in ground or well-ventilated and cool storage shed located near the planting site.
 - c. Boxed Plants:
 - 1) Check plant box containers before moving them.
 - 2) Prior to relocating boxes, repair box damage that may cause harm to the root ball at no increase in Contract Price.
 - a) Repairs include, but are not limited to, providing new bottoms, side reinforcement, re-banding, box repair, or replacement.
 - d. Pre-Transportation of Palms:
 - 1) Water palms thoroughly for 1 week before loading.
 - a) Do not apply anti-transpirants.
 - 2) Prior to shipping palms, reduce the crown and clean the trunks of the palms in accordance with the requirements specified in this Section.
 - a) Remove dead fronds, flower stalks, and seed pods from palm trees, leaving a minimum of fronds beyond the horizontal crown of 6 to 8 tiers of live fronds on each tree.

- b) Tie the crown fronds together loosely, in an upward position to protect the heart of the tree.
 - (1) Tie the fronds with jute or hemp in 2 places.
 - 3) Before palms are loaded, tie small pieces of flagging tape to the newest emerging leaf spear in order to track growth.
 - 4) For lifting and off-loading the palms, a lattice-type, telescoping, or specially designed crane properly sized for the weight of the palm is required.
 - 5) After loading palms, cover the leaves, trunk, and roots with dense shade cloth or other woven material to minimize wind damage.
- 3. Labeling Plants:
 - a. Deliver plants, bundles, and containers of plant material to the Site with a securely attached durable, legible, waterproof tag legibly indicating the plant's name and size in accordance with ANSI Z60.1.
 - 1) Indicate the botanical and common name and size on the label as specified in the plant list.
 - a) In all cases, give precedence to botanical names over common names.
 - 2) Provide data on the landscape material labels substantiating that the plants, trees, shrubs, and planting materials comply with specified requirements.
 - 3) Provide tags for all trademarked plants indicating true species selection.
- 4. Transporting Plants:
 - a. Protect materials from deterioration during shipment and delivery.
 - 1) Ship plants in a manner that will not cause shock or damage to branches, trunks, or root systems.
 - a) Protect branches of plants by tying-in the branches and covering all exposed branches.
 - 2) Furnish vehicles of the size and type suitable for carrying the quantities and sizes of materials shipped without damage to the plants.
 - 3) Pack each species or variety of plant with due regard to shipping conditions and the time to be consumed in transit and delivery.
 - 4) While plants are in transit, protect them against freezing temperatures, sun, wind, and other adverse weather conditions.
 - a) Deliver plant materials to the Site in a protected condition to prevent wind damage and drying.
 - (1) Plants delivered in a wilted condition will be rejected.
 - (2) Do not permit the root systems of the plants to dry out at any time.
 - b) When plants are transported in closed vehicles, provide adequate ventilation to prevent "sweating".

- c) When plants are transported in open vehicles, provide a covering that will allow air to circulate and prevent internal heat from building up.
- b. Transporting Palms:
 - 1) Take complete responsibility for protecting palms during transport.
 - 2) Furnish a trailer for transporting palms that is long enough to avoid damage to the heart of the palm.
 - a) Only use woven nylon slings as securing devices.
 - 3) Minimize movement of palms during transport that might jar or damage the apical meristem.
 - a) Place a nylon choker to maintain proper balance and support.
 - b) Protect the trunk at the points of contact with slings of burlap, canvas, sections of automobile tire casing, or other suitable protective materials.
 - 4) If transporting palms requires over 6 hours, have the driver syringe the leaves and roots with water at 4-hour intervals.
 - 5) If palms are shipped during the summer months, ship them in the evening to minimize rootball drying and sun stress.
- 5. Comply with the regulations applicable to landscape materials.
 - a. Include certificates of inspection required by governing authorities with shipments of landscape materials.
 - b. Provide plants that have been freshly dug at the time of delivery.
 - c. Provide at least one tagged plant in each bundle or lot.
- 6. Provide planting stock declared and certified to be free from disease and insect pests of all kinds.
 - a. Accompany each shipment, invoice, or order of plants with all necessary inspection certificates, and give them to the Program/Project Manager upon arrival at the point of delivery.
- 7. Deliver trees and shrubs after preparations for planting have been completed, and plant them immediately.
 - a. Do not prune trees and shrubs prior to delivery unless otherwise approved by Program/Project Manager.
 - b. Prior to digging evergreen trees, apply anti-transpirant to the trees.
 - c. Provide protective covering for trees and shrubs during shipment.
 - d. Do not drop balled and burlapped stock during delivery or handling.
 - e. Do not bend or bind-tie trees or shrubs in such manner as to damage their bark, break their branches, or destroy their natural shape.
- 8. Deliver packaged materials in unopened containers showing the weight, analysis, and name of its manufacturer.
 - a. Deliver commercial fertilizer to the Site in the original, unopened containers, each bearing the manufacturer's guaranteed analysis.
- 9. Acceptance at the Site:
 - a. General Plant Health and Condition:

- 1) Provide plants in a healthy condition with normal symmetrical form; developed foliage, branches, and cane systems; and free from broken tops.
 - a) Plant material exhibiting a heated or sweated condition due to tight packing or poor ventilation is subject to rejection.
 - b) Any plants furnished with fine hair roots omitted, or with main roots cut, will be immediately rejected.
 - c) Provide plants, including their roots, free from scale, knots, sunscald, injuries, abrasions, disfigurements, disease, insect eggs, and infestations or any other injurious qualities.
 - (1) If any small wounds are on the plants, they must have satisfactory callus roll formed or forming over them.
 - d) Provide plants that show good annual growth.
 - e) Provide plants with plump and well filled buds for the species.
 - f) Provide plants with evergreen foliage of a good intense color.
- 2) Trees:
 - a) Provide well branched trees, with grafts at ground level and with trunks throughout their full height.
 - b) Trees with weak, thin trunks incapable of supporting themselves when planted are unacceptable.
- 3) Date Palms:
 - a) Have a qualified palm specialist or palm plant pathologist observe all Date Palms (*Phoenix*) before the palms are dug up and moved.
 - (1) Submit a Date Palm (*Phoenix*) Observation Report from the qualified palm specialist or palm plant pathologist to Program/Project Manager for information.
 - b) Final approval of the overall appearance of the Date Palms is the responsibility of the Program/Project Manager.
 - c) Date Palms (*Phoenix*) may be rejected if they are found to have been pruned within 5 months prior to observation.
- 4) Container Stock:
 - a) Provide container stock free of root bind and having sufficient roots to hold the rootball intact after removal from the container.
 - b) Provide Saguaro with sufficient roots to ensure a structurally sound foundation to sustain the cactus in its vertical position while encountering winds up to 40 miles per hour and/or under wet soil conditions.
 - (1) Mark the north-facing side.
- 5) "B and B" Plants:
 - a) "B and B" plants arriving with broken or loose balls, or having "manufactured" earth in lieu of the original and undisturbed soil in which the plant grew will be rejected.
- 6) Tagged Material Records:

- a) Submit copies of records showing that selected plant materials were delivered to the Site to the Program/Project Manager.

B. Storage and Handling Requirements:

1. Take sole responsibility for the health and vigor of the plant material.
2. Unloading Palms:
 - a. Gently lift palms off the transport, setting the choker to the outside to turn the palm to the inside as it is lifted.
 - 1) Use only 6 inch nylon chokers.
 - b. Do not bend, shake, drop, pull on, or otherwise damage the palm bud or heart.
3. Handling Plant Material:
 - a. Handle each species or variety of plant in an approved manner as required by soil and climatic conditions at the time of digging.
 - b. Do not drop or handle plants by their foliage, branches, or trunks.
 - c. Handle container plants only by the container.
 - d. When placing the plants by using a crane, lift the containers using a nylon strap to protect the trunk and stems from damage.
 - 1) Do not use chains for lifting.
 - e. Handling of Palms:
 - 1) Minimize lifting or handling palms by the trunk.
 - 2) Use only a 6 inch wide nylon sling when moving or lifting palms.
 - a) Never bind or handle palms with wire, chains, or rope.
 - 3) Do not stack palms.
4. Temporary Plant Storage:
 - a. If accepted planting stock is not planted immediately, properly heel-in or store it.
 - 1) Stock left out of the ground and unprotected overnight, left with roots exposed to heat or freezing, or otherwise unprotected during transit, unloading, heeling-in, or planting will be rejected.
 - 2) Do not remove container-grown stock from containers until planting time.
 - b. Store plant materials where they are protected against damage and dehydration until planted.
 - c. If planting is delayed more than 6 hours after their delivery, set trees and shrubs in the shade, protect them from weather and mechanical damage, and keep their roots moist by covering them with mulch, burlap, or other acceptable means of retaining moisture.
 - 1) Provide shade for sun-sensitive plants.
 - d. Take complete responsibility for protecting palms during storage.
 - 1) Plant palms immediately upon arrival, or store them for no more than 3 to 4 days in a shaded area where the entire tree can be misted and burlapped.
 - a) Do not allow the palm tree to lay in the sun or on asphalt.

5. Pesticides and Herbicides:

- a. Periodically verify the current status, and the delivery, storage, handling, and transporting requirements of pesticides and herbicides used.

1.08 SITE CONDITIONS

A. Ambient Conditions:

1. Perform planting operations only when weather and soil conditions permit, and in accordance with locally accepted practices.
 - a. Unsuitable conditions include moisture saturated or frozen in place soil, and precipitation of any kind present or occurring during the Work.
 - b. When drought, excessive moisture, or other unsatisfactory conditions prevail, stop work when directed by the Program/Project Manager.
2. Planting Times and Conditions:
 - a. The Work of this Section may include dormant or cold weather planting procedures for appropriate species, including staking plant materials and installing protective mulch on plant pit locations.
 - 1) Plant dormant deciduous trees suitable for such seasonal operations, in order that landscaping can be in place at the earliest possible time.
 - b. If special conditions warrant a variance to the planting operations, submit proposed planting times to the Program/Project Manager and obtain an approval of the variance in writing.
 - c. Plant field-grown trees in the same growing season in which they were dug.

B. Existing Conditions:

1. Plant quantities shown in the planting schedule on the Contract Drawings are for general reference only.
2. Determine the actual plant quantities and materials necessary to complete the Work in accordance with the symbols shown on the Contract Drawings.

1.09 WARRANTY

A. Special Warranty:

1. Warrant trees and shrubs for a period of one year after the date of acceptance or until the Plant Maintenance Period specified in Paragraph 3.10.A ends, whichever is later, against defects.
 - a. The date of acceptance is defined as the date for the inspection requested by the Contractor after the last planting is installed and mulched, and at which time all conditions are acceptable to the Owner and the Program/Project Manager.

- 1) Irrigation record drawings must be approved.
- 2) Pre-maintenance observation punch list items must be completed and approved by the Program/Project Manager.
- b. Although periodic requests for payment will be accepted, their individual approval and subsequent payment does not activate the warranty period until all plants are in place and inspected by the Owner and the Program/Project Manager.
- c. Defects include death and unsatisfactory growth, except for defects resulting from neglect by the Owner, abuse or damage by others, or unusual phenomena or incidents which are beyond the Contractor's control.
2. Provide a warranty that does not limit plant replacement to "one time"; replace plants as many times as necessary in a single location until acceptance.
3. Replacement Plants:
 - a. All replacement plants provided under the warranty must be approved by the Program/Project Manager at the source prior to planting.
 - b. Provide a 100 percent guarantee for all replacement plants.
 - c. Plant the replacement plants per the provisions of this Section.
 - d. The Contractor is not responsible for plant loss or damage caused by unusually extreme weather, vandalism, or lack of maintenance by the Owner.
4. If the Warranty Period extends beyond the plant establishment/maintenance period, check the landscaping at least once every 2 weeks during the Warranty Period, and submit any advised changes in writing to the Program/Project Manager.
5. Submit the warranty in writing as part of the closeout submittals.

PART 2 PRODUCTS

2.01 SUBSTITUTIONS

- A. Under no circumstances will substitutions for plants or sizes listed on the Contract Drawings be allowed, except with the express approval of and as directed by the Program/Project Manager.
1. The Program/Project Manager will consider plants of other kinds than those indicated on the planting schedule only upon submission of proof that the specified plant is not reasonably procurable in the local region. Proof shall be considered contacting a minimum of five (5) nurseries for availability.
 - a. Request proposed substitutions due to unavailability in writing for approval by the Program/Project Manager prior to confirming the order.
 - b. Should plant materials not be secured, and materials become unavailable at the time of installation, install a larger container size of an equal plant variety at no increase in Contract Price.

2. Plants larger than specified in the planting schedule may be used if approved by the Program/Project Manager and provided at no increase in Contract Price.
 - a. If the use of larger plants is approved, increase the root ball in proportion to the size of the plant.
- B. Replacement plants will be approved based on their resemblance to the plant specified in regard to appearance, ultimate height, shape, habit of growth, and general soil and other requirements.
- C. In no case may the average cost and value of the substituted plants be less than the cost and value of plants indicated.

2.02 DESIGN CRITERIA

- A. Provide materials and perform the work of this Section to comply with the requirements of those industry standards cited, except as may be amended herein.
- B. Plant Types and Names:
 1. Provide plants true to type and name in accordance with the latest edition of AJCHN Standardized Plant Names nomenclature.
 - a. Properly label each plant with its type and name.
 - 1) Where a formal arrangement or consecutive order of trees or shrubs are shown on the Contract Drawings, select stock for uniform height and spread, and label it with numbers to assure symmetry in planting.
 - b. Provide the quantity of trees, shrubs, and plants of the size, genus, species, and variety shown and scheduled for landscape work in the planting schedule specified in Subparagraph 1.07.B.1 and that complies with the recommendations and requirements of ANSI Z60.1 and recognized horticultural sources.
- C. Species, Sizes, Grades, and Condition:
 1. Refer to the planting schedule on the Contract Drawings for the species and size of plants required.
 - a. Requirements for measurements, branching, and quality of plants in the planting schedule generally follow the code of standards currently recommended by the American Association of Nurserymen, Inc. in ANSI 260.1, or in accordance with City standards.
 2. Minimum Acceptable Plant Sizes:
 - a. Provide plants of sizes conforming to the measurements indicated on the Contract Drawings or specified.
 - 1) Measure plants before pruning with the branches in normal position.

- 2) Plants larger in size than indicated may be used if acceptable to the Program/Project Manager and if the sizes of root balls are increased proportionately, but at no increase in Contract Price.
 - a) If larger plants are used, proportionately increase the root ball or spread of roots in accordance with ANSI Z60.1 rules.
- b. Provide plants of a size corresponding to that normally expected for the species and variety of commercially available nursery stock as specified on the Contract Drawings.
 - 1) Plants are subject to certain variations in size and measurement if specified on the Contract Drawings.
 - 2) Provide plants equal to or exceeding the measurements specified in the Plant List, which are minimum acceptable sizes.
 - 3) Plants must be measured before pruning, with branches in normal position.
 - 4) For plants used in a group or in close proximity, provide plants of the same variety and of uniform size.
- c. Do not prune, trim, or top tree or plant materials prior to delivery; and only alter their shape with the approval of and as directed by the Program/Project Manager.
 - 1) Street trees require 7 feet of clearance over pedestrian areas.
 - 2) Prune plants as approved by the Program/Project Manager.
- d. Trees:
 - 1) The height of branching must bear a relationship to the size and variety of the tree specified, and the crown must be in good balance with the trunk and trunk caliper.
 - 2) Do not provide "poled" trees or remove the leader.
 - 3) Single-trunk plants must be reasonably straight and symmetrical with the crown according to species and have a persistent main leader.
 - 4) Dig and box boxed trees at least 90 days prior to planting.
 - 5) Provide trees for groves that match in caliper, height, spread, and overall form.
 - 6) For palm trunks that are to be matched in height, measure the trunk from the top of the rootball to the edge of the brown trunk.
 - 7) The minimum palm rootball size is 5 feet by 5 feet by 5 feet with a flat bottom.
 - 8) Provide date palms (*Phoenix*) having diamond cut that provides a clean consistent appearance.
3. Unless otherwise specified, provide Grade No. 1 plants in accordance with ANSI Z60.1.
4. Provide plants that have a normal habit of growth and that are sound, healthy, vigorous, and free of fresh bark abrasions, excessive abrasions, and other objectionable disfigurements.

D. Plant Source and Condition:

1. Provide nursery-grown stock unless otherwise indicated or specified.
 - a. Provide plants complying with the Arizona State Department of Agriculture regulations for nursery observations, rules, and ratings.
 - b. Provide healthy, vigorous stock, grown in a recognized nursery in accordance with good horticultural practice and free of disease, injurious insects, eggs, larvae, and defects such as mechanical wounds, broken branches, decay, knots, sun-scald, injuries, abrasions, disfigurement, or any other defect.
 - c. Provide plants that have been growing in a climate comparable to that of the Site for at least 2 years.
 2. Provide freshly dug trees and shrubs.
 3. Provide plants having well-branched, vigorous, and balanced root and top growth.
 4. Provide deciduous trees having straight trunks with well-branched tops and a single leader.
 5. Provide plants, including their containers, free of noxious weeds including Bermuda, Johnson, and nut grasses.
 - a. Containerize salvaged plants as specified in Section 02237, Plant Salvage.
- E. Plant Acclimation:
1. Acclimate plant material to the Arizona environs for not less than 8 months prior to planting.
 - a. Any off-site storage arrangement must meet this acclimation requirement.
 2. Make materials stored for acclimation available for periodic review by the Program/Project Manager.

2.03 MATERIALS

- A. Ocotillo:
1. Provide Ocotillo in good condition with bark free of abrasions, rotting, or other damage.
 2. Provide well branched Ocotillo plants.
 3. Provide Ocotillo having a 24" box diameter root mass.
 - a. For container grown ocotillo, the plant must be well rooted in the container.
 - b. For bare rooted ocotillo, the plant must have a healthy, developed root system suitable for bare root planting.
- B. Palms:
1. Geneses: Date Palms (*Phoenix*), California Fan Palms (*Washingtonia robusta*), and Mexican Fan Palms (*Washingtonia filifera*).
 2. 30 days prior to digging *Washingtonia* palms, skin a maximum of 60 percent of the trunk measuring from soil line.

- a. Prevent the spread of vascular disease and minimize wounding by tools in sterilizing agent before skinning or pruning palms, and moving from one palm to another.
 3. For digging palm root systems, use either a trenching machine or a backhoe having a narrow bucket.
- C. "B and B" and Container-Grown Plants:
 1. If plants are designated herein or on the Contract Drawings as "B and B", provide balled and burlapped plants as follows:
 - a. Form a ball from the original and undisturbed soil in which the plant grew.
 - b. Wrap the ball with burlap or similar approved material, and tightly lace it to hold the ball firm and intact.
 - c. Provide "B and B" plants having a ball diameter and depth in accordance with ANSI Z60.1 and sufficiently large to include the necessary root system.
 2. When containers are indicated or specified, furnish and plant the plants in approved decomposable containers if possible or unless otherwise specified.
 - a. Remove non-decomposable containers as the plant is placed in the ground.
 3. Provide containers sufficiently rigid to hold the ball shape and protect the root mass during shipping.
 4. Grow plants in pots, cans, tubs, or boxes for a minimum of 3 months and a maximum of 1 year without root bind before delivery.
 5. Provide container stock having sufficient roots to hold the soil intact when the plant is removed from the container.
 6. Insure that containers are free from noxious weeds including Bermuda grass.

2.04 ACCESSORIES

- A. Anti-Transpirant:
 1. Provide an organic, non-toxic, biodegradable anti- transpirant spray that forms a clear, protective coating on foliage to help plants retain moisture.
 2. Manufacturers:
 - a. Wilt-Pruf Products, Inc., www.wiltpruf.com.
 - b. Approved equal.
- B. Backfill:
 1. Provide backfill for trees, shrubs, and root pruning trenches as indicated on the Contract Documents.
- C. Backfill mix:

1. Provide backfill mix consisting of 4 parts topsoil, 1 part sand, and 1 part stabilized organic matter for each cubic yard of topsoil.
 2. Mix the backfill mix in bulk in a preparation area, and do not individually place and mix it within the plant pits.
 3. For date palms, the backfill mix shall be 100 percent clean washed concrete sand.
- D. Decomposed Granite 1/2" Minus Madison Gold:
1. Provide 1/2" Minus decomposed granite Madison Gold in color throughout, and having the following material size gradation using standard sieve sizes:
 - a. 100 percent passing the 1-1/2-inch sieve.
 - b. 100 percent passing the 1-inch sieve
 - c. 82 percent passing the 1/2-inch sieve.
 - d. 51 percent passing the Number 4 sieve.
- E. Guy Stakes:
1. Provide wooden guy stakes, free of knots or other structural defects that would cause breakage while the stake is being pounded into place.
 - a. Dimensions, Minimum: 2 inches by 2 inches by 8 feet in length.
- F. Guy Wire:
1. For guying plants as shown in the Contract Drawings, provide 12 gage minimum, multi-stranded, galvanized steel wire covered with rubber hose where it would otherwise come into contact with the plant.
- G. Gypsum:
1. Provide gypsum as commercially available for planting uses.
- H. Pesticides/Herbicides Treatment Applications:
1. Provide the types of insecticides or herbicides and use methods of application conforming to Environmental Protection Agency, state, and local requirements and labeling instructions.
 2. Only use insecticides or herbicides approved by the Program/Project Manager.
 - a. Notify the Program/Project Manager and obtain prior approval for the use of any chemicals for insect eradication or control and weed eradication or control.
 3. Herbicides:
 - a. Provide weed control as approved by the Licensed Pest Control Advisor.
 - b. Pre-emergent herbicide:
 - 1) Provide pre-emergent surface-applied herbicide capable of providing control of key grasses and broadleaf weeds.
 - 2) Manufacturers:

- a) United Phosphorus, Inc., Surflan® pre-emergent herbicide, www.upi-usa.com.
 - b) Approved equal.
 - c. Post-emergent herbicide:
 - 1) Provide post-emergent herbicide designed for aquatic use with no restrictions on water use, specifically domestic use, after application.
 - 2) Manufacturers:
 - a) Dow AgroSciences LLC, Rodeo®, www.dowagro.com.
 - b) Approved equal.
- I. Mulch:
 - 1. Plant Mulch:
 - a. Provide wood cellulose fiber mulch free from foreign material and substances toxic to plant growth and having the following properties.
 - 1) Acid reaction: 4 to 5 of that of shredded oak tree bark.
 - 2) Moisture Content: 15 to 40 percent natural.
 - 3) Particle Size: In the range from 1/2-inch to 2-inch diameter.
 - 4) Grade: Processors Number 1.
 - 5) Carbon to Nitrogen Ratio 20:1 or less.
- J. Topsoil:
 - 1. Provide topsoil in accordance with the requirements of Section 02919, Topsoil.
- K. Water:
 - 1. Provide and transport water for planting operations.
 - a. Provide water that is free of oil, acid, salts, and other toxic elements.
 - b. The water source must be approved by the Program/Project Manager prior to use.

2.05 SOURCE QUALITY CONTROL

- A. Inspections:
 - 1. The Program/Project Manager may inspect trees and shrubs either at the place of growth or at the Site before planting for compliance with the requirements for genus, species, variety, size, and quality.
 - a. The Program/Project Manager has the right to further inspect trees and shrubs for size and condition of balls and root systems, insects, injuries and latent defects, and to reject unsatisfactory or defective material at any time during the progress of the Work.
 - 2. Inform the Program/Project Manager of the source of supply for plant material for this Contract so that he has the opportunity to select the materials at the source.

- a. Not less than 14 days prior to installing plantings, submit complete and detailed information concerning the source of supply for each item of plant material on the planting schedule that appears on the Contract Drawings.
 - b. Make all planting stock available for inspection in the nursery before it is dug.
- 3. Do not make substitutions:
 - a. If specified landscape material is not obtainable, submit proof of non-availability to the Program/Project Manager, together with a proposal for the use of equivalent material.
- B. Non-Conforming Work:
 - 1. The Program/Project Manager is the sole judge of the acceptability of the plant material.
 - 2. Defective Materials:
 - a. Any plant not conforming to the requirements herein is considered to be defective.
 - b. Mark all defective plants, whether or not in place, as rejected; and immediately remove them from the Site, and replace them with new plants additional increase in Contract Price.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Investigate field conditions and be familiar with the Site.
 - a. Verify that trenches, foundation backfill, or other filled excavations are compacted prior to beginning landscape Work.
 - b. Verify that planting areas are free of any waste or debris.
 - 2. Verify that final grades within plus or minus 0.10 foot of the design elevation have been established prior to commencing landscaping operations.
 - a. Allow for inclusion of amendments, settling, and similar conditions.
 - b. Verify that surface drainage is away from building foundations and wall, and will ensure proper drainage of the Site as indicated on the Contract Drawings.
 - c. Advise Program/Project Manager of discrepancies in grade between the Contract Drawings and actual Site conditions.
- B. Evaluation and Assessment:
 - 1. Determine the requirements for preparation and construction methods appropriate to the soil type, weather conditions, and Site anomalies.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Maintain the grade stakes until it is mutually agreed to by the parties concerned to remove them.
 - 2. Underground Obstructions to Planting:
 - a. Prior to any landscape operations, locate and protect all existing underground installations in landscaping areas.
 - 1) Verify the location of underground utilities and facilities through Arizona Blue Stake.
 - a) Determine the location of underground utilities and mark the locations with stakes or flags.
 - b) Perform the Work of this Section in a manner that avoids damaging in-place utilities.
 - (1) Hand excavate as required.
 - 2) Report any conflicts or discrepancies identified to the Program/Project Manager, and do not start landscaping operations until the discrepancies are corrected.
 - 3) Whenever excavating holes for proposed/existing palm/tree removal/installation in close proximity to utility duct bank facilities, direct the landscape Subcontractor to hand dig the bottom 2 feet of the hole.
 - a) Excavate a 4-foot by 4-foot by 4-foot hole for each palm or tree.
 - 3. Temporary Tree and Plant Protection:
 - a. Identify, protect, and maintain existing vegetation within protected areas in accordance with the requirements of Section 01568, Temporary Tree and Plant Protection, for the duration of the Contract.
 - 4. Provide temporary erosion control and sediment controls in accordance with the requirements of ADEQ and AZPDES requirements.
 - 5. Protective Fencing:
 - a. Prior to the start of construction activities on the Site, define the limits and boundaries of the areas designated as off-limits.
 - b. Provide protective fencing as noted on the Contract Drawings and in accordance with Section 01568, Temporary Tree and Plant Protection, for existing landscaped plants and preserve-in-place vegetation to protect them from construction activities.
 - c. Provide temporary fencing in accordance with Section 01500, Temporary Facilities and Controls, to adequately protect workers, the general public, and existing features and structures from construction activities.
 - 6. "Preserve In Place" Plant Materials:
 - a. Maintain all "preserve in place" plants as designated on the Contract Drawings.
 - b. Provide an adequate water supply to any "preserve in place" plants affected by construction activities.

B. Surface Preparation:

1. Weed Control:

- a. If live perennial weeds exist on the Site at the beginning of the landscaping operation, employ an Arizona licensed pesticide applicator to spray those weeds with contact herbicide according to the manufacturer's instructions.
 - 1) Submit a pesticides/herbicides record that includes the following:
 - a) Pesticides/herbicides applications dates and locations.
 - b) Types of insecticides or herbicides used, both pre- and post-emergent.
 - c) Trade names, chemical composition, formulation, concentration, and application rates of active ingredients.
 - d) Methods of application.
 - e) Name and state license number of applicator.
- b. After allowance of adequate time for systemic weed kill, clear and remove the dead vegetation; and use mechanical, manual, and/or chemical treatment to maintain the entire Site weed-free until Final Acceptance by the Program/Project Manager.
 - 1) Remove all weeds, including Bermuda Grass, Johnson Grass, Buffle Grass and Nut Grass; and dispose of the weeds off-site in a legal disposal area.

2. Layout of Planting Areas:

- a. Prior to grading, paint, stake, or flag the layout of berm locations for approval by the Program/Project Manager.
- b. Shape planting areas as indicated or directed by Program/Project Manager.

3. Grading:

- a. Grade the planting areas to a smooth, even, and uniform plane with no abrupt changes to surface.
 - 1) Make minor grade modifications required to establish the final grade.
 - 2) Grade the planting areas so finish grades are plus or minus 1 inch below adjacent paved areas, sidewalks, valve boxes, headers, clean-outs, manholes, and similar structures, or as indicated in the details on the Contract Drawings.
- b. Level the planting areas to properly float water for even distribution of irrigation water.
- c. Dispose of any unacceptable or excess soil or other materials at a legal off-site disposal area, and pay the dumping fees and charges.
 - 1) Remove soil generated by excavations to a legal, off-site location unless the soil can be used to obtain required grades.

4. Moisture Content:

- a. Do not work the soil when the moisture content is so great that excessive compaction will occur, or when the soil is so dry that dust that dust will form in the air or clods will not break readily.

- b. Apply water as required to obtain ideal moisture levels for backfilling and for planting as specified.
- 5. Layout of Plant Materials:
 - a. Lay out the planting areas and flag the plant locations in reasonably close conformity to the dimensions and locations shown on the Contract Drawings.
 - b. Relocate planting areas or make other modifications at this time to avoid utility lines and impervious or wet soil conditions.
 - c. The Program/Project Manager will check the layout and flagging of the planting areas prior to the start of the installation of the irrigation system.
- 6. Soil Preparation:
 - a. After removing any extraneous materials but prior to installing the irrigation system, till the soil to a depth of 12 inches .
 - b. Where access by large machines is limited, use a rototiller to break up the soil.
 - c. Level the soil by raking only; do not compact the soil.
 - d. Disk or till sloped areas along the contour.
 - e. Leave the surface rough.
- C. Demolition/Removal:
 - 1. When conditions detrimental to plant growth, such as rubble fill, adverse drainage conditions, or obstructions, are encountered during excavation notify the Program/Project Manager and obtain direction before planting.
 - 2. Remove any rock and other underground obstructions, if possible, to the depth necessary to permit proper planting according to the Contract Drawings and as specified.
 - 3. Excavate and remove any subsurface obstructions, materials, or substances which conflict with or impact the installation of plants or may be detrimental to plant health to a minimum of 2 times the root ball container depth and 4 times the root ball container width.
 - 4. If underground construction, obstructions, or rock are encountered within excavations for planting areas, other locations for the plantings may be selected only with the approval of the Program/Project Manager.

3.03 EXCAVATION FOR PLANTING

- A. Prior to any excavation for planting pits, trenches, beds, or irrigation, obtain the Program/Project Manager's approval of all planting areas and locations.
- B. Shrub Bed Preparation:
 - 1. For the shrub masses shown on the Contract Drawings, provide a continuous bed for each mass planting.

- a. Strip the bed of turf, and cultivate the entire area by incorporating peat and any required soil supplements into the top 6 inches of the existing topsoil.
 - 1) Cultivate the area by rototilling or plowing and discing so that the entire surface is tilled.
- b. Incorporate a quantity of peat into the topsoil equal to 3 inches of peat spread uniformly over the plant bed.
- c. For shrub, ground cover, and other planting beds in areas where extensive weed elimination is necessary, take the following additional measures to prepare the beds prior to disturbing the planting bed areas:
 - 1) Apply a pre-emergent herbicide to the areas per the herbicide manufacturer's instructions.
 - a) Take care to assure the pre-emergent herbicide is placed only in the area of the plant bed.
 - 2) Apply a frill or injection method application of a post-emergent herbicide to woody vegetation of a size larger than 1-inch caliper per the herbicide manufacturer's instructions.
 - a) Apply this to all woody stumps remaining from previous clearing and grubbing operations.
 - b) Paint the frill application on a fresh cut stump area.
 - 3) Apply a spray application of a post-emergent herbicide to the proposed plant bed area per manufacturer's instructions.
 - a) Take care so that overspray does not extend beyond the bed areas.
 - b) Verify that plants to be eliminated are in an active growing state prior to applying the spray.
 - 4) After a 7-Day waiting period, determine if a repeat application of the post-emergent herbicide is required.
 - a) If weeds and the existence of vegetation in the area of the plant bed are evident, apply a second application.
 - 5) After a 7-Day waiting period beyond the final post-emergent herbicide application, dig out woody plant stumps larger than 1 inch caliper, including the roots, and dispose of them off-site.
 - 6) Remove any existing vegetation not killed by the herbicide application by hand digging, and removed it off-site.
 - 7) Cultivate the beds as specified in Subparagraphs 3.03.B.1.a and 3.03.B.1.b.
- C. Planting Bed, Plant Trench, and Plant Pit Preparation:
 - 1. Plan digging operations, particularly those on slopes, so actual planting operations will follow within 24 hours.
 - 2. Prepare planting beds, plant trenches, and plant pits to the depths required below finished grade according to the recommended practices of ANSI Z60.1.

3. Excavate plant pits with vertical sides and flat bottoms.
 - a. Construct plant pit diameters at least two and half times the diameter of the plant root ball with at least 6 inches of open excavation between the root ball and the vertical wall of the pit in all directions.
 - b. Refer to the planting details on the Contract Drawings for further information.
4. In pits for larger plants, such as for deciduous shade trees and evergreens, provide sufficient depth to allow placing the root ball on the subgrade prior to backfilling.
 - a. Percolation Test:
 - 1) Prior to planting any trees, determine if there is a problem drainage condition by running a percolation test on the tree pits as follows:
 - a) Fill the planting pit 1/2 full of water.
 - b) Allow 24 hours for the pit to drain.
 - c) If the pit has not substantially drained after 24 hours, install a caisson as specified in Subparagraph 3.03.C.4.c.
 - b. Construct plant pit diameters at least two and half times the diameter of the plant root ball with at least 12 inches of open excavation between the root ball and the vertical wall of the pit in all directions.
 - c. Caisson Installation:
 - 1) For trees greater than a 24 inch box size, drill a 5 feet deep by 8 inch diameter caisson in the bottom of the pit.
 - 2) Fill the caisson with 1-1/2 inch crushed stone up to the bottom of the pit.
 - 3) Adjust the depth of the caisson if ground water or caliche is encountered.
 - d. Refer to the planting details on the Contract Drawings for further information.
 5. Container Stock Plant Pits:
 - a. Provide approximately circular plant pits with a diameter 3 times the width and a depth at least the height of the plant ball or container.
 - 1) If the pits are dug with an auger and the sides of the pits become glazed, scarify the glazed surface.
 - 2) Provide pits large enough to permit handling and planting without injury or breakage of the root ball or root system.
 - b. If soil is added to level or stabilize the plant, compact the soil to avoid settlement after planting.
 - c. Do not allow plants to stand in these pits without watering.
 6. Boxed Tree Planting Pits:
 - a. Boxed material must be observed and approved by the Program/Project Manager prior to planting it in a new location as shown on the Contract Drawings.
 - b. Provide planting pits with a minimum of 3 times the width of the box size and a depth the same as the depth of the box size, or as large as

- necessary for placing the tree in the pit without damage to the tree, adjacent structures, or existing landscaping.
- c. Conduct the soil percolation test as specified in Subparagraph 3.03.C.4.a.
7. Palm Planting Pits:
- a. Provide palm planting pit the same depth and twice the width as the rootball.
 - b. Conduct the soil percolation test as specified in Subparagraph 3.03.C.4.a.
- D. Work Under or Near Existing Vegetation:
- 1. Where landscape operations occur below the canopy spread of existing trees, perform the work by hand or other methods as necessary to complete the Work and prevent damage to any limbs, branches, trunks, or roots.
 - a. Field verify the location or route that will provide the least disturbance of the root structure.
 - b. When roots 2 inches or larger in diameter are encountered, tunnel or excavate under or around them and protect them from any damage.
 - c. When roots less than 2 inches in diameter are encountered, cleanly prune and paint them with 2 coats of standard tree paint or compound prior to backfilling.
 - d. Do not leave roots unprotected from damage caused by exposure or loss of moisture.
 - 2. Complete excavation or trenching below existing trees that are shown to remain by staying the greatest allowable distance away from the trunk and limiting work to one side of the tree.
 - 3. Notify the Program/Project Manager for direction if conditions are encountered which may affect trees or landscape installation methods.

3.04 PLANTING

- A. Plant trees and shrubs after the final grades are established and prior to the planting of lawns unless otherwise acceptable to Program/Project Manager.
- 1. If the planting of trees and shrubs is to occur after lawn work, protect the lawn areas and promptly repair damage to lawns resulting from planting operations.
- B. Plant Setting Operations:
- 1. Perform planting operations in conformance with planting details shown on the applicable Contract Drawings.
 - 2. Set plants plumb and straight with allowance for settlement and in accordance with following:
 - a. Set plants to ensure that after settlement the plant stem projects from the soil as much as before transplanting.

- b. Set plants no shallower or deeper than they stood in the nursery, and excavate pits as specified in Paragraph 3.03.C to the correct depth to set the plants at their proper height.
- 3. Shrubs:
 - a. Unless directed otherwise by the Program/Project Manager, place shrub as far from foundations, fences, walls, and walks as the character of growth demands, but in any event no closer than 20 inches.
- 4. Trees, Yuccas, and Saguaros:
 - a. Do not place trees, yuccas, and saguaros closer than 6 feet to foundations, fences, walls, and walks unless directed otherwise by the Program/Project Manager.
 - b. Set trees, yuccas, and saguaros plumb and rigidly brace them in position until the soil has been tamped solidly around the ball.
- 5. Container Stock:
 - a. Completely remove containers from potted plants; however, keep the earth unbroken around roots.
 - b. After removing the plant from the container, scarify the side of the root ball to eliminate any root bound condition.
 - 1) Do not plant the stock if the root ball is cracked or broken.
 - c. Handle balled and burlapped plants by the earth ball, and not by the plant itself.
 - d. Unless otherwise specified, place all plants in the center of planting pits with the plant upright, and face the plant to give the best appearance and relationship to the adjacent plants or structures.
 - e. Set each plant in prepared circular pits deep enough to accommodate a bed of topsoil not less than 6 inches deep under the ball or pot of shrubs and 12 inches under the ball of trees.
 - 1) After placing balled and burlapped plants in their pits without removing the burlap, lay the burlap back from the ball.
 - 2) Remove burlap from the top third of root balls, and completely remove ropes, twine, and wires from root balls.
 - f. Set the plants in relation to the surrounding grade so they are even with the depth at which they were grown in the nursery or container.
 - g. Place backfill mix in plant pits under and around root balls in 6-inch layers and tamp it to eliminate voids.
 - 1) At the halfway point in backfilling, flood the pit with water and continue backfilling after the water dissipates.
 - a) Place a 2-inch layer of plant mulch within the ring prior to watering.
 - 2) Backfill pits to grade, and build up a ring of soil 3 inches deep over the edge of the plant pit to facilitate maintenance watering.
- 6. Boxed Trees, Yuccas, Saguaros, and Palms:

- a. Notify the Program/Project Manager at least 2 days in advance of planting boxed trees, yuccas, saguaros, and palms to obtain approval of the equipment to be used for planting.
 - 1) The Program/Project Manager must also be present at the time the trees, yuccas, saguaros, and palms are set and positioned in the planting pit.
- b. Fill the excavated planting pits half way with water, and allow them to drain before placing the trees in the pits.
 - 1) Any drainage problem must be rectified prior to planting the tree.
- c. Carefully lower the boxed trees, yuccas, saguaros, and palms into their pits using approved equipment, and at no time push or drop them into the pit.
 - 1) Position boxed trees 30 inches or greater, saguaros greater than 6 inches, and all palms by crane.
 - 2) Position the top of the root ball 1 inch above the adjacent finish grade.
- d. Do not damage branches and root balls.
- e. Add soil backfill under the tree or sand under the palm, yucca, or saguaro if needed to bring the root ball to the proper height.
 - 1) Plant saguaros and yuccas to their original depth.
- 7. Setting Bare Root Plants:
 - a. Set bare root plants with the root system properly spread out, and work backfill mix in among the roots.
 - b. Cleanly cut off any broken or frayed roots.
 - c. Backfill the bare root plants to grade in 6-inch layers using water to settle each layer.
 - d. Form a ring of soil 3 inches deep over the edge of each plant pit to facilitate maintenance watering.
- C. Planting Ground Cover, Bulbs, and Perennials:
 - 1. Till plant beds for perennials to a minimum depth of 8 inches and amend the beds with 1 part soil amendment per 4 parts topsoil.
 - 2. Setting Ground Cover Plants:
 - a. Set each plant in a slight depression for catching rainwater, and top-off such depressions with 2 inches of mulch spread uniformly and compacted.
 - b. Thoroughly water the ground cover bed immediately following planting.
- D. Palm Planting
 - 1. Palm trees shall not be planted until the irrigation system is installed, functioning and has been approved by the Engineer.
 - 2. Layout palms of locations shown on the plans. Use 3 foot lath, color coded for each palm height. The Engineer will check and approve location of palms in the field prior to any planting operations

3. The palm tree excavation shall be a minimum of the depth of the root ball and twice the diameter of the root ball. Palm planting pits shall be reviewed and approved by the Engineer.
 4. Palms shall not be planted any deeper than one (1) foot above the soil line of the palm trees original finish grade line. If the existing finish grade line is not obvious or visual contractor shall mark line with pruning paint or other acceptable method no wider than 1/2" at base of palm trunk to provide reference during planting operations.
- E. Immediately after plant setting and prior to watering, evenly apply mulch over planting areas not more than 3 inches deep.
- F. Backfilling:
1. Planting areas are considered to have sufficient topsoil for preparing beds; however, furnish and place the topsoil required within each plant pit for the backfill mix.
 - a. Place the backfill in 6-inch increments of depth.
 - b. Work the backfill mix around plant balls in the pits and firmly tamp and/or puddle it as backfilling progresses
 - c. Fill voids in order to eliminate air pockets.
 - d. If necessary, and always in the case of shade trees, hold each plant in a vertical position while the backfill soil is being placed.
 - e. Remove sticks, sod, clods, or other material that could decompose and form air pockets in the planting media.
 2. On level ground and on relatively gentle slopes, leave a shallow basin, the diameter of the plant pit, around each plant.
 3. On steep slopes, pull sufficient soil to the lower side of the plant to form a shallow basin to catch and hold water.
 4. Backfilling Planting Pits:
 - a. Backfill tree planting pits with clean native topsoil taken from the Site as the box sides are progressively removed to minimize damage to the root ball and to prevent it from collapsing.
 - b. Backfill palm planting pits the same as tree planting pits, except use backfill consisting of 25 percent palm sand and 75 percent native topsoil.
 - c. Backfill the bottom of the planting pits to prevent undue settling.
 - d. Backfill plants with prepared soil that will be thoroughly settled by watering and tamping to fill all voids.
 5. Palm Tree Backfilling Planting Pits:
 - a. Backfill shall be 100 percent clean washed concrete sand. Palms shall be placed in the pit and watered in as they are backfilled. Watering shall be done with a pipe sticker, six foot length topped with a 90 degree elbow and placed on the end of at least a 3/4 inch hose with adequate water volume to settle the backfill materials. One laborer shall work the sticker up and down, washing the sand down around

- the rootball as the backfilling is accomplished. The backfill sand shall be thoroughly saturated, all around the periphery of the root boll, before going on to the next palm. It is of the utmost importance that this procedure occur as each palm is being planted, following this procedure later in the day or waiting for the next day to perform this function is considered unacceptable and may result in replanting effort and or replacement of the palm tree.
- b. After planting provide five (5) gallons of a water soluble micronutrient fertilizer such as "Wood Ace" Palm Fertilizer by Vigoro, "Soluble Stem" by Peters Fertilizer or "Minor Gro" manufactured by W.R. Grace and Company. Submit selected manufacturer instructions and analysis to the Engineer for approval prior to use.
 - c. After planting, drench the soil with the fungicide "SUBDUE" by Ciba-Giegy or approved equal at the manufacturers recommendations by flooding the planting basin. Reapply as often as label permits throughout the landscape establishment phase.
 - d. Contractor shall be required to apply a foliar drench of each palms fronds and bud starting at 14 calendar days following planting and then once a month at manufacture recommended ratios until the end of the landscape establishment phase. Foliar drench products include but are not limited to:
 - 1) Kocide Copper T.S. fungicide
 - 2) Manzate dithane flowable fungicide
 - 3) Benelate fungicide
 - e. After four weeks, contractor shall apply four (4) pounds of Engineer approved palm tree granular fertilizer per palm tree. Contractor shall reapply at six month intervals. Place fertilizer in a one inch band around the base of each Palm.
 - f. Contractor shall install all other elements shown on the details within the plan set when planting the palm trees.
- G. Watering and Filling:
- 1. Water the trees at planting and as needed until the permanent automatic irrigation system is installed and operating.
 - 2. For watering palms initially, use a 6-foot long pipe sticker topped with a 90 degree elbow at the end of a 3/4 inch hose to water the palm at planting, but not afterwards.
 - a. Water the sand as planting and backfilling occurs.
 - b. Dispense the initial application of disease control for the palms into the backfill watering in accordance with the recommendations of the licensed Pest Control Advisor.
 - 3. Water-compact the topsoil to the extent approved by the Program/Project Manager.
 - a. After settlement, supply additional topsoil as required to make a constant finished grade as detailed.

H. Fertilization:

1. After placing backfill, but prior to final watering and mulching, apply fertilizer to all plants at the following rates:
 - a. Evergreen Trees: 1/8 pound per foot of height.
 - b. Shade Tree: 2 pounds per inch of caliper.
 - c. Deciduous Shrub: 1/4 pound per foot of height.
 - d. Evergreen Shrub: 1/8 pound per foot of height.
 - e. Flowering Tree: 1 pound per inch of caliper.
 - f. Ornamental Grass: 1 pound per 100 square feet.
 - g. Bulbs: 2 pounds per 100 square feet.
 - h. Ground Cover: 20 to 40 pounds per 1,000 square feet.
 - i. Perennials: 1 pound per 100 square feet.

I. Applying Plant Mulch:

1. Remove weeds and deleterious materials from the area before spreading plant mulch.
2. Mulch plant beds and pits as follows:
 - a. Mulch plants after they are planted with tanbark to a uniform depth of 3 inches.
 - 1) Except in during winter planting, place mulch within 2 days after planting.
 - a) In the case of winter planting, place mulch immediately.
 - 2) Mulch tree pits to the outer edge of the earth berm.
 - 3) Mulch the shrub plantings, which are masses, with mulch covering the entire area within the limits of the plant mass.
 - 4) Adjust grades, allowing for the thickness of the mulch by cutting or filling.
 - b. Rake the surface smooth and even over the prepared surface.
 - c. After leveling the mulch, thoroughly soak it with water to the full depth of the mulch.

J. Pruning:

1. Prune new plant material as necessary to remove injured twigs and branches and to compensate for loss of roots during transplanting, but never prune more than half of the original branch structure.
 - a. Only prune damaged or broken main roots of new materials with a clean oblique cut immediately above the point of damage.
 - b. Conform pruning operations to the best horticultural practices with due respect to natural form and growth characteristics of the individual species.
2. Prune the tops of all deciduous stock at the time of planting or immediately thereafter.
 - a. Preserve a single terminal leader when pruning deciduous trees.
 - b. Paint cuts over 3/4-inch in diameter with an approved tree-wound paint.

3. Prune existing trees indicated to remain to remove all dead and interfacing branches.
 - a. Remove lower branches to provide a minimum clearance of 5 feet from finished grade
 - b. Paint cuts over 3/4-inch in diameter with an approved tree-wound paint.
 4. Do not trim any green or partially green fronds during the landscape establishment phase unless directed by the Engineer.
- K. Interface with Other Work:
1. Irrigation System
 - a. Do not begin planting until the irrigation system has been installed and accepted either in total or in increments, except as noted in Subparagraph 3.02.B.5.c.
 - b. Use the newly constructed irrigation system to provide the initial watering and all subsequent watering of the planting.
 - c. Boxed trees and palms may be placed before irrigation system installation.
 - 1) Maintain these boxed plants in prime condition until the irrigation system is automated by providing them with adequate water.

3.05 REPAIR/RESTORATION

- A. Repair or replace damaged structures, plants, and similar items in which damage resulted from planting operations at no increase in Contract Price.
1. Photograph existing conditions impacted by landscape installation.
 2. Limits of Repair/Restoration Work:
 - a. The limits of this work are determined by the limit of disturbance, or as necessary to complete the satisfactory restoration of impacted systems or items, including, but not limited to, the following:
 - 1) Restoration of existing landscaping and irrigation systems.
 - 2) Removal, relocation, or replacement of existing landscape plants, inert groundcovers, or other materials or surfaces disturbed by the Work of this Contract.
 - 3) Restoration and repair of structures as necessary return them to their original condition prior to construction.
 - a) Repair may include, but not be limited to, concrete, masonry, stucco, painting, utilities, and signage.
 3. For non-turf landscaped areas, restore the granite, rock, soil, or other existing landscape surfacing using material to match the existing in type and quality.
 4. Existing Underground Installations:
 - a. Repair any damage to existing underground installations resulting from landscaping operations at no increase in Contract Price.

5. Provide a sample of the replacement materials prior to performing replacement work.
 - a. Existing undamaged materials may be reused for restoration work, subject to the approval of the Program/Project Manager.
6. Neatly join, course, connect, attach, or butt (as applicable) the restoration work to the existing construction, and match the color, texture, and appearance of the existing construction to the satisfaction of the Program/Project Manager.
7. If damage to the structures, grounds, equipment, and/or their contents develops within the stipulated warranty period and is due to the use of material or workmanship which are inferior, defective, or not in accordance with this Contract, make good all unsatisfactory conditions or damage, and make good any work or materials or grounds which are disturbed in fulfilling the requirements of the warranty.
 - a. Make such additional repairs and replacements as required by the Program/Project Manager at no increase in contract Price.

B. Replacement Plants:

1. Provide replacements for any damaged plants in accordance with the requirements of this Section and the warranty provisions.
 - a. If a plant dies or deforms after acceptance but during the warranty period, remove and replace it immediately; or, in the case of plants requiring proper seasonal planting, replace it in the next appropriate season, even if that season falls beyond the warranty period.
 - 1) If a large portion of a plant dies back causing a permanent or long-term deformity, replace it.
 - 2) Replace plants as many times as necessary in a single location during the warranty period.
 - 3) Replace all plants that are dead, unhealthy, or in a badly damaged condition with plants of the same exact type, species, and size originally specified. Note this size replacement does not apply to Saguaro's replacements for Saguaro's that perish and have to be replaced shall include replacement with a six (6) foot spear.
 - 4) Do not make replacements during seasons definitely unfavorable for planting.
 - 5) Remove rejected trees or shrubs immediately from the Site, at no increase in contract Price.
 - 6) Any delay on the part of the Contractor in removing and replacing unsatisfactory materials is cause for the Owner to have such work performed, and to back charge the Contractor for that work.

Commented [jme1]: Check on Saguaro Replacement Size

C. Existing Plant Materials

1. Replace any existing plants outside the construction limits that are removed, damaged, or destroyed during construction with plants of the same size, and variety at no increase in Contract Price.
2. Replace any plants designated as "preserve in place" that are removed, damaged, or destroyed during construction with trees and shrubs of the same species, size, and variety at no increase in Contract Price.

3.06 SITE QUALITY CONTROL

A. Inspections:

1. Inspections for acceptance of the planting stock prior to the plants being placed in their permanent position will be made at the planting site.
 - a. At the conclusion of the maintenance period, the Program/Project Manager will make an inspection of the landscaping work to determine its condition for acceptance. Final Acceptance
2. Substantial Completion:
 - a. Substantial Completion, as defined in Section 01770, Closeout Procedures, will be granted only when 100 percent of the irrigation system and associated items are installed.
 - b. At Substantial Completion, a Conditional Acceptance of landscape planting and irrigation work may be granted.
 - c. Pre-Maintenance Observation:
 - 1) A pre-maintenance observation of the landscape planting and irrigation work under this Contract will be performed upon Substantial Completion.
 - 2) A punch list of landscape planting and irrigation work items requiring remedial work will be generated.
 - 3) Be sure to have a representative present at the Pre-Maintenance Observation.
 - 4) Upon completion and acceptance of the punch list items, the Plant Establishment Period, will begin.
 - 5) Document and submit the date initiating the Plant Establishment Period it at that time.
3. Plant Establishment Period:
 - a. Whenever the planting and related Work has been substantially completed, upon request from the Contractor the Program/Project Manager will perform an initial inspection.
 - b. After this initial inspection, and subject to approval of the Work, the Program/Project Manager will issue a written field notification setting the effective beginning date for the Plant Establishment Period.
 - c. The Plant Establishment Period will last for a period of at least 90 calendar days, but is subject to extension by the Program/Project Manager if the landscape areas are improperly maintained, appreciable plant replacement is required, or other corrective work becomes necessary.

- d. At the end of the Plant Establishment Period or at Final Acceptance, the Program/Project Manager will make a final acceptance inspection of the planted areas.
- e. If the termination of the Plant Establishment Period extends beyond the Final Acceptance date for the Contract, the additional period of time for plant establishment will be considered as a special warranty period within the standard one-year warranty period, and the Program/Project Manager may authorize final payment in accordance with the Agreement.
- 4. Keep a copy of the Contract Drawings and Specifications available at the Site until Final Acceptance.
- B. Non-Conforming Work
 - 1. All plants which settle deeper than the surrounding grade will be rejected and must be raised to the correct level.

3.07 CLEANING

- A. Leave the sites of planting in a clean, safe, neat condition; and not in an unsightly condition.
- B. Remove debris and/or toxic material from planting areas prior to beginning planting.
- C. Waste Management:
 - 1. As the landscape work is completed during the Contract, and at intervals as directed by the Program/Project Manager, clear the Site of all rubbish or debris, and of extraneous materials, including quantities of subsoil, rock, and other spoils remaining from excavation after planting.
 - a. Remove excess and waste material from the Site daily, and keep adjacent areas cleared.
 - b. Immediately remove rejected and unacceptable material from the Site and dispose of it properly.
 - c. At the end of the 1-year warranty period, remove all guying materials.
 - 2. Dispose of dead plant materials off-site at no increase in Contract Price.
 - a. During the preparation of shrub beds, and after the 7-day waiting period beyond the final post-emergent herbicide application, dispose of woody plant stumps and any existing vegetation not killed by the herbicide application off-site as specified in Subparagraphs 3.03.B.1.c.5 and 3.03.B.1.c.6.

3.08 CLOSEOUT ACTIVITIES

- A. Maintenance Instructions:

1. Prior to the expiration of the required maintenance period, submit typewritten recommended procedures to be established by the Owner to maintain landscape work for 1 full year.

3.09 PROTECTION

A. Staking and Bracing Plants:

1. After plant setting work, install guy stakes and guy supports on those plants indicated as being staked to prevent uprooting by wind or otherwise.
2. Staking Trees:
 - a. Within 3 days after planting, stake trees as follows:
 - 1) Stake trees up to 2 inches caliper and evergreen plants 6 feet tall and taller with 2 guy stakes placed on opposite sides of the tree, with a top tie placed for maximum support and a tie placed midway between the top and ground.
 - a) Provide extra ties if in the opinion of the Program/Project Manager they are needed.
 - 2) Stake trees 2 inches caliper with 3 stakes.
 - b. Stake trees at the perimeter line of the root ball as detailed on the Contract Drawings.
 - c. Drive stakes vertically, and not twisted or pulled, and to a sufficient depth into firm ground to hold the tree rigid, but do not injure the root ball.
 - d. Replace or pound flush with the top of the soil stakes with a broken or jagged top.
 - e. Avoid rigid restraint of the tree, and allow for some trunk movement as shown in the planting details.
3. Guy Wire:
 - a. Do not allow guy wire to come in contact with the plants.
 - b. Cover guy wire with rubber hose as shown in the Contract Drawings where such contact points would otherwise occur.
4. Do not locate stakes and guy supports where pedestrian safety would be endangered.
5. Brace palms, yuccas, and saguaros as shown in the details.

3.10 MAINTENANCE

A. Plant Maintenance Period:

1. Begin maintenance operations immediately after planting is performed and continue them throughout construction.
2. Maintain landscaped areas on a continuous basis as they are completed during the course of the Work and until Final Acceptance or the termination of the Plant Establishment Period, whichever occurs later.
 - a. This continuous maintenance period is the Plant Maintenance Period.

B. Maintenance Requirements:

1. Maintenance activities include, but are not limited to, performing the following activities:
 - a. Insuring that all plants are in a sound, healthy, and vigorous condition free from insects, diseases, bark abrasions, or other objectionable disfigurements.
 - b. Weeding and cultivating the planted areas at intervals acceptable to the Program/Project Manager.
 - c. Applying mulch as needed and maintaining mulched landscaped areas throughout the warranty period as specified, including rescuing and replacing mulch that has sloughed off and weeding mulched areas.
 - d. Pruning and re-staking plants as directed by the Program/Project Manager.
 - 1) Maintain and adjust stake wires if necessary and rewrap tree trunks when necessary.
 - 2) Perform pruning, other than the initial pruning, as necessary to remove dead leaders and branches.
 - e. Replacing any plant that is unacceptable at any time up to and including Final Acceptance of the Contract or completion of the Plant Establishment Period, whichever comes later.
 - 1) Replace any dead or dying plant material as directed by the Program/Project Manager.
 - f. Removing all errant trash and debris from the landscape areas on a continuous basis or as necessary.
 - g. Performing other particular operations as specified.
2. Palm Disease Control
 - a. Six weeks after installation of palms, or during periods of high humidity and warm temperatures, request an inspection of each palm by a Licensed Pest Control Advisor, and obtain information regarding application of compounds for palm bud rot.
 - b. Inspect palms monthly for palm bud rot.
3. Palm Fertilization:
 - a. Do not apply fertilizer for 6 to 8 weeks after planting a palm.
 - b. After 8 weeks, apply 3 pounds of 3:1:3 plus micronutrients fertilizer and 1 pound of magnesium sulfate ($MgSO_4$) on *Washingtonia filifera* palms.
 - c. Thoroughly water-in fertilizers.
 - d. Contractor shall provide a maintenance report to the Engineer monthly on the status of the health of the palms. Contractor shall take immediate action if the palm trees show a decline in health and or issues that are detrimental to the palms survival and establishment.
 - e. Contractor shall be required to check for water penetration as well as drainage throughout the root zone once a week and monthly thereafter until the end of the landscape establishment. These findings

shall be entered into a log with the dates and initials of person verifying the drainage. Monitoring shall be done the day prior to applying supplemental water. After the initial watering-in, water the palms with a good soaking, 40-50 gallons per palm every day. Watering amounts and schedule are estimates and are subject to change by Engineer after reviewing the log and observations in the field.

- f. Unless otherwise specified by the Engineer, the contractor shall be responsible for the cost of replacement and planting of any palm tree, in kind at like height that is not in a vigorous growing condition as determined by the Engineer or the palm does not survive. Palm height is measured from the existing grade line around the palm to base of the growing palm bud.
 - g. Palms that do not survive the removal, storage and planting become the property of the contractor for disposal. Contractor shall replace all dead and or palm trees rejected by the Engineer for health reasons within five (5) working days from notice by Engineer.
 4. Continue maintenance activities for a period of at least 1 year from the time of acceptance.
 5. Provide adequate personnel to perform the required maintenance.
- C. Watering:
1. Thoroughly water plants at least bi-weekly and in a satisfactory manner during the construction period until acceptance.
 - a. Water plant root systems at regular intervals and keep the surrounding soil in condition to promote root growth.
 2. Provide all necessary water, tank trucks, hoses, and appurtenances.
- D. Palm Care after Planting:
1. In the summer, untie the top tie on fronds 30 days after planting; and cut the bottom tie 45 days later.
 2. In cooler months, untie the top and bottom ties after 90 days, or when new shoots have pushed up beyond the top of the existing fronds.
 3. Do not prune palms for a minimum 30 days after removal of the bottom tie.
 4. Remove braces when the bottom tie is cut.

Revision 2

SECTION 02919

TOPSOIL

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for the preparation and fine grading of topsoil subgrade.
 - 2. Requirements for furnishing, spreading, and testing topsoil and humus.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 02925 - Seeding and Soil Supplements.

1.02 REFERENCE STANDARDS:

- A. American Association of State Highway and Transportation Officials (AASHTO):
 - 1. AASHTO T 89, Standard Method of Test for Determining the Liquid Limit of Soils.
- B. American Society for Testing and Materials (ASTM):
 - 1. ASTM E 329, Standard Specification for Agencies Engaged in Construction Inspection and/or Testing.
- C. Association of Analytical Communities International (AOAC):
 - 1. AOAC Official Methods of Analysis of AOAC International.

1.03 SUBMITTALS

- A. Informational Submittals:
 - 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Topsoil and humus analysis and recommendations for soil supplements per Subparagraph 3.01.B.1 and 3.03.E.1.

1.04 QUALITY ASSURANCE

- A. Qualifications:
 - 1. Quality Assurance Testing and Inspection Agency Qualifications:
 - a. Employ an independent quality assurance testing and inspection agency qualified to perform the inspections and testing required by this Section.

- b. The independent quality assurance testing and inspection agency must conform to the quality standards of the nationally recognized associations and agencies that promulgate the test standards, particularly ASTM E 329.
- c. Materials are subject to inspection and testing in the nursery and field by the independent quality assurance testing and inspection agency.
 - 1) Direct the independent quality assurance testing and inspection agency to submit certified written reports that document the results of all tests and inspections performed directly to the Engineer immediately after the work is performed.
 - a) In the reports, state whether the tested and inspected items comply with specified requirements or deviate from them.
 - 2) Inspections and tests performed by the quality assurance testing and inspection agency do not relieve the Contractor of responsibility for providing materials and fabrication procedures in compliance with specified requirements.

1.05 SITE CONDITIONS

A. Ambient Conditions:

- 1. Do not perform finish grading during unsuitable weather.

PART 2 PRODUCTS

2.01 MATERIALS

A. Topsoil:

- 1. On-site, previously stripped topsoil that has been stockpiled for reuse may be used for planting and seeding operations.
 - a. Use topsoil of uniform quality, free from hard clods, roots, sods, stiff clay, hard pan, stones larger than 1 inch, lime cement, ashes, slag, concrete, tar residue, tarred paper, boards, chips, sticks or any undesirable material.
- 2. If additional imported topsoil is required for planting and seeding backfill, provide topsoil that meets the following requirements from an approved off-site source:
 - a. Provide new topsoil consisting entirely of earth and organic materials that are fertile, friable, natural loam, surface soil, reasonably free of subsoil, clay lumps, brush, weeds and other litter, and free of roots, stumps, stones larger than 1 inch in any dimension, and other extraneous or toxic matter harmful to plant growth.
 - 1) Obtain topsoil from local sources, or from areas having suitable soil characteristics, where the soil has the proven ability to grow crops.
 - a) Before delivering the topsoil to the Site, submit a written statement certifying the locations of the properties from where

the topsoil is to be obtained, the names and addresses of the owners, the depth to be stripped, the crops grown, and the fertilizers and pesticides applied during the past 2 years.

- 2) Obtain topsoil only from naturally, well-drained sites where topsoil occurs to a depth of not less than 4 inches.
 - a) Do not obtain topsoil from bogs or marshes.
 3. Limit the maximum particle size to that capable of being readily placed and compacted in loose 6-inch layers.
 4. If necessary, take steps to make it conform to the acceptable pH acidity range and percentage of organic matter specified:
- B. Water:
1. Provide water suitable for irrigation and free from ingredients harmful to plant life.
- C. Humus:
1. Provide dark brown to black domestic natural humus consisting of reed or sedge peat, granulated and free of lumps, that can be readily incorporated into topsoil, and meets the following requirements:
 - a. Size: Provide humus capable of passing through a 1/2-inch screen.
 - b. Composition:
 - 1) Provide humus free from sticks, stones, weedy roots, or other foreign matter; and having ample water-holding capacity and ability to retain plant food.
 - 2) Provide humus low in wood material, iron, and sulfur ash content.
 - c. Percent Moisture: Between 35 and 50 percent when delivered from stockpiles.
 2. Acceptable Products:
 - a. Humall Peat as supplied by Pennsylvania Peat Moss, Inc., Hazleton, Pennsylvania.
 - b. Or approved equal.

2.02 EQUIPMENT

- A. Compaction Roller:
1. Furnish a compaction roller weighing approximately 500 pounds.
- B. Watering Equipment:
1. Furnish hose and other watering equipment required for the work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Pre-Installation Testing:
1. Topsoil:

- a. Test on-site, previously stripped topsoil that has been stockpiled for reuse and imported topsoil to certify that it meets the following requirements:
- 1) Acidity Test:
 - a) Test Procedure:
 - (1) Test the acidity of the soil.
 - b) Acceptance Criteria:
 - (1) Acidity Range: pH 5.0 to pH 7.0, inclusive, is acceptable.
 - 2) Percent Organic Matter Test:
 - a) Test Procedure:
 - (1) Determine the percent organic matter by loss on ignition of moisture-free samples dried in accordance with the current method of the AOAC Official Methods of Analysis of AOAC International.
 - b) Acceptance Criteria:
 - (1) Topsoil must contain at least 5 percent organic matter.
 - 3) Dry Weight Density Test:
 - a) Test Procedure:
 - (1) Determine the Dry Weight Density.
 - b) Acceptance Criteria:
 - (1) 95 pounds per cubic foot, minimum, is acceptable.
 - 4) Liquid Limit (Maximum) Test:
 - a) Test Procedure:
 - (1) Determine the maximum liquid limit in accordance with the procedures specified in AASHTO T 89.
 - b) Acceptance Criteria:
 - (1) 65 or less is acceptable.
 - 5) Gradation Analysis:
 - a) Test Procedure:
 - (1) Use U.S. Standard sieves to gradate the topsoil.
 - b) Acceptance Criteria:
 - (1) Provide topsoil with a gradation per Table 02919-1.

Table 02919-1 Topsoil Gradation Analysis	
Sieve Size	Minimum Percent Passing
2 inch	100
Number 4	75
Number 10	60
Number 200	35

2. Humus:

- a. Test the humus to verify that it meets the following requirements:
 - 1) Acidity Test:
 - a) Test Procedure:
 - (1) Test the acidity of the soil.
 - b) Acceptance Criteria:
 - (1) Acidity Range: pH 5.0 to pH 7.0 (intensity to acidity), inclusive, is acceptable.
 - 2) Moisture Test:
 - a) Test Procedure:
 - (1) Determine the weight loss upon oven drying of the humus.
 - b) Acceptance Criteria:
 - (1) 60-75 percent weight loss upon oven drying is acceptable.
 - 3) Water Absorption Test:
 - a) Test Procedure:
 - (1) Determine the water absorbing ability of the humus.
 - b) Acceptance Criteria:
 - (1) 150 to 350 percent, inclusive, is acceptable.
 - 4) Percent Organic Matter Test:
 - a) Test Procedure:
 - (1) Determine the percent organic matter by loss on ignition of moisture-free samples dried in accordance with the current method of the AOAC Official Methods of Analysis of AOAC International.
 - (2) Dry the sample at 110 degrees Celsius prior to combustion.
 - b) Acceptance Criteria:
 - (1) Humus must contain at least 80 percent organic matter on a dry basis.
 - (2) Humus must contain at most 10 percent wood material, iron, and sulfur ash on a dry basis.

B. Evaluation and Assessment:

- 1. Submit topsoil and humus test reports of the tests to the Engineer for approval.

3.02 PREPARATION

A. Demolition / Removal:

- 1. After construction work is finished and rough grading has settled and been approved but prior to finish grading, remove all sticks, stones, and foreign material one inch or greater in size from the subgrade to receive topsoil.

B. Surface Preparation:

- 1. Harrow or otherwise loosen the subgrade to a depth of 3 to 4 inches.

3.03 APPLICATION

- A. Provide topsoil for all areas within the limits of the Contract that meet both of the following criteria:
 - 1. Areas disturbed by changes in grade, site clearing, or Contractor operations.
 - 2. Areas not to be paved, not containing plantings or structures, and that will not be disturbed by utility construction.
- B. Spreading Topsoil:
 - 1. Spread topsoil over areas to be seeded, planted, or scheduled to receive additional topsoil; and conform it smoothly to the lines, grades, and elevations shown on the Contract Drawings.
 - a. Spread topsoil to a depth of 6 inches, after natural settlement.
- C. Grading Topsoil:
 - 1. After spreading the topsoil, rake up large stiff clods, hard lumps, roots, litter, and other foreign matter and stones larger than 3/4 inch in their greatest dimension.
 - a. Remove this raked material from the premises, or dispose of it where directed in a satisfactory manner.
 - 2. Fine grade and rake the topsoiled areas to a smooth, uniform surface.
 - a. Apply humus to the surface of the spread topsoil, and work it into the mix during raking operations.
 - b. Apply a quantity of humus as necessary to meet the 5 percent organic matter content specified.
- D. Compacting Topsoil:
 - 1. Compact the topsoil with an approved roller.
 - 2. Re-grade and re-roll the topsoil until satisfactory grades as shown on the Contract Drawings are obtained having the required depths of topsoil
- E. Prepare the topsoiled areas for seeding and lawn establishment.
 - 1. Soil Supplements:
 - a. After performing topsoil testing, determine the soil analysis and submit soil supplement recommendations to the Engineer for approval.
 - 1) Prior to adding any soil supplements to the topsoil, take a sufficient quantity of topsoil samples to allow a representative analysis of on-site topsoil and imported topsoil from outside sources, if any.
 - 2) Have the Quality Assurance Testing and Inspection Agency perform the testing specified in Paragraph 3.01.A.
 - 3) Provide recommendations for both the grade and application rates of fertilizer and such other soil supplements as required.
 - b. Apply lime and fertilizer mixed as specified in Section 02925, Seeding and Soil Supplements.

3.04 ADJUSTING

- A. If necessary, make the topsoil conform to the pH acidity range and percentage of organic matter listed in Subparagraphs 3.01.A.1.a.
1. All material unsuitable for use as topsoil becomes the property of the Contractor), and he must expeditiously remove it from the Site.

SECTION 03100

CONCRETE FORMS AND ACCESSORIES

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for designing and providing concrete formwork, falsework, bracing, and shoring for constructing the concrete structures depicted on the Contract Drawings and specified in the Specifications.

B. Related Requirements:

1. Section 01330 - Submittal Procedures.
2. Section 01400 - Quality Requirements.
3. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCES

A. Abbreviations and Acronyms:

1. ACA: An acronym for Ammoniacal Copper Arsenate, a leach-resistant waterborne wood preservative.
2. CCA: An acronym for Chromated Copper Arsenate, a leach-resistant waterborne wood preservative.
3. VOC: An acronym for volatile organic compounds, generally meant to refer to organic chemical compounds that have high enough vapor pressures under normal conditions to significantly vaporize and enter the atmosphere.

B. Reference Standards:

1. American Concrete Institute (ACI):
 - a. ACI 347-14 - Guide to Formwork for Concrete.
2. APA-The Engineered Wood Association (APA):
 - a. APA Panel Handbook & Grade Glossary.
3. International Code Council (ICC):
 - a. ICC International Building Code (IBC) as Amended by the City of Phoenix.
4. Southern Pine Inspection Bureau (SPIB):
 - a. SPIB Standard Grading Rules for Southern Pine Lumber.
5. State of Arizona:
 - a. Arizona Department of Transportation (ADOT):
 - 1) ADOT 2008 Standard Specifications for Road and Bridge Construction.
6. U. S. Government:
 - a. U.S. Department of Commerce:
 - 1) Product Standards:

Forms for Curb & Gutter and Sidewalk

It is acceptable to use standard lumber sizes as formwork for curb, gutter, and sidewalks.

- a) PS-1-95 - Construction and Industrial Plywood.
 - b) PS-20-94 - American Softwood Lumber.
- 7. Western Wood Products Association (WWPA):
 - a. WWPA G5 - Western Lumber Grading Rules '05.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure they receive notification sufficiently early to allow them ample time to schedule and perform the required testing and inspections performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring this testing into the Work.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Form ties per Subparagraph 2.03.A.
 - 2) Form coating materials per Subparagraph 2.03.B.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
- B. Qualifications:
 - 1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency having the qualifications specified in Section 01400, Quality Requirements.
 - 2. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency having the

qualifications specified in Section 01400, Quality Requirements, and the City of Phoenix Testing Laboratory.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA

- A. Design the formwork and falsework in accordance with ACI 347 and with the following:
 - 1. Capacities:
 - a. In the design, include assumed values of live load, dead load, weight of moving equipment operated on the formwork, temporary construction material, foundation pressures, stresses, lateral stability, and such other factors pertinent to safety of the structure during construction.
 - 2. Design the formwork to be readily removable without impact, shock, or damage to cast-in-place concrete surfaces and adjacent construction.
 - 3. Design the formwork to conform to the concrete sections indicated on the Contract Drawings, and provide concrete within the following ACI 347 tolerances:
 - a. Concrete Surfaces Exposed to Public View: Class A tolerance.
 - b. Concrete Surfaces Not Exposed to Public View: Class C tolerance.
 - c. Where stricter tolerances are indicated on the Contract Drawings, they supersede the ACI tolerances specified herein.
 - 4. Include the factors pertinent to the safety of personnel during construction in the design.
 - 5. Types of Formwork and Falsework Permitted:
 - a. Exposed Finish Concrete:
 - 1) Design and furnish formwork of metal, fiberglass, or other materials that provide a smooth, uniform concrete surface texture.
 - 2) Do not design and furnish formwork of materials having a raised grain, torn surfaces, worn edges, or other defects that will impair the concrete surface texture.
 - b. Unexposed Finish Concrete:
 - 1) Design and furnish formwork of plywood, lumber, metal, or another acceptable material.
 - c. Earth forms are not permitted.

2.02 MATERIALS:

- A. Form Sheathing and Panels:
 - 1. For form sheathing and panels, provide Exterior Type B-B Plywood Class I and II that conforms to U.S. Product Standard PS-1-95.
 - a. Thickness: 5/8 inch, minimum.
 - b. On surfaces not exposed to view, only use Class II plywood.

- B. Framing, Sheathing, Struts, Braces, and Shoring for Forms:
 - 1. Provide framing, sheathing, struts, braces, and shoring for the forms made from lumber conforming to WWPAA Grading Rules or SPIB Grading Rules.
- C. Metal Forms:
 - 1. Furnish steel forms of a pre-engineered standard design, conforming to the concrete sections indicated on the Contract Drawings.
 - 2. Do not provide stay-in-place metal forms except as follows:
 - a. With the approval of the Program/Project Manager only, stay-in-place metal forms may be used for building structures.
 - b. Stay-in-place metal forms may be used for cast-in-place concrete decks on elevated guideway.
- D. Rough Structural and Dimension Lumber:
 - 1. Provide lumber of allowable species, surfaced on four sides as applicable, and grade stamped with the appropriate WWPAA or SPIB stamp indicating product compliance with PS-20-94.

2.03 ACCESSORIES

- A. Form Ties:
 - 1. Provide factory-fabricated, adjustable-length, removable or snap-off metal form ties conforming to ACI 347.
 - a. Do not fabricate wire ties, flat bands, or form ties on the Site.
 - 2. Removable Ties:
 - a. For ties that are designed to be completely removed, taper the ties over their full length that passes through the concrete.
 - 1) In building foundation walls, install tapered ties so the large end of the taper is on the ground side of the concrete wall.
 - b. Do not use removable type ties that leave holes larger than one inch.
 - 3. Snap-off Metal Ties:
 - a. Provide snap-off metal ties with ends that break at least 1-1/2 inches from the face of the wall.
 - 4. Do not use wood spacers.
 - 5. To construct structures designed to exclude groundwater, use ties designed to prevent seepage or flow of water along the embedded tie.
 - 6. Submit Product Data and current specifications for the form tie materials.
- B. Form Coatings:
 - 1. Provide commercial formulation VOC compliant form-coating compounds that do not bond with, stain, or affect concrete surfaces.
 - a. Provide form-coating compounds that do not impair subsequent treatment of concrete surfaces requiring bond or adhesion, or impede the wetting of surfaces to be cured with water or curing compounds.
 - 2. Submit current Product Data for the form coating materials.

PART 3 EXECUTION

3.01 PROTECTION OF IN-PLACE CONDITIONS:

- A. Protect in-place materials and the work of other trades during concrete work.

3.02 ERECTION

- A. Construct the forms in accordance with ACI 347 and to the required dimensions.
 - 1. Fabricate the forms for easy removal without hammering or prying against concrete surfaces.
 - 2. Provide offsets, keyways, recesses, chamfers, blocking, screeds, bulkheads, anchorages, inserts, and such other features as required.
- B. Erect the forms plumb, straight, mortar tight, and paste tight where appearance is important.
 - 1. Form intersecting planes so that true, clean-cut corners are created.
 - 2. Do not expose the concrete surfaces to the edge grain of plywood used to fabricate forms.
- C. Openings:
 - 1. Provide temporary openings where the interior area of formwork is inaccessible for cleanout, for inspection before concrete placement, or for placement of concrete.
 - a. Locate temporary openings on forms in locations as inconspicuous as possible consistent with the requirements of the work.
 - b. Provide openings in concrete formwork of the correct size and in the proper location to accommodate other items and operations of construction work passing through the forms.
 - 2. Securely brace and set temporary openings tightly to forms to prevent the loss of concrete mortar.
- D. Securely brace and shore the forms to prevent displacement, bowing, pillowing, and to safely support the imposed concrete load.
- E. Prior to the concrete pour, wet wood forms sufficiently to prevent the joints from opening
- F. Form Coatings:
 - 1. Apply form coatings in accordance with the coating manufacturer's specifications.
 - 2. Do not allow form coatings to come in contact with construction joints and reinforcing steel.
 - 3. Do not allow excess form coating material to accumulate in the forms.
- G. Interface with Other Work:

1. Build items such as inserts, anchors, miscellaneous metal items, and other embedded items indicated on the Contract Drawings into the forms; or otherwise secure these items in the forms.
 - a. Accurately place and securely support items to be built into forms.

H. Tolerances:

1. Set and maintain concrete forms within the allowable tolerance limits specified in Subparagraph 2.01.A.3.
2. For forms and falsework for elevated guideway, comply with the additional tolerance requirements specified in Subsection 601-3.02 in the ADOT Standard Specifications for Road and Bridge Construction.

3.03 REMOVAL

- A. The Program/Project Manager's consent to remove forms does not relieve the Contractor of the responsibility for the safety of the Work.
- B. If the atmospheric temperature at the Site has been continuously above 50 degrees Fahrenheit from the time of the pour, remove the forms at the earliest practical time within the limits set forth in this Article 3.03, and maintain wet curing without delay.
 1. Forms for walls and other vertical faces may be carefully removed 24 hours after the last portion of concrete in the section involved has been placed, provided the concrete has sufficiently hardened to preclude damage resulting from form removal, and provided these members are not subjected to loads for a period of 14 days.
 2. Maintain horizontal forms in place for a minimum of 14 days or until the concrete, as determined by job-cured cylinders, has attained a compressive strength of 3000 psi.
 3. If a water-reducing retarder is used in the concrete mix, the normal time period for removing forms may need to be increased.
- C. ~~If the atmospheric temperature at the site drops below 50 degrees Fahrenheit, leave all forms in place for at least 5 days regardless of the temperature within protective coverings or enclosures.~~ Follow provisions in ACI 306R
- D. Remove forms in accordance with ACI 347 without damaging the concrete and in a manner that ensures complete safety and serviceability of the structure.
 1. Do not cut form ties back from the face of the concrete.
- E. Do not remove supporting forms or shoring until the members have acquired sufficient strength to safely support the weight of the members and the anticipated construction loads without distortion or excessive deflection.

Cold Weather Concreting & Formwork

RFI
721

3.04 RE-INSTALLATION

- A. Forms may be re-used, only if they meet the same requirements as new forms with respect to their effect on poured concrete appearance and structural stability.
- B. Reusing forms may not cause delays or changes in the concrete pour schedule when compared to the concrete pour schedule that is made possible by using all new forms in the case of wood forms, or by having available the total number of forms required in the case of metal forms.

3.05 SITE QUALITY CONTROL

- A. Inspections:
 - 1. Notify the Program/Project Manager at least 10 days prior to scheduled concrete placement operations to allow sufficient time for the code-required Approved Agency responsible for performing special inspections to schedule an inspection of the concrete formwork.
 - 2. Prior to placement of concrete, inspect the forms for shape, location, and dimension of the concrete member being formed.
 - a. Provide lumber free of material defects that would unacceptably deform the finished concrete product or cause visible imperfections on surfaces exposed to public view.
 - 3. Prior to placement of concrete, verify the items to be embedded are properly placed and anchored.
 - 4. Notify the Program/Project Manager upon removal of each concrete form so a review of the newly stripped surfaces may be made before patching takes place.
 - 5. Examine concrete surfaces following removal of forms to verify the surface does not contain residual form coating that will interfere with other materials or coatings to be applied.
- B. Non-Conforming Work
 - 1. If formwork is found to be out of alignment, or requires residual or other detrimental material to be removed from the forms or pour area, realign the forms and/or remove the detrimental material from the formwork before pouring concrete into the form.
 - 2. If detrimental form coating is found, use approved methods to remove it prior to applying other materials or coatings.

3.06 WASTE MANAGEMENT AND DISPOSAL:

- A. Do not leave any wood, shavings, sawdust, and similar items on the ground or buried in backfill.
 - 1. Do not burn scrap on the Work Site.
 - a. Do not burn scraps that have been pressure treated.

2. Do not send materials treated with pentachlorophenol, CCA, or ACA to co-generation facilities or "waste-to-energy" facilities.

- B. Prevent sawdust and wood shavings from entering the storm drainage system.

3.07 PROTECTION

- A. Protect formwork materials before, during, and after erection to ensure acceptable finished concrete work.

SECTION 03150

VERTICAL RESTRAINERS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for providing vertical restrainer units for elevated guideway structures as detailed on the Contract Drawings at the locations indicated thereon.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 05120 - Structural Steel.

1.02 REFERENCE STANDARDS:

- A. American National Standards Institute (ANSI):
 - 1. ANSI A135.4 – Basic Hardboard.
- B. ASTM International (ASTM):
 - 1. ASTM A603-98(2014) - Standard Specification for Zinc-Coated Steel Structural Wire Rope.
 - 2. ASTM C203-05a(2017) - Standard Test Methods for Breaking Load and Flexural Properties of Block-Type Thermal Insulation.
- C. International Code Council (ICC):
 - 1. ICC International Building Code (IBC) as Amended by the City of Phoenix.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. 10 days before the vertical restrainer units are to be installed, give notice to those performing other construction work related to the vertical restrainer units' installation, such as to those performing work that must be supported by or that will provide support of the vertical restrainer units, to allow such items to be introduced or furnished before the vertical restrainer units are installed.
 - 2. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to ensure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.

B. Sequencing:

1. Sequence the installation of the vertical restrainer units and integrate the installation of the vertical restrainer units into the construction of the abutments and pier caps.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Vertical restrainer units.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Vertical restrainer units and other concrete accessories.
 - b. Site Quality Control Submittals:
 - 1) Vertical restrainer unit test loop assemblies.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section related to vertical restrainer units.

B. Qualifications:

1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency having the qualifications specified in Section 01400, Quality Requirements.
2. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency having the

qualifications specified in Section 01400, Quality Requirements, and the City of Phoenix Testing Laboratory.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Vertical Restrainer Units:
 - a. Ship the cable assemblies for the vertical restrainer units as a complete unit.
 - 2. Ensure that materials are delivered to the site at times and intervals that facilitate uninterrupted progress of the Work and continuity of installation.
 - a. Deliver vertical restrainer units to be embedded in or attached to concrete in ample time so that the Work is not delayed.
- B. Storage and Handling Requirements:
 - 1. Handle vertical restrainer units so no parts are bent, broken, or otherwise damaged; and avoid damage to other material and work.
 - a. Exercise care to avoid over stressing the units.
 - b. Replace pieces that are damaged, unless the Program/Project Manager authorizes repairs.
 - 2. Store the vertical restrainer units on platforms, skids, or other supports to prevent contact with dirt, debris, and moisture.
 - a. Protect vertical restrainer units from exposure to conditions that produce rust.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA

- A. Delegated Design Submittals:
 - 1. Submit the manufacturer's descriptive Product Data, including current specifications, for the vertical restrainer units specified in this Section.
 - 2. Submit the manufacturer's installation instructions for the vertical restrainer units specified in this Section.

2.02 MATERIALS

- A. Vertical Restrainer Units:
 - 1. Provide vertical restrainer units as shown on the Contract Drawings and as follows:
 - a. Cable Assemblies:
 - 1) Provide 3/4-inch diameter preformed cables having a 6 by 19 strand core or an independent wire rope core (IWRC), and having a Class A galvanized coating complying with the requirements specified in ASTM A 603, right regular lay, and manufactured from improved plow steel having a minimum breaking strength of 21 tons (42 kips).

- 2) To prevent separation, securely wrap the free ends of the cable restrainer units at each end.
- 3) Take responsibility for determining the required length of the cable assemblies.
- b. Structural Steel:
 - 1) Provide structural steel components complying with the requirements specified in Section 05120, Structural Steel.
- B. Hardboard:
 1. Provide Class 1 tempered hardboard conforming to the requirements specified in ANSI A135.4.
 2. Surface: Provide plain hardboard having one smooth side (S1S).
 3. Thickness: 1/8 inch minimum, unless otherwise specified or shown on the Contract Drawings.
- C. Preformed Joint Filler:
 1. Provide commercially available expanded polystyrene board having a minimum flexural strength of 35 pounds per square inch determined in accordance with the requirements specified in ASTM C 203.
 2. Compressive Yield Strength: Between 16 and 40 pounds per square inch at 5 percent compression.

2.03 SOURCE QUALITY CONTROL

- A. Coordination of Other Tests and Inspections:
 1. Notify the code-required Approved Agency responsible for performing special inspections when concrete for this Contract is being mixed, placed, and/or tested.
 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Inspect the locations intended to receive vertical restrainer units for deficiencies which would prevent proper execution of the concrete work.
- B. Evaluation and Assessment:
 1. Do not proceed with vertical restrainer unit installation until deficiencies discovered by the inspection are corrected to the satisfaction of the Program/Project Manager.

3.02 INSTALLATION

- A. Vertical Restrainer Unit:
 - 1. Provide vertical restrainer units at the locations indicated on the Contract Drawings and in accordance with the details shown.
 - a. Pre-position the portions of the vertical restrainer units to be embedded in the pier caps in advance of new concrete pours.
 - b. Provide a means of holding the cable assemblies in their planned positions.
 - c. Seal the openings in the structural tube to prevent intrusion of concrete.
- B. Preformed Joint Filler Installation:
 - 1. Provide expanded polystyrene preformed joint filler on the concrete substrate where shown on the Contract Drawings.
- C. Hardboard Installation:
 - 1. Face the surfaces of the expanded polystyrene with hardboard where shown on the Contract Drawings.
- D. Special Techniques:
 - 1. Perform welding operations in accordance with the requirements specified in Section 05120, Structural Steel.
- E. Interface with Other Work:
 - 1. During superstructure/deck construction, integrate the upper portion of the installed vertical restrainer units extending up from the abutments and pier caps into the concrete end diaphragm pours of the guideway superstructures.

3.03 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 - 1. During the period when vertical restrainer units are being installed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing and inspection of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection

later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.

2. Vertical Restrainer Unit Cable Assembly Test:

a. Test Procedure:

- 1) Submit a minimum of one vertical restrainer unit test loop assembly for every 40 cable assemblies to the Program/Project Manager for testing.
 - a) Fabricate the test loop assembly from the same lot of material, wire rope, and fittings or clips as the cable assemblies.
 - b) Provide test loop assemblies not less than 27 inches or more than 33 inches long when pulled taut.

b. Acceptance Criteria:

- 1) Cable assemblies complying with the requirements specified will be acceptable.

B. Non-Conforming Work

1. Promptly remove and replace Work that does not comply with specified requirements.
 - a. Correct deficiencies in the Work that inspections and test reports have indicated to be not in compliance with requirements.
2. Record the work required and the work performed to correct deficiencies in the Work of this Section.

3.04 PROTECTION

- A. Protect vertical restrainer units installed in abutments and pier caps until the upper portion extending up from the pier caps is integrated into the concrete end diaphragm pours during superstructure/deck construction.

3. ICC-ES Legacy Report ER-4028 – Dayton/Richmond Dowel Bar Splice Systems.

F. State of Arizona:

1. Arizona Department of Transportation (ADOT):
 - a. ADOT 2008 Standard Specifications for Road and Bridge Construction.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Reinforcement bars.
 - 2) Weldable reinforcement bars.
 - 3) Welded wire reinforcement (WWR).
 - 4) Wire.
 - 5) Dowel bar splicer system.
 - 6) Bar-lock coupler.
 - 7) Headed deformed bars.
 - 8) Slab joint dowel bars.
 - 9) Deformed bar anchors.
 - 10) Metal Accessories.
 - b. Shop Drawings:
 - 1) Concrete reinforcement drawings.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Installation and storage instructions for the dowel bar splicer system.
 - 2) Installation and storage instructions for the bar lock coupler.

- 3) Installation and storage instructions for the headed deformed bars.
- 4) Installation and storage instructions for the deformed bar anchors.
- b. Source Quality Control Submittals:
 - 1) Certified copies of mill test reports per Subparagraph 2.04.A.2.a (in lieu of the testing required by Subparagraph 2.04.A.2.b).
2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA1.3 – Use Recycled Materials
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating material cost for each product and the fraction by weight that is considered recycled.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 1. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
- B. Qualifications:
 1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency having the qualifications specified in Section 01400, Quality Requirements.
 2. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency having the qualifications specified in Section 01400, Quality Requirements, and the City of Phoenix Testing Laboratory.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 1. Ship reinforcement and accessories to the Site with items of the same size and shape fastened in bundles with securely wired-on identification tags giving the size and mark.
- B. Storage and Handling Requirements:

1. Store concrete reinforcing materials in a manner that prevents excessive rusting and fouling with dirt, grease, and other bond-breaking coatings.
 - a. Store the reinforcement and accessories above ground on platforms, skids, or other supports.
 - b. Cover reinforcement and accessories.
 - c. Store the dowel bar splicer systems and the bar lock couplers in accordance with the manufacturer's storage instructions.
2. Protect reinforcement from deforming, bending, kinking, and other injury.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA

- A. Delegated Design Submittals:
 1. Shop Drawings:
 - a. In accordance with ACI 315, prepare and submit concrete reinforcement Shop Drawings that show all fabrication dimensions and the locations for placing reinforcement and bar supports.
 - 1) Indicate bending diagrams, splicing and lap of rods, shapes, dimensions, and details of bar reinforcing and accessories.
 2. Product Data:
 - a. Submit the manufacturer's descriptive Product Data, including current specifications, for each product proposed for the Work of this Section.
 3. Manufacturer's Instructions:
 - a. Submit manufacturer's installation and storage instructions for the dowel bar splicer system, the bar lock couplers, headed deformed bars, and deformed bar anchors.
- B. Sustainability Requirements:
 1. Sustainability Requirements:
 - a. Recycled Content
 - b. Provide Concrete Reinforcement whose combined post-consumer recycled content and one-half pre-consumer recycled content at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.

2.02 MATERIALS

- A. Reinforcing Steel:
 1. Reinforcement Bars:
 - a. Provide deformed steel reinforcement bars in accordance with the requirements for Grade 60 as specified in ASTM A615/A615M.
 2. Weldable Reinforcement Bars:
 - a. Where welding of reinforcement is indicated in the Contract Documents, provide deformed low-alloy steel reinforcement complying

- with the requirements for Grade 60 as specified in ASTM A706/A 706M.
3. Welded Wire Reinforcement (WWR):
 - a. Provide welded wire reinforcement in accordance with the requirements of ASTM A1064/A1064M as may be noted in the Contract Documents.
 4. Wire:
 - a. Provide wire in accordance with the requirements of ASTM A1064/A1064M.
- B. Dowel Bar Splicer System:
1. Provide a dowel bar splicer system only where one is shown on the Contract Drawings or where approved by the Program/Project Manager.
 2. Contractor shall provide only one Manufacture on the project for threaded type of splice systems.
 3. Provide a two-piece dowel bar splicer system manufactured from Grade 60 steel as specified in ASTM A615/A615M, and having a “dowel-in” piece consisting of a deformed rebar with the splice end externally-threaded so it can be threaded into the mating “dowel bar splicer” piece which consists of a deformed rebar equipped with an internally-threaded hole and integral nailing flange plate factory-forged onto the end of the bar.
 4. The strength of the completed splice must exceed the yield strength specified for Grade 60 steel rebar in ASTM A615/A615M as follows:
 - a. For building structures, exceed 160 percent of the yield strength specified.
 - b. For elevated guideway structures, exceed 125 percent of the yield strength specified.
 5. Where “dowel bar splicers” are provided for mating with “dowel-ins” to be installed later, install the manufacturer’s plastic internal coupler protectors in the “dowel bar splicers”.
 6. Provide solid plastic sleeves placed over the “dowel-in” ends to protect the threading from damage, contamination, and rust.
 7. Acceptable Manufacturers:
 - a. Dayton Superior Concrete Accessories, www.daytonsuperior.com.
 - b. ERICO International, Inc., www.erico.com.
 - c. Approved equal.
- C. Bar-Lock Coupler:
1. Provide a bar-lock coupler only where one is shown on the Contract Drawings or where approved by the Program/Project Manager.
 2. Provide bar-lock couplers having lock-shear bolts with internal serrated grip rails that splice with rebar mechanically.
 3. Provide each coupler with a removable center pin for easy referencing.
 4. The strength of the completed splice must exceed the yield strength specified for Grade 60 steel rebar in ASTM A615/A615M as follows:

- a. For building structures, exceed 160 percent of the yield strength specified.
 - b. For elevated guideway structures, exceed 125 percent of the yield strength specified.
5. Acceptable Manufacturers:
 - a. Dayton Superior Concrete Accessories, www.daytonsuperior.com.
 - b. Approved equal.
- D. Headed Deformed Bars:
 1. Provide a headed deformed bar system only where approved by the Program/Project Manager.
 2. Provide headed deformed bars complying with the requirements specified in ASTM A970; and do not allow obstructions or interruptions of the bar deformation, if any, to extend more than 2 bar diameters from the bearing face of the head.
 3. The strength of the headed deformed bar must exceed 160 percent of the specified yield strength of Grade 60 steel rebar specified in ASTM A615/A615M.
 4. Manufactures:
 - a. ERICO International, Inc., Lenton Couplers, ICC-ES Legacy Report ER-3967, www.erico.com.
 - b. Dayton Superior Corporation, Dayton/Richmond dowel bar splice systems, ICC-ES Legacy Report ER-4028, www.daytonsuperior.com.
 - c. Approved equal.
- E. Slab Joint Dowel Bars:
 1. To transfer shear forces at slab-on-grade joints, provide plain round dowel bars conforming to requirements of ASTM A663/A663M, Grade 70, 75, or 80; and which are not burred, roughened, or deformed out-of-round so slippage is not hindered.
 2. Coat the slab joint dowel bars with curing compound conforming to the requirements specified in Section 03300, Cast-In-Place Concrete, to render the surface of the bars bondless.
- F. Deformed Bar Anchors:
 1. Provide deformed anchors conforming to the requirements of ASTM A1064/A1064M, except with a minimum yield strength of 70 ksi and a minimum ultimate tensile strength of 80 ksi.
 - a. Provide low carbon steel anchors with the following composition:
 - 1) Carbon: 0.23 percent, maximum.
 - 2) Manganese: 0.90 percent, maximum.
 - 3) Phosphorus: 0.040 percent, maximum.
 - 4) Sulfur: 0.050 percent, maximum.
 2. Acceptable Manufacturers:
 - a. Nelson Stud Welding, Inc, Type D2L, www.nelsonstud.com.
 - b. Approved equal.

G. Metal Accessories:

1. Provide metal accessories in accordance with the requirements of the CRSI Manual of Standard Practice.

2.03 FABRICATION:

A. Shop Fabrication:

1. Fabricate reinforcement to the dimensions indicated on the Contract Drawings and within the tolerances given in ACI 315.
2. Bend steel reinforcement using the cold bending method.
 - a. Do not use bars with kinks or bends not indicated on the Contract Drawings.
 - b. Fabricate bar shapes in a manner that will not injure the material or lessen the member strength.
 - c. Use either a hand- or power-operated bending machine designed for bending reinforcing steel.

2.04 SOURCE QUALITY CONTROL

A. Tests and Inspections:

1. Materials specified in this Section require advance examination or laboratory testing according to the methods referenced herein, or as required by the Program/Project Manager.
 - a. Notify the Program/Project Manager when manufacturing, fabrication, or mill testing of the items intended for the Work of this Section are to be performed.
2. The Testing and Inspection Agency or the City of Phoenix Testing Laboratory will perform the source testing specified in this Paragraph, unless the testing is not required as specified.
 - a. The tests specified in Subparagraphs 2.04.A.3 through 2.04.A.9 may be waived if certified copies of mill test reports are submitted showing complete compliance with the specified requirements.
 - b. If the certified mill test reports are not submitted the Testing and Inspection Agency must perform the specified tests.
3. Deformed Carbon Steel Bar Reinforcement Tests:
 - a. Test Procedure:
 - 1) The following properties of the deformed and plain carbon steel bar reinforcement will be determined using the methods specified in ASTM A615/A615M:
 - a) The carbon, manganese, phosphorus, and sulfur content of the dowel bar material.
 - b) The tensile strength, yield strength, and percentage elongation.
 - 2) The bend test will be performed on the deformed and plain carbon steel bar reinforcement using the methods specified in ASTM A615/A615M.

- b. Acceptance Criteria:
 - 1) Deformed and plain carbon steel bar reinforcement that exhibit the chemical composition, tensile strength, yield strength, percent reduction of area, and weight (mass) per unit length within the ranges specified in ASTM A615/A615M, and that pass the bend test for the bar size, as specified in ASTM A615/A615M are acceptable.
- 4. Low-Alloy Steel Deformed Bar Reinforcement Tests:
 - a. Test Procedure:
 - 1) The following properties of the low-alloy steel deformed and plain bar reinforcement will be determined using the methods specified in ASTM A706/A706M:
 - a) The carbon, manganese, phosphorus, and sulfur content of the dowel bar material.
 - b) The tensile strength, yield strength, and percentage elongation.
 - 2) The bend test will be performed on the low-alloy steel deformed and plain bar reinforcement using the methods specified in ASTM A706/A706M.
 - b. Acceptance Criteria:
 - 1) Low-alloy steel deformed and plain bar reinforcement that exhibit the chemical composition, tensile strength, yield strength, percent reduction of area, and weight (mass) per unit length within the ranges specified, and that pass the bend test for the bar size, as specified in ASTM A706/A706M are acceptable.
- 5. Steel Welded Wire Reinforcement Tests:
 - a. Test Procedure:
 - 1) The tensile strength, yield strength, and percent reduction of area will be determined, and the bend test for steel welded wire reinforcement will be performed in accordance with the methods specified in ASTM A1064/A1064M.
 - b. Acceptance Criteria:
 - 1) Steel wire used to fabricate the steel welded wire reinforcement that exhibits the tensile strength, yield strength, and percent reduction of area within the ranges specified, and that passes the bend test for the wire size as specified in ASTM A1064/A1064M are acceptable.
- 6. Deformed Bar Anchor Tests:
 - a. Test Procedure:
 - 1) The tensile strength and yield strength will be determined, and the bend test for steel deformed bar anchors will be performed in accordance with the methods specified in ASTM A496/A496M.
 - b. Acceptance Criteria:

- 1) Deformed bar anchors exhibiting the tensile strength and yield strength within the ranges specified in Subparagraph 2.01.E.1 are acceptable.
7. Dowel Bar Splicer System Tests:
 - a. Test Procedure:
 - 1) The following properties of the dowel bar used to fabricate the dowel bar splicer components will be determined using the methods specified in ASTM A615/A615M:
 - a) The carbon, manganese, phosphorus, and sulfur content of the dowel bar material.
 - b) The tensile strength, yield strength, and percentage elongation.
 - 2) The bend test will be performed on the dowel bar used to fabricate the dowel bar splicer components using the methods specified in ASTM A615/A615M.
 - b. Acceptance Criteria:
 - 1) Dowel bar splicer components that exhibit the chemical composition, tensile strength, yield strength, percent reduction of area, and weight (mass) per unit length within the ranges specified in ASTM A615/A615M, and pass the bend test for the bar size as specified in ASTM A615/A615M are acceptable.
8. Dowel Bar Tests:
 - a. Test Procedure:
 - 1) The chemical composition, tensile strength, yield point, and percent elongation of slab joint dowel bars will be determined in accordance with the methods specified in ASTM A663/A663M.
 - b. Acceptance Criteria:
 - 1) Dowel bars exhibiting the tensile strengths, yield points, and percent's elongation within the ranges as specified in ASTM A663/A663M for the Grade of bar tested are acceptable.
9. Bar Lock Coupler Test:
 - a. Test Procedure:
 - 1) The yield strength of the bar lock coupler splice will be determined using the methods specified in ASTM A615/A615M:
 - b. Acceptance Criteria:
 - 1) Bar lock coupler splices that exhibit the yield strength meeting or exceeding the value specified in Subparagraph 2.01.C.4 are acceptable.

B. Non-Conforming Work:

1. Do not use concrete reinforcement that fails the testing.

PART 3 EXECUTION

3.01 INSTALLATION

A. Placing Concrete Reinforcement:

1. Place metal concrete reinforcement accurately and in accordance with ACI 318.
 - a. Do not lay metal reinforcement on formwork.
 - b. Terminate reinforcement 2 inches from the face of expansion joints.
 - c. Continue reinforcement across or through construction joints.
 - d. Place additional concrete reinforcement around openings in slabs and walls as detailed on the Contract Drawings.
 - e. Provide reinforcing accessories to securely brace the reinforcement against displacement outside of permitted tolerances.
2. Slab Reinforcement Placement:
 - a. Install welded wire reinforcement as indicated, lapping joints eight inches with the overlap being measured between the outermost cross wires of each reinforcement sheet and securely wiring the joints together.
 - b. Extend welded wire reinforcement to within 2 inches of sides and ends of slabs.
 - c. To support slab reinforcement from the ground, place the reinforcement on concrete blocks of the correct height and having a compressive strength equal to or greater than the specified compressive strength of the concrete being placed.
 - 1) Use concrete blocks not larger than 3 inches by 3 inches and of a height equal to required bottom steel cover.
 - d. To support slab reinforcement from formwork, place the reinforcement on bar chairs made of plastic or metal.
 - 1) If the slab surface is exposed to view, provide supports with legs protected by plastic or stainless steel.
 - e. Field weld deformed bar anchors to slab edge steel bent plate as shown on the Contract Drawings.

B. Concrete Reinforcement Field Bends:

1. Do not field bend bars partially embedded in concrete.
2. When obstructions interfere with the placement of reinforcement, pass such obstructions by placing reinforcement around it.
 - a. Do not bend the reinforcement to clear the obstructions.

C. Shortening Concrete Reinforcement:

1. Shorten (trim) concrete reinforcement, if required, by shearing or sawing.
2. Shortening concrete reinforcement using an acetylene torch may be acceptable, but only if the location of the shortening is approved by the Program/Project Manager in writing in advance.

- D. Welding Concrete Reinforcement:
 - 1. Do not weld concrete reinforcement except when using ASTM A706/A706M weldable reinforcement, and only where indicated in the Contract Documents or approved in writing by the Program/Project Manager.
 - a. Only weldable rebar as specified in Subparagraph 2.02.A.2 is permitted to be welded.
 - 2. Select proper filler materials, preheat temperatures, and performance/procedures in accordance with the requirements specified in AWS D1.4/D1.4M.
- E. Splicing Concrete Reinforcement:
 - 1. Splice reinforcement in accordance with ACI 318 and as indicated on the Contract Drawings.
 - a. Make mechanical butt splices in accordance with the manufacturer's installation instructions.
 - 2. Secure reinforcement at intersections with not less than 16 gauge annealed wire or appropriately sized clips.
 - a. Where bar spacing is less than 12 inches, tie alternate intersections.
 - b. Do not tack-weld crossing bars.
- F. Slab Joint Dowel Bar Installation:
 - 1. Install one-half the length of the coated bar dowel into the slab to be poured.
- G. Elevated Guideway Structures:
 - 1. For elevated guideway structures, comply with the additional concrete reinforcement requirements specified in Subsection 605-3 in the ADOT Standard Specifications for Road and Bridge Construction.

3.02 SITE QUALITY CONTROL

- A. Inspections:
 - 1. Notify the Program/Project Manager at least 10 days prior to scheduled concrete placement operations so he or she can inspect the placement of reinforcement, and to allow sufficient time for the code-required Approved Agency responsible for performing special inspections to schedule an inspection of the concrete reinforcement.
 - 2. Prior to placing concrete, inspect the reinforcement size, location, spacing, clear distance between bars and to the outside face of the concrete, and the reinforcement will not be displaced during the placement of concrete.
 - a. Verify the rebar splicer system is installed at the approved locations, is the correct type, and is installed in accordance with the manufacturer's guidelines.

3.03 CLEANING

- A. Clean or otherwise protect metal reinforcement so that at the time the concrete is placed, the reinforcement is free from rust, scale, or other coatings that could destroy or reduce the concrete to steel bond.

3.04 PROTECTION

- A. Provide protection for concrete reinforcement during concrete pours in accordance with ACI 318, unless indicated otherwise on the Contract Drawings.
- B. Protect in-place reinforcement from excessive construction traffic and other work.

SECTION 03250

POST-TENSIONING

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for furnishing, installing, stressing, and grouting tendons in post-tensioned concrete members at the locations shown on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 – Sustainable Design Requirements
 - 3. Section 01400 - Quality Requirements.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
 - 2. LRFD: Load and Resistance Factor Design, a system of structural analysis and design methodologies developed for bridges, with load and resistance factors based on the known variability of applied loads and material properties.
- B. Definitions:
 - 1. Functional Tendon Groups: Cantilever tendons, continuity tendons, draped external tendons, continuous profiled tendons passing through one or more spans, and similar tendon groupings.
 - 2. Post-Tensioning: A method of prestressing, used to reinforce concrete, masonry, and other structural elements, that induces internal stresses during the construction phase that are designed to counteract the external loads the member is anticipated to encounter during its life cycle.
 - 3. Tendon: A number of individual strands of a certain diameter or the diameter of a bar.
 - 4. Unbonded Tendons: Tendons generally located external to the concrete.
- C. Reference Standards:

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Notify everyone at the Site when stressing operations are scheduled to occur.
2. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing and inspections performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.
3. Before concrete is to be placed, coordinate work that must support or be embedded in the concrete to allow embedded items to be introduced or furnished before the concrete is placed and not delay the Work.

B. Pre-Installation Meetings:

1. Prior to installing post-tensioning tendons, convene an onsite meeting to establish and coordinate procedures that will enable the Contractor to provide the best possible product under anticipated field conditions.
2. Required attendees to this meeting include representatives of organizations and material suppliers involved with the design and construction of the post-tensioned concrete elements.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Sheathing material type and thickness.
 - 2) Pre-packaged grout.
 - b. Shop Drawings:
 - 1) Fabrication and placement details.
 - 2) Proposed post-tensioning method and equipment.
 - c. Certificates:
 - 1) Certified copies of mill test reports for post-tensioning steel material.
 - 2) Jack and gauge unit calibration certificates.
 - d. Delegated Design Submittals:
 - 1) Design calculations.
 - 2) Job-site grout mix.
 - e. Special Procedure Submittals:
 - 1) Grouting Operation Plan.
 - f. Qualification Statements:
 - 1) Post-tensioning technicians' qualifications.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Stressing Records.
 - 2) Grouting Report
2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA 1.3 - Use Recycled Materials
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.

B. Qualifications:

1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency having the qualifications specified in Section 01400, Quality Requirements.
2. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency having the qualifications specified in Section 01400, Quality Requirements, and the City of Phoenix Testing Laboratory.
3. Stressing Crew Qualifications:
 - a. Individuals proposed for post-tensioning technicians who will be performing the post-tensioning operations must as a minimum be certified by an independent training certification program such as that provided for Level 1 certification by the Post-Tensioning Institute (PTI).
 - b. Submit copies of the certification for post-tensioning technicians who will use the proposed system.

4. Professional Engineer Qualifications:
 - a. Employ a licensed Professional Engineer, registered in the State of Arizona, having experience performing post-tensioning calculations.

C. Certifications:

1. Certified Post-tensioning Steel Mill Tests:
 - a. For post-tensioning steel material, submit certified copies of mill test reports to the Program/Project Manager that, as a minimum, contain the following information for approval:
 - 1) Heat number and identification.
 - 2) Standard chemical analysis for heat of steel.
 - 3) Ultimate tensile strength.
 - 4) Yield stress at 1 percent extension under load.
 - 5) Elongation of failure.
 - 6) Modulus of elasticity.
 - 7) Diameter and net area.
 - 8) Type of material.
2. Jack and Gage Calibration Certificates:
 - a. Submit a calibration certificate for every jack and gage unit being furnished.
 - 1) Pair each jack with a particular gage, and keep them together as a unit.
 - 2) Calibrate each jack and gage pair together as a unit.
 - b. Calibrate equipment against known standards at intervals not exceeding 6 months.

D. Preconstruction Testing:

1. Have the Job-Site Grout Mix tested in accordance with the methods specified in Subparagraph 2.03.A.2 and approved by the Program/Project Manager prior to preparing production batches.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Delivery Requirements:
 - a. Post-tensioning Steel:
 - 1) Suitably wrap, package, and cover post-tensioning steel at the factory to prevent physical damage during transportation and from deleterious corrosion.
 - 2) Clearly identify the grade, coil, heat number, and type on the packs or coils.
 - b. Maintain a record of all delivered materials, and make it available to the City Representative, the Program/Project Manager, and Inspectors upon request.
2. Acceptance Requirements:

- a. Have the post-tensioning installer inspect post-tensioning steel and all accessories at the time of delivery to the Site and prior to placement.
 - 1) Notify the Program/Project Manager of observed damages immediately.
 - b. Surface Condition:
 - 1) Pits on steel strand surfaces shall not exceed 0.002 inches in diameter or length.
 - 2) If surface rust is present, remove it with a fine steel wool pad or by vigorously rubbing it with a cloth.
 - c. Remove and discard lengths of strands containing broken or corroded wires.
- B. Storage and Handling Requirements:
- 1. Duct:
 - a. Store duct coils in dry location on raised platform.
 - b. Cover duct coils to prevent introduction of contaminants into the duct.
 - 2. Grout:
 - a. Store grout related materials on a raised, dry platform with adequate weatherproof covering.
 - b. Prior to using materials, verify they have not exceeded the shelf life listed by the manufacturers.
 - 3. Post-tensioning Steel:
 - a. Keep post-tensioning steel dry.
 - 1) Place post-tensioning steel stored at the Site above the ground on elevated covered platforms.
 - 2) Do not expose post-tensioning steel materials to water and/or dirt.
 - b. Do not expose post-tensioning steel materials stored more than one month to direct sunlight.

1.07 SITE CONDITIONS

- A. Ambient Conditions:
- 1. Take precautions to minimize exposure of tendons to weather and on-site conditions that may promote corrosion.

PART 2 PRODUCTS

2.01 DESIGN CRITERIA:

- A. Sustainability Requirements:
- 1. ENVISION Requirements:
 - a. Recycled Content
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement

indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.

- B. Comply with provisions of the following codes, specifications, and standards except where more stringent requirements are specified:
 - 1. PTI Post-Tensioning Manual.
 - 2. Section 602, Prestressing Concrete, in the ADOT Standard Specifications for Road and Bridge Construction for elements supporting the elevated guideway structure.
 - 3. AASHTO LRFD Bridge Design Specifications.
 - a. Allowable design stresses on the concrete cannot exceed values obtained following procedures defined in the AASHTO LRFD Bridge Design Specifications.
 - 4. ACI 318/318R.
- C. Anchorage and Coupling Capacities:
 - 1. Anchorages must be capable of developing at least 95 percent of the actual ultimate strength of the post-tensioning steel in accordance with the requirements of the Post-Tensioning Institute (PTI) specifications.
 - 2. The anchorage device must be capable of holding the post-tensioning steel without exceeding the anticipated set under a load producing a stress of not less than 95 percent of the guaranteed minimum tensile strength of the post-tensioning steel.
 - 3. Anchorages and couplings must be capable of fully developing the minimum guaranteed ultimate strength of tendons without excessive slip.
- D. Local Zone (Confinement) Reinforcing:
 - 1. The post-tensioning system Supplier is responsible for designing the local zone (confinement) reinforcing.
- E. Calculations:
 - 1. Prepare detailed design calculations, signed and sealed by the Professional Engineer, which include the following:
 - a. The elongation of the tendons at the time of jacking
 - b. The initial forces in the tendons.
 - c. The final working force.
 - d. The stresses in the anchorages and the distribution plates.
 - 2. Submit the design calculations to the Program/Project Manager for approval.
- F. Shop Drawings:
 - 1. Prepare Shop Drawings, signed and sealed by the Professional Engineer, that include the following information:
 - a. Fabrication and placement details showing the following:
 - 1) Details and dimensioned layout of tendons.
 - 2) Tendon sizes.

- 3) Type of post-tensioning duct.
 - 4) End anchorages.
 - 5) Coupler details.
 - 6) Corrosion protection materials, details, and application limits.
 - 7) For internal post-tensioning only, details of grout inlet and outlet fabrication, and inlet and outlet locations along the ducts.
 - b. Describe the proposed post-tensioning method and equipment, including the tensioning sequence, the type of pressure-monitoring devices, anchorages, tendon elongation, and tendon cutoff.
 - c. Submit the Shop Drawings to the Program/Project Manager for approval.
- G. Grouting Operation Plan:
 1. Provide a written Grouting Operation Plan addressing procedures for mixing, pumping, duct cleaning, and if required, re-grouting.
 - a. Include procedures to be implemented if leaks are observed in the ducts.
 2. Submit the Grouting Operation Plan to the Program/Project Manager for approval.

2.02 MATERIALS

- A. Ducts:
 1. Select ducts based on the recommendations for sheathing materials in the PTI Post-Tensioning Manual.
 2. Sheathing Material:
 - a. Provide ducts manufactured from ferrous metal, high-density polyethylene (HDPE), or polypropylene (PP).
 - 1) Provide material that is nonreactive with concrete, post-tensioning steel, and reinforcement steel.
 - 2) Provide material capable of preventing cement paste from the surrounding concrete entering into the duct.
 - 3) Provide material strong enough to retain its shape and to resist un-repairable damage during construction.
 - 4) Provide smooth plastic duct for external post-tensioning systems.
 - b. Provide rigid galvanized ferrous metal ducts for use on elevated guideway support members.
 - c. Submit Product Data for the sheathing material indicating its type and thickness.
 3. Post-tensioning Duct Size:
 - a. Provide post-tensioning ducts having an inside cross sectional area at least 2 times greater than the net area of the post-tensioning strand, or inside diameter 0.25 inches larger than the outside diameter of the post-tensioning bar.
 4. Grout Inlet and Outlet Vents for Internal Post-Tensioning:

- a. For internal post-tensioning only, provide grout inlet and outlet vents of sufficient diameter to allow the free-flow of grout into, and to allow air, water, and bleed-water to escape from ducts.
 - b. Provide shut-off valves or other approved positive means of closing grout inlet and outlet vents.
 5. Sealing:
 - a. Provide positively sealed connections between the post-tensioning duct and the anchor assembly, between the prestressing ducts and the deviation pipes, and between spliced sections of duct.
- B. Post-Tensioning Steel:
 1. Strands:
 - a. Provide post-tensioning tendons fabricated from steel complying with the requirements for Grade 270 Low Relaxation Strand specified in AASHTO M 203M/M 203 (ASTM A 416/A 416M).
 2. Bars:
 - a. Provide high strength steel bars complying with the requirements of ASTM A 722/A 722M, including Supplementary Requirements S1 and S2.
 - b. Tensile Strength (Minimum): 150 ksi.
 3. Manufacturers:
 - a. Manufacturer List:
 - 1) Arizona Post Tension, Inc., Telephone: (520) 623-2624.
 - 2) Post Tension of Nevada, Inc., Telephone: (602) 353-1577.
 - 3) Pulte Building Systems, Telephone: (623) 907-3340.
 - 4) Southwest Post-Tension Systems, Inc., Telephone: (602) 262-2253.
 - 5) Suncoast Post-Tension, Ltd., Telephone: (602) 279-2763.
 - 6) Approved equal.
- C. Anchorages and Couplings:
 1. Fabricate anchorages and couplings from metal compatible with the stressing reinforcement and having proven corrosion resistance.
 2. Anchorages:
 - a. Provide button-head, wedge, nut and thread, grip nut, thread-bar, threaded plate, or other approved type anchorages.
 - b. Provide anchorages with bearing plates, bars, rings, bells, or another positive attaching anchor fitting.
 3. Couplings and Fittings:
 - a. Provide couplings with a housing long enough to permit the movement necessary, and for internal post-tensioning only provide fittings which allow complete grouting of all components.
- D. Deviation Pipes:
 1. Provide smooth, steel deviation pipes bent to the radii indicated on the Contract Drawings.

- E. Pre-Packaged Grout:
 - 1. Provide pre-packaged, cement-based, nonmetallic, nonshrink fluid grout specially formulated for grouting cables and tendons.
 - 2. Submit Product Data for the pre-packaged grout to the Program/Project Manager for approval prior to using the grout.
 - 3. Acceptable Manufacturers:
 - a. Five Star Products, Inc., Five Star® Special Grout 400, www.fivestarprouducts.com
 - b. The Euclid Chemical Co., Euco Cable Grout PTX, www.euclidchemical.com.
 - c. Sika Corporation, SikaGrout® 300 PT, www.sikaconstruction.com.
 - d. Or approved equal.
- F. Corrosion Inhibiting Grease:
 - 1. Provide a corrosion inhibiting grease complying with the requirements of the post-tensioning manufacturer.

2.03 MIXES

- A. Job-Site Grout Mix:
 - 1. Job-Site Grout Materials:
 - a. Provide a job-site grout mix consisting of mixture of Portland cement, a shrinkage compensating admixture, and potable water.
 - 1) Portland Cement:
 - a) Provide Type I or II Portland cement complying with the requirements of ASTM C 150.
 - 2) Admixture:
 - a) Provide shrinkage compensating admixture complying with the requirements of ASTM C 940, and exhibiting a 2 percent minimum and 6 percent maximum unconfined expansion.
 - b) Do not provide material containing aluminum powder, chlorides, fluorides, sulfites, and/or nitrates.
 - b. Water Cement Ratio:
 - 1) Provide the minimum Water Cement Ratio necessary for proper placement; but not exceeding 0.45.
 - 2. Job-Site Grout Performance:
 - a. Compressive Strength: 3000 psi at 7 days and 5000 psi at 28 days when tested according to ASTM C 942.
 - b. Set Time: Greater than 3 hours, but less than 12 hours, when measured according to ASTM C 953.
 - c. Volume Change: 0.0 percent to less than 0.1 percent at 24 hours, and no more than 0.2 percent at 28 days when measured according to ASTM C 1090.
 - d. Pumpability: Efflux time immediately after mixing between 11 and 30 seconds when measured according to ASTM C 939.

3. Submit the job-site grout mix to the Program/Project Manager for approval.

2.04 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 1. Materials specified in this Section require advance examination or laboratory testing according to the methods referenced herein, or as required by the Program/Project Manager.
 2. The Testing and Inspection Agency or the City of Phoenix Testing Laboratory will perform the source testing specified in this Paragraph, unless the testing is not required as specified.
 - a. The tests specified in Subparagraphs 2.04.A.3 through 2.04.A.4 may be waived if certified copies of mill test reports are submitted showing complete compliance with the specified requirements.
 - b. If the certified mill test reports are not submitted the Testing and Inspection Agency must perform the specified tests.
 3. Duct Sheathing Strength Test:
 - a. Test Procedure:
 - 1) Determine the strength of the sheathing in accordance with Section 5, Sheathing, of the PTI Acceptance Standards for Post-Tensioning Systems.
 - b. Acceptance Criteria:
 - 1) Submit test data showing the sheathing has sufficient strength to withstand damage during installation and concrete placement in accordance with Section 5, Sheathing, of the PTI Acceptance Standards for Post-Tensioning Systems.
 4. Duct Sheathing Durability Test:
 - a. Test Procedure:
 - 1) Determine the durability of the sheathing in accordance with Section 5, Sheathing, of the PTI Acceptance Standards for Post-Tensioning Systems.
 - b. Acceptance Criteria:
 - 1) Submit test data showing the sheathing has sufficient durability to withstand damage during installation and concrete placement in accordance with Section 5, Sheathing, of the PTI Acceptance Standards for Post-Tensioning Systems.

PART 3 EXECUTION

3.01 INSTALLERS

- A. Installation and stressing of tendons must be performed by individuals certified by an independent training and certification program as provided by the Post-Tensioning Institute (PTI). Evidence of such certification must be presented to

the Special Inspector on site prior to the performance of any post-tensioning stressing operations.

3.02 PREPARATION

- A. Take measures to notify everyone at the Site that a stressing operation will be occurring.
 - 1. Implement a warning system in place, such as flashing lights or red flags, to indicate stressing operations are in progress.

3.03 INSTALLATION

- A. Installing Deviation Pipes:
 - 1. Locate and cast the deviation pipes in the concrete beams as shown on the Contract Drawings.
 - a. Clean and deburr the deviation pipes to prevent damage to the post-tensioning tendons.
- B. Installing Duct:
 - 1. Place duct enclosures for post-tensioning steel at the locations shown on the Contract Drawings.
 - 2. For internal post-tensioning only, securely fasten the ducts in place to prevent their movement and displacement during concrete placement.
 - a. Do not allow the duct support spacing to exceed the values given in the Post-Tensioning Institute Manual.
 - 3. Verify the ducts are mortar tight.
 - 4. After the ducts are installed, keep the ends of the duct covered to prevent entry of water or debris.
- C. Installing Post-tensioning Steel:
 - 1. If the post-tensioning steel is installed after the concrete has been placed, demonstrate the ducts are free of water and debris prior to installing the tendon strands.
 - 2. Develop a strand placement plan to prevent steel from collecting foreign matter.
 - a. Verify the post-tensioning steel is clean when placed into the ducts.
 - 3. For all externally post-tensioned tendons, apply a corrosion inhibiting grease to the tendons to act as a corrosion protection system.
 - 4. Secure the post-tensioning steel at its ends using an approved permanent type anchoring device.
 - 5. Provide an approved device that effectively distributes the load on the anchoring device to the concrete.
- D. Post-Tensioning Tendon Strands:
 - 1. Furnish an experienced trained crew to properly stress the tendon strands with an Inspector present during entire stressing operation.

2. Do not begin the stressing operation before verifying the ducts are clean and dry.
3. Fit the jacking system with a pressure gauge; calibrate the jacking system and pressure gauge together, and keep the two together as a unit.
 - a. Calibrate the stressing jack and gauge immediately prior to use.
 - b. Furnish a certified calibration chart for the jack and gauge.
4. Prior to beginning the jacking operation, verify the anchorage is aligned and properly supported so uniform bearing on concrete is assured, and verify local and general zone reinforcement was provided.
5. Do not tension the tendon strands until both the required concrete compressive strength has been achieved and 7 calendar days have passed since last concrete was placed.
6. Tension the tendons as indicated on the approved Shop Drawings . For multi-span beams jacking of the tendons is to be done at each end of the tendon. For single-span beams, jacking of the tendons may be done from one end only.
7. Stress the tendons in the sequence shown on the approved Shop Drawings.
 - a. Jack the post-tensioning steel in 2 increments as follows:
 - 1) First, apply a small initial stress to straighten the post-tensioning steel, to eliminate slack, and to provide a reference point for measuring the elongation, as indicated on the approved Shop Drawings.
 - 2) Second, apply the final tension and measure strand elongations.
 - b. Do not allow the maximum temporary stress (jacking stress) to go above 81 percent of the minimum ultimate tensile strength of the post-tensioning steel.
8. Measure and record the jacking forces applied to all post-tensioning steel.
 - a. Conduct the tensioning process to allow the force being applied and the elongation of the post-tensioning steel to be measured at all times.
 - b. Record elongations at the intermediate and final stressing stages indicated on the approved Shop Drawings, or at the following intermediate and final gauge readings:
 - 1) 20 percent.
 - 2) 50 percent.
 - 3) 100 percent.
9. Verify the wedge seating measurement is consistent with the amount assumed in the approved Shop Drawings and Calculations. Make adjustments to the required jacking stresses and corresponding elongations to accommodate any differences between these two amounts as directed by the post-tensioning system supplier.
10. If the jacking forces and elongations are satisfactory and acceptable to the Program/Project Manager, cut off the ends (tails) of the post-tensioning steel strands only after direction from the Program/Project Manager.

- a. Protect strand tails until the Program/Project Manager approves cutting them off.
 - 1) A cutting torch is NOT an acceptable means for cutting post-tensioning steel strands.
- 11. Permanently protect the anchorage and anchor fittings against corrosion.
- E. Grouting Equipment:
 - 1. Grout Mixing Equipment:
 - a. Furnish mechanical mixing equipment capable of continuously mixing and pumping grout to provide a uniform, thoroughly blended grout.
 - b. Furnish grout equipment capable of placing grout at a pressure of at least 150 psi but not greater than 250 psi.
 - 1) Furnish grout equipment with an accurate pressure gauge.
 - 2) Prevent the introduction of oil, air, and other foreign substances into the grout.
 - 3) Prevent the loss of grout and water.
 - 2. Standby Flushing Equipment:
 - a. Furnish standby flushing equipment at the Site to flush out partially grouted ducts when necessary.
 - b. Furnish standby flushing equipment capable of providing dry, oil-free compressed air for removing water from the ducts, and for checking the passageway of the duct.
 - 3. Grout Injection and Ejection Pipes:
 - a. Fit grout injection pipes and ejection pipes with positive mechanical shutoff valves.
- F. Placing Grout:
 - 1. Prior to grouting post-tensioning ducts, fill the ducts with compressed air to verify if any duct connections, joints, or fittings require sealing or repair.
 - 2. Clean all ducts so they are free of deleterious materials that would impair the bonding of the grout or could interfere with grouting procedures.
 - 3. Verify all tendons are fully tensioned and anchored prior to any grouting operation.
 - 4. Prior to introducing grout into the pumping equipment, pass the grout through a screen having clear openings less than 1/8-inch in size.
 - 5. After steel installation, grout each duct before the time limit defined in Section 4.4.6.5 in the PTI Post-Tensioning Manual expires.
 - a. When grouting begins, open all vents in the duct.
 - b. Allow grout to flow only in one direction.
 - c. Do not add water to improve fluidity.
 - d. Once the steady flow of grout without residual water or air is maintained close intermediate vents.
 - e. Continuously waste the grout at the outlet until no visible slugs of air or water are ejected.
 - f. Maintain a minimum pressure of 75 psi for one minute in pressurized duct.

- g. Maintain the grout temperature between 50 degrees Fahrenheit and 90 degrees Fahrenheit.
 - 1) If hot weather conditions could contribute to quick stiffening of the grout, implement approved methods to avoid pump blockage.
 - 2) If freezing conditions will occur during or after grout placement, take appropriate measures to protect the grout from freezing.
6. If a leak is detected in the duct, seal the leaks as outlined in the approved grouting plan.

G. Tolerances:

1. Place ducts within plus or minus 1/4 inch of the dimensions shown on the approved Shop Drawings.

3.04 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. During the period when concrete is being post-tensioned, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing and inspections.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing and inspection personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Site Tests:
 - a. Production tests on the grout mix to be placed will be performed as follows:
 - 1) Wick Induced Bleed Test:
 - a) Test Procedure:
 - (1) Perform one test per day in accordance with a modified version of the test method specified in ASTM C 940 to record bleed water above the grout.
 - (a) Immerse a 20-inch length of AASHTO M 203M/M 203 (ASTM A 416/A 416M) seven wire 0.5-inch diameter strand into a cylinder of the grout mix.
 - b) Acceptance Criteria:
 - (1) An acceptable bleed value for the grout is 0.0 percent after 3 hours of normal room temperature (70 degrees Fahrenheit).
 - 2) Strength Test:
 - a) Test Procedure:

- (1) Perform one test per day in accordance with the methods specified in ASTM C 942.
 - b) Acceptance Criteria:
 - (1) Grout whose strength is 3000 psi at 7 days and 4000 psi at 28 days is acceptable.
- 3) Fluidity (Flow Cone) Test:
 - a) Test Procedure:
 - (1) Perform one test every 2 hours during grouting operations in accordance with the methods specified in ASTM C 939.
 - b) Acceptance Criteria:
 - (1) Grout whose efflux time immediately after mixing is between 11 and 30 seconds is acceptable.
- 4) Volume Test:
 - a) Test Procedure:
 - (1) Perform one test per day in accordance with the methods specified in ASTM C 1090.
 - b) Acceptance Criteria:
 - (1) Grout whose volume change is 0.0 percent to less than 0.1 percent at 24 hours, and no more than 0.2 percent at 28 days is acceptable.
- b. Production tests on the tendons will be performed by the Contractor and observed by the Special Inspector as follows:
 - 1) Elongation Test:
 - a) Test Procedure:
 - (1) Compare the actual obtained elongation of the tendon with the theoretical calculated elongation as indicated on the approved Shop Drawings.
 - b) Acceptance Criteria:
 - (1) Tendon elongations that differ less than or equal to 5 percent from those indicated on the approved Shop Drawings are acceptable.
 - (2) If the tendon elongations differ by more than 5 percent, check the entire operation, determine the source of error, and correct the problem prior to proceeding with the Work as directed by the post-tensioning system Supplier and approved by the Program/Project Manager.
 - 2) In-Place Friction Test of Tendons:
 - a) Test Procedure:
 - (1) For tendons longer than 100 feet, a minimum of 1 tendon in a functional tendon group performing the same function will be tested in place.
 - (a) The tendon selected will be representative of the size and length of the functional tendon group being tested.

- (2) The tendon will be stressed at an anchor assembly with a load cell or second certified jack at the dead end in 8 equal increments up to 80 percent of the specified ultimate tendon strength.
 - (a) The gage pressure, elongation, and load cell force will be recorded for each increment.
 - (b) Wedge seating in both the live end (back of jack) and dead end (back of load cell), and friction within the anchorages, wedge plates, and jack resulting from slight deviations of the strands passing through these assemblies will be taken into account.
 - (c) For long tendons requiring multiple jack pulls with intermediate anchoring, the elongation at the jacking end will be accurately measured allowing for intermediate wedge seating and slop from the jack's wedges.
- b) Acceptance Criteria:
 - (1) Tendon elongations that differ less than or equal to 5 percent from those indicated on the approved Shop Drawings are acceptable.
 - (2) If measured elongations are outside the range of the anticipated theoretical elongation plus or minus 5 percent, generate detailed calculations to confirm the final tendon forces are in agreement with the Contract Drawings and approved Shop Drawings, and determine reasons for the discrepancy.
 - (3) When reconciling theoretical versus actual elongations, do not vary the expected friction and wobble coefficients by more than plus or minus 10 percent.
 - (4) Significant elongation shortfalls are indicative of poor duct alignments and/or obstructions.
 - (5) At least 1 successful friction test for each tendon group is required or the tendons are unacceptable.
 - (6) If there are irreconcilable differences between forces and elongations or other difficulties during the stressing operations, the Program/Project Manager may require additional friction tests be performed by the Contractor.
- 3) Dynamic Testing of Unbonded Tendons:
 - a) Test Procedure:
 - (1) Notify the Program/Project Manager at least 2 weeks prior to the proposed test date.
 - (2) For unbonded superstructure tendons, 2 dynamic tests will be performed on a representative specimen.

- (a) Furnish a test tendon that duplicates the behavior of the full size tendon, and that does not have less than 10 percent of the capacity of the full size tendon.
 - (b) The specimen for the second test does not need to be the same specimen used for the first test.
 - (c) For systems using multiple strands, wires, or bars, use a full size test tendon.
 - (3) The first test will subject the tendon to 500,000 cycles from 60 percent to 66 percent of its minimum specified ultimate strength.
 - (4) The second test will subject the tendon to 50 cycles from 40 percent to 80 percent of its minimum specified ultimate strength.
 - (5) Each period of each cycle will subject the tendon to the lower stress level up to the upper stress level and back to the lower stress level specified.
 - b) Acceptance Criteria:
 - (1) The tested tendon must withstand 500,000 cycles from 60 percent to 66 percent of its minimum specified ultimate strength without failure.
 - (2) In lieu of having the dynamic testing performed, the Contractor may submit data from prior successful dynamic tests for approval by the Program Manager.
3. Inspections:
- a. Continuous Special Inspections will be performed during the entire tendon placement, and stressing and grouting operations.
 - b. Stressing Records:
 - 1) The Contractor performing the post-tensioning operations will compile complete post-tensioning operation records that include the following information:
 - a) Project and Contract name.
 - b) Date of installation.
 - c) Post-tensioning tendon location.
 - d) Required tendon elongation.
 - e) Gauge pressure to achieve elongation.
 - f) Actual elongation achieved.
 - g) Actual gauge pressure.
 - h) Serial or identification number of the jacking equipment.
 - i) Weather conditions.
 - j) Name and signature of stressing operator.
 - 2) Within 48 hours of completion, submit complete post-tensioning operation records to the Program/Project Manager for approval and acceptance.
 - c. Grouting Report:

- 1) The Contractor performing the post-tensioning operations will compile a report on tendon grouting that includes the following:
 - a) Identification of the tendon grouted.
 - b) Date tendon was stressed and grouted.
 - c) Type of grout (site mixed or pre-packaged).
 - d) Length of grouting operation.
 - e) Grouting pressure.
 - f) Quality of grout used.
 - g) Summary of problems with grouting, if any; and corrective action taken if required.
 - h) Field test results.
- 2) Within 72 hours of completion, submit the Grouting Report on tendon grouting to the Program/Project Manager for approval and acceptance.

B. Non-Conforming Work

1. Permissible wire breakage in a strand is limited to 2 percent maximum.
2. When there is a significant shortfall between the actual elongation and the theoretical value, and the acceptance criteria indicated herein is not met, make corrections or compensations for such shortfall as proposed by the post-tensioning system Supplier and approved by the Program/Project Manager. The Contractor is responsible for resolving such shortfalls and non-conforming Work to the satisfaction of the Program/Project Manager at no increase in the Contract Price.

SECTION 03260

GABION RETAINING WALL

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for constructing metal gabion retaining walls.
- B. Related Requirements:
 - 1. PSHIA - Submittal Procedures.
 - 2. PSHIA - Quality Requirements.

1.02 REFERENCES

- A. Reference Standards:
 - 1. American Institute of Steel Construction, Inc. (AISC):
 - 2. ASTM International (ASTM):
 - a. ASTM A185 - Standard Specification for Steel Welded Wire Reinforcement.
 - b. ASTM A82 - Standard Specification for Steel Wire
 - 3. Maricopa County:
 - a. Air Quality Department (MCAQD):
 - 1) Guidance for Dust Control Permit for Application.
 - 2) Application for Dust Control Permit.
 - 3) Dust Control Logs.
 - 4) Burn Permit Application,
<http://www.maricopa.gov/aq/divisions/compliance/dust/docs/pdf/BURN-APP2.pdf>.
 - b. Maricopa County Air Pollution Control Regulations:
 - 1) Regulation II – Permits and Fees:
 - a) Rule 200 – Permit Requirements, Section 305 – Dust Control Permit,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/200-0803.pdf.
 - b) Rule 280 – Fees,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/280-0803.pdf.
 - 2) Regulation III – Control of Air Contaminants:
 - a) Rule 300 – Visible Emissions,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/300-0803.pdf.

- b) Rule 310 – Fugitive Dust from Dust-Generating Operations,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/310-0803.pdf.
- c) Rule 310.01 - Fugitive Dust from Non-Traditional Sources of Fugitive Dust,
http://www.maricopa.gov/aq/divisions/planning_analysis/rules/docs/310.01-0803.pdf.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Before construction of the Gabion Retaining Walls contractor shall build mockup of Gabion Wall per Section 01454 and gain approval from PSHIA staff.
 - 2. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required approvals of the mockup wall work.
- B. Pre-Installation Meetings:
 - 1. Prior to placement of any of the gabion retaining walls, convene an onsite meeting with PSHIA staff to establish and coordinate procedures that will enable the Contractor to provide the best possible product under anticipated field conditions.
 - 2. Required attendees to this meeting include representatives of organizations and material suppliers involved with the design and construction of the gabion retaining wall features.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of PSHIA, Submittal Procedures:
 - a. Product Data:
 - 1) Gabion Basket Hilfiker ArtWeld Gabions (welded wire mesh)
 - b. Shop Drawings:
 - 1) Schedule showing proposed construction methods, and the sequence of wall work effort.
 - c. Samples:
 - 1) Samples of materials being used when requested.
- B. Informational Submittals:
 - 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of PSHIA, Submittal Procedures:
 - a. Manufacturer's Instructions:

- 1) Hilfiker ArtWeld Gabions (welded wire mesh) accessories installation instructions.

C. Closeout Submittals:

1. Submit the following to the Construction Manager in accordance with the requirements of PSHIA, Closeout Submittals:

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Dust Control Permit:
 - a. Conspicuously post a copy of the Maricopa County Air Quality Department Dust Control Permits in a weather resistant location at the Site where it can be read by the workers.

B. Site Samples:

1. Submit Samples of materials being used when requested by the Program/Project Manager, including the Samples' names, sources, and descriptions.

C. Mock-Ups:

1. Mock-ups are required for gabion retaining walls see Section 01454.
 - a. Do not incorporate mock-ups into the final work.
 - b. Provide a mock-up showing the finished wall work for gabion materials, rock fill color for exposed rock surfaces not less than 3 feet by 3 feet in size.
 - 1) Furnish the number of mock-up panels necessary to obtain the approval of the basket material and final rock color.
 - 2) Approved mock-ups will serve as the standard for the aesthetic quality of the surface finish, and be called the Control Sample.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery:

- a. A Certificate of Compliance shall accompany each shipment of gabions to a job site provide this certificate to PSHIA Program/Project Manager for review and approval.
- b. Gabion Baskets delivered to the site are to be stored by the Contractor at the established staging area.

B. Storage and Handling Requirements:

1. Store gabion baskets so contamination, evaporation, moisture penetration, and damage is prevented.

PART 2 PRODUCTS

2.01 GABIONS

1. Gabions: shall be of a single unit construction. Gabions shall be welded wire non-galvanized mesh basket of a single unit of construction. The bottom mat, sides, dividers, back face, front face, shall be connected and spiraled into rectangular baskets of the specified sizes. The non-galvanized welded wire mesh baskets shall be Hilfiker Retaining Walls Artweld Gabion 1-800-762-8962 or approved equal. Contractor shall provide samples of welded wire mesh baskets to the Program/Project Manager at least 30 days in advance of the time when its use is expected to begin.

The base, ends, sides, and lid shall be fabricated from 3"x3" 9 Gauge Black Welded Wire Mesh and connected in such a manner that strength and flexibility at the connection are at least equal to that of the wire mesh. The gabions shall be fabricated in such a manner that they can be assembled at the construction site with Spiral Binders and pre-formed stiffeners to form rectangular baskets of the specified size. The height, length, and width of the gabions shall not vary more than 5 percent from the dimensions shown on the plans. Gabions shall be divided into cells of equal length, not more than 3 feet long, by diaphragms made of the same wire mesh as used for the gabion body. Each gabion shall be fabricated with the necessary diaphragm or diaphragms secured in proper position on the base in such a manner that no additional tying at the base will be necessary.

2. Wire for the manufacture and assembly of gabions shall meet or exceed all of the following requirements:

Description	Requirement
3"x3" (9 ga. - 0.144 in. min.) Welded Wire Fabric	ASTM A185
9 ga. Pre-Formed Stiffener	ASTM A82
9 ga. Spiral Binder	ASTM A82

3. Rock for filling the gabions shall be approved in advance by PSHIA Program/Project Manager and shall be a color as listed on the drawings but shall be in compliance with the following gradation requirements:

100% passing 8 inches (20.3 cm), 0-5% passing 4 inches (10.2 cm)

Rock for the baskets shall conform to the requirements of MAG Section 703 and shall match the color and gradation as called for on the project plans. Rock shall be sound and durable, free from clay or shale seams, cracks or other structural defects. The Bulk Specific gravity (SSD) shall be determined in accordance with the requirements of AASHTO T 85 and shall be a minimum of 2.4. Rock used to fill the welded wire mesh baskets rock shall be well graded varying from four inches minimum to nine inches maximum in size. Rock shall have the following gradation: D50 =6", DMax=9", DMin=4". Control for the gradation will be by visual inspection of the Engineer.

PART 3 EXECUTION

3.01 FOUNDATION PREPARATION

- A. The foundation on which the gabions are to be placed shall be cut or filled and graded to the lines and grades shown on the drawings. Surface irregularities, loose material, vegetation, and all foreign matter shall be removed from foundation surface area. When fill is required, it shall consist of materials conforming to the specified requirements. Gabions and bedding or specified geotextiles shall not be placed until the foundation preparation is completed, and the subgrade surfaces have been inspected and approved by the PSHIA Program/Project Manager. Bedding material for the baskets that will create the benches on natural grade shall consist of native earth scarified to a depth of one foot and compacted to 95% density. Bedding material for Gabion Basket Retaining walls shall consists of 12 inches Aggregate Base Materials in Compliance with MAG Section 702 placed over native earth compacted to a 95% density. The bedding shall be free of clay or organic material.
- B. Compaction of bedding or filter material will be required per plans and specifications. The surface of the finished material shall be to grade and free of mounds, dips or windrows. Extra care should be taken with foundation preparations in order to ensure a level and smooth surface. Geotextile shall be installed in accordance with the requirements of the plans and specifications.

3.02 ASSEMBLY AND PLACEMENT

- A. Gabions shall first be assembled individually as empty units. Each gabion shall be manufactured with the necessary panels, properly spaced and secured, so they can be rotated into position at the construction site with no additional tying of the rotation joint. The panels and diaphragms shall be rotated into position and joined along vertical edges. Temporary Hog Ring fasteners may be used for preassembly to connect panels. Welded wire mesh baskets shall be fabricated in such a manner that the sides, ends, lid and diaphragms can be assembled at the construction site into geometric or semi-circular units of specified sizes. Welded wire mesh baskets are to be of single unit of

construction, the base ends and sides to be welded or physically connected into a single unit or one edge of these members connected to the end section of another unit in such a manner that strength and flexibility at the point of connection is at least equal to that of the mesh. The height, length, and width of welded wire baskets shall not vary more than 1 percent from the dimensions shown on the plans.

All perimeter edges of welded wire mesh baskets are to be securely selvedge or bound so that the joints formed by tying the selvages have at least the same strength as the body of the mesh.

- B. Use 9-gauge spiral binders to connect all diaphragms and lids, the spiral shall be screwed into position such that it passes through each mesh opening along the joint. One end of all 9-gauge spiral binders shall be crimped to secure the spiral in place. Temporary fasteners may remain in place.
- C. Assembly of Successive Gabions (Gabion to Gabion Joints):
 - 1. The construction sequence for welded wire baskets shall require placement of the bottom basket and 95% compaction adjacent the basket. Once the first layer of baskets has been placed, filled, compacted, and approved by the Engineer the second layer may be constructed. This process will be repeated until the entire height of welded wire baskets has been completed.
 - 2. Empty gabions shall be set in place. Individually constructed empty gabions shall be joined successively to the next empty gabion with 9-gauge spirals, before filling with rock begins. The 9-gauge spiral binders shall secure, in one pass, all selvedge or end wires of panels of all the adjacent gabions along the joint.
 - 3. All welded wire mesh baskets shall be tied together each to its neighbor along all contacting edges in order to form a continuous connecting structure.

3.03 CONSTRUCTION

- A. Filling With Rock:
 - 1. The gabions shall be carefully filled with rock, either by machine or hand methods, ensuring alignment, avoiding bulges, and providing a compact mass that minimizes voids. At no point in the filling process may rock be mechanically placed from a height of over 36" from machine to fill area. Machine placement will require supplementing with handwork to ensure the desired results. The cells in any row shall be filled in stages so that the depth of rock placed in any one cell does not exceed the depth of rock in any adjoining cell by more than 12 inches. Along the exposed faces, the outer layer of stone shall be carefully placed and arranged by hand to ensure a neat, compact placement with a uniform appearance.

- a. When constructing with 1.5-foot high or 3-foot high gabions, pre-formed stiffeners shall be used to produce a flat, smooth external surface.
- b. Pre-formed Stiffeners shall be installed on the exposed face of the gabion prior to rock placement, two rows at 1/3 points on 3' high gabions, one row at 1/2 point in 1.5' high gabions.
- c. When filling 3-foot high gabions, rock shall be placed in 3 nominal 12-inch layers; when filling 1.5-foot high gabions, rock shall be placed in two 9-inch layers.
- d. Rock shall be placed in close contact in the unit so that maximum fill is obtained. The units may be filled by machine with sufficient hand work to accomplish requirements of this specification.
- e. Flat faces of rock shall be placed against the face of the wire mesh. Larger rocks should be utilized on the outside faces of the basket and smaller rocks placed on the interior of the baskets to fill voids.
- f. The last lift of rock in each cell shall be level with the top of the welded wire mesh basket in order to properly close the lid and provide an even surface for the top of the basket to close and be level.

B. Closure of Lids:

1. Lids shall be tied along the front, ends, and diaphragms of individual gabions and to successive gabions with 9-gauge spiral binders in the same manner as specified by the manufacturer. The use of crowbars or other single point leverage bars for lid closing is prohibited due to the potential for damage to the baskets.

3.04 SITE QUALITY CONTROL

A. Site Inspections:

1. Inspections:

a. Gabion Wall Installation:

- 1) Evaluate gabion walls for layout, placement of manufacturer stiffeners to keep baskets straight and true.
- 2) Rock placement to avoid damage to gabion walls and to ensure that rock color, texture and size are in compliance with the plans and as selected and approved by PSHIA Program/Project Manager.

B. Gabion Wall Acceptance:

1. Completed gabion wall work which meets the specified requirements will be accepted without qualification.
2. Completed gabion wall work which fails to meet one or more requirements but which has been repaired to be in compliance will be accepted without qualification.

C. Non-Conforming Work

1. Completed gabion wall work which fails to meet one or more requirements and which cannot be brought into compliance may be accepted or rejected as provided in this Section.
 - a. The Phoenix Sky Harbor International Airport and the Program/Project Manager reserve the right to reject any or all items which do not meet the requirements of the Contract Drawings and Specifications.
 - b. Remove items determined to be non-conforming, and replace the non-conforming items removed with Work that conforms to the specified requirements.
2. Gabion Wall Appearance:
 - a. Repair defects which adversely affect the appearance of the gabion walls exposed to view if possible.
 - 1) If in the opinion of the Program/Project Manager the defect cannot be repaired, the gabion wall may be accepted or rejected as provided in this Section.
 - 2) Gabion Walls not exposed to view is not subject to rejection for defective appearance.

3.05 CLEANING

- A. At the end of each day, clean and remove waste gabion materials or rock material from the work area.

3.06 MEASUREMENT

- A. Welded wire mesh gabion basket retaining walls will be measured by the cubic yard by computing the volume of the rock filled baskets used.

3.07 PAYMENT

- A. The accepted quantities of Gabion basket retaining walls/welded wire mesh basket retaining walls, measured as provided above, will be paid for at the contract unit price per cubic yard, which price shall be full compensation for the work, complete in place, including excavating, bedding material, subgrade preparation (95% compaction), structural backfill (95% compaction at 9" vertical lifts), furnishing and installing the rock, filter fabric, soil reinforcement mats (limits specified on plans), and welded wire mesh baskets, and metal hardware as required. The soil reinforcement mats material, installation, compaction and structural backfill shall be considered incidental to the cost of the Gabion basket retaining walls/welded wire mesh basket retaining walls.

SECTION 03300

CAST-IN-PLACE CONCRETE

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for designing cast-in-place concrete mixes.
 - 2. Requirements for furnishing, placing, and curing reinforced and unreinforced Portland cement concrete for concrete structures as indicated in the Contract Documents.
 - 3. Requirements for the testing and acceptance of cast-in-place concrete structures.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 – Sustainable Design Requirements
 - 3. Section 01400 - Quality Requirements.
 - 4. Section 03100 - Concrete Forms and Accessories.
 - 5. Section 03200 - Concrete Reinforcement.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
 - 2. F_F: Flatness F-number.
 - 3. F_L: Levelness F-number.
 - 4. VOC: An acronym for volatile organic compounds, generally meant to refer to organic chemical compounds that have high enough vapor pressures under normal conditions to significantly vaporize and enter the atmosphere.
- B. Definitions:
 - 1. Cementitious Material: A mixture of cement and fly ash.
 - 2. Construction Joint: A bulkheaded joint in concrete having concrete reinforcement through the vertical surface.

3. Contraction/Expansion Joint: A joint in concrete for controlling cracking resulting from stresses caused by thermal expansion or contraction of the concrete.
4. Control Joint: A joint occurring in concrete where a concrete pour stops, and that has no concrete reinforcement through the joint so the joint can move horizontally as it cures and shrinks.
5. Flatness F-Number (F_F): A dimensionless number that defines the relative smoothness of a floor slab.
6. Levelness F-Number (F_L): A dimensionless number that defines the relative conformity of a floor surface to a horizontal plane.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Before concrete is to be placed, give a 10-day advance notice to those performing other construction work related to the concrete pours, such as to those performing work that must be supported by or embedded in concrete, to allow such items to be introduced or furnished before the concrete is placed.
2. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.

B. Pre-Installation Meetings:

1. Prior to placement of concrete, convene an onsite meeting to establish and coordinate procedures that will enable the Contractor to provide the best possible product under anticipated field conditions.
2. Required attendees to this meeting include representatives of organizations and material suppliers involved with the design and construction of concrete elements.

RFI 1805 WTS GW Deck Placement Sequencing Time

C. Sequencing:

1. When placing concrete in walls and slabs, allow at least 2 days elapsed time for slabs and 5 days elapsed time for walls before concrete is placed against adjacent vertical joints.

D. Scheduling:

1. A minimum of 10 days prior to placing concrete, submit a schedule showing proposed construction methods, construction joint locations, and the sequence of pouring to the Program/Project Manager for approval.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:

a. Product Data:

- 1) Cement.
- 2) Fly ash.
- 3) Normal weight concrete aggregates.
- 4) Light weight concrete aggregates.
- 5) Water-reducing admixture.
- 6) Water-reducing and retarding admixtures, if required.
- 7) Water-reducing and accelerating admixtures, if required.
- 8) High-range, water-reducing admixture, if required.
- 9) Shrinkage-reducing admixture, if required.
- 10) Synthetic fibers.
- 11) Curing materials.
- 12) Clear curing and sealing compound.
- 13) Non-slip (dry-shake) aggregate surface.
- 14) Preformed expansion joint fillers.
- 15) Vinyl waterstops.
- 16) Surface applied waterstop.
- 17) Epoxy bonding compound.
- 18) Epoxy adhesive (for grouting dowels).
- 19) Construction joint devices.
- 20) Contraction joint inserts.
- 21) Construction and contraction joint filler (for slabs-on-grade).
- 22) Vapor barrier.

- 23) Acrylic emulsion paint.
 - b. Shop Drawings:
 - 1) Schedule showing proposed construction methods, construction joint locations, and the sequence of pouring.
 - c. Samples:
 - 1) Samples of materials being used when requested.
 - 2) Samples of each type of blast finish.
 - d. Certificates:
 - 1) Batch Mixing Plant Certification.
 - 2) Curing Compound/Architectural Finish Bond Certification.
 - 3) Clear Curing and Sealing Compound Certification.
 - 4) Fly Ash Certification.
 - 5) Mix/Admixture Certification.
 - e. Delegated Design Submittals:
 - 1) Proposed materials and methods to repair concrete surfaces.
 - 2) Design mixes on FINAL CONCRETE MIX DESIGN SUBMITTAL FORM.
 - 3) Materials and methods to be used to produce each type of blast finish.
- B. Informational Submittals:
- 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Floor flatness/levelness test results.
 - 2) Shrinkage-Reducing Admixture Test results
 - b. Manufacturer's Instructions:
 - 1) Concrete material and accessories installation instructions.
 - c. Manufacturer's Reports:
 - 1) Copies of concrete delivery tickets.
 - 2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - ENVISION Credit RA1.3 – Use Recycled Materials
 - 1) .
 - b. ENVISION Credit RA1.4 - User Regional Material
- 1.05 AT LEAST 60% OF ALL MATERIALS, PLANTS, AND SOILS ARE SOURCED WITHIN THE DISTANCES SPECIFIED: SOILS (50 MI, 80 KM), AGGREGATE (50 MI, 80 KM), CONCRETE (100 MI, 160 KM), PLANTS (250 MI, 400 KM), AND ALL OTHER MATERIALS (500 MI, 800 KM). QUALITY ASSURANCE
- A. Regulatory Agency Sustainability Approvals:
- 1. Special Inspections:

- a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
 2. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency and the City of Phoenix Testing Laboratory.
 3. U.S. Environmental Protection Agency Requirements:
 - a. Only provide curing compounds which comply with the low volatile organic compound (VOC) requirements as defined in 40 CFR 51.100, Requirements for Preparation, Adoption, and Submittal of Implementation Plans.
 4. Dust Control Permit:
 - a. If sandblasting operations will be performed for this Contract, comply with the requirements of the Maricopa County Dust Control Permit and air pollution control requirements, particularly Maricopa County Air Pollution Control Regulation Rules 310 and 310.01.
 - 1) Rule 310 requires maintaining daily logs recording the actual implementation of control measures identified in the Dust Control Permit.
 - b. Conspicuously post a copy of the Maricopa County Air Quality Department Dust Control Permits in a weather resistant location at the Site where it can be read by the workers.
- B. Certifications:
1. Batch Mixing Plant Certification:
 - a. Submit to the Program/Project Manager and local authorities requiring them, certificates originated by the batch mixing plant certifying the ready mixed concrete, as manufactured and delivered, is in conformance with ASTM C94/C94M.
 2. Curing Compound/Architectural Finish Bond Certification:
 - a. Submit written certification by the product manufacturer the liquid membrane-forming curing compound to be applied over concrete which is to receive an architectural finish is non-detrimental to the bond of the finish material.
 3. Clear Curing and Sealing Compound Certification:

- a. Submit written certification by the product manufacturer the curing and sealing compound is compatible with other treatments and finishes to be applied to the concrete.
 - 4. Fly Ash Certification:
 - a. Submit written certification by the product Supplier the fly ash conforms to the requirements specified.
 - 5. Mix/Admixture Certification:
 - a. Prior to submitting the concrete mix design to the Program/Project Manager for approval, submit written certification the mix conforms to the requirements of proposed admixtures.
- C. Site Samples:
 - 1. Submit Samples of materials being used when requested by the Program/Project Manager, including the Samples' names, sources, and descriptions.
 - 2. Submit Samples of each type of sandblast finish required not less than 12 inches by 12 inches in size, and indicate the materials and methods to be used to produce the finish.
- D. Mock-Ups:
 - 1. Mock-ups are required for structural concrete that requires a finish treatment.
 - a. Do not incorporate mock-ups into the final work.
 - b. Provide a mock-up showing the finish texture and color for exposed concrete surfaces not less than 3 feet by 3 feet in size.
 - 1) Furnish the number of mock-up panels necessary to obtain the approval of the color and texture on each panel.
 - 2) Approved mock-ups will serve as the standard for the aesthetic quality of the surface finish, and be called the Control Sample.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Delivery Tickets:
 - a. Each load of concrete from the batch plant must be accompanied by a delivery ticket.
 - b. Each delivery ticket must be signed by the Contractor's representative, and be annotated with the time and place of concrete pours from the load represented by the delivery ticket.
 - c. Keep the original delivery tickets as a record at the Site, and submit copies to the Program/Project Manager for information.
 - 1) Make delivery tickets available for inspection upon request by the Program/Project Manager.
 - d. Include the tabulation described by ASTM C94/C94M as well as any additional information the local codes may require on the delivery ticket.

B. Storage and Handling Requirements:

1. Store concrete admixtures so contamination, evaporation, moisture penetration, and damage are prevented.
2. Do not use concrete admixtures stored longer than 6 months.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Cold Weather Concreting:

- a. Perform cold weather concrete work in accordance with the requirements of ACI 306R and the following additional requirements:

- 1) The temperatures of the subbase and other surfaces in contact with concrete must be above freezing.
 - a) The subbase and surfaces of concrete forms must be free of snow and ice.
 - b) Do not place concrete around any embedment which has a temperature below freezing.
- 2) Provide heating equipment for protecting concrete and concrete materials during freezing or near-freezing weather.

- a) Do not use foreign materials or materials containing snow or ice.
 - b) When using artificial heat indoors, vent exhaust gases to the outside.

2. Hot Weather Concreting:

- a. Perform hot weather concrete work in accordance with the requirements of ACI 305R and the following additional requirements:

- 1) Do not deliver concrete having a temperature exceeding 90 degrees Fahrenheit to the Work Site.
- 2) Cool the mix's ingredients before mixing to prevent the temperature of the mix from exceeding 90 degrees Fahrenheit.
- 3) Furnish windbreaks, shading, fog spraying, sprinkling, or wet covering when necessary.

3. Contact with Aluminum Materials:

- a. Do not allow concrete to be in contact with aluminum materials at any time.

PART 2 PRODUCTS

2.01 SUSTAINABILITY REQUIREMENTS:

A. Sustainability Requirements:

1. Recycled Content

- a. For each mix design, provide 20% of fly ash by weight and the total material value for each mix type used on the project.

2. Regional Content

- a. For each mix design, provide component breakdown of concrete ingredients highlighting the extraction location and the distance to the Project site for each component.
- b. At least 60% of all materials are sourced within the distances specified: soils (50 mi, 80 km), aggregate (50 mi, 80 km), concrete (100 mi, 160 km), and all other materials (500 mi, 800 km).

2.02 DESIGN CRITERIA:

- A. American Concrete Institute (ACI) Compliance:
 1. Provide cast-in-place concrete work conforming to the requirements of ACI 301 except as modified by the Contract Documents.
- B. Concrete Design Mix:
 1. Water-Cement Ratio:
 - a. Use the cementitious material to determine the water/cementitious (W/C) ratio for the concrete in accordance with ACI 318/318R.
 - 1) Class AAA Concrete: Provide a maximum water-cement ratio of 0.45.
 - 2) Class AA Concrete: Provide a maximum water-cement ratio of 0.45.
 - 3) Class A Concrete: Provide a maximum water-cement ratio of 0.50.
 - 4) Class B Concrete: Provide a maximum water-cement ratio of 0.55.
 - 5) Class C Concrete: Proportion the mix to meet the strength requirements.
 2. Cementitious Material Content, Minimum:
 - a. Class AAA: 640 pounds per cubic yard.
 - b. Class AA: 600 pounds per cubic yard.
 - c. Class A: 520 pounds per cubic yard.
 - d. Class B: 470 pounds per cubic yard.
 - e. Class C: 420 pounds per cubic yard.
 3. Concrete Admixtures:
 - a. Only provide non-corrosive, non-chloride concrete admixtures.
- C. Delegated Design Submittals:
 1. Submit the manufacturer's descriptive Product Data and current specifications for the concrete materials and accessories specified in this Section to the Program/Project Manager for approval.
 2. Submit the manufacturer's installation instructions for the concrete materials and accessories specified in this Section to the Program/Project Manager for information.

2.03 PERFORMANCE:

- A. Concrete Mix Design Capacities:
 1. Compressive Strength, Minimum:

- a. Class AAA: 5000 psi or greater at 28 days as indicated on the Contract Drawings.
- b. Class AA: 4000 psi at 28 days.
- c. Class A: 3000 psi at 28 days.
- d. Class B: 2500 psi at 28 days.
- e. Class C: 2000 psi at 28 days.

2.04 MATERIALS

A. Cement:

- 1. Provide Portland cement conforming to the requirements for Type II, low alkali, cement specified in ASTM C150.
- 2. For exposed concrete, provide only one approved brand and manufacturer of cement.

B. Fly Ash:

- 1. Provide fly ash conforming to the requirements specified for Type F in ASTM C618.
- 2. Maximum Loss of Ignition: Not to exceed 4 percent.
- 3. Provide the same type and source of fly ash to manufacture concrete.

C. Normal Weight Concrete Aggregate:

- 1. Provide processed coarse and fine aggregate meeting the requirements of ASTM C33.
- 2. Coarse Aggregate:
 - a. Provide coarse aggregate complying with the following maximum size limitations, but in no case larger than 1 1/2 inches:
 - 1) One-fifth or less of the narrowest dimension between the sides of the forms within which the concrete is to be cast.
 - 2) Three-fourths or less of the minimum clear spacing between reinforcing bars.
 - 3) One-third or less of the slab thickness for unreinforced slabs.
 - b. Provide reduced aggregate with a particle size not less than 1/8 inch or more than 1/2 inch in any dimension, and containing a maximum of 5 percent of particles passing a No. 8 sieve.

D. Light Weight Concrete Aggregate:

- 1. Provide processed coarse and fine aggregate meeting the requirements of ASTM C 330.
- 2. Provide aggregate having a maximum size of 3/4 inch.
- 3. Provide reduced aggregate having a particle size not less than 1/8 inch.

E. Synthetic Fibers:

1. Provide 100 percent virgin polypropylene fibers complying with the requirements for reinforcing Type III concrete specified in ASTM C1116/C1116M, and having the following additional characteristics:
 - a. Length: 1-1/2 inch.
 - b. Color: Clear.
 - c. Tensile Strength: 90 ksi to 110 ksi.
 - d. Acid/Alkali Resistance: Excellent quality.
 - e. Absorption Rate: Nil.

F. Water:

1. Provide water clean and free of injurious amounts of oils, acids, alkalis, salts, organic materials, and other substances deleterious to concrete or concrete reinforcement.

G. Concrete Admixtures:

1. Admixture Manufacturers:
 - a. Provide admixtures produced by established, reputable manufacturers.
2. Water-Reducing Admixture:
 - a. Except for concrete including another admixture listed in this Paragraph 2.04.G, provide a water-reducing admixture conforming to the requirements for a Type A admixture specified in ASTM C494/C494M.
 - b. Manufacturers:
 - 1) The Euclid Chemical Company, Eucon WR-75, www.euclidchemical.com.
 - 2) BASF Admixtures, Inc., Pozzoloth 220N, www.basf-admixtures.com.
 - 3) Sika Corporation, Plastocrete 161, www.sikaconstruction.com.
 - 4) Approved equal.
3. Water-Reducing and Retarding Admixture:
 - a. Provide a water-reducing and retarding admixture conforming to the requirements specified for Type D in ASTM C494/C494M.
 - b. Manufacturers:
 - 1) The Euclid Chemical Company, Eucon Retarder-75, www.euclidchemical.com.
 - 2) BASF Admixtures, Inc., Pozzoloth 100XR, www.basf-admixtures.com.
 - 3) Sika Corporation, Plastiment, www.sikaconstruction.com.
 - 4) Approved equal.
4. Water-Reducing and Acceleration Admixture:
 - a. Provide a water-reducing and acceleration admixture conforming to the requirements specified for Types C or E in ASTM C494/C494M.
 - b. Manufacturers:

- 1) The Euclid Chemical Company, Accelguard 80, www.euclidchemical.com.
 - 2) BASF Admixtures, Inc., Pozzutec 20, www.basf-admixtures.com.
 - 3) Sika Corporation, Plastocrete 161 FL, www.sikaconstruction.com.
 - 4) Approved equal.
5. High-Range, Water-Reducing Admixture:
- a. Provide a high-range, water-reducing admixture conforming to the requirements specified for Type F in ASTM C 494/C 494M.
 - b. Manufacturers:
 - 1) The Euclid Chemical Company, Eucon 1037, www.euclidchemical.com.
 - 2) BASF Admixtures, Inc., Pozzolith 400N, www.basf-admixtures.com.
 - 3) Sika Corporation, Sikament 2000, www.sikaconstruction.com.
 - 4) Approved equal.
6. Shrinkage-Reducing Admixture:
- a. Provide a shrinkage-reducing admixture which reduces concrete shrinkage due to drying without reducing the concrete 28-day strength.
 - b. If air-entraining agents are used, provide a shrinkage-reducing admixture compatible with conventional air-entraining agents.
 - c. Shrinkage Reduction:
 - 1) Provide a shrinkage-reducing admixture which reduces the concrete shrinkage of concrete containing the admixture relative to concrete not containing the admixture between 41 percent and 62 percent when tested in accordance with the test method specified in ASTM C157/C157M.
 - d. Manufacturers:
 - 1) W. R. Grace and Company, www.na.graceconstruction.com.
 - 2) Approved equal.

2.05 MIXES

- A. Proportions of Ingredients:
1. Select the proportion of normal weight concrete in the mix in accordance with the requirements of ACI 211.1.
 2. Establish proportions of ingredients of the mix, including the water-cement ratio, on the basis of either laboratory trial mixture tests or standard deviation analysis, using the materials specified within this Section.
 - a. Perform the Laboratory Trial Mixture Test in accordance with Section 4 in ACI 301.
 - b. Perform the Standard Deviation Analysis in accordance with Section 4 in ACI 301.
 - c. Do not allow the fly ash content of the combined weight of fly ash and cement to exceed 25 percent.

- 1) Refer to the Contract Drawings for additional restrictions and limits to the use of fly ash.
3. Do not use fly ash in integrally colored concrete.

B. Slump:

1. Proportion and produce concrete to produce a slump as indicated in Table 03300-1.

Table 03300-1 Concrete Slump Requirements		
Type of Construction	Slump (Inches)	
	Maximum⁽¹⁾	Minimum
Reinforced foundation walls and footings	3	2
Slabs, stair pans and landings	4	3
Building columns, piers, and beams	4	3
Pavements and slabs-on-grade	3	1

2. For concrete containing high-range water-reducing admixtures, the maximum allowable slump after the admixture is added to concrete with an initial slump of 2 to 4 inches is 8 inches.

C. Admixtures:

1. Comply with the manufacturer's recommendations when using concrete admixtures.
2. Water-Reducing Admixture:
 - a. Unless high temperatures occur or placing conditions dictate a change, provide concrete containing a water-reducing admixture.
3. Water-Reducing and Retarding Admixture:
 - a. When high temperatures occur or placing conditions dictate, the water-reducing admixture (Type A) may be replaced with a water-reducing and retarding admixture (Type D).
 - 1) Notify the Program/Project Manager of this change, and submit product data for the water-reducing and retarding admixture prior to placing the modified concrete.
4. Water-Reducing and Accelerating Admixture:
 - a. When low temperatures occur or placing conditions dictate, the water-reducing admixture (Type A) can be replaced with a water-reducing and accelerating admixture (Type C or E).
 - 1) Notify the Program/Project Manager of this change, and submit product data for the water-reducing and accelerating admixture prior to placing the modified concrete.

2.06 ACCESSORIES

A. Curing Materials:

1. Provide curing materials that will not stain or affect the concrete finish, or lessen the concrete strength.
 - a. Burlap:
 - 1) Provide burlap materials conforming to the requirements of AASHTO M182.
 - b. Sheet Materials:
 - 1) Provide sheet materials conforming to the requirements of ASTM C171.
 - c. Liquid Membrane Curing Compound:
 - 1) Provide liquid membrane curing compound material conforming to the requirements for Type 1 specified in ASTM C309.
 - 2) Provide liquid membrane curing compounds which are nontoxic, and have a maximum volatile organic compound (VOC) rating of 350 grams per liter in compliance with the requirements of the U.S. Environmental Agency.
 - 3) Ensure that liquid membrane curing compound is compatible with future concrete coatings and surface treatments.
 - 4) Manufacturers:
 - a) L&M Construction Chemicals, Inc., L&M Cure, www.lmcc.com.
 - b) BASF Admixtures, Inc., Masterkure 200W, www.basf-admixtures.com.
 - c) Euclid Chemical Company, Kurez DR, www.euclidchemical.com.
 - d) Approved equal.

B. Clear Curing and Sealing Compound:

1. Provide a liquid clear curing and sealing compound conforming to the requirements for Type I, Class A, specified in ASTM C1315.
2. Provide liquid clear curing and sealing compounds which are nontoxic, and have a maximum volatile organic compound (VOC) rating of 350 grams per liter in compliance with the requirements of the U.S. Environmental Agency.
3. Manufacturers:
 - a. Euclid Chemical Co., Super Diamond Clear VOX, www.euclidchemical.com.
 - b. BASF Admixtures, Inc., Sonneborn®, Kure-N-Seal 25LV, www.chemrex.com.
 - c. L&M Construction Chemical, Inc., Lumiseal WB Plus, www.lmcc.com.
 - d. Approved equal.

- C. Non-Slip (Dry-Shake) Aggregate Surfacers:
 - 1. Provide aluminum-oxide, non-slip aggregate surfacer to be applied to fresh concrete by the dry-shake method.
 - 2. Manufacturers:
 - a. Sonneborn; Frictex, www.chemrex.com.
 - b. Approved equal.
- D. Preformed Expansion Joint Fillers:
 - 1. Nonextruding and Resilient Bituminous Types:
 - a. Provide nonextruding and resilient bituminous types of joint fillers for exterior use in pavements and sidewalks only.
 - b. Provide nonextruding and resilient bituminous joint fillers conforming to the requirements of ASTM D1751.
 - 2. Sponge Rubber and Cork Type:
 - a. Provide sponge rubber and cork joint fillers conforming to the requirements of ASTM D1752.
 - 3. Self-Expanding Cork Type:
 - a. Provide self-expanding cork joint fillers conforming to the requirements of ASTM D1752.
 - 4. Manufacturers:
 - a. The Euclid Chemical Company/Tamms Industries, Inc., www.euclidchemical.com.
 - b. W. R. Meadows, Inc., www.wrmeadows.com.
 - c. APS Supply Company, <http://apscork.com>.
 - d. Approved equal.
- E. Vinyl Waterstops:
 - 1. Provide ribbed type waterstops conforming to the requirements of COE CRD C572, and manufactured from virgin polyvinyl chloride plastic compound.
 - 2. Construction Joints:
 - a. Provide flat ribbed 6-inch by 3/8-inch construction joints, such as Vinylex Corporation Catalog Number R6-38 with hog-rings.
 - 3. Expansion Joints:
 - a. Provide ribbed 9-inch by 3/8-inch expansion joints with a 1-1/2-inch outside diameter center bulb, such as Vinylex Corporation Catalog Number RLB9-38 with hog-rings.
 - 4. Manufacturers:
 - a. Vinylex Corporation, catalog numbers as specified above, www.vinylex.com.
 - b. The Euclid Chemical Company/Tamms Industries, Inc., www.euclidchemical.com.
 - c. W. R. Meadows, Inc., www.wrmeadows.com.
 - d. Greenstreak, www.greenstreak.com.
 - e. Approved equal.

F. Surface Applied Waterstop:

1. Provide a specially formulated joint sealant manufactured from chloroprene rubber and chloroprene rubber modified to impart hydrophilic properties, and that swells upon contact with water.
 - a. Coat the waterstop with a coating formulated to inhibit initial expansion due to moisture present in fresh concrete.
2. Size: 10mm by 20mm dual extrusion design.
3. Provide the waterstop manufacturer's standard adhesive binder for securing the waterstop to hardened concrete.
 - a. Package surface applied waterstop in continuous length coils.
4. Manufacturers:
 - a. Greenstreak; Hydrotite CJ, www.greenstreak.com.
 - b. ADEKA; Ultraseal, www.adeka.com.
 - c. Vinylex, Swellseal 2010, www.vinylex.com.
 - d. Approved equal.

G. Epoxy Bonding Compound:

1. Provide a high-modulus, low-viscosity, moisture-insensitive epoxy adhesive conforming when mixed to the requirements for Type II, Grade 2, Classes B and C as specified in ASTM C881/C 881M; and having the following properties:
 - a. Compressive Strength (Minimum): 8,000 psi at 28 days when measured in accordance with the requirements of ASTM D695.
 - b. Tensile Properties:
 - 1) Tensile Strength (Minimum): 4,000 psi at 14 days when measured in accordance with the requirements of ASTM D638.
 - 2) Elongation at Break: One to three percent when measured in accordance with the requirements of ASTM D638.
 - 3) Modulus of Elasticity: 3×10^5 psi when measured in accordance with the requirements of ASTM D638.
 - c. Minimum Bond Strength (Plastic Concrete to Hardened Concrete): 1,700 psi at 14 days (moist cure) when measured in accordance with the requirements of ASTM C882.
2. Manufacturers:
 - a. Sika Corporation; Sikadur 32 Hi-Mod, www.sikaconstruction.com.
 - b. Euclid Chemical Company; Euco Epoxy #452 MV or #620, www.euclidchemical.com.
 - c. Fosroc, Inc.; Notobond 881, www.studiolina.com/studio/websites/fosroc.
 - d. Approved equal.

H. Epoxy Adhesive (For Grouting Dowels):

1. Provide a moisture insensitive epoxy adhesive of thick (gel) consistency conforming to the requirements for Type IV, Grades 2 and 3, Classes A, B, and C, except for gel times, as specified in ASTM C881/C881M, complying

with the requirements for Type IV Grade 3, Class A, B, and C except for gel times as specified in AASHTO M235, Type IV Grade 3, Class A, B, and C except for gel times, and having the following properties:

- a. Compressive Strength (Minimum): 10,000 psi at 28 days when measured in accordance with the requirements of ASTM D695.
 - b. Tensile Properties:
 - 1) Tensile Strength (Minimum): 3,000 psi at 14 days when measured in accordance with the requirements of ASTM D638.
 - c. Minimum Bond Strength (Hardened Concrete to Hardened Concrete): 2,000 psi at 14 days (moist cure) when measured in accordance with the requirements of ASTM C882.
2. Manufacturers:
- a. HILTI Hit-RE 500-SD; www.us.hilti.com.
 - b. Simpson Set XP, www.simpsonanchors.com.
 - c. Or approved equal.
- I. Construction Joint Devices:
1. Provide integral, galvanized steel construction joint devices formed to make a tongue and groove profile in slabs on grade.
 - a. For concrete areas exposed to view, provide plastic joint cap strips that can be removed to allow placement of sealant.
 2. Manufacturers:
 - a. Meadowburke, www.meadowburke.com.
 - b. Heckmann Building Products, Inc., www.heckmannbuildingprods.com.
 - c. Approved equal.
- J. Contraction Joint Inserts:
1. Provide two-piece, plastic, preassembled, preformed contraction joints with a depth of embedment equal to 1/4 of the slab thickness.
 2. Manufacturers:
 - a. Meadowburke, Burke Zip Strip, www.meadowburke.com.
 - b. W.R. Meadows, Speed - E - Joint, www.wrmeadows.com.
 - c. Approved equal.
- K. Construction and Contraction Joint Filler (For Slabs-on-Grade):
1. Provide two-component epoxy construction and control joint fillers.
 2. Manufacturers:
 - a. Sika Corporation, Sikadur 51 SL, www.sikaconstruction.com.
 - b. Euclid Chemical Company, Euro 700, www.euclidchemical.com.
 - c. BASF Admixtures, Inc., Masterfill 300, www.basf-admixtures.com.
 - d. Approved equal.
- L. Vapor Barrier:
1. Provide black, 3-ply, high-density polyethylene vapor barrier reinforced with nylon cords, and having the following properties.

- a. 3-inch Tensile Strength: 64 pounds when measured in accordance with the requirements of ASTM D882.
 - b. 3-inch Elongation: 450 percent when measured in accordance with the requirements of ASTM D882.
 - c. Puncture-Propagation Tear (PPT) Resistance: 15 pounds when measured in accordance with the requirements of ASTM D2582.
 - d. Tongue Tear: 11 pounds when measured in accordance with the requirements of ASTM D751.
 - e. Cold Creek: -25 degrees Fahrenheit when measured in accordance with the requirements of ASTM D1709.
 - f. Drop Dart: 1.75 pounds when measured in accordance with the requirements of ASTM D1709.
2. Manufacturers:
- a. STEGO Industries, LLC, Stego Wrap Vapor Barrier; www.stegoindustries.com.
 - b. Reef Industries, Inc.; Griffolyn Type 65 Barrier, www.reefindustries.com.
 - c. Raven Industries, Dura Skrim 8BBR, www.ravenind.com.
 - d. Inteplast Group; Barrier Bac VB 250 or VB 350, www.inteplast.com.
 - e. Approved equal.
- M. Advanced Vapor Barrier:
- 1. Provide multi-layer co-extruded vapor barrier complying with the requirements for Class C membrane specified in ASTM E1745, and manufactured from polyethylene and barrier resins having high impact strength and resistance to gas and moisture transmission, including methane and radon gas.
 - a. Thickness:
 - 1) Provide advanced vapor barrier that is a minimum of 20 mils (0.51mm) thick.
 - b. Tensile Strength:
 - 1) Provide advanced vapor barrier having a minimum tensile strength of 58 pounds (258N) when measured in accordance with Method B specified in ASTM E154.
 - c. Puncture Resistance:
 - 1) Provide advanced vapor barrier having a minimum puncture resistance of 2600 grams when measured in accordance with the method specified in ASTM D1709.
 - d. Temperature Limit:
 - 1) Provide advanced vapor barrier capable of functioning up to a temperature of 180 degrees Fahrenheit (82 degrees Celsius).
 - e. Permeance:
 - 1) Provide advanced vapor barrier having a permeance of 0.090 U. S. Perms (0.060 Metric Perms) when measured in accordance with the method specified in ASTM E154.

- 2) Alternately, provide advanced vapor barrier having a water vapor permeance of 0.030 U. S. perms when measured in accordance with Method B1 specified in ASTM E 96/E96M.
- f. Radon Diffusion Coefficient:
 - 1) Provide advanced vapor barrier having a radon diffusion coefficient of less than 0.25×10^{-12} square meters per second when determined using the method developed by the Technical Research Institute of Sweden.
- g. Methane Permeability:
 - 1) Provide advanced vapor barrier having a methane permeability of less than 5×10^{-10} square meters per day-atmosphere when measured in accordance with the method specified in ASTM D1434.
2. Manufacturers:
 - a. Raven Industries, VaporBlock® Plus™ 20, www.ravenind.com.
 - b. W. R. Grace and Company, Florprufe® 120, <http://www.grace.com>.
 - c. Approved equal.
- N. Acrylic Emulsion Paint:
 1. Provide acrylic emulsion paint complying with the requirements of Sections 1002-2.04 and 1002-3 (D) in the ADOT Standard Specifications for Road and Bridge Construction.

2.07 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 1. Materials specified in this Section require advance examination or laboratory testing according to the methods referenced herein, or as required by the Program/Project Manager.
 - a. Prior to producing concrete, submit all mix designs proposed for the Contract to the Program/Project Manager for approval on the form appended to the end of this Section.
 - 1) Include a standard deviation analysis or laboratory trial mixture test data with the submittal in accordance with Section 4 of ACI 301.
 - 2) Use the materials specified in this Section in the proposed design mixes.
 - 3) Make adjustments in the proposed design mix as directed by the Program/Project Manager.
 2. Shrinkage-Reducing Admixture Test:
 - a. Test Procedure:
 - 1) Test normal weight fiber-reinforced concrete containing the shrinkage-reducing admixture for shrinkage in accordance with the test method specified in ASTM C157/C157M.
 - 2) Submit the concrete mix design for the normal weight fiber-reinforced concrete containing the shrinkage-reducing admixture

- and the Shrinkage-Reducing Admixture Test results to the Program/Project Manager for information.
- b. Acceptance Criteria:
 - 1) Concrete having shrinkage within the percentages specified passes the Shrinkage-Reducing Admixture Test.
 - B. Coordination of Other Tests and Inspections:
 - 1. Notify the code-required Approved Agency responsible for performing special inspections when concrete for this Contract is being mixed, placed, and/or tested.
 - 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Inspect the locations intended to receive cast-in-place concrete for deficiencies which would prevent proper execution of the concrete work.
 - 2. For each elevated slab support system, verify that the steel erector/fabricator team has surveyed the erected structural steel frame and defined the top of steel elevation of the floor members and the edge of slab locations, and review these structural steel frame surveys to understand the conditions prevailing.
 - a. Prior to placing concrete, determine potential levelness issues related to the floor slab tolerance requirements listed in Paragraph 3.03.H.
- B. Evaluation and Assessment:
 - 1. Do not proceed with concrete placement until deficiencies discovered by the inspection are corrected to the satisfaction of the Program/Project Manager.

3.02 PREPARATION

- A. Surface Preparation:
 - 1. Prepare formwork in advance in accordance with the requirements of Section 03100, Concrete Forms and Accessories.
 - a. Remove snow, ice, water, and debris from within the forms in advance of concrete pours.
 - 2. Pre-position reinforcement in accordance with the requirements of Section 03200, Concrete Reinforcement; in advance of concrete pours.
 - 3. Sprinkle the subgrade sufficiently to eliminate water loss from concrete in accordance with ACI 302.1R.

- a. Before placing concrete, verify the subgrade is moist with no free water and no muddy or soft spots.
4. Vapor Barrier:
 - a. Provide vapor barrier under floor slabs where shown on the Contact Drawings, when its use is stipulated in the soils report, or where the finish flooring manufacturer recommends its use; and coordinate with the finish flooring manufacturer to ensure the barrier product used for that application is appropriate.
 - b. Immediately before pouring concrete floor slabs, place the vapor barrier on crushed stone base under the slab pours.
 - 1) Lap all vapor barrier sides 6 inches and vapor barrier ends 12 inches.
 - 2) Patch holes and rips in the vapor barrier film to the satisfaction of the Program/Project Manager.
 - 3) At exterior walls, turn the vapor barrier up to the top of the slab.
 - c. Coordinate vapor barrier placement with the installation of the perimeter foundation insulation.
5. Pre-position waterstops, expansion joint materials, anchors, and other embedded items in advance of new concrete pours.
 - a. PVC Waterstops:
 - 1) Provide PVC waterstops with hog-rings in all joints where water tightness is required.
 - a) Provide PVC waterstops in joints exposed to liquids at bottom of walls for elevator and escalator pits, or where shown in the Contract Documents.
 - b) In substructures and other structures required to be watertight, install waterstop if concreting is to be discontinued for a sufficient length of time which could result in undesirable seepage cracks developing in the concrete.
 - c) On expansion joints, center the waterstop so one-half of the waterstop width is embedded in the concrete on each side of the joint.
 - (1) Keep the PVC waterstop's center bulb un-embedded.
 - 2) Use continuous lengths without splices where possible.
 - a) Connect all adjoining waterstops, including vertical and horizontal runs, to provide a continuous water barrier.
 - b) Provide factory-formed and tested waterstop corners and intersections leaving only straight butt joint splices in the field.
 - 3) Adequately support waterstops to prevent displacement and deformity of the waterstops during concrete pours.
 - 4) Maintain a 2-inch minimum clearance between the waterstop and reinforcing steel.
 - 5) Splices:
 - a) Heat seal adjacent surfaces in accordance with manufacturer's recommendations using a thermostatically

- controlled electric source of heat that provides sufficient heat to melt but not to char the material.
- b) Splice Strength: Not less than 50 percent of the mechanical strength of the parent section.
 - c) Water Tightness: Make the splices' water tightness equal to the continuous PVC waterstop material.
- b. Surface Applied Waterstops:
- 1) Provide surface applied waterstops at the locations indicated on the Contract Drawings.
 - 2) Install the surface applied waterstops in strict accordance with the manufacturer's installation instructions.
- c. Embedded Pipes and Conduits:
- 1) The Program/Project Manager may permit material not harmful to the concrete to be embedded in the concrete if the following conditions are satisfied:
 - a) The item(s) to be embedded do not cross expansion joints within the slab depth.
 - b) The maximum outside dimension of an item to be embedded is not greater than one-third the overall thickness of the member in which it is to be embedded.
 - c) The minimum spacing between items to be embedded is not less than 3 widths on center, or 3 inches clear between items, whichever is less.
 - d) The item(s) to be embedded will not impair the strength of the concrete member.
 - e) A 2-inch minimum clearance from the embedded item(s) to the face of the concrete slab is maintained.
 - f) The item(s) to be embedded are not made of aluminum.
 - g) The item(s) to be embedded are coated, taped, or wrapped in accordance with governing code requirements.
 - h) Concrete reinforcement within the concrete member will not be cut, bent, or displaced in order to embed the item(s) unless approved by the Program/Project Manager.
- d. Anchor Rods:
- 1) Install anchor rods accurately, both vertically and horizontally, in the formwork as shown on the Contract Drawings.
 - 2) Ensure anchor rods are held firmly in the correct position and at the proper elevation by suitable templates during the placement of concrete.
 - 3) Limit the variation in the locations of anchor rods and other embedded items from the dimensions shown on the Contract Drawings to within the tolerances listed in AISC 303.
6. Anchor Reinforcement Dowels into Existing Concrete.
- a. Using a carbide tip bit or star bit, drill holes for each dowel to the size and depth indicated on the Contract Drawings.

- 1) Core drilling is not permitted.
- 2) Do not drill into, cut, or otherwise damage existing reinforcement bars.
 - a) If existing reinforcement bars are encountered during the drilling operation, relocate the hole to clear the existing reinforcement as directed by the Program/Project Manager.
 - (1) Plug unused holes as directed by the Program/Project Manager.
 - b. Blow clean each finished hole with an oil free air jet, and then flush the hole with a jet of clean water.
 - c. Immediately prior to placing and grouting the dowel bar into the hole, remove all water from the hole and from the walls of the hole.
 - d. Mix and place epoxy adhesive completely around the dowel bar in the hole in strict accordance with the manufacturer's recommendations.
 - 1) Do not exceed the manufacturer's specified time limit within which the material must be placed after mixing.
 - 2) Do not re-temper grout that has begun to stiffen; discard such grout.

3.03 CONSTRUCTION

A. Construction of Concrete Elements:

1. Construct the concrete elements indicated on the Contract Drawings or in the Specifications; including but not limited to beams, columns, slabs, foundations, in-ground encasement of piping and conduit, reaction backings for piping, concrete backfill, and the reinforced concrete bases for equipment and piping provided under this Contract.
2. Provide only Class AA concrete to construct concrete elements for this Contract except where indicated otherwise on the Contract Drawings or in the Specifications.
 - a. For in-ground encasement of piping, provide Class B concrete.
 - 1) Encase pipes under structures and buildings or indicated to be encased in concrete on the Contract Drawings in concrete for the full length of the pipe run under the structure and as indicated.
 - b. For in-ground encasement of conduit runs, provide Class B concrete.
 - 1) Encase conduit runs indicated on the Contract Drawings.
 - c. For reaction backings, provide Class B concrete.
 - d. For backfilling of over-excavated foundation area, foundation voids, and cavities, provide Class C concrete.

B. Concrete Production:

1. Furnish plant equipment and facilities conforming to the requirements specified in the NRMCA Plant Certification Checklist - Section 3 for producing ready-mixed concrete.

2. Batch, mix, and transport ready-mixed concrete in accordance with ASTM C 94/C 94M.
3. Add admixtures to the mix in accordance with ACI 301.
4. For synthetic fiber-reinforced concrete, add the synthetic fibers at a rate of 1.5 pounds per cubic yard of concrete.
5. Do not add water to concrete mixes at the Work Site unless it has been withheld from the mix at the batch mixing plant.
 - a. Indicate the amounts of mix water to be withheld for later addition at the Work Site on the approval form.
 - b. If the Program/Project Manager approves adding water to the mix at the Site, perform additional revolutions at the mixing speed to adequately incorporate the additional water into the mixture.
6. Provide reduced aggregate concrete only for use in metal pan stairs.

C. Conveying and Placing Concrete:

1. Maintain the required concrete quality by rapidly conveying the concrete from the mixer to the location of the placement, and by using methods which will prevent segregation and loss of ingredients.
 - a. After introducing either the mixing water to the cement and aggregates, or the cement to the aggregates, complete discharging the concrete within 1-1/2 hours or before the mixing drum has revolved 300 revolutions; whichever comes first.
 - b. Do not convey concrete through aluminum or aluminum alloy equipment.
 - c. Do not place concrete if concrete temperature exceeds 90 degrees Fahrenheit.
2. If the concrete is to be conveyed and placed by pumping, conform to the applicable requirements of ACI 304R, Chapter 9, and ACI 304.2R.
 - a. Do not place concrete by pumps or other similar devices without prior written approval of the Program/Project Manager.
3. Place concrete in accordance with the requirements of ACI 304R and the additional requirements specified in this Section.
 - a. Do not drop concrete freely more than 4 feet or in areas where reinforcing will cause segregation.
 - b. Deposit concrete in approximately horizontal layers 12 to 18 inches deep.
 - c. Do not allow concrete to flow laterally more than three feet.
 - d. Do not use concrete which has partially hardened, or has been contaminated by foreign materials.
 - 1) Place concrete at a rate so the concrete which is being integrated with the fresh concrete is still plastic.
 - 2) Do not deposit concrete on concrete which has hardened sufficiently to cause the formation of seams or planes of weakness within sections.
 - e. Do not place concrete in forms containing standing water.

- f. Do not bend reinforcement out of position when placing concrete.
- g. Within pour sections, continuously place concrete to produce a monolithic unit.
- h. Do not cast or erect beams, girders, or slabs supported by columns or walls until the concrete in the vertical support members is 7 days old.
- i. Do not place concrete on frozen surfaces.
- j. Sequence concrete pours in accordance with Paragraph 1.03.C.
- k. Comply with special requirements specified in Article 1.07 for placing concrete during cold or hot weather.

D. Consolidating Concrete:

- 1. Consolidate concrete by vibration only.
 - a. Work the concrete around the concrete reinforcement and embedded items, and into corners.
 - b. Eliminate all air or stone pockets; and eliminate other causes of honeycombing, pitting, and planes of weakness.
 - c. Use vibrators capable of transmitting vibrations to the concrete in frequencies sufficient to provide satisfactory consolidation.
 - 1) Use the internal type of vibration equipment, and not the type attached to forms or concrete reinforcement.
 - 2) Do not use vibrators to spread the concrete.
 - d. Do not leave vibrators in one spot long enough to cause segregation.
- 2. Keep sufficient vibration equipment in reserve on the Site to prevent a shutdown of the Work occasioned by a failure of the primary vibration equipment.

E. Joints:

- 1. Joint Locations:
 - a. Only the locations of critical joints are indicated on the Contract Drawings.
 - 1) Locate additional joints in walls, slabs, and foundations throughout the structures as required.
 - a) 10 days prior to scheduled concrete pours, submit requests for additional joint locations associated with the pours to the Program/Project Manager for approval.
 - b) Do not make concrete pours unless the joint locations have been approved by the Program/Project Manager.
 - b. Install expansion joints and contraction joints where indicated on the Contract Drawings.
 - c. Locate additional contraction joints and construction joints in slabs-on-grade at the following maximum spacing unless noted otherwise:
 - 1) In 5-inch slabs, space the joints 12 feet apart each way.
 - 2) In 6-inch slabs, space the joints 15 feet apart each way.
 - 3) In 8-inch slabs, space the joints 20 feet apart each way.
 - d. Locate the additional construction joints required in walls and foundations where they will least impair the strength of the structure.

- 1) Do not locate construction joints in continuous grade beams and footings more than 60 feet apart horizontally.
 - 2) Do not locate construction joints in foundation mat slabs more than 30 feet apart horizontally.
 - 3) Do not locate construction joints in continuous walls more than 30 feet apart horizontally.
 - a) At corners or other intersections of 2 or more walls, provide construction joints in each wall less than 20 feet from the intersection point in all directions.
 - b) Align construction joints in walls with the construction joints placed in the supporting foundation element (base slab, continuous footing, grade beam), or offset the construction joints a minimum of 5 feet.
2. Construction Joints:
- a. Provide keyways in construction joints where indicated on the Contract Drawings.
 - b. Provide PVC waterstops in construction joints exposed to liquids, are in contact with earth, or are exposed to the weather.
 - c. If concrete placement is interrupted long enough for a “cold joint” (hardened surface) to form, install keyway with embedded dowels so one splice length will extend into the present concrete section pour, and one splice length will extend into the adjacent future pour.
 - 1) Size the embedded dowels to match the size of the concrete reinforcement in the slab, wall, or foundation being poured.
 - 2) For installing dowels into hardened concrete or concrete that has reached its final set, comply with the requirements specified in Subparagraph 3.02.A.6.
 - 3) Do not “wet stab” dowels into fresh concrete or concrete that has not reached its final set.
 - d. Horizontal construction joints are not permitted in slabs or footings; and are not allowed in beams, unless the joints in the beams are detailed in the structural Contract Drawings.
3. Control Joints and Construction Joints in Slabs-On-Grade:
- a. Control joints in a slab-on-grade can be provided using a contraction joint insert.
 - 1) Press a straight edge cutting tool into the slab’s wet concrete to part the aggregate.
 - 2) Place the insert into the separation until the top of the insert lays on the surface of the wet concrete.
 - 3) Remove the top section of the insert, and float the concrete to fill voids adjacent to the insert and finish the concrete surface.
 - b. Contraction joints can be provided in a slab-on-grade by saw-cutting a continuous straight slot to a depth of one-fourth the thickness of the slab.

- 1) Submit detailed procedures and plans to the Program/Project Manager for review and acceptance before constructing control joints.
 - 2) Saw the slot as soon as the concrete has hardened sufficiently; but complete the sawing within 12 hours after the concrete has been placed.
 - 3) When saw cutting a new joint that crosses an existing saw cut joint, provide corner break-out protection for the existing joint.
 - c. Fill all construction and contraction joints in slabs-on-grade with the construction and contraction joint filler specified herein.
 4. Expansion Joints and Control Joints in Walls:
 - a. Do not extend reinforcing or other embedded metal items through expansion and control joints except where indicated otherwise on the Contract Drawings.
 - b. For expansion joints and control joints exposed to liquids, in contact with earth, or exposed to the weather; provide PVC waterstops in the joints.
 5. Bonding New Concrete to Hardened Concrete:
 - a. Bond fresh new concrete to hardened, previously poured concrete in accordance with one of the following:
 - 1) Roughen to ¼" amplitude and clean the hardened concrete to remove foreign matter and laitance, and then saturate the hardened concrete with water for 24 hours immediately prior to the pour and remove standing water.
 - 2) Apply bonding agent in accordance with the manufacturer's printed instructions. Coordinate selection of epoxy with the working time of epoxy and concrete placement and forming operation. Acceptable manufacturers and products include the following:
 - a) Sika Armatec 110 Epocem by Sika
 - b) Sikadur 32 Hi-Mod by Sika
 - c) Or Approved Equal
 6. No exceptions to the specified requirements for joints are permitted unless written approval is given by the Program/Project Manager.

F. Finishing Concrete:

 1. Formed Surface Finishes:
 - a. Apply one or more of the following finishes to the surfaces of formed concrete after removing the forms:
 - 1) Rough Form Finish:
 - a) The surface of the formed concrete may not include roughness and irregularities exceeding 1/2 inch.
 - b) Patch tie holes and defects.
 - 2) Ordinary Wall Finish:

- a) The surface of the formed concrete must be true and uniform without any conspicuous offsets or bulges.
 - b) Gradual irregularities may not exceed 1/2 inch, and abrupt irregularities may not exceed 1/4 inch.
- 3) Plywood Finish:
 - a) The surface must comply with the requirements for the Ordinary Wall Finish, except gradual irregularities exceeding 1/2 inch and abrupt irregularities exceeding 1/8 inch must be removed.
 - (1) Completely remove all fins on the surface.
 - (2) Rub the surfaces which cannot meet these requirements as specified in Subparagraph 3.03.F.1.a.4.
 - b) Construct the surface of the forms using 5/8-inch plywood or boards lined with tempered hardboard not less than 3/16 inch thick
 - c) Place the plywood or liner sheets in an orderly and symmetrical arrangement using sheets as large as practicable.
 - d) Do not use sheets showing torn grain, worn edges, patched holes from previous use, or other defects which will impair the texture of the concrete surfaces.
- 4) Rubbed Finish:
 - a) This finish is applied to a freshly hardened Plywood Finish.
 - b) Wet the surfaces, and rub them with a carborundum brick or other abrasive until all form marks, projections, and irregularities have been removed; and a smooth uniform surface, texture, and color are produced.
 - c) Complete the rubbing operation within one day of the removal of the concrete forms.
 - d) Wash the surface clean after rubbing with water.
- 2. Unformed Surface Finishes:
 - a. Apply one or more of the following finishes to the surfaces of unformed concrete:
 - 1) Floated Finish:
 - a) After the concrete has been placed, consolidated, struck off, and leveled, do no further work until the concrete is ready for the floating operation.
 - b) Begin a floating operation when the water sheen has disappeared and the surface of the concrete has stiffened sufficiently to permit the operation.
 - (1) During or after the first floating, check the planeness of the surface.
 - (2) Eliminate high spots and fill low spots in the slab pour.
 - (3) Re-float the slab to a uniform texture having a finish within the floor flatness/levelness tolerance specified in

Subparagraph 3.03.H.2, and complying with the criteria indicated on the Contract Drawings.

- 2) Steel Trowel Finish:
 - a) This finish is applied to a fresh Floated Finish by working the floated finish with a steel trowel.
 - (1) Perform the first troweling to produce a smooth surface which is relatively free of defects, but which may still show some trowel marks.
 - (2) Perform additional trowelings by hand after the surface has hardened sufficiently.
 - (3) Perform the final troweling when a ringing sound is produced as the trowel is moved over the surface.
 - b) Thoroughly consolidate the surface by hand trowel operations to produce a finished surface essentially free of trowel marks, uniform in texture and appearance.
- 3) Broom or Belt Finish:
 - a) This finish is applied immediately to a fresh Floated Finish by drawing a broom or burlap across the surface to give the surface a coarse transverse scored texture.
- 4) Nonslip Finish:
 - a) Apply non-slip aggregate surfacer to the surfaces using the "dry shake" method of application.
 - b) Apply the non-slip aggregate surfacer in accordance with manufacturer's recommendations and at a rate not less than 25 pounds per 100 square feet.
3. Special Finishes:
 - a. Deck Finish:
 - 1) After the first power or single hand troweling of the slab surface, draw a light hair broom across the slab to produce a fine shallow scored texture.
 - b. Architectural Finishes: 24th St Station Topping
Slab Mix Design RFI
1996
 - 1) Provide special finishes as specified or indicated on the Contract Drawings.
 - 2) Terrazzo Style Decorative Concrete Finish: Decorative concrete is produced by grinding and finishing trowel finished cured concrete in a manner similar to that for terrazzo.
 - a) Rough Grinding: Grind with 26 grit diamond plugs to remove surface fines and expose aggregate. Maintain specified concrete flatness.
 - b) Following initial grind with two additional grinds using 80 grit diamonds and 80 grit stones (max. depth of grind = 1/8")
 - c) Cleanse floor with clean water and rinse. Remove excess rinse water to prevent staining.

- d) Steel trowel Portland Cement grout onto surface to fill all voids, cement grout to match color of concrete, allow to cure overnight.
 - e) Fine Grinding: Grind with 80 grit (or finer) stones to remove grout and 120 grit diamonds until polished terrazzo-like surface is achieved. Concrete shall show a minimum of 60 percent aggregate.
 - f) Wash all surfaces with neutral cleaner with Ph factor between 7 and 10, biodegradable and phosphate free.
 - g) Rinse with clear water and allow to surface dry.
 - h) Seal surface with two coats of approved solvent based acrylic penetrating sealer.
- 3) Sandblast Finish:
- a) To ensure the surfaces to be blasted are at the same age in order that uniform finishes result, coordinate the construction and removal of formwork with blasting.
 - b) During abrasive blast finishing operations, protect adjacent areas and materials from dust, dirt, and physical damage.
 - c) Use abrasive grit of the proper type and grade to expose aggregate and the surrounding matrix surface to duplicate finish on the Control Sample mock-up.
 - d) Perform the blasting in as continuous an operation as possible, using the same crew and equipment to maintain the continuity of the finish.
 - e) Carefully blast edges and corners with abrasive so uniform edges and corners are maintained.
- 4) Painted Concrete Surfaces:
- a) Paint concrete surfaces of the elevated guideway structures where indicated on the Contract Drawings using acrylic emulsion paint in accordance with Section 610-3.05 (B) (4) of the ADOT Standard Specifications for Road and Bridge Construction to match the beige color prevalent in the airport as directed by the Program/Project Manager.
4. Whether the concrete is to remain natural concrete or will receive an additional applied finish or material, finish the concrete surfaces as indicated or scheduled on the Contract Drawings and as specified in this Section.
- a. For concrete having unformed surfaces, use just enough mortar to avoid the need for excessive floating.
 - b. Slope exposed unformed surfaces to provide quick, positive drainage; and to avoid puddles in low spots.
 - 1) Unless noted otherwise on the Contract Drawings, slope all unformed surfaces exposed to the weather 1/4 inch per foot for drainage.

5. Unless the type of finish is indicated on the Contract Drawings or is a Special Finish, finish concrete surfaces as follows.
 - a. Rough Form Finishes:
 - 1) Provide a Rough Form Finish on concrete surfaces to be covered by earth.
 - b. Ordinary Wall Finishes:
 - 1) Provide an Ordinary Wall Finish for the following:
 - a) Interior and exterior concrete wall surfaces not exposed to view.
 - b) The undersides of concrete slabs to be covered by architectural ceilings.
 - c. Plywood Finishes:
 - 1) Provide a Plywood Finish for all surfaces to be painted.
 - d. Rubbed Finishes:
 - 1) Provide a Rubbed Finish for the following:
 - a) Interior and exterior concrete surfaces exposed to view which will not be painted.
 - b) Exterior concrete surfaces above the level beginning 6 inches below finished ground.
 - c) Concrete equipment pads.
 - e. Floated Finishes:
 - 1) Provide a Floated Finish for all unformed concrete surfaces unless otherwise specified.
 - f. Steel Trowel Finishes:
 - 1) Provide a Steel Trowel Finish for the following:
 - a) Interior floors of structures except where an Architectural Finish is to be applied.
 - b) Interior concrete stair treads.
 - c) The tops of exposed concrete walls.
 - g. Broom or Belt Finishes:
 - 1) Provide a Broom or Belt Finish for the following:
 - a) Exterior concrete ramps.
 - h. Non-slip Finishes:
 - 1) Provide a Non-Slip Finish for exterior concrete stair treads and landings.
 - i. Architectural Finishes:
 - 1) Provide Architectural Finishes as specified or indicated on the Contract Drawings.

G. Curing Concrete:

1. Immediately after placing and finishing concrete, protect the concrete from premature drying, excessive hot or cold temperatures, wind, dust storms, and mechanical injury.
2. Cure the concrete by water curing, sheet form curing, or liquid membrane curing compound methods in accordance with ACI 308R.

- a. Cure concrete continuously for a minimum of 7 days at ambient temperatures above 40 degrees Fahrenheit.
 - 1) Cure the concrete during cold weather according to the requirements of ACI 306R.
 - 2) Cure the concrete during hot weather according to the requirements of ACI 305R.
- b. If liquid curing compounds will be used to cure the concrete, complete finishing operations prior to applying the compound; and apply the compound as soon as the free water on the concrete surface disappears and no water sheen is visible.
 - 1) Do not use liquid curing compounds on concrete surfaces which will receive later treatments, such as hardeners, special finishes, protective coatings, dampproofing, waterproofing, future grout, grout fill, or other coatings.
 - 2) Do not use liquid curing compound when the ambient air temperature during placement and for 24 hours after placement is or will fall below 35 degrees Fahrenheit.
 - 3) The surface must be capable of having workers walk on it without marring the surface.
 - 4) Using a high-pressure airless sprayer, apply 2 uniform coats of liquid curing membrane compound following the manufacturer's application recommendations.
 - a) Apply the second coat perpendicular to the first coat.
 - b) Do not apply liquid curing membrane compound to the surfaces of construction joints.
 - c) Protect exposed reinforcement during application of liquid curing membrane compound.
 - d) Water cure those areas not coated with liquid curing membrane compound.
 - e) Where an area has been accidentally coated with curing membrane compound or another special coating, clean this excess coating from the surface by blast cleaning or using another method recommended by the manufacturer of the special coating.
3. Protect the finished surfaces and slabs from hot dry wind and the direct rays of the sun to prevent checking and crazing.

H. Tolerances:

1. Provide concrete surface and finish elevations in accordance with the requirements of ACI 117.
2. Floor Flatness/Levelness Tolerances:
 - a. Measure floor tolerances, both the flatness F-number (F_F) and the levelness F-number (F_L), in accordance with the requirements specified in ASTM E1155.

- 1) Perform floor tolerance tests within 24 hours after concrete placement occurs, and submit the test results to the Program/Project Manager within 72 hours of the testing.
- 2) Levelness F-numbers (F_L) do not apply to un-shored steel framed construction.
 - a) In this case, allowable variations from the top of slab elevations indicated on the Contract Drawings are plus or minus $3/8$ inch.
- b. Overall F Numbers:
 - 1) Overall F_F numbers and F_L numbers represent a test surface defined as the total floor area of 1 building level.
 - 2) Overall F numbers for the floor must conform to the floor classifications defined on the Contract Drawings and in ACI 117.
- c. Local F Numbers:
 - 1) Local F_F numbers and F_L numbers represent a test section within a concrete pour.
 - 2) Each test section may not exceed 2500 square feet in area.
 - 3) Local F number tolerances must at a minimum be $2/3$ of the specified overall F number tolerances.
3. The tolerance of the horizontal distance from the centerline of the guidebeam (PGL) to the edge of the concrete at a station platform is $+1/2''/-0''$.

3.04 REPAIR/RESTORATION

- A. Remove concrete that has been segregated into ingredients during consolidation by vibrator operations, and replace the segregated concrete removed with new concrete.
- B. Repair of Formed Concrete Surfaces:
 1. As soon as the forms have been stripped from the concrete and the concrete surfaces have been exposed, do the following:
 - a. Remove fins and other projections, fill recesses left by the removal of form ties, and repair surface defects which do not impair the structural strength of the concrete.
 - b. Clean all exposed concrete surfaces and adjoining areas stained by the leakage of concrete to the satisfaction of the Program/Project Manager.
 2. Repair tie holes and other small cavities by cleaning out the resulting cavities, wetting the cavity area, and then filling the cavity with a stiff mortar of the same material used in the concrete, but somewhat leaner.
 3. Repair and patch other defective areas with cement mortar of mix proportions and materials identical to those used in the surrounding concrete.
 - a. Produce a finish on the patch indistinguishable from the surrounding concrete.

4. Where honeycomb or voids are not excessive, and repairs are authorized by the Program/Project Manager; saw cut a 1/2 to 3/4 inch deep square outline around the area of defective concrete, and chip out the defective concrete inside the outline to a depth not less than 2-inches until sound solid concrete is encountered.
 - a. If chipping is necessary, make the edges of the depression perpendicular to the concrete surface or slightly undercut to provide a key at the edge of the patch.
 - b. Thoroughly clean, dampen, and brush coat the area to be patched with neat cement grout; and follow this preparation by placing a cement mortar to patch the concrete.
 - 1) Other patching materials may be used if accepted by the Program/Project Manager in writing prior to start of repair work.
 - c. Keep the patch damp for 7 days at a temperature above 50 degrees Fahrenheit.

C. Repair of Unformed Concrete Surfaces:

1. Finished flatwork exceeding the allowable tolerances may be repaired provided the strength or appearance of the flatwork is not adversely affected.
 - a. Remove high spots with a terrazzo grinder.
 - b. Fill in low spots with an approved patching compound.
 - c. Perform other remedial measures as permitted by the Program/Project Manager.
2. Surface defects on unformed surfaces may be repaired provided the strength or appearance of the item is not adversely affected.
 - a. Remove high spots and surface irregularities with a diamond-disk or stone grinder.
 - b. Fill in low spots with an approved patching compound.

D. The Program/Project Manager will determine the extent and manner of actions to be taken to repair defective concrete.

1. Obtain approval from the Program/Project Manager before performing repair work other than removing imperfect texture and filling pin holes and insert holes.
2. Prior to repairing defects, submit proposed materials and repair methods to the Program/Project Manager for approval.

3.05 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. During the period when concrete is being placed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing

- personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
- b. Provide and maintain adequate and separate facilities for safe storage and proper curing of concrete test cylinders on the Work Site for the sole use of the Testing and Inspection Agency and the code-required Approved Agency.
 - c. Strength testing requirements are based on using 6 inch by 12 inch size cylinders.
 - d. Provide containers for transporting concrete test cylinders to the testing laboratory.
 - e. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials or proportions requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - f. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Concrete Slump Test:
- a. Test Procedure:
 - 1) Determine the slump of a concrete sample from each truckload of concrete upon its arrival at the Work Site, and from other concrete whenever the consistency of the concrete appears to vary.
 - 2) Determine the temperature of the concrete sample.
 - 3) Determine the slump according to the requirements of ASTM C 143/C 143M.
 - b. Acceptance Criteria:
 - 1) Refer to Paragraph 2.05.B.
3. Air Content Test:
- a. Test Procedure:
 - 1) Determine the air content of the concrete for each concrete strength test sample in accordance with ASTM C231, ASTM C173/C 73M, or ASTM C138/C138M.
 - b. Acceptance Criteria:
 - 1) The Program/Project Manager will determine acceptability based on the results.
4. Concrete Strength Test for New Concrete:
- a. To evaluate the potential strength and uniformity of new concrete, perform at least 5 strength tests for each specified mix design to represent the mix's strength.
 - b. Test Procedure:
 - 1) Secure composite samples in accordance with ASTM C172.
 - a) Obtain representative test samples from different batches of concrete on a truly random basis by selecting a test batch

- number at random before commencing the placement of concrete.
- b) When pumping or pneumatic equipment is used, obtain samples at the truck and discharge ends.
 - c) Take sufficient test samples to perform not less than 5 strength tests of two 28 day cylinders per test for each concrete mix design.
 - (1) Take samples for each concrete mix design not less than once a day, or not less than once for each 50 cubic yards of concrete, or not less than once for each 3000 square feet of surface area placed.
- 2) Mold at least 5 concrete test cylinders in strict compliance with the requirements of ASTM C31/C31M for each strength test, and cure the cylinders for a 24-hour initial curing period.
- a) Have a responsible representative from the Testing and Inspection Agency observe the making of the concrete test cylinders by the Contractor, and immediately thereafter pack them in a sturdy container furnished by the Contractor and approved by the Testing and Inspection Agency.
 - b) Surround the concrete test cylinders with wet sand or sawdust and protect them from freezing.
 - c) Sequentially number the concrete test cylinders and record the number, the date each cylinder was made, and the results of the slump test, air content, and the temperature for each sample on the proper form; forward the form to the Program/Project Manager, and then transport the cylinders to the testing laboratory where they will be cured in strict compliance with ASTM C31/C31M until the time of the test.
- 3) Each strength test will be conducted in accordance with ASTM C39/C39M as follows:
- a) One 6 inch by 12 inch size concrete cylinder from the same sample will be tested 7 days after the cylinders were made for information.
 - b) An additional two 6 inch by 12 inch size concrete cylinders from the same sample will be tested for acceptance 28 days after the cylinders were made.
 - c) Two 6 inch by 12 inch size concrete cylinders will be put on hold for 56 days and tested only when the running average of three concrete cylinder tests falls below the acceptance criteria.
 - d) The result of the strength test is the average of the compressive strength results for the 2 specimen cylinders tested at 28 days.
 - e) If one concrete test cylinder in a strength test manifests evidence of improper sampling, molding, or testing, it will be

discarded, and the strength of the remaining cylinder will be considered to be the test result; if both specimen cylinders in a test for a single sample show any of the above defects, the entire test for those samples will be discarded.

- c. Acceptance Criteria:
 - 1) The test results for standard molded and cured test cylinders will be evaluated separately for each specified concrete mix design by comparing the test results to the minimum requirements for the Class of concrete as specified in Article 2.02.
 - 2) The strength level of the concrete will be considered satisfactory so long as the average of all sets of 3 consecutive compressive strength test results equal or exceed the specified strength f'_c , and no individual strength test result falls below the specified strength f'_c by more than 500 psi.
- 5. Concrete Strength Test for Concrete in Place:
 - a. The Program/Project Manager will determine locations where the concrete in place is potentially deficient, and where to obtain test cores to least impair the structure's strength.
 - 1) As an aid to evaluate in place concrete strength or for selecting areas to be cored, the Program/Project Manager may permit concrete in place to be tested by impact hammer, sonoscope, or other nondestructive device to determine the relative strengths at various locations in the structure.
 - 2) The preliminary non-destructive tests of concrete in place will not be used as a basis for accepting or rejecting the concrete, rather the core testing will be the basis for accepting or rejecting the in-place concrete.
 - b. Concrete Core Test:
 - 1) Test Procedure:
 - a) The Program/Project Manager will determine the locations in each member or area of concrete in place where the required cores may be obtained.
 - b) At least 3 representative core samples will be taken from each member or area of concrete in place that is considered potentially deficient.
 - (1) Each core sample will be at least 3-inches in diameter.
 - (2) If the concrete in the structure will be dry under service conditions, the cores will be air dried for 7 days before the test at a temperature of 60 to 80 degrees Fahrenheit and a relative humidity of less than 60 percent; the cores will be tested dry.
 - (3) If the concrete in the structure will be more than superficially wet under service conditions, the cores will be tested after moisture conditioning them in accordance with ASTM C42/C42M.

- c) The core samples will be tested in accordance with ASTM C42/C42M.
 - (1) If one or more of the cores shows evidence of having been damaged before the testing, it must be replaced either subsequent to or during its removal from the structure.
 - d) Solidly fill core holes with low slump concrete.
 - 2) Acceptance Criteria:
 - a) Concrete in the area represented by a core test will be considered adequate if the average compressive strength of the cores is equal to at least 85 percent of the specified strength f'_c , and if no single core is less than 75 percent of the specified strength f'_c .
 - b) If the core tests fail to demonstrate concrete strengths adequate for the intended purpose of the member or members in question, or are inconclusive or impractical to obtain, or if structural analysis does not confirm the safety of the structure, load tests may be required.
 - (1) The results will be evaluated in accordance with ACI 318/318R.
6. Inspections:
- a. Concrete Surface Irregularities:
 - 1) Evaluate floor flatness/levelness in accordance with criteria defined in Paragraph 3.03.H, in ASTM E1155, and on the Contract Drawings.
- B. Concrete Acceptance:
- 1. Completed concrete work which meets the specified requirements will be accepted without qualification.
 - 2. Completed concrete work which fails to meet one or more requirements but which has been repaired to be in compliance will be accepted without qualification.
- C. Non-Conforming Work
- 1. Completed concrete work which fails to meet one or more requirements and which cannot be brought into compliance may be accepted or rejected as provided in this Section.
 - a. The Phoenix Sky Harbor International Airport and the Program/Project Manager reserve the right to reject any or all items which do not meet the requirements of the Contract Drawings and Specifications.
 - b. Remove items determined to be non-conforming, and replace the non-conforming items removed with Work that conforms to the specified requirements.
 - 2. Concrete Compressive Strength:
 - a. If concrete fails to meet the minimum specified compressive strength test requirements, the concrete represented by such tests will be

considered questionable and subject to further testing and other requirements as follows:

- 1) Additional curing may be required as directed by the Program/Project Manager.
- 2) Modifications may be required for remaining concrete work, including changes in the concrete mix designs.
- 3) When the strength of the structure is considered potentially deficient by the Phoenix Sky Harbor International Airport and/or the Program/Project Manager, structural analysis and/or additional testing may be required.
 - a) If in the opinion of the Phoenix Sky Harbor International Airport and/or the Program/Project Manager there is cause for concern over the adequacy of the structure regardless of the results of any previous tests, additional tests of the hardened concrete may be required.
 - (1) The additional testing of questionable concrete will be conducted in accordance with the requirements of ASTM C42/C42M, except as noted in Subparagraph 3.05.C.2.a.3.a.2.
 - (2) If the initial test acceptance requirements had been met, the Contractor is not required to bear the costs of such additional tests unless their results confirm that the concrete in place is deficient.
3. Concrete Appearance:
 - a. Repair defects which adversely affect the appearance of the specified finish in concrete exposed to view if possible.
 - 1) If in the opinion of the Program/Project Manager the defect cannot be repaired, the concrete may be accepted or rejected as provided in this Section.
 - 2) Concrete not exposed to view is not subject to rejection for defective appearance.
4. Location of Members:
 - a. Concrete members cast in the wrong location may be rejected if the strength, appearance, or function of the structure is adversely affected; or if the misplaced items interfere with other construction.
5. Dimensional Tolerances:
 - a. Inaccurately formed concrete surfaces which are exposed to view and do not conform to the requirements of ACI 117 may be rejected.
 - 1) Repair, or remove and replace, the section as required.
 - 2) If the outlines of formed concrete surfaces are smaller than required by an amount exceeding the requirements of ACI 117, they will be considered deficient in strength and subject to the provisions of Subparagraph 3.05.C.2.

- 3) If the outlines of formed concrete surfaces are larger than required by an amount exceeding the requirements of ACI 117, they may be rejected.
 - a) The Program/Project Manager may require that the excess material be removed.
 - b) If the excess material is to be removed, do so in a manner that maintains the strength of the section and meets the other applicable requirements of function and appearance.

3.06 CLEANING

- A. At the end of each day, clean and remove waste sandblasting material from the Work area.
- B. After fiber-reinforced concrete has reached its 28-day design strength, burn off the exposed excess fibers.

3.07 ATTACHMENTS

- A. The following attachments are appended to this Section following the "END OF SECTION" marker:
 1. Final Concrete Mix Design Submittal Form.
 2. Test Results Submittal Form.

SECTION 03410

PLANT-PRECAST STRUCTURAL CONCRETE

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for plant manufactured precast concrete products
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 – Sustainable Design Requirements
- C. Abbreviations and Acronyms:
 - 1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users..

1.02 REFERENCE STANDARDS:

- A. American Association of State Highway and Transportation Officials (AASHTO):
 - 1. Standard Specifications for Transportation Materials and Methods of Testing and Sampling:
 - a. AASHTO M 251 - Standard Specification for Plain and Laminated Elastomeric Bridge Bearings.
- B. American Concrete Institute (ACI):
 - 1. ACI 211.1 - Standard Practice for Selecting Proportions for Normal, Heavyweight, and Mass Concrete.
 - 2. ACI 301 - Specifications for Structural Concrete.
 - 3. ACI 318/318R - Building Code Requirements for Structural Concrete and Commentary.
- C. ASTM International (ASTM):
 - 1. ASTM A 36/A 36M, Standard Specification for Carbon Structural Steel.
 - 2. ASTM A 82/A 82M – Standard Specification for Steel Wire, Plain, for Concrete Reinforcement.
 - 3. ASTM A 123/A 123M, Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

4. ASTM A 536 - Standard Specification for Ductile Iron Castings.
5. ASTM A 615/A 615M - Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
6. ASTM A 706/A 706M - Standard Specification for Low-Alloy Steel Deformed and Plain Bars for Concrete Reinforcement.
7. ASTM C 31/C 31M - Standard Practice for Making and Curing Concrete Test Specimens in the Field.
8. ASTM C 33 - Standard Specification for Concrete Aggregates.
9. ASTM C 39/C 39M - Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.
10. ASTM C 109/C 109M - Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in. or [50-mm] Cube Specimens).
11. ASTM C 143/C 143M - Standard Test Method for Slump of Hydraulic-Cement Concrete.
12. ASTM C 150 - Standard Specification for Portland Cement.
13. ASTM C 171 - Standard Specification for Sheet Materials for Curing Concrete.
14. ASTM C 173/C 173M - Standard Test Method for Air Content of Freshly Mixed Concrete by the Volumetric Method.
15. ASTM C 192/C 192M - Standard Practice for Making and Curing Concrete Test Specimens in the Laboratory.
16. ASTM C 231 - Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method.
17. ASTM C 309 - Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete.
18. ASTM C 494/C 494M - Standard Specification for Chemical Admixtures for Concrete.
19. ASTM C 942 - Standard Test Method for Compressive Strength of Grouts for Preplaced-Aggregate Concrete in the Laboratory.
20. ASTM C 1064/C 1064M – Standard Test Method for Temperature of Freshly Mixed Hydraulic-Cement Concrete.
21. ASTM D 412 – Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers—Tension.
22. ASTM D 2240 – Standard Test Method for Rubber Property—Durometer Hardness.
23. ASTM C857 – Standard Practice for Minimum Structural Design Loading for Underground Precast Concrete Utility Structures.
24. ASTM C858 – Standard Specification for Underground Precast Concrete Utility Structures.
25. ASTM C891 – Standard Practice for Installation of Underground Precast Utility Vault Structures
26. ASTM C1037 – Standard Practice for Inspection of Underground Precast Utility Vault Structures.

D. City of Phoenix (COP):

1. Phoenix Building Construction Code and Amendments.

- E. International Code Council (ICC):
 - 1. ICC International Building Code (IBC) as Amended by the City of Phoenix.
- F. Precast/Prestressed Concrete Institute (PCI):
 - 1. PCI Plant Certification Program
 - 2. PCI MNL-116 - Manual for Quality Control for Plants and Production of Structural Precast Concrete Products.
 - 3. PCI MNL-117 - Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products.
 - 4. PCI MNL-135 – Tolerance Manual for Precast and Prestressed Concrete Construction.
- G. Institute for Sustainability Infrastructure (ISI)
 - 1. ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing and inspections performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.
 - a. Provide 10 days notification prior to the time the precast concrete units will be available for plant inspection.
 - 2. Before concrete is to be placed, coordinate work that must support or be embedded in the concrete to allow embedded items to be introduced or furnished before the concrete is placed and not delay the Work.
- B. Sequencing:
 - 1. Sequence the erection of the precast utility vaults to be coordinated with construction of all utilities that attach to the vault.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Precast concrete unit anchorage, lifting inserts, and other devices
 - 2) Mechanical splice sleeves.
 - 3) Splice sleeve grout.
 - 4) Bearing pads.
 - 5) Accessory items.

- b. Shop Drawings:
 - 1) Precast concrete units.
 - c. Certificates:
 - 1) Material certifications.
 - d. Delegated Design Submittals:
 - 1) Precast concrete unit design calculations.
 - 2) Concrete mix design proportions and concrete mix design test data.
 - e. Special Procedure Submittals:
 - 1) Materials and methods proposed for repairing surface defects.
 - f. Qualification Statements:
 - 1) Precast concrete manufacturing plant's quality control procedures, or verification of the plant's current PCI Plant Certification.
- B. Informational Submittals:
- 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Manufacturer's handling methods for the products.
 - 2) Installation instructions for precast concrete unit anchorage, lifting inserts, and other devices.
 - 3) Manufacturer's installation instructions for the precast concrete units.
 - 4) Installation instructions for accessory items.
 - 5) Manufacturer's instructions for mixing, placing, and curing splice sleeve grout.
 - b. Source Quality Control Submittals:
 - 1) Slump test reports.
 - 2) Compressive Strength test reports.
 - 3) Air Content test reports.
 - 2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA 1.3 - Use Recycled Materials
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - b. ENVISION Credit RA 1.4 – Use Regional Materials
 - 1) Submit product data indicating location and distance from Project of material manufacture and point of extraction or harvest for each raw material. Include statement indicating at least 60% of all materials, plants, and soils are sourced within the distances specified: soils (50 mi, 80 km), aggregate (50 mi, 80 km), concrete

(100 mi, 160 km), plants (250 mi, 400 km), and all other materials (500 mi, 800 km).

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Special Inspections:

- a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
- b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.

2. Testing and Inspection Agency:

- a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky harbor International Airport will employ both an independent Testing and Inspection Agency and the City of Phoenix Testing Laboratory.

B. Qualifications:

1. Plant-Precast Structural Concrete Manufacturer's Qualifications:

- a. Experience:
 - 1) Employ an experienced and acceptable precast concrete manufacturer to design and fabricate the precast concrete units.
 - 2) The precast concrete unit manufacturer must maintain a permanent quality control department, or retain an independent testing agency on a continuing basis.
 - a) If an independent testing agency has been retained, the agency must issue a report, signed and sealed by a Professional Engineer licensed in the State of Arizona, detailing the ability of the precast concrete manufacturer to produce quality units consistent with industry standards.
 - 3) Submit documentation showing the precast structural concrete manufacturer has been regularly and continuously engaged in manufacturing structural precast concrete similar to those required under this Contract for at least 5 years.
- b. Plant Certification Requirements:
 - 1) The precast manufacturer must be certified by the PCI Plant Certification Program and must meet the requirements of PCI MNL-116 and/or PCI MNL-117 as applicable.
 - 2) The precast manufacturer must have quality control procedures established in accordance with the PCI Plant Certification

- Program in place prior to and during production of the products for this Contract.
- 3) Submit the plant's quality control procedures demonstrating adherence to the PCI Plant Certification Program or verification of the plant's current PCI Plant Certification, to the Program/Project Manager for approval.
2. Professional Engineer Qualifications:
 - a. Have the precast concrete manufacturer employ a licensed Professional Engineer, registered in the State of Arizona, who has experience performing precast structural concrete calculations to design the standard precast concrete units and prepare Shop Drawings.
- C. Certifications:
1. Material Certifications:
 - a. Submit copies of material certifications and laboratory test reports from the precast concrete manufacturer for the Portland cement, pozzolans, aggregates, admixtures, and curing compound proposed for the Work of this Section.
 - b. For reinforcement steel material, submit certified copies of mill test reports to the Program/Project Manager that, as a minimum, contain the following information for approval:
 - 1) Heat number and identification.
 - 2) Standard chemical analysis for heat of steel.
 - 3) Ultimate tensile strength.
 - 4) Yield stress at 1 percent extension under load.
 - 5) Elongation of failure.
 - 6) Modulus of elasticity.
 - 7) Diameter and net area.
 - 8) Type of material.
- D. Site Samples:
1. If required by the Contract Documents, submit Samples of special concrete finishes and/or Samples of architectural concrete finishes to the Program/Project Manager for approval prior to starting production.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
1. Ensure adequate access to the Site is available to enable hauling, storage, and proper handling of the precast concrete units.
 2. Do not ship precast concrete units that do not meet the specified criteria.
 3. Transport precast concrete units in a manner that minimizes potential damage.

4. The Program/Project Manager will examine each precast concrete unit as it is delivered to the Site for quality and acceptance, and reject unacceptable units.
- B. Storage and Handling Requirements:
 1. Employ lifting methods and devices intended for the purpose as indicated on the approved Shop Drawings.
 - a. Submit manufacturer's information showing acceptable handling methods for the products.
 - b. Lift precast concrete units at points provided by the precast concrete manufacturer using suitable lifting devices.
 - c. Consistent with industry standards, furnish lifting devices having a minimum factor of safety of 4.
 - 1) Furnish reusable lifting hardware and rigging having a minimum factor of safety of 5.
 2. Store and handle precast concrete units in a manner that will minimize potential damage.
 - a. Do not place units directly on the ground.

PART 2 PRODUCTS

2.01 DESCRIPTION:

- A. Regulatory Requirements:
 1. Phoenix Building Construction Code:
 - a. Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments [ICC International Building Code (IBC) as Amended by the City of Phoenix].
 2. Safety Requirements:
 - a. The Contractor is responsible for determining and implementing the procedures for erecting precast concrete members safely and that comply with the applicable regulations of the Federal, State, and local Authorities Having Jurisdiction.
- B. Sustainability Requirements:
 1. Sustainability Requirements:
 - a. Recycled Content
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - 2) For each mix design, provide % of fly ash by weight and the total material value for each mix type used on the project.
 - b. Regional Content

- 1) Submit product data indicating location and distance from Project of material manufacture and point of extraction or harvest for each raw material. Include statement indicating at least 60% of all materials, plants, and soils are sourced within the distances specified: soils (50 mi, 80 km), aggregate (50 mi, 80 km), concrete (100 mi, 160 km), plants (250 mi, 400 km), and all other materials (500 mi, 800 km).

2.02 DESIGN CRITERIA:

A. Concrete Compressive Strength:

1. Provide precast concrete units having a 28-day compressive strength (f'_c) =4000 PSI minimum, as indicated in the Contract Documents.

B. Precast Concrete Units:

1. Have the Professional Engineer employed by the precast concrete manufacturer perform the following tasks:
 - a. Design the precast concrete units to withstand the indicated design load conditions- Highway Rated or Aircraft Rated as specified in the Contract Documents.
 - 1) Consider stresses induced during shipping, handling, and installation in order to avoid product cracking or other handling damage.
 - b. Prepare design calculations for the precast concrete units.
 - 1) Design joints and sealants between adjacent units to meet the specified design and performance requirements.
 - 2) Include the complete analysis for lifting stresses, the sizing of lifting devices, and foundation attachment.
 - c. Determine the concrete mix design proportions.
 - 1) Submit a mix design for each strength and type of concrete to be used.
 - a) Include copies of concrete mix design test reports complying with the requirements of Section 4 in ACI 301 showing the mix has successfully produced concrete with the specified properties, and will be suitable for Contract conditions.
 - b) Provide the quantity, type, and brand of all mix design constituents in the design, and include applicable data sheets for each constituent.
 - d. Prior to fabricating the precast concrete units, prepare Shop Drawings for the precast concrete units showing complete design, installation, and construction information in such detail as to enable the Program/Project Manager to determine the adequacy of the proposed custom-made precast concrete units for the intended purpose.
 - 1) Include the design loads for the precast concrete units on the Shop Drawings.

- 2) Include details showing the size and placement of steel reinforcement.
 - 3) Indicate the type and configuration of joints and sealants between adjacent units.
 - 4) Include plans and elevations showing dimensions, connection details, finishes, openings, cast-in-place items, and the erection sequence.
 - 5) Include design calculations for the precast concrete connection to the foundation system unless otherwise noted.
2. Submit the precast concrete unit Shop Drawings and design calculations, prepared, stamped, and signed by the Professional Engineer, to the Program/Project Manager for approval.

2.03 MATERIALS:

A. Cement:

1. Provide Type I or II cement complying with the requirements of ASTM C 150.
2. For all exposed precast concrete use the same brand, type, and source of cement.

B. Normal Weight Concrete Coarse and Fine Aggregates:

1. Provide aggregates complying with the requirements of ASTM C 33.
2. Do not provide aggregates that contain substances which may be deleteriously reactive with the alkalis in the cement.

C. Admixtures:

1. Accelerating, Retarding, Water-Reducing Admixtures:
 - a. Provide accelerating, retarding, water-reducing (moderate to high) admixtures complying with the requirements of ASTM C 494/C 494M.

D. Water:

1. Provide water clean and free of injurious amounts of oils, acids, alkalis, salts, and other substances deleterious to concrete and concrete reinforcement..

E. Concrete Reinforcement:

1. Reinforcement Bars:
 - a. Deformed Billet-Steel:
 - 1) Provide deformed billet-steel reinforcing bars complying with the requirements for Grade 60 bars as specified in ASTM A 615/A 615M.
 - b. Deformed Low-Alloy Steel:
 - 1) Where welding of reinforcement is required, provide deformed low-alloy steel reinforcing bars complying with the requirements of ASTM A 706/A 706M.

2. Wire:
 - a. Provide plain wire complying with the requirements of ASTM A 82/A 82M.
- F. Inserts and Embedded Metal:
 1. Provide inserts and embedded metal items of the type required for the intended use that comply with the following:
 - a. Provide structural steel plates, angles, and other shapes complying with the requirements of ASTM A 36/A 36M.
 - b. Hot-dip galvanize items in accordance with the requirements of ASTM A 123/A 123M.
 - c. Provide proprietary items in accordance with the manufacturer's published literature.
 2. Mechanical Splice Sleeves:
 - a. Provide mechanical splice sleeves for embedment in precast concrete members that are designed to splice rebar in one precast member to rebar in adjacent members when the rebar in the adjacent member is inserted into the mechanical splice sleeve and injection grouted.
 - 1) Material: Ductile iron complying with the requirements specified in ASTM A 536.
 - 2) Splice Yield Point: Equivalent to a Type 2 connection as specified in ACI 318/318R.
 - 3) Geometry: Frusto-conical shape, equipped with both inlet and outlet grout ports and sleeves, and having an integral internal rebar stop midway along the sleeve.
 - b. Submit Product Data for the mechanical splice sleeves to the Program/Project Manager for approval.
 - c. Manufacturers:
 - 1) Splice Sleeve North America®, www.splicesleeve.com.
 - 2) Approved equal.
- G. Anchorage, Lifting Inserts, and Devices:
 1. For the precast concrete unit anchorage, lifting inserts, and other devices, submit Product Data sheets and proper installation instructions from the precast concrete manufacturer to the Program/Project Manager for approval.
 - a. Clearly indicate precast concrete unit dimensions.
 - b. Clearly indicate safe working loads.
- H. Bearing Pads:
 1. Provide neoprene bearing pads a minimum of 1/8 inch thick, and conforming to the requirements of Section 25 in AASHTO M 251 and the following:
 - a. Hardness (Minimum): Durometer 60 when measured in accordance with the requirements of ASTM D 2240.

- b. Ultimate (Breaking) Elongation: 350 percent when measured in accordance with the requirements of ASTM D 412.

I. Accessory Items:

- 1. For accessory items installed before or after the delivery of the precast concrete units, submit proper installation instructions and relevant Product Data to the Program/Project Manager for approval.

2.04 FABRICATION:

A. Shop Fabrication:

- 1. The precast concrete producer must conform to the requirements of the PCI Quality Control Manual for Precast Concrete Plants.
- 2. Concrete Forms:
 - a. Provide forms for manufacturing precast concrete units of the type and design consistent with industry standards and practices.
 - 1) Provide forms capable of consistently providing uniform products and dimensions.
 - 2) Construct the forms so the forces and vibrations to which the forms will be subjected cause no damage to the precast concrete unit.
 - b. Clean concrete build-up from the forms after each use.
 - c. Apply release agents to the forms according to the manufacturer's recommendations, but do not allow release agent to build-up on the form's casting surfaces.
- 3. Concrete Reinforcement:
 - a. For placing and splicing, conform to ACI 318/318R.
 - b. Provide concrete cover on the reinforcement as shown on the Contract Drawings.
 - c. Fabricate cages of reinforcement by tying the bars into rigid assemblies.
 - d. Position the reinforcing as specified by the design so the concrete cover conforms to the requirements.
 - e. Provide positive means to assure the reinforcement does not move significantly during the casting process.
 - f. Mechanical Splice Sleeve Installation:
 - 1) Insert embedded reinforcement steel bars to be spliced using mechanical splice sleeves into the splice sleeve until it reaches the rebar stop in the center of the splice sleeve.
 - 2) Secure the reinforcement steel bar and mechanical splice sleeve firmly in place using sleeve setters or other means to prevent displacement during concrete placement.
 - g. Do not use metal chairs in the finish face.
- 4. Embedded Items:
 - a. Position embedded items at the locations indicated in the Contract Documents and approved Shop Drawings.

- b. Hold inserts, plates, lifting devices, and other items to be embedded in the precast concrete rigidly in place so they do not move during casting operations.
- 5. Concrete:
 - a. Mixing Concrete:
 - 1) Perform mixing operations so the concrete produced is uniform in strength, consistency, and appearance.
 - b. Placing Concrete:
 - 1) Deposit conventional concrete in the forms as near to the final location as practical.
 - 2) Consolidate concrete so segregation of the concrete and the creation of honeycombed areas are minimized.
 - a) Furnish vibrators for consolidating the concrete having frequencies and amplitudes sufficient to produce well-consolidated concrete.
 - c. Curing Concrete:
 - 1) Commence curing operations immediately following the initial set of the concrete and of surface finishing.
 - 2) Using one of the following methods, prevent moisture from evaporating from exposed surfaces until adequate strength for stripping the precast concrete unit from the forms is reached:
 - a) Cover the concrete with polyethylene sheets using sheets as specified in ASTM C 171, or
 - b) Cover the concrete with burlap or another absorptive material and keep the material moist, or
 - c) Apply a membrane-curing compound as specified in ASTM C 309 at a rate not exceeding 200 square feet per gallon, or in accordance with the manufacturer's recommendations.
- 6. Openings for Utilities:
 - a. Utility Openings including manhole frame at top if needed.
 - 1) Provide all openings required for the utilities as shown in the Contract Documents.
- 7. Stripping Precast Concrete Units from Forms:
 - a. Do not remove precast concrete units from the forms until the concrete reaches the compressive strength required by the design for stripping.
 - b. If no such requirement exists, products may be removed from the forms after the final set of concrete provided stripping does not have an effect on performance or appearance of the final product.
 - 1) Routinely measure the stripping strengths to ensure the product has attained sufficient strength for safe handling.

B. Fabrication Tolerances:

- 1. Provide precast concrete units conforming to the unit tolerances specified in PCI MNL-135.

2.05 MIXES:

- A. Concrete Mix Design:
 - 1. Concrete Proportions:
 - a. Base the selection of concrete proportions on the methodology presented in ACI 211.1 for normal weight concrete.
 - b. Develop concrete proportions using the same type and brand of cement, the same type and gradation of aggregates, and the same type and brand of admixture.
 - c. Do not use accelerators containing calcium chloride in precast concrete containing reinforcing steel or other embedded metal items.
 - 2. Water-Cement Ratio:
 - a. Provide concrete mixes having a water-cement ratio of 0.45 or less.
 - 3. Air Content:
 - a. Provide concrete mixes having a total air content of 5 percent plus or minus 1 percent by volume.
- B. Splice Sleeve Grout:
 - 1. Provide high strength, nonshrink filler mortar specially formulated for Type 2 connections in accordance with the requirements of ACI 318/318R, and having 11,000 psi minimum strength at 28 days.
 - 2. Submit Product Data for the splice sleeve grout to the Program/Project Manager for approval.
 - 3. Submit the splice sleeve grout manufacturer's instructions for mixing, placing, and curing the grout to the Program/Project Manager for information.
 - 4. Manufacturers:
 - a. Splice Sleeve North America, SS Mortar® grout, www.splicesleeve.com.
 - b. BASF, www.buildingsystems.basf.com.
 - c. Approved equal.

2.06 FINISHES:

- A. Shop Finishing Methods:
 - 1. If no finishing procedure is specified, finish concrete surfaces using a strike-off at the level of the top of the form; otherwise finish unformed surfaces of precast concrete products as specified:
 - a. Formed Non-Architectural Surfaces:
 - 1) Cast surfaces against approved forms in accordance with standard industry practices for cleaning forms, designing concrete mixes, placing concrete, and curing concrete.
 - 2) Normal color variations, form joint marks, small surface holes caused by air bubbles, and minor chips and spalls will be accepted.

- 3) Major imperfections, excessive honeycombing, and other major defects are unacceptable.
- b. Unformed Surfaces:
 - 1) Finish unformed surfaces with a vibrating screed, or by hand with a float.
 - 2) Normal color variations, minor indentations, and minor chips and spalls will be accepted.
 - 3) Major imperfections, excessive honeycombing, and other major defects are unacceptable.
- c. Special Finishes:
 - 1) Provide troweled, broom, or other finishes in accordance with the Contract Documents.
 - 2) Perform the finishing in accordance with industry standards or supplier specifications.

2.07 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 - 1. During the period when precast concrete is being placed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing and inspection personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. Provide and maintain adequate and separate facilities for safe storage and proper curing of concrete test cylinders for the sole use of the Testing and Inspection Agency and the code-required Approved Agency.
 - c. Provide containers for transporting concrete test cylinders to the testing laboratory.
 - 2. Tests:
 - a. The precast concrete manufacturer must demonstrate the following quality control tests are performed as required in accordance with the specified ASTM International standards by submitting test reports documenting compliance with the following tests:
 - b. Slump Test:
 - 1) Test Procedure:
 - a) Perform a slump test in accordance with the requirements of ASTM C 143/C 143M either for each 50 cubic yards of concrete produced for each mix design, or once a day, whichever comes first.
 - 2) Acceptance Criteria:
 - a) Slump of up to 4 inches is acceptable unless a high range reducing admixture is used, in which case slump up to 8 inches is acceptable.

- c. Compressive Strength Test:
 - 1) Test Procedure:
 - a) For each mix design, perform a compressive strength test on at least 4 specimens for each 50 cubic yards of concrete produced for each mix design.
 - (1) Test 2 cylinders at 7 days and 2 cylinders at 28 days.
 - b) Perform a compressive strength test in accordance with the requirements of ASTM C 39/C 39M.
 - 2) Acceptance Criteria:
 - a) Mixes having the 28-day compressive strength (f'_c) as specified in Subparagraph 2.03.A.1 are acceptable.
 - d. Air Content Test:
 - 1) Test Procedure:
 - a) Perform an air content test in accordance with the requirements of either ASTM C 231 or ASTM C 173/C 173M for each 50 cubic yards of concrete produced for each mix design, but not less than once a day.
 - 2) Acceptance Criteria:
 - a) Concrete having the air content as specified in for each mix design as specified in Subparagraph 2.05.A.3.a are acceptable.
 - 3. Inspections:
 - a. The Program/Project Manager or Approved Agency may place an Inspector in the precast concrete unit manufacturing plant when the units provided under this Section are being manufactured.
- B. Non-Conforming Work:
- 1. Repairing Minor Defects:
 - a. Products having defects that will not impair the functional use or expected life of a precast concrete unit may be repaired by an approved method that does not impair the product.
 - 1) Formed surfaces relatively free of air voids and honeycombed areas do not require patching and repair unless the surfaces are required to be finished by the design or are exposed to public view.
 - 2) Submit the materials and methods proposed for repairing surface defects to the Program/Project Manager for approval.
 - 2. Repairing Honeycombed Areas:
 - a. Where honeycombed areas are to be repaired, remove all loose material and cut back the areas to essentially horizontal or vertical planes.
 - 1) Cut back the areas to a depth where coarse aggregate particles break under chipping rather than being dislodged.
 - b. Use proprietary repair materials in accordance with the manufacturer's instructions to fill the depression.

- c. If proprietary repair materials are not used, saturate the area with water immediately prior to starting the repair.
 - 1) Make sure the repair area is damp, but free of excessive water.
 - 2) Apply a cement-sand grout or an approved bonding agent to the chipped surfaces, followed immediately by consolidating an appropriate repair material into the cavity.
 - 3. Repairing Major Defects:
 - a. Have qualified personnel evaluate defects in precast concrete products which impair the functional use or the expected life of the products to determine if repairs are feasible, and if so, to establish the repair procedure.
 - 4. Finish Requirements:
 - a. Repair and patching work must comply with finish requirements of the Contract for the item.
 - 1) Colors of repaired and patched work must reasonably match the colors specified for the work and/or surrounding areas.
- C. Coordination of Other Tests and Inspections:
 - 1. Notify the code-required Approved Agency responsible for performing special inspections when concrete for this Contract is being mixed, placed, and/or tested.
 - 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Verify the structure and anchorage inserts for the precast members to be placed are within the allowable tolerances.
- B. Evaluation and Assessment:
 - 1. Notify the Program/Project Manager of out of tolerance anchorage inserts for the precast members.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Erect adequate barricades, warning lights, and/or signs to safeguard traffic in the immediate area of hoisting and handing operations.

3.03 ERECTION

- A. Erect precast concrete units to the lines and grades indicated in the Contract Documents or as otherwise specified.

- B. Fasten the precast concrete units in place in accordance with the approved Shop Drawings.
 - 1. Submit the precast concrete unit manufacturer's installation instructions to the Program/Project Manager for information.
- C. Furnish and maintain temporary bracing in place for the precast concrete units until final support and bracing is provided to maintain position, stability, and alignment.
- D. Special Techniques:
 - 1. Field modifications to the precast concrete units are not allowed unless approved by the precast unit manufacturer and the Program/Project Manager.
 - 2. Mechanical Splice Sleeve Installation:
 - a. Insert the end of rebar to be spliced into the mechanical splice sleeve to the rebar stop in the center of the splice sleeve side of the splice.
 - b. Temporarily brace the erected precast elements prior to injecting splice sleeve grout into the inlet grout sleeve and port.
 - c. Follow the grout manufacturer's instructions for mixing, placing, and curing the grout.
 - 1) Prior to pumping grout into the mechanical splice sleeve, continuously pour grout into the mechanical splice sleeve to eliminate air pockets.
 - a) Visually inspect the pocket to verify the sleeve is filled with grout, and use a wire to stir the grout to remove entrapped air.
 - 2) Inject the grout into the inlet grout sleeve using a low pressure pump, and insure the grout completely fills the space in the mechanical splice sleeve by observing grout flowing freely without air bubbles from the outlet grout sleeve.
 - 3) Following the grouting operation, remove the pump and seal the grout injection point and air release point with rubber stoppers to avoid loss of grout.
- E. Tolerances:
 - 1. Furnish, erect, and interface precast concrete members within the tolerances specified for the applicable element type in PCI MNL-135.

3.04 REPAIR / RESTORATION

- A. The repair of damage occurring to the precast concrete units after installation is the responsibility of the Contractor.
 - 1. Repairs made to exposed surfaces must match the color and texture of the surrounding concrete.

- B. The Contractor is responsible for any chipping, spalling, or other damage to the Work discovered at the Site, unless the damage occurred during storage by others.

3.05 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. During the period when precast concrete is being erected, the Testing and Inspection Agency and the code-required Approved Agency must perform testing and inspections.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing and inspection personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. Cooperate with the Testing and Inspection Agency and code-required Approved Agency to facilitate their testing and inspections.
 - c. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Splice Sleeve Grout Test:
 - a. Test Procedure:
 - 1) Prior to approving each batch of splice sleeve grout for use, four 2-inch cube specimens of grout from the batch must first be sampled, fabricated, stored, and cured in accordance with the requirements specified in ASTM C 109/C 109M and ASTM C 942.
 - 2) In accordance with the requirements specified in ASTM C 109/C 109M and ASTM C 942, the compressive strength of the grout will be determined by testing one cube specimen at 7 days, two cube specimens at 28 days, and one cube specimen at 56 days, if required.
 - b. Acceptance Criteria:
 - 1) Grout having a minimum compressive strength equal to the strength specified in Subparagraph 2.05.B.1.c is acceptable.
3. Inspections:
 - a. Observe the lines and grades of installed units to verify they are correct.

B. Non-Conforming Work:

1. Notify the precast concrete erector of observed discrepancies between the lines and grades of installed units and those indicated in the Contract Documents so corrective action can be taken.

3.06 CLEANING

- A. Clean soiled precast concrete surfaces, taking care to prevent damage to the surfaces and surrounding materials.

3.07 PROTECTION

- A. Immediately after the precast concrete units are erected, protect the units from damage.

END OF SECTION

SECTION 03434

PRESTRESSED CONCRETE U-BEAMS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Requirements for prestressed concrete U-beams, including providing the precast concrete beams; furnishing, placing, and tensioning prestressing steel; and pressure grouting the ducts enclosing the prestressing steel, in accordance with the details shown on the Contract Drawings.
 - a. Prestress the precast concrete members using the pretensioning method.
2. Requirements for furnishing and installing additional items required by the particular prestressing system used.
 - a. Such items as ducts, anchorage assemblies, and grout used for pressure grouting the ducts for post-tensioning systems as required and specified in Section 03250, Post-Tensioning; and strand deflection devices such as hold-downs and hold-ups for pretensioning systems are examples.

B. Related Requirements:

1. Section 01330 - Submittal Procedures.
2. Section 03200 - Reinforcing Steel.
3. Section 03300 - Cast-In-Place Concrete.
4. Section 03410 - Plant-Precast Structural Concrete.

1.02 REFERENCES

A. Definitions:

1. Basic Anchorage Device: A prestressing tendon anchorage device that meets the restricted bearing compressive strength limits and minimum plate stiffness requirements specified in Article 9.7.2, Bridges Composed of Simple-Span Precast Prestressed Girders Made Continuous, appearing in Division I, Design, of the AASHTO Standard Specifications for Highway Bridges.
2. Special Anchorage Device: A prestressing tendon anchorage device that must be proven experimentally by meeting the acceptance criteria for the standardized acceptance test specified in Article 10.3.2.3, Special Anchorage Device Acceptance Test, appearing in Division II, Construction, of the AASHTO Standard Specifications for Highway Bridges.

B. Reference Standards:

1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO Standard Specifications for Highway Bridges.
 - b. AASHTO Standard Specifications for Transportation Materials and Methods of Sampling and Testing.
 - 1) AASHTO M 194M/M 194 - Standard Specification for Chemical Admixtures for Concrete.
 - 2) AASHTO M 203M/M 203 – Standard Specification for Steel Strand, Uncoated Seven-Wire for Concrete Reinforcement.
 - 3) AASHTO M 204M/M 204 – Standard Specification for Uncoated Stress-Relieved Steel Wire for Prestressed Concrete.
 - 4) AASHTO M 275M/M 275 - Standard Specification for Uncoated High-Strength Steel Bar for Prestressing Concrete.
2. American Concrete Institute (ACI):
 - a. ACI 318/318R - Building Code Requirements for Structural Concrete and Commentary.
3. ASTM International (ASTM):
 - a. ASTM A 416/A 416M – Standard Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete.
 - b. ASTM A 421/A 421M – Standard Specification for Uncoated Stress-Relieved Steel Wire for Prestressed Concrete.
 - c. ASTM A 722/A 722M – Standard Specification for Uncoated High-Strength Steel Bars for Prestressing Concrete.
 - d. ASTM C 31/C 31M - Standard Practice for Making and Curing Concrete Test Specimens in the Field.
 - e. ASTM C 39/C 39M - Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.
 - f. ASTM C 150 - Standard Specification for Portland Cement.
 - g. ASTM C 172 - Standard Practice for Sampling Freshly Mixed Concrete.
 - h. ASTM C 494/CA 494M – Standard Specification for Chemical Admixtures for Concrete.

C. Precast/Prestressed Concrete Institute (PCI):

1. PCI MNL-135 – Tolerance Manual for Precast and Prestressed Concrete Construction.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate with the Program Manager and the Phoenix Sky Harbor International Airport to insure that notification is received by them sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.

- a. Provide 10 days notification prior to the time the precast concrete units will be available for plant inspection.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Construction Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Precast concrete unit anchorage.
 - 2) Precast concrete unit lifting inserts.
 - 3) Other Precast concrete unit devices.
 - 4) Precast concrete unit accessory items.
 - b. Shop Drawings:
 - 1) Shop Drawings of the proposed prestressed precast concrete U-beams.
 - c. Certificates:
 - 1) Certificate of Analysis for the Portland cement used in the grout mix.
 - 2) Calibration certifications for the jacking system.
 - d. Delegated Design Submittals:
 - 1) Design calculations for the proposed prestressed precast concrete U-beams.
 - 2) Graph for the jacking system showing the gauge pressure and force plotted for the tensioning calibration range.
 - e. Qualification Statements:
 - 1) Professional Engineer's qualifications.

B. Informational Submittals:

1. Submit the following to the Construction Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Concrete mix designs, and concrete mix design test data.
 - b. Manufacturer's Instructions:
 - 1) Manufacturer's handling methods for the products.
 - 2) Installation instructions for the precast concrete units.
 - 3) Installation instructions for precast concrete unit anchorage
 - 4) Installation instructions for precast concrete unit lifting inserts.
 - 5) Installation instructions for other precast concrete unit devices.
 - 6) Installation instructions for precast concrete unit accessory items.
 - c. Site Quality Control Submittals:
 - 1) Force/elongation records of the tensioning process.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
- B. Qualifications:
 - 1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency having the qualifications specified in Section 01400, Quality Requirements.
 - 2. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky harbor International Airport will employ an independent Testing and Inspection Agency having the qualifications specified in Section 01400, Quality Requirements
 - 3. Professional Engineer Qualifications:
 - a. Have the precast concrete manufacturer employ a licensed Professional Engineer, registered in the State of Arizona, who has experience performing structural concrete calculations for prestressed precast concrete to design the precast concrete U-beams and appurtenances and to prepare the required Shop Drawings.
 - b. Submit the Professional Engineer's qualifications to the Program Manager for approval.
- C. Certificates:
 - 1. Portland Cement:
 - a. Submit a Certificate of Analysis for the Portland cement used in the grout mix.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Do not ship precast concrete units if damage impairing the performance of the product could result.
 - 2. Transport precast concrete units in a manner that will minimize potential damage.
 - 3. Deliver precast concrete units to the Site in accordance with the approved delivery schedule to avoid excessive build-up of units in the storage area at the Site.

4. The Inspector will inspect each precast concrete unit as it is delivered to the Site for quality and acceptance.
5. All prestressing steel, anchorage assemblies, and bar couplers without proper lot numbers found at the Site will be rejected.

B. Storage and Handling Requirements:

1. Employ lifting methods and devices intended for the purpose as indicated on the approved Shop Drawings.
 - a. Submit manufacturer's information that shows acceptable handling methods for the products.
 - b. Lift precast concrete units at points provided by the precast concrete manufacturer using suitable lifting devices.
 - c. Consistent with industry standards, furnish lifting devices having a minimum factor of safety of 4.
 - 1) Furnish reusable lifting hardware and rigging having a minimum factor of safety of 5.
2. Store and handle precast concrete units and materials in a manner that will minimize potential damage.
 - a. Do not place precast concrete units directly on the ground.
 - b. Store Portland cement so it is protected from dampness.
 - 1) Do not use cement which has become partially set or which contains caked lumps.
3. Prohibitions:
 - a. Do not perform any welding near the prestressing steel or ducts unless it is indicated on the Contract Drawings, or directed by the Program Manager.
 - b. Do not locate a welding ground near the prestressing steel or ducts.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Hot Weather Grouting:
 - a. If during grouting operations hot weather conditions could contribute to too quick stiffening of the grout, prevent blockages during grout pumping operations by cooling the grout using approved methods.
 - b. To increase grout pumping efficiency and/or set time, the inclusion approved chemical admixtures in the grout is allowed.
2. Cold Weather Grouting:
 - a. If during and following grouting operations freezing weather conditions could prevail, provide adequate means to protect the grout in the ducts from damage caused by freezing.

PART 2 PRODUCTS

2.01 MANUFACTURED UNITS

A. Description:

1. Prestressed concrete U-beams consist of precast concrete structural members that have prestressing steel enclosed in pressure grouted ducts embedded in the beams or non-enclosed strands embedded in the beams as indicated on the Contract Drawings.
2. Additional components of the prestressed concrete U-beams required by the particular prestressing system and, if required, shop post-tensioning system used include anchorage assemblies and strand deflection devices such as hold-downs and hold-ups for the pretensioning systems.
3. Precast Concrete U-Beams:
 - a. Have the manufacturer's Professional Engineer perform the following tasks:
 - 1) Design precast concrete units as indicated in the Contract Documents and capable of withstanding the indicated design load conditions.
 - a) Prepare design calculations for the proposed precast concrete beams.
 - (1) Indicate the tensioning of the strands.
 - (2) Indicate the elongation of the strands at the time of jacking.
 - (3) During the design of the precast concrete U-Beams, consider the stresses induced during shipping, handling, and installation in order to avoid product cracking or handling damage.
 - (a) Include a complete analysis of lifting stresses, the sizing of lifting devices, and foundation attachment.
 - (b) Clearly indicate safe working loads.
 - b) Design joints and sealants between adjacent units to meet the specified design and performance requirements.
 - 2) Determine the concrete mix design proportions.
 - a) Submit a mix design for each strength and type of concrete that will be used.
 - (1) Include the mix's 28-day compressive strength, air content, and slump.
 - (2) Provide the quantity, type, and brand of all mix design constituents in the design, and include applicable Product Data for each constituent.
 - (3) Include copies of supporting concrete mix design test reports showing the mix has successfully produced concrete with the specified properties, and will be suitable for Contract conditions.

- 3) Prior to releasing the precast concrete beam design for fabrication, have the manufacturer's Professional Engineer prepare, seal, sign, and submit Shop Drawings, design calculations, and manufacturer's installation instructions for the proposed precast concrete beams to the Program Manager for approval.
 - a) Show complete design, installation, and construction information in sufficient detail to enable the Program Manager to determine whether or not the beams conform to the original design intent.
 - b) Indicate the type, size, number, and properties of the strands.
 - c) Indicate the sizes, shapes, dimensions, placement, and concrete cover of steel reinforcement.
 - (1) Include reinforcing steel required to be relocated or added to existing structures.
 - d) Show the locations and the harping points of the strands, and identify the type of finish or surface condition on the top of the precast U-beams.
 - e) Show the method and procedure for jacking the strands.
 - f) Indicate the type and configuration of joints and sealants between adjacent units.
 - g) Indicate the design loads for the precast concrete units.
 - h) Show precast concrete U-Beam dimensions, connection details, openings, and the erection sequence.
 - i) Include composite scale drawings with plan, elevation, and section views that show the relative positions of all embedded items and their embedment depths for both the prestressed elements and the other Work that is associated with these elements.
 - (1) Embedded items include the prestressing ducts, vents, anchorage reinforcement and hardware, reinforcing steel, anchor bolts, earthquake restrainers, deck joint assemblies, drainage systems, utility conduits, and other similar items.
 - j) Include details of supplemental steel that remains as part of finished product.
4. Anchorage Devices:
 - a. Provide either basic or special anchorage devices designed to satisfy the anchor efficiency requirements of Article 10.3.2, Post-Tensioning Anchorages and Couplers, as specified in Division II, Construction, of the AASHTO Standard Specifications for Highway Bridges.
 - 1) The anchor efficiency test specified must be performed by an approved independent testing and inspection agency acceptable to the Program Manager.
 - b. Basic Anchorage Devices:

- 1) If basic anchorage devices are provided, design the anchorage device and determine the required strength of the concrete in which it is to be embedded.
- c. Special Anchorage Devices:
 - 1) If special anchorage devices are provided, they must satisfy the acceptance test requirements of both Articles 9.21.7.3, Special Anchorage Devices, appearing in Division I, and 10.3.2.3, Special Anchorage Device Acceptance Test, appearing in Division II, Construction, of the AASHTO Standard Specifications for Highway Bridges.
 - a) The special anchorage device acceptance test must be performed by an approved independent testing and inspection agency acceptable to the Program Manager.
 - (1) Submit test records of the special anchorage device acceptance test to the Program Manager for approval.
 - d. Submit Product Data sheets and proper installation instructions for the precast concrete U-Beam anchorage, lifting inserts, and other devices to the Program Manager for approval.
5. Accessory Items:
 - a. Submit Product Data sheets and proper installation instructions for the accessory items, installed before or after delivery of the precast concrete units, to the Program Manager for approval.
- B. Design Criteria:
 1. Precast Concrete:
 - a. Concrete Compressive Strength
 - 1) Provide precast concrete units having a 28-day compressive strength (f'_c) as noted on the Contract Drawings.
 - b. Provide the auxiliary and confining reinforcement, minimum edge distance, minimum anchor spacing, and minimum concrete strength at the time of stressing as indicated in the Contract Documents.
 - c. Provide precast concrete units conforming to the unit tolerances specified in PCI MNL-135 for the element, erection, and interfacing.
 2. Stresses in the Prestressing Steel:
 - a. Unless otherwise indicated in the Contract Documents, stresses in the prestressing steel may not exceed those specified in the AASHTO Standard Specifications for Highway Bridges.
 - 1) Consider the working force to be the force remaining in the prestressing steel after all losses, including creep and shrinkage of concrete, elastic compression of concrete, losses in prestressing steel due to sequence of stressing, friction, and all other losses peculiar to the method or system of prestressing, have taken place or have been provided for.
- C. Materials:
 1. Anchorage Devices:

- a. Provide either basic or special anchorage devices as indicated in the Contract Documents.
- b. Provide anchoring devices capable of holding the prestressing strands with a minimum of differential slippage.
2. Ducts:
 - a. Provide duct enclosures for post-tensioning steel fabricated from rigid galvanized ferrous metal, and that have sufficient strength to maintain their correct alignment during the placing of concrete.
 - b. Fabricate Ducts with either welded or interlocked seams.
 - 1) Seams and transition couplings connecting ducts to anchoring devices do not need to be galvanized.
 - 2) Provide positive metallic connections at joints between sections of duct that do not result in angle changes at joints.
 - 3) Tape all connections using waterproof tape.
 - c. Provide ducts and/or anchorage assemblies with pipes or other suitable connections that will allow grout to be injected into the duct after prestressing operations are completed.
3. Portland Cement Concrete:
 - a. Provide Portland cement concrete complying with the requirements specified in Section 03300, Cast-In-Place Concrete, for the class indicated in the Contract Documents.
4. Prestressing Steel:
 - a. Provide prestressing steel that complies with the requirements of AASHTO M 204M/M 204.
 - 1) Provide high-tensile steel wire, high-tensile seven-wire strand, or high-tensile alloy bars as indicated on the Contract Drawings.
 - a) High-tensile steel wire:
 - (1) Provide high-tensile steel wire complying with the requirements specified in AASHTO M 204M/M 204 (ASTM A 421/A 421M).
 - b) High -tensile seven-wire strand:
 - (1) Provide high-tensile seven-wire strand complying with the requirements for Grade 270 specified in AASHTO M 203M/M 203 (ASTM A 416/A 416M).
 - (2) In addition to the 0.5 inch diameter prestressing steel shown on the Contract Drawings, 0.6 inch diameter seven-wire strand may be used for cast-in-place structures.
 - c) High -tensile alloy bars:
 - (1) Provide high-tensile alloy bars complying with the requirements specified in AASHTO M 275M/M 275 (ASTM A 416/A 416M).
 5. Reinforcing Steel:
 - a. Provide reinforcing steel that complies with the requirements of Section 03200, Reinforcing Steel.

6. Debonding Material (Sheathing):
 - a. Provide debonding material consisting of tubular, non-slit, high-density plastic sheathing with a minimum wall thickness of 0.025 inch, and an inside diameter exceeding the maximum outside diameter of the pretensioning strand by 0.025 inch to 0.14 inch.
 - b. Provide debonding material which does not react with concrete, coating, or steel; and will prevent the intrusion of water or cement paste during concrete placement.

D. Shop Fabrication:

1. Jacking Equipment:
 - a. Furnish hydraulic jacks equipped with either a pressure gauge or load cell capable of determining the jacking force of the jack.
 - 1) Use either single strand or multiple strand jacks to tension the prestressed members.
 - 2) Calibrate both the jack and its gauge as a unit, and furnish a certified calibration chart for each unit.
 - a) Submit the latest calibration certifications for the jacking system to the Program Manager with the design calculations for information.
 - b) Calibration certifications for the jacking system older than 6 months are unacceptable.
 - 3) Furnish pressure gauges having either a 6-inch diameter reading dial or a digital display indicator.
 - a) Visibility: Readable by a person with normal vision at a distance of 10 feet.
 - b) Gauge Load Accuracy: Within one percent of the load throughout the entire range of the gauge.
 - c) Reading Dial Increments: No more than 2 percent of the jacking force.
 - b. Submit a graph showing the gauge pressure in pounds per square inch and force in thousands of pounds for the jacking system plotted through the entire range of the tensioning calibration.
2. Strand Splicing:
 - a. Splicing of strands is permitted, but splicing is not allowed within a member.
 - b. Only one splice per strand is allowed.
 - c. Strands to be spliced must have the same lay or direction of twist.
3. Stringing Prestressing Steel:
 - a. Limit the rotation of each strand to one revolution per 100 feet of exposed strand.
 - b. Do not incorporate the lengths of strand having points that have been previously gripped in anchoring devices within the following lengths of strand being strung.
4. Tensioning Prestressing Steel:

- a. At the time of its installation and tensioning, satisfactorily protect the prestressing steel from damage by abrasion, moisture, rust, or corrosion; and make sure the prestressing steel is free of dirt, rust, oil, grease, and other deleterious substances.
- b. Using hydraulic jacks, tension the prestressing steel so that the force in the prestressing steel is not less than the value shown on the Contract Drawings.
 - 1) Conduct the tensioning process so that the force applied to the prestressing steel and the elongation of the prestressing steel will be measured at all times during the process.
 - a) Keep a record of the prestressing force applied and the associated elongations measured during the entire tensioning process.
 - b) Submit the force/elongation records of the tensioning process to the Program Manager for information.
 - 2) Apply the jacking force to the prestressing steel in 2 increments:
 - a) Apply an initial force to the strands to straighten them, eliminate slack, and provide a starting reference point for measuring elongation.
 - b) Then apply the pretensioning force, and measure the elongation.
 - c) Compare the actual elongation measured during application of the calibrated jacking force to the theoretical calculated elongation.
 - (1) If the actual measured elongation differs from the theoretical calculated elongation by more than 5 percent, do not proceed with the tensioning until the tensioning procedure is checked and the source of the error is determined and corrected.
5. Precast the concrete for the prestressed concrete U-beams in accordance with the requirements of Section 03410, Plant-Precast Structural Concrete, except use the materials and additional procedures specified in this Section.
 - a. Do not transfer the tensioning force in the pretensioned strands to the precast member until the concrete strength, determined by performing concrete strength test on concrete specimens made and cured under the same conditions as the precast member, has attained the compressive release strength required.
 - 1) The tests will be performed by the Testing and Inspection Agency and/or the code-required Approved Agency.
 - 2) The transfer of the tensioning force in the pretensioned strands to the precast member is considered the end of the curing period.
 - b. If the concrete has not been placed within 72 hours of the tensioning of the prestressing strands, re-tension the strands prior to placing the concrete.

- c. If so ordered by the Program Manager, no more than 3 hours prior to placing the concrete for the member those prestressing strands that were individually tensioned may be checked for loss of force.
 - 1) Re-tension all strands showing a loss of prestress greater than 3 percent to the original jacking force.
- 6. Detension the strands following the curing period by releasing the strands from one or both ends of the casting bed depending on which method will produce the least movement of members in the casting bed and the least horizontal eccentricity of the initial prestressing force in the member.
 - a. If the concrete has been heat-cured, detension the strands immediately following the curing period.
- 7. Cut off all projecting strands that are not scheduled to remain for future embedment.
 - a. Cut and bend the strands scheduled to remain to the dimensions shown on the Contract Drawings.
 - b. If the end of the prestressed concrete U-beam will not be embedded in cast-in-place concrete, cut all strands or grind them flush with the surface of the concrete; and thoroughly coat them with a bitumastic type sealant.
- 8. Debonded Strands
 - a. Extend debonding material for debonded prestressing steel through the header.
 - b. Tie and tape the debonding material at the terminus inside the member.
 - c. Within 48 hours of detensioning the steel, seal the openings between the strand and the sheathing for the debonded strands with a 100 percent silicone sealant.
 - d. Do not use strands debonded over the full length of the U-beam.
- 9. Clean concrete laitance and other foreign matter from exposed uncoated reinforcing bars and strand.
 - a. If concrete laitance has hardened and other foreign matter remains on the bars, use abrasive blast methods to clean the bars.
 - b. On exposed epoxy-coated reinforcing steel, limit cleaning methods to those that do not damage the coating.
 - 1) Complete cleaning these bars while the concrete laitance is still plastic.
 - 2) Repair damage to the epoxy coating to the satisfaction of the Program Manager.

E. Mixes:

- 1. Grout Mix:
 - a. Provide cement grout consisting of no more than 5 gallons of water to one 94-pound bag of Portland cement.
 - 1) Portland Cement:
 - a) Provide Portland cement complying with the requirements for Type II specified in ASTM C 150.

- b) The cement may not contain more than 0.60 percent total alkali, which consists of the sum of sodium oxide and potassium oxide calculated as sodium oxide.
- c) Do not intermingle or use cement of different brands or types in the same batch.
- 2) Water:
 - a) Provide water free from injurious amounts of oil, acid, alkali, clay, vegetable matter, silt, and other harmful matter.
 - b) Do not use water containing more than 1000 ppm of Chlorides as Cl, or of sulphates as SO₄.
- b. Including a chemical admixture that complies with the requirements of AASHTO M 194M/M 194 (ASTM C 494/CA 494M) and is approved by the Program Manager in the grout is allowed.
 - 1) Do not use admixtures containing chlorides or nitrates.

F. Finishes:

- 1. Shop Finishing Methods:
 - a. Finish and patch the precast concrete surfaces as indicated on the Contract Drawings and specified in Section 03300, Cast-In-Place Concrete.
 - 1) After patching surfaces exposed to view, apply a rubbed finish, and use a mortar "lather" matching the color of the surrounding surface to produce a thin film on the surface.
 - 2) Once light dust appears, brush or sack the surface in one direction to produce a uniform texture and color.
 - b. Unless otherwise shown on the Contract Drawings, roughen the top surface of the prestressed concrete U-beams using a hand tine rake while the concrete is still plastic.

2.02 SOURCE QUALITY CONTROL

A. Tests and Inspections:

- 1. During the period when concrete is being placed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. Provide and maintain adequate and separate facilities for safe storage and proper curing of concrete test cylinders on the Site for the sole use of the Testing and Inspection Agency and the code-required Approved Agency.
 - c. Provide containers for transporting concrete test cylinders to the testing laboratory.

- d. The Testing and Inspection Agency and the code-required Approved Agency must perform additional materials testing due to changes in materials or proportions requested by the Contractor or testing required by failure of material to meet specified requirements.
 - e. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Concrete Strength Test:
- a. To evaluate the potential strength and uniformity of the precast concrete, at least 5 strength tests will be performed for each prestressed concrete U-beam to represent the beam's strength.
 - b. Test Procedure:
 - 1) Composite samples will be secured in accordance with ASTM C 172.
 - a) Representative test samples will be obtained from different batches of concrete on a truly random basis by selecting a test batch number at random before commencing the placement of concrete.
 - b) When pumping or pneumatic equipment is used, samples will be obtained at the truck and discharge ends.
 - c) Sufficient test samples to perform not less than 5 strength tests of two 28-day cylinders per test will be taken for each concrete mix design.
 - (1) Samples for each concrete mix design will be taken not less than once a day, or not less than once for each 100 cubic yards of concrete placed.
 - 2) At least 4 concrete test cylinders will be molded in strict compliance with the requirements of ASTM C 31/C 31M for each strength test, and the cylinders will be cured for a 24-hour initial curing period.
 - a) A responsible representative from the Quality Assurance Testing and Inspection Agency will make the concrete test cylinders, and immediately thereafter pack them in a sturdy container furnished by the Contractor and approved by the Quality Assurance Testing and Inspection Agency.
 - b) Surround the concrete test cylinders with wet sand or sawdust and protect them from freezing.
 - c) The concrete test cylinders will be sequentially numbered and the number, the date each cylinder was made, and the results of the slump test and the temperature for each sample on the will be recorded on the proper form, and the concrete test cylinders will be transported to the testing laboratory where

they will be cured in strict compliance with ASTM C 31/C 31M until the time of the test.

- 3) Each strength test will be performed in accordance with ASTM C 39/C 39M as follows:
 - a) 2 concrete test cylinders from the same sample will be tested 7 days after the cylinders were made for information.
 - b) 2 additional concrete test cylinders from the same sample will be tested 28 days after the cylinders were made for acceptance.
 - c) The compressive strengths of the two specimen cylinders tested at 28 days will be averaged.
 - d) If one concrete test cylinder in a strength test manifests evidence of improper sampling, molding, or testing, it will be discarded and the strength of the remaining cylinder will be considered to be the test result; if both specimen cylinders in a test for a single sample show any of the above defects, the entire test for that sample will be discarded.
- c. Acceptance Criteria:
 - 1) The test results for standard molded and cured test cylinders will be evaluated separately for each prestressed concrete U-beam by comparing the test results to the minimum requirements for the Class of concrete as specified.
 - 2) The strength level of the concrete will be considered satisfactory so long as the average of all sets of 3 consecutive compressive strength test results equal or exceed the specified strength f'_c , and no individual strength test result falls below the specified strength f'_c by more than 500 psi.
3. Inspections:
 - a. Record and submit force/elongation records of the tensioning process to the Program Manager for information.
 - b. The Program Manager may verify the accuracy of the certified calibration charts for the jacking equipment using its own load cells.
 - 1) If the certified calibration for the jacking equipment is found to be in error, immediately discontinue tensioning operations being performed by that equipment until a new certified calibration chart is produced.
- B. Non-Conforming Work:
 1. Repairing Minor Defects:
 - a. Products having defects that will not impair the functional use or expected life of a precast concrete beam may be repaired by any method that does not impair the product.
 2. Repairing Honeycombed Areas:
 - a. Where honeycombed areas are to be repaired, remove all loose material and cut back the areas to essentially horizontal or vertical planes.

- 1) Cut back the areas to a depth where at which coarse aggregate particles break under chipping rather than being dislodged.
 - b. Use proprietary repair materials in accordance with the manufacturer's instructions to fill the depression.
 - c. If proprietary repair materials are not used, saturate the area with water immediately prior to starting the repair.
 - 1) Make sure the repair area is damp, but free of excessive water.
 - 2) Apply a cement-sand grout or an approved bonding agent to the chipped surfaces, followed immediately by consolidating an appropriate repair material into the cavity.
 3. Repairing Major Defects:
 - a. Have qualified personnel evaluate defects in precast concrete products which impair the functional use or the expected life of the products to determine if repairs are feasible, and if so, to establish the repair procedure.
- C. Coordination of Other Tests and Inspections:
1. Notify the code-required Approved Agency responsible for performing special inspections when concrete for this Contract is being mixed, placed, and/or tested.
 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
1. Make sure that adequate access to the Site to enable hauling, storage, and proper handling of the precast concrete beams has been provided.
 2. Erect adequate barricades, warning lights, and/or signs to safeguard traffic in the immediate area of hoisting and handing operations.

3.02 INSTALLATION

- A. Install precast concrete beams to the lines and grades indicated on the Contract Documents or as otherwise specified.
- B. Set the precast concrete beams in place in accordance with the approved Shop Drawings.
1. Submit the precast concrete beam installation instructions to the Program Manager for information.
- C. Furnish and maintain temporary bracing in place for the precast concrete beams as required for structural stability until final support is provided.

- D. Special Techniques:
 - 1. Field modifications to the precast concrete beams are not allowed unless approved by the Program Manager.
 - 2. Painting:
 - a. Paint the exposed surfaces of the precast concrete U-beams that will not receive additional concrete in accordance with the requirements specified in Section 03300, Cast-In-Place Concrete.
- E. Tolerances:
 - 1. Furnish, erect, and interface the precast concrete members within the tolerances specified for the applicable element type in PCI MNL-135.

3.03 REPAIR / RESTORATION

- A. The repair of damage occurring to the precast concrete beams after installation is the responsibility of the Contractor.
- B. The Contractor is responsible for any chipping, spalling, or other damage to the Work discovered at the Site, unless the damage occurred during storage by others.

3.04 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 - 1. During the period when precast concrete is being erected, the Testing and Inspection Agency and the code-required Approved Agency must perform testing and inspections.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing and inspection personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. Cooperate with the Testing and Inspection Agency and code-required Approved Agency to facilitate their testing and inspections.
 - c. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
 - 2. Special Anchorage Device Acceptance Test:
 - a. Test Procedure:
 - 1) The test will be performed on special anchorage devices as specified in Article 10.3.2.3, Special Anchorage Device Acceptance Test, appearing in Division II, Construction, of the AASHTO Standard Specifications for Highway Bridges.
 - b. Acceptance Criteria:

- 1) Special anchorage devices complying with the criteria specified in Article 10.3.2.3, Special Anchorage Device Acceptance Test, appearing in Division II, Construction, of the AASHTO Standard Specifications for Highway Bridges will be acceptable.
3. Inspections:
 - a. The installation of the prestressed concrete U-beams will be periodically observed to verify the beams are installed in accordance with "Chapter 16 - Precast Concrete" in ACI 318/318R.
- B. Non-Conforming Work
 1. Notify the prestressed concrete U-beam erector of observed discrepancies between the installation of the beams and the installation indicated in the Contract Documents so corrective action can be taken.

3.05 PROTECTION

- A. Immediately after the precast concrete beams are erected, protect the units from damage.

SECTION 03435

PRESTRESSED CONCRETE BEAMS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for prestressed concrete beams, including providing the precast concrete beams; furnishing, placing, and tensioning prestressing steel in accordance with the details shown on the Contract Drawings.
 - a. Prestress the precast concrete members using the pretensioning method.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 – Sustainable Design Requirements
 - 3. Section 03200 - Reinforcing Steel.
 - 4. Section 03300 - Cast-In-Place Concrete.
 - 5. Section 03410 - Plant-Precast Structural Concrete.

1.02 REFERENCES

- A. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO Standard Specifications for Highway Bridges.
 - b. AASHTO Standard Specifications for Transportation Materials and Methods of Sampling and Testing.
 - 1) AASHTO M 194M/M 194 - Standard Specification for Chemical Admixtures for Concrete.
 - 2) AASHTO M 203M/M 203 – Standard Specification for Steel Strand, Uncoated Seven-Wire for Concrete Reinforcement.
 - 3) AASHTO M 204M/M 204 – Standard Specification for Uncoated Stress-Relieved Steel Wire for Prestressed Concrete.
 - 4) AASHTO M 275M/M 275 - Standard Specification for Uncoated High-Strength Steel Bar for Prestressing Concrete.
 - 2. American Concrete Institute (ACI):
 - a. ACI 318/318R - Building Code Requirements for Structural Concrete and Commentary.
 - 3. ASTM International (ASTM):
 - a. ASTM A 416/A 416M – Standard Specification for Steel Strand, Uncoated Seven-Wire for Prestressed Concrete.
 - b. ASTM A 421/A 421M – Standard Specification for Uncoated Stress-Relieved Steel Wire for Prestressed Concrete.

- c. ASTM A 722/A 722M – Standard Specification for Uncoated High-Strength Steel Bars for Prestressing Concrete.
- d. ASTM C 31/C 31M - Standard Practice for Making and Curing Concrete Test Specimens in the Field.
- e. ASTM C 39/C 39M - Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.
- f. ASTM C 150 - Standard Specification for Portland Cement.
- g. ASTM C 172 - Standard Practice for Sampling Freshly Mixed Concrete.
- h. ASTM C 494/CA 494M – Standard Specification for Chemical Admixtures for Concrete.
- 4. Institute for Sustainability Infrastructure (ISI):
 - a. ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.
- B. Precast/Prestressed Concrete Institute (PCI):
 - 1. PCI MNL-135 – Tolerance Manual for Precast and Prestressed Concrete Construction.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure that notification is received by them sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.
 - a. Provide 10 days notification prior to the time the precast concrete units will be available for plant inspection.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Precast concrete unit anchorage.
 - 2) Precast concrete unit lifting inserts.
 - 3) Other Precast concrete unit devices.
 - 4) Precast concrete unit accessory items.
 - b. Shop Drawings:
 - 1) Shop Drawings of the prestressed precast concrete beams.
 - c. Certificates:

- 1) Certificate of Analysis for the Portland cement used in the grout mix.
- 2) Calibration certifications for the jacking system.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Concrete mix designs, and concrete mix design test data.
 - b. Manufacturer's Instructions:
 - 1) Manufacturer's handling methods for the products.
 - 2) Installation instructions for the precast concrete units.
 - 3) Installation instructions for precast concrete unit anchorage
 - 4) Installation instructions for precast concrete unit lifting inserts.
 - 5) Installation instructions for other precast concrete unit devices.
 - 6) Installation instructions for precast concrete unit accessory items.
 - c. Site Quality Control Submittals:
 - 1) Force/elongation records of the tensioning process.
2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA 1.3 - Use Recycled Materials
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - b. ENVISION Credit RA 1.4 – Use Regional Materials
 - 1) Submit product data indicating location and distance from Project of material manufacture and point of extraction or harvest for each raw material. Include statement indicating at least 60% of all materials, plants, and soils are sourced within the distances specified: soils (50 mi, 80 km), aggregate (50 mi, 80 km), concrete (100 mi, 160 km), plants (250 mi, 400 km), and all other materials (500 mi, 800 km).

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.

B. Qualifications:

1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency having the qualifications specified in Section 01400, Quality Requirements.
2. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky harbor International Airport will employ an independent Testing and Inspection Agency having the qualifications specified in Section 01400, Quality Requirements

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 1. Do not ship precast concrete units if damage impairing the performance of the product could result.
 2. Transport precast concrete units in a manner that will minimize potential damage.
 3. Deliver precast concrete units to the Site in accordance with the approved delivery schedule to avoid excessive build-up of units in the storage area at the Site.
 4. The Inspector will inspect each precast concrete unit as it is delivered to the Site for quality and acceptance.
 5. All prestressing steel, and bar couplers without proper lot numbers found at the Site will be rejected.
- B. Storage and Handling Requirements:
 1. Employ lifting methods and devices intended for the purpose as indicated on the approved Shop Drawings.
 - a. Submit manufacturer's information that shows acceptable handling methods for the products.
 - b. Lift precast concrete units at points provided by the precast concrete manufacturer using suitable lifting devices.
 - c. Consistent with industry standards, furnish lifting devices having a minimum factor of safety of 4.
 - 1) Furnish reusable lifting hardware and rigging having a minimum factor of safety of 5.
 2. Store and handle precast concrete units and materials in a manner that will minimize potential damage.
 - a. Do not place precast concrete units directly on the ground.
 - b. Store Portland cement so it is protected from dampness.
 - 1) Do not use cement which has become partially set or which contains caked lumps.

3. Prohibitions:
 - a. Do not perform any welding near the prestressing steel or ducts unless it is indicated on the Contract Drawings, or directed by the Program/Project Manager.
 - b. Do not locate a welding ground near the prestressing steel or ducts.

PART 2 PRODUCTS

2.01 MANUFACTURED UNITS

- A. ENVISION Requirements:
 1. Recycled Content
 - a. Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 2. Regional Content
 - a. For each mix design, submit product data indicating location and distance from Project of material manufacture and point of extraction or harvest for each raw material. Include statement indicating at least 60% of all materials, plants, and soils are sourced within the distances specified: soils (50 mi, 80 km), aggregate (50 mi, 80 km), concrete (100 mi, 160 km), plants (250 mi, 400 km), and all other materials (500 mi, 800 km).
- B. Description:
 1. Prestressed concrete beams consist of precast concrete structural members that have prestressing steel strands embedded in the beams as indicated on the Contract Drawings.
 2. Additional components of the prestressed concrete beams required by the particular prestressing system used include strand deflection devices such as hold-downs and hold-ups for the pretensioning systems.
 3. Precast Concrete beams:
 - a. Have the manufacturer's Professional Engineer perform the following tasks:
 - 1) Determine the concrete mix design proportions.
 - a) Submit a mix design for each strength and type of concrete that will be used.
 - (1) Include the mix's 28-day compressive strength, air content, and slump.
 - (2) Provide the quantity, type, and brand of all mix design constituents in the design, and include applicable Product Data for each constituent.
 - (3) Include copies of supporting concrete mix design test reports showing the mix has successfully produced

concrete with the specified properties, and will be suitable for Contract conditions.

- 2) Prior to releasing the precast concrete beam design for fabrication, have the manufacturer's Professional Engineer prepare, seal, sign, and submit Shop Drawings, design calculations, and manufacturer's installation instructions for the proposed precast concrete beams to the Program/Project Manager for approval.
 - a) Show complete design, installation, and construction information in sufficient detail to enable the Program/Project Manager to determine whether or not the beams conform to the original design intent.
 - b) Indicate the type, size, number, and properties of the strands.
 - c) Indicate the limits of strand debonding.
 - d) Indicate the sizes, shapes, dimensions, placement, and concrete cover of steel reinforcement.
 - (1) Include reinforcing steel required to be relocated or added to existing structures.
 - e) Show the locations and the harping points of the strands, and identify the type of finish or surface condition on the top of the precast beams.
 - f) Indicate the tensioning of the strands.
 - g) Indicate the elongation of the strands at the time of jacking.
 - h) Show precast concrete beam dimensions, connection details, openings, and the erection sequence.
 - i) Include composite scale drawings with plan, elevation, and section views that show the relative positions of all embedded items and their embedment depths for both the prestressed elements and the other Work that is associated with these elements.
 - (1) Embedded items include the prestressing ducts, vents, anchorage reinforcement and hardware, reinforcing steel, anchor bolts, earthquake restrainers, deck joint assemblies, drainage systems, utility conduits, and other similar items.
 - j) Include details of supplemental steel that remains as part of finished product.
 - k) Indicate lifting points, devices and loads.
 4. Accessory Items:
 - a. Submit Product Data sheets and proper installation instructions for the accessory items, installed before or after delivery of the precast concrete units, to the Program/Project Manager for approval.
- C. Design Criteria:
1. Precast Concrete:
 - a. Concrete Compressive Strength

- 1) Provide precast concrete units having a 28-day compressive strength (f'_c) as noted on the Contract Drawings.
 - b. Provide the auxiliary and confining reinforcement, minimum edge distance, minimum anchor spacing, and minimum concrete strength at the time of stressing as indicated in the Contract Documents.
 - c. Provide precast concrete units conforming to the unit tolerances specified in PCI MNL-135 for the element, erection, and interfacing.
2. Stresses in the Prestressing Steel:
 - a. Unless otherwise indicated in the Contract Documents, stresses in the prestressing steel may not exceed those specified in the AASHTO Standard Specifications for Highway Bridges.
 - 1) Consider the working force to be the force remaining in the prestressing steel after all losses, including creep and shrinkage of concrete, elastic compression of concrete, losses in prestressing steel due to sequence of stressing, friction, and all other losses peculiar to the method or system of prestressing, have taken place or have been provided for.

D. Materials:

1. Portland Cement Concrete:
 - a. Provide Portland cement concrete complying with the requirements specified in Section 03300, Cast-In-Place Concrete, for the class indicated in the Contract Documents.
2. Prestressing Steel:
 - a. Provide prestressing steel that complies with the requirements of AASHTO M 204M/M 204.
 - 1) Provide high-tensile steel wire, high-tensile seven-wire strand, or high-tensile alloy bars as indicated on the Contract Drawings.
 - a) High-tensile steel wire:
 - (1) Provide high-tensile steel wire complying with the requirements specified in AASHTO M 204M/M 204 (ASTM A 421/A 421M).
 - b) High -tensile seven-wire strand:
 - (1) Provide high-tensile seven-wire strand complying with the requirements for Grade 270 specified in AASHTO M 203M/M 203 (ASTM A 416/A 416M).
 - c) High -tensile alloy bars:
 - (1) Provide high-tensile alloy bars complying with the requirements specified in AASHTO M 275M/M 275 (ASTM A 416/A 416M).
3. Reinforcing Steel:
 - a. Provide reinforcing steel that complies with the requirements of Section 03200, Reinforcing Steel.
4. Debonding Material (Sheathing):
 - a. Provide debonding material consisting of tubular, non-slit, high-density plastic sheathing with a minimum wall thickness of 0.025 inch, and an

inside diameter exceeding the maximum outside diameter of the pretensioning strand by 0.025 inch to 0.14 inch.

- b. Provide debonding material which does not react with concrete, coating, or steel; and will prevent the intrusion of water or cement paste during concrete placement.

E. Shop Fabrication:

1. Jacking Equipment:

- a. Furnish hydraulic jacks equipped with either a pressure gauge or load cell capable of determining the jacking force of the jack.
 - 1) Use either single strand or multiple strand jacks to tension the prestressing steel.
 - 2) Calibrate both the jack and its gauge as a unit, and furnish a certified calibration chart for each unit.
 - a) Submit the latest calibration certifications for the jacking system to the Program/Project Manager with the design calculations for information.
 - b) Calibration certifications for the jacking system older than 6 months are unacceptable.
 - 3) Furnish pressure gauges having either a 6-inch diameter reading dial or a digital display indicator.
 - a) Visibility: Readable by a person with normal vision at a distance of 10 feet.
 - b) Gauge Load Accuracy: Within one percent of the load throughout the entire range of the gauge.
 - c) Reading Dial Increments: No more than 2 percent of the jacking force.
- b. Submit a graph showing the gauge pressure in pounds per square inch and force in thousands of pounds for the jacking system plotted through the entire range of the tensioning calibration.

2. Strand Splicing:

- a. Splicing of strands is permitted, but splicing is not allowed within a member.
- b. Only one splice per strand is allowed.
- c. Strands to be spliced must have the same lay or direction of twist.

3. Stringing Prestressing Steel:

- a. Limit the rotation of each strand to one revolution per 100 feet of exposed strand.
- b. Do not incorporate the lengths of strand having points that have been previously gripped in anchoring devices within the following lengths of strand being strung.

4. Tensioning Prestressing Steel:

- a. At the time of its installation and tensioning, satisfactorily protect the prestressing steel from damage by abrasion, moisture, rust, or corrosion; and make sure the prestressing steel is free of dirt, rust, oil, grease, and other deleterious substances.

- b. Using hydraulic jacks, tension the prestressing steel so that the force in the prestressing steel is not less than the value shown on the Contract Drawings.
 - 1) Conduct the tensioning process so that the force applied to the prestressing steel and the elongation of the prestressing steel will be measured at all times during the process.
 - a) Keep a record of the prestressing force applied and the associated elongations measured during the entire tensioning process.
 - b) Submit the force/elongation records of the tensioning process to the Program/Project Manager for information.
 - 2) Apply the jacking force to the prestressing steel in 2 increments:
 - a) Apply an initial force to the strands to straighten them, eliminate slack, and provide a starting reference point for measuring elongation.
 - b) Then apply the pretensioning force, and measure the elongation.
 - c) Compare the actual elongation measured during application of the calibrated jacking force to the theoretical calculated elongation.
 - (1) If the actual measured elongation differs from the theoretical calculated elongation by more than 5 percent, do not proceed with the tensioning until the tensioning procedure is checked and the source of the error is determined and corrected.
- 5. Precast the concrete for the prestressed concrete beams in accordance with the requirements of Section 03410, Plant-Precast Structural Concrete, except use the materials and additional procedures specified in this Section.
 - a. Do not transfer the tensioning force in the pretensioned strands to the precast member until the concrete strength, determined by performing concrete strength test on concrete specimens made and cured under the same conditions as the precast member, has attained the compressive release strength required.
 - 1) The tests will be performed by the Testing and Inspection Agency and/or the code-required Approved Agency.
 - 2) The transfer of the tensioning force in the pretensioned strands to the precast member is considered the end of the curing period.
 - b. If the concrete has not been placed within 72 hours of the tensioning of the prestressing strands, re-tension the strands prior to placing the concrete.
 - c. If so ordered by the Program/Project Manager, no more than 3 hours prior to placing the concrete for the member those prestressing strands that were individually tensioned may be checked for loss of force.

- 1) Re-tension all strands showing a loss of prestress greater than 3 percent to the original jacking force.
6. Detension the strands following the curing period by releasing the strands from one or both ends of the casting bed depending on which method will produce the least movement of members in the casting bed and the least horizontal eccentricity of the initial prestressing force in the member.
 - a. If the concrete has been heat-cured, detension the strands immediately following the curing period.
7. Cut off all projecting strands that are not scheduled to remain for future embedment.
 - a. Cut and bend the strands scheduled to remain to the dimensions shown on the Contract Drawings.
 - b. If the end of the prestressed concrete beam will not be embedded in cast-in-place concrete, cut all strands or grind them flush with the surface of the concrete; and thoroughly coat them with a bitumastic type sealant.
8. Debonded Strands
 - a. Extend debonding material for debonded prestressing steel through the header.
 - b. Tie and tape the debonding material at the terminus inside the member.
 - c. Within 48 hours of detensioning the steel, seal the openings between the strand and the sheathing for the debonded strands with a 100 percent silicone sealant.
 - d. Do not use strands debonded over the full length of the beam.
9. Clean concrete laitance and other foreign matter from exposed uncoated reinforcing bars and strand.
 - a. If concrete laitance has hardened and other foreign matter remains on the bars, use abrasive blast methods to clean the bars.

F. Finishes:

1. Shop Finishing Methods:
 - a. Finish and patch the precast concrete surfaces as indicated on the Contract Drawings and specified in Section 03300, Cast-In-Place Concrete.
 - 1) After patching surfaces exposed to view, apply a rubbed finish, and use a mortar "lather" matching the color of the surrounding surface to produce a thin film on the surface.
 - 2) Once light dust appears, brush or sack the surface in one direction to produce a uniform texture and color.
 - b. Unless otherwise shown on the Contract Drawings, roughen the top surface of the prestressed concrete beams using a hand tine rake while the concrete is still plastic.

2.02 SOURCE QUALITY CONTROL

A. Tests and Inspections:

1. During the period when concrete is being placed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. Provide and maintain adequate and separate facilities for safe storage and proper curing of concrete test cylinders on the Site for the sole use of the Testing and Inspection Agency and the code-required Approved Agency.
 - c. Provide containers for transporting concrete test cylinders to the testing laboratory.
 - d. The Testing and Inspection Agency and the code-required Approved Agency must perform additional materials testing due to changes in materials or proportions requested by the Contractor or testing required by failure of material to meet specified requirements.
 - e. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Concrete Strength Test:
 - a. To evaluate the potential strength and uniformity of the precast concrete, at least 5 strength tests will be performed for each prestressed concrete beam to represent the beam's strength.
 - b. Test Procedure:
 - 1) Composite samples will be secured in accordance with ASTM C 172.
 - a) Representative test samples will be obtained from different batches of concrete on a truly random basis by selecting a test batch number at random before commencing the placement of concrete.
 - b) When pumping or pneumatic equipment is used, samples will be obtained at the truck and discharge ends.
 - c) Sufficient test samples to perform not less than 5 strength tests of two 28-day cylinders per test will be taken for each concrete mix design.
 - (1) Samples for each concrete mix design will be taken not less than once a day, or not less than once for each 100 cubic yards of concrete placed.
 - 2) At least 4 concrete test cylinders will be molded in strict compliance with the requirements of ASTM C 31/C 31M for each

- strength test, and the cylinders will be cured for a 24-hour initial curing period.
- a) A responsible representative from the Quality Assurance Testing and Inspection Agency will make the concrete test cylinders, and immediately thereafter pack them in a sturdy container furnished by the Contractor and approved by the Quality Assurance Testing and Inspection Agency.
 - b) Surround the concrete test cylinders with wet sand or sawdust and protect them from freezing.
 - c) The concrete test cylinders will be sequentially numbered and the number, the date each cylinder was made, and the results of the slump test and the temperature for each sample on the day of sampling will be recorded on the proper form, and the concrete test cylinders will be transported to the testing laboratory where they will be cured in strict compliance with ASTM C 31/C 31M until the time of the test.
- 3) Each strength test will be performed in accordance with ASTM C 39/C 39M as follows:
- a) 2 concrete test cylinders from the same sample will be tested 7 days after the cylinders were made for information.
 - b) 2 additional concrete test cylinders from the same sample will be tested 28 days after the cylinders were made for acceptance.
 - c) The compressive strengths of the two specimen cylinders tested at 28 days will be averaged.
 - d) If one concrete test cylinder in a strength test manifests evidence of improper sampling, molding, or testing, it will be discarded and the strength of the remaining cylinder will be considered to be the test result; if both specimen cylinders in a test for a single sample show any of the above defects, the entire test for that sample will be discarded.
- c. Acceptance Criteria:
- 1) The test results for standard molded and cured test cylinders will be evaluated separately for each prestressed concrete beam by comparing the test results to the minimum requirements for the Class of concrete as specified.
 - 2) The strength level of the concrete will be considered satisfactory so long as the average of all sets of 3 consecutive compressive strength test results equal or exceed the specified strength f'_c , and no individual strength test result falls below the specified strength f'_c by more than 500 psi.
3. Inspections:
- a. Record and submit force/elongation records of the tensioning process to the Program Manager for information.

- b. The Program/Project Manager may verify the accuracy of the certified calibration charts for the jacking equipment using its own load cells.
 - 1) If the certified calibration for the jacking equipment is found to be in error, immediately discontinue tensioning operations being performed by that equipment until a new certified calibration chart is produced.
- B. Non-Conforming Work:
 - 1. Repairing Minor Defects:
 - a. Products having defects that will not impair the functional use or expected life of a precast concrete beam may be repaired by any method that does not impair the product.
 - 2. Repairing Honeycombed Areas:
 - a. Where honeycombed areas are to be repaired, remove all loose material and cut back the areas to essentially horizontal or vertical planes.
 - 1) Cut back the areas to a depth where at which coarse aggregate particles break under chipping rather than being dislodged.
 - b. Use proprietary repair materials in accordance with the manufacturer's instructions to fill the depression.
 - c. If proprietary repair materials are not used, saturate the area with water immediately prior to starting the repair.
 - 1) Make sure the repair area is damp, but free of excessive water.
 - 2) Apply a cement-sand grout or an approved bonding agent to the chipped surfaces, followed immediately by consolidating an appropriate repair material into the cavity.
 - 3. Repairing Major Defects:
 - a. Have qualified personnel evaluate defects in precast concrete products which impair the functional use or the expected life of the products to determine if repairs are feasible, and if so, to establish the repair procedure.
- C. Coordination of Other Tests and Inspections:
 - 1. Notify the code-required Approved Agency responsible for performing special inspections when concrete for this Contract is being mixed, placed, and/or tested.
 - 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:

1. Make sure that adequate access to the Site to enable hauling, storage, and proper handling of the precast concrete beams has been provided.
2. Erect adequate barricades, warning lights, and/or signs to safeguard traffic in the immediate area of hoisting and handing operations.

3.02 INSTALLATION

- A. Install precast concrete beams to the lines and grades indicated on the Contract Documents or as otherwise specified.
- B. Set the precast concrete beams in place in accordance with the approved Shop Drawings.
 1. Submit the precast concrete beam installation instructions to the Program/Project Manager for information.
- C. Furnish and maintain temporary bracing in place for the precast concrete beams as required for structural stability until final support is provided.
- D. Special Techniques:
 1. Field modifications to the precast concrete beams are not allowed unless approved by the Program/Project Manager.
 2. Painting:
 - a. Paint the exposed surfaces of the precast concrete beams that will not receive additional concrete in accordance with the requirements specified in Section 03300, Cast-In-Place Concrete as indicated on the plans.
- E. Tolerances:
 1. Furnish, erect, and interface the precast concrete members within the tolerances specified for the applicable element type in PCI MNL-135.

3.03 REPAIR / RESTORATION

- A. The repair of damage occurring to the precast concrete beams after installation is the responsibility of the Contractor.
- B. The Contractor is responsible for any chipping, spalling, or other damage to the Work discovered at the Site, unless the damage occurred during storage by others.

3.04 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. During the period when precast concrete is being erected, the Testing and Inspection Agency and the code-required Approved Agency must perform testing and inspections.

- a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing and inspection personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. Cooperate with the Testing and Inspection Agency and code-required Approved Agency to facilitate their testing and inspections.
 - c. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Inspections:
- a. The installation of the prestressed concrete beams will be periodically observed to verify the beams are installed in accordance with "Chapter 16 - Precast Concrete" in ACI 318/318R.
- B. Non-Conforming Work
1. Notify the prestressed concrete beam erector of observed discrepancies between the installation of the beams and the installation indicated in the Contract Documents so corrective action can be taken.

3.05 PROTECTION

- A. Immediately after the precast concrete beams are erected, protect the units from damage.

SECTION 03600

GROUTS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for the grouts, except for masonry grouts, indicated on the Contract Drawings and required in other Specification Sections.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01400 - Quality Requirements.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 03300 - Cast-In-Place Concrete.

1.02 REFERENCE STANDARDS:

- A. American Concrete Institute (ACI):
 - 1. ACI 305R, Hot Weather Concreting.
 - 2. ACI 306R, Cold Weather Concreting.
 - 3. ACI 306.1, Standard Specification for Cold Weather Concreting.
 - 4. ACI 308, Standard Specification for Curing Concrete.
 - 5. ACI 351.1R, Grouting between Foundations and Bases for Support of Equipment and Machinery.
- B. ASTM International (ASTM):
 - 1. ASTM C 33, Standard Specification for Concrete Aggregate.
 - 2. ASTM C 109/C 109M, Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using two-inch or 50-mm Cube Specimens).
 - 3. ASTM C 150, Standard Specification for Portland Cement.
 - 4. ASTM C 191, Standard Test Method for Time of Setting of Hydraulic Cement by Vicat Needle.
 - 5. ASTM C 827, Standard Test Method for Change in Height at Early Ages of Cylindrical Specimens from Cementitious Mixtures.
 - 6. ASTM C 1090, Standard Test Method for Measuring Changes in Height of Cylindrical Specimens from Hydraulic-Cement Grout.
 - 7. ASTM C 1107, Standard Specification for Packaged Dry, Hydraulic Cement Grout (Nonshrink).

1.03 SUBMITTALS

- A. Action Submittals:

1. Submit the following to the Construction Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Non-shrink metallic grout.
 - 2) Non-shrink non-metallic grout.
 - b. Certificates:
 - 1) Grout manufacturer non-shrink certification.
- B. Informational Submittals:
 1. Submit the following to the Construction Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Manufacturer's placing instructions.

1.04 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
- B. Qualifications:
 1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency having the qualifications specified in Section 01400, Quality Requirements.
 2. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency having the qualifications specified in Section 01400, Quality Requirements, and the City of Phoenix Testing Laboratory.
- C. Certifications:
 1. Submit independent laboratory test reports from the grout manufacturers certifying the non-shrink grout meets the performance requirements specified in Article 2.01.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. During delivery, provide a protective covering over grout materials to prevent moisture damage and contamination.
- B. Storage and Handling Requirements:
 - 1. During handling, provide a protective covering over grout materials to prevent moisture damage and contamination.
 - 2. Store and precondition grout and grout materials in accordance with the grout manufacturer's requirements.
 - a. Provide air conditioned storage if required.
 - 3. Store grout materials in undamaged condition with seals and labels intact as packaged by the manufacturer.

1.06 SITE CONDITIONS

- A. Ambient Conditions:
 - 1. Protect grout against high and low temperatures and unfavorable environmental conditions in accordance with the requirements of ACI 305R, ACI 306R, and ACI 306.1 for placement of concrete until it has cured.

PART 2 PRODUCTS

2.01 PERFORMANCE:

- A. Non-Shrink Grout:
 - 1. Provide non-shrink grout that meets the following requirements from the time of placement:
 - a. Early Height Change: 0.0 to 4.0 percent when tested in accordance with the requirements of ASTM C 827.
 - b. Hardened Height Change: 0.0 to 0.3 percent when tested in accordance with the requirements of ASTM C 1090.
 - c. Compressive Strength: 4,000 psi developed with a trowelable mix within 24 hours when tested in accordance with the requirements of ASTM C 109/C 109M modified in accordance with the requirements of ASTM C 1107.
 - d. Indicating placement time: Not less than 60 minutes based on initial set, when tested in accordance with the requirements of ASTM C 191.
 - 2. Provide grout that meets the performance requirements of ASTM C 1107 for Grades A, B, and C.

2.02 MATERIALS:

- A. Aggregate:

1. Fine Aggregate: Provide fine aggregate conforming to the material quality requirements of ASTM C 33.
- B. Non-Shrink Metallic Grout:
 1. Provide a factory-premixed material containing no corrosive irons, aluminums, chemicals, or gypsums.
 - a. Provide a ready-mix type of grout requiring only the addition of water.
 - 1) Provide water proportions conforming to the manufacturer's specifications for the desired mix consistency.
 - b. Do not add other materials to the grout.
 - c. Provide grout manufactured using cement complying with the requirements for Type I (Normal) cement as specified in ASTM C 150.
 - d. To enhance impact resistance, provide grout containing metallic aggregate.
 2. Acceptable Manufacturers:
 - a. Five Star Products, Inc., www.fivestarproducts.com.
 - b. US Grout, LLC., www.usgrout.com.
 - c. Approved equal.
- C. Non-Shrink Non-Metallic Grout:
 1. Provide a factory-premixed material containing no corrosive irons, aluminums, chemicals, or gypsums.
 - a. Provide a ready-mix type of grout requiring only the addition of water.
 - 1) Provide water proportions conforming to the manufacturer's specifications for the desired mix consistency.
 - b. Do not add other materials to the grout.
 - c. For grout applications not in contact with sewage or soils, provide grout manufactured using cement complying with the requirements for Type I (Normal) cement as specified in ASTM C 150.
 - d. For grout applications in contact with sewage or soils, provide grout manufactured using complying with the requirements for Type II (sulfate resistant) cement as specified in ASTM C 150.
 2. Acceptable Manufacturers:
 - a. Five Star Products, Inc., www.fivestarproducts.com.
 - b. US Grout, LLC., www.usgrout.com.
 - c. BASF Construction Chemicals - Building Systems, www.buildingsystems.basf.com.
 - d. The Euclid Chemical Company, www.euclidchemical.com.
 - e. Approved equal.
- D. Portland Cement:
 1. Provide Portland cement conforming to the requirements for Type II as specified in ASTM C 150.
 - a. For applications where the grout will be in contact with sewage, use only Type II (sulfate resistant) cement.

E. Water:

1. Provide potable quality water that is free from deleterious amounts of acids, alkalis, and organic substances.

2.03 MIXES:

A. Neat Cement:

1. Use Type II Portland cement and water in the same proportions specified in Section 03300 for Class AA cast-in-place concrete, but omit the fine and coarse aggregates from the mix.

PART 3 EXECUTION

3.01 EVALUATION AND ASSESSMENT

- A. Submit the grout manufacturer's descriptive product data and current specifications covering the non-shrink metallic grout and non-shrink non-metallic grout products to the Program/Project Manager for approval.
- B. Submit the grout manufacturer's placing instructions to the Program/Project Manager for approval.

3.02 PREPARATION

- A. Surface Preparation:
 1. Clean the surfaces to be grouted to a condition free of oil, grease, laitance, dirt, and other contaminants.
 2. Remove loose material.
 3. Remove rust, paint, and oil from metal components that will be in contact with grout.
 4. Perform additional surface preparation in accordance with the grout manufacturer's instructions.

3.03 INSTALLATION

- A. Formwork:
 1. Use forming procedures that allow proper and complete placement of the grout.
 2. Pre-treat wood forms with forming oils so the forms do not absorb moisture, or as approved by the grout manufacturer.
 3. Anchor formwork support elements so no movement is possible.
 4. Remove formwork supports only after the grout has hardened.
- B. Mixing the Grout:
 1. Use a power operated mechanical mixer of sufficient capacity to mix complete batches of grout without interruption.

2. Mix non-shrink grout in accordance with manufacturer's published instructions.
- C. Non-Shrink Metallic Grout:
 1. Place non-shrink metallic grout in exposed or unexposed areas where grouting or equipment is subject to heavy vibratory forces.
 2. Place non-shrink metallic grout in accordance with the manufacturer's published instructions.
- D. Non-Shrink Non-Metallic Grout:
 1. Place non-shrink non-metallic grout only at locations indicated on the Contract Drawings.
 2. Place non-shrink non-metallic grout in accordance with the manufacturer's published instructions.
- E. Equipment and Machinery Support:
 1. To support installed equipment and machinery, place non-shrink grout between the foundations of the supporting structures and the equipment and machinery bases in accordance with the requirements of ACI 351.1R.

3.04 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. During the period when grout is being placed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. Provide and maintain adequate and separate facilities for safe storage and proper curing of grout test samples on the Work Site for the sole use of the Testing and Inspection Agency and the code-required Approved Agency.
 - c. Provide containers for transporting grout test samples to the testing laboratory.
 - d. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials or proportions requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - e. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
 2. Compressive Strength Test:

- a. Test Procedure:
 - 1) A test sample will be obtained from the first placement of the day, and for every 3 cubic yards of grout placed each day.
 - 2) The grout will be tested in accordance with the requirements of ASTM C 109/C 109M modified in accordance with the requirements of ASTM C 1107.
 - b. Acceptance Criteria:
 - 1) Grout meeting the requirements specified in Subparagraph 2.01.A.1.c will be acceptable.
 - 3. Inspections:
 - a. All grout placement will be visibly inspected to verify if proper placement procedures are being followed.
- B. Non-Conforming Work
- 1. Remove under-strength grout, and replace the removed grout with grout meeting the specified requirements.

SECTION 03601

POLYESTER CONCRETE OVERLAY

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. This work includes placing a polyester concrete overlay with a high molecular weight methacrylate (HMWM) resin prime coat for exterior walkways.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01400 - Quality Requirements.
 - 3. Section 01780 - Closeout Submittals.

1.02 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Construction Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data: Polyester Concrete
 - b. Overlay Placement Plan
 - 1) Schedule of overlay work and testing for each bridge
 - 2) Description of equipment for applying HMWM resin
 - 3) Description of equipment for measuring, mixing, placing, and finishing polyester concrete overlay
 - 4) Method for isolating expansion joints
 - 5) Cure time for polyester concrete
 - 6) Description of equipment for applying sand
 - 7) Storage and handling of HMWM resin and polyester concrete components
 - 8) Disposal of excess HMWM resin, polyester concrete, and containers
 - c. Public Safety Plan to include:
 - 1) An airborne emissions monitoring plan prepared and executed by a certified industrial hygienist (CIH) certified in comprehensive practice by the American Board of Industrial Hygiene. The plan must have at least 4 monitoring points including the mixing point, application point, and point of nearest public contact. Monitor airborne emissions during overlay work and submit emissions monitoring results after completing the work.

- 2) An action plan for protection of the public when airborne emissions levels exceed permissible levels.
- 3) A copy of the CIH's certification.

B. Informational Submittals:

1. Submit the following to the Construction Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Manufacturer's Instructions:
 - 1) Manufacturer's mixing and placing instructions.

1.03 QUALITY ASSURANCE

A. Trial Overlay: Complete a trial overlay before starting work. Results from airborne emissions monitoring of the trial overlay must be submitted to the Construction Manager before starting production work. The trial overlay must:

1. Be at least 8 feet wide by 4 feet long, $\frac{3}{4}$ inch thickness, incorporate the colors shown on the plans
2. Be constructed on a prepared concrete base
3. Be placed within the project limits at an approved location
4. Be constructed using the same equipment as the production work
5. Replicate field conditions for the production work
6. Determine the initial polyester concrete set time
7. Demonstrate suitability of the proposed means and methods
8. Demonstrate suitability of the airborne emissions monitoring plan
9. Illustrate minimum finish requirements per code and as stated in drawings.

PART 2 PRODUCTS

2.01 MATERIALS

A. Polyester polymer concrete physical properties

1. Density: 135 lb/cu ft
2. Compressive Strength: 7000 psi
3. Tensile Strength: 800 psi

B. Polyester Resin Binder Must:

1. Be an unsaturated isophthalic polyester-styrene co-polymer.
2. Contain at least 1 percent by weight gamma-methacryloxypropyltrimethoxysilane, an organosilane ester silane coupler.
3. Be used with a promoter compatible with suitable methyl ethyl ketone peroxide and cumene hydroperoxide initiators.

4. Comply with the following:

Polyester Resin Binder

Property	Requirement	Test Method
Viscosity *	0.075 to 0.200 Pa·s (RVT, No. 1 Spindle, 20 RPM at 77°F)	ASTM D 2196
Specific Gravity *	1.05 to 1.10 at 25°C	ASTM D 1475
Elongation	35 percent, minimum Type I at 11.5 mm/min. Thickness = 6.5±1 mm	ASTM D 638
	Sample Conditioning: 18/25/50 + 5/70	ASTM D 618
Tensile Strength	17.5 MPa, minimum Type I at 11.5 mm/min. Thickness = 6.5±1 mm	ASTM D 638
	Sample Conditioning: 18/25/50 + 5/70	ASTM D 618
Styrene Content *	40 percent to 50 percent by weight	ASTM D 2369
PCC Saturated Surface-Dry Bond Strength	3.5 MPa, minimum, at 24 hours and 21° ± 1°C	California Test 551
Static Volatile Emission *	60 gram per square meter, loss, maximum	SCAQMD Method 309-91

*Test must be performed before adding initiator.

C. Aggregate for polyester concrete must:

1. Have at most 45 percent crushed particles retained on the 2.36-mm sieve.
2. Have fine aggregate consisting of natural sand.
3. Have a weighted average aggregate absorption of at most 1 percent.
4. At the time of mixing with resin, have a moisture content of at most one half of the weighted average aggregate absorption.
5. Comply with one of the following aggregate gradings:

Combined Aggregate Grading

Sieve Size	Percentage Passing	
	3/8 inch Maximum	No. 4 Maximum
12.5-mm	100	100
9.5-mm	83 - 100	100
4.75-mm	65 - 82	62 - 85
2.36-mm	45 - 64	45 - 67
1.18-mm	27 - 48	29 - 50
600-µm	12 - 30	16 - 36
300-µm	6 - 17	5 - 20
150-µm	0 - 7	0 - 7
75-µm	0 - 3	0 - 3

- D. HMWM resin prime coat consists of a resin, promoter, and initiator. HMWM resin must:

1. Be low odor and wax-free
2. Comply with the following:

Methacrylate Resin		
Property	Requirement	Test Method
Volatile Content *	30 percent, maximum	ASTM D 2369
Viscosity *	0.025 Pa·s, maximum, (Brookfield RVT with UL adaptor, 50 RPM at 25°C)	ASTM D 2196
Specific Gravity *	0.90 minimum, at 25°C	ASTM D 1475
Flash Point *	180°F, minimum	ASTM D 3278
Vapor Pressure *	1.0 mm Hg, maximum, at 25°C	ASTM D 323
PCC Saturated Surface-Dry Bond Strength	3.5 MPa, minimum at 24 hours and 21 ± 1°C	California Test 551

* Test must be performed before adding initiator.

- E. Finish quality shall meet the following:
1. Texture: Medium broom finish
 - a. Meet or exceed wet and dry coefficient of friction code requirements for walking surfaces
 2. Color: Two colors shown on drawings. Architect to select custom colors.
 3. Flake Color Chips: Mica flakes
 - a. Color: Black
 - b. Size: Standard 1/4"
 - c. Broadcast Option: Light sprinkle

PART 3 EXECUTION

3.01 EVALUATION AND ASSESSMENT

- A. Submit the polyester concrete manufacturer's descriptive product data and current specifications covering products to the Program/Project Manager for approval.
- B. Submit the polyester concrete manufacturer's placing instructions to the Program/Project Manager for approval.

3.02 PREPARATION

- A. Surface Preparation: Thoroughly clean surface area to receive HMWM prime coat, final clean and dry with compressed air. Follow all preparation instructions per manufacturer's recommendations

3.03 INSTALLATION

- A. HMWM Prime Coat: Thoroughly mix all components of HMWM resin prime coat. Apply the HMWM resin to the deck surface:
1. Clean the surfaces to be grouted to a condition free of oil, grease, laitance, dirt, and other contaminants.
 2. Remove loose material.
 3. Remove rust, paint, and oil from metal components that will be in contact with grout.
 4. Perform additional surface preparation in accordance with the grout manufacturer's instructions.
- B. Polyester Concrete Mixing:
1. Use a continuous mixer that:
 - a. Employ an auger screw/chute device.
 - b. Be equipped with an automatic metering device that measures and records aggregate and resin volumes. Record volumes at least every 5 minutes, including time and date. Submit recorded volumes at the end of the work shift.
 - c. Have a visible readout gage that displays volumes of aggregate and resin being recorded.Produce a satisfactory mix consistently during a demonstration.
- C. Polyester Concrete Placement:
1. Immediately after applying the HMWM prime coat
 2. Before gelling
 3. Within 15 minutes of adding initiator
 4. Consolidate and finish the overlay to the required grade and cross section using finishing equipment.
 5. Finish the surface per plans
 - a. Broadcast mica flakes onto concrete surface to achieve the finish quality aesthetically.

SECTION 03935

FIBER-REINFORCED POLYMER CONCRETE REHABILITATION

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for designing and providing a bonded carbon fiber reinforced polymer (CFRP) system to strengthen deteriorated concrete and structurally engineered modified concrete structures.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 01500 - Temporary Facilities and Controls.
 - 4. Section 01736 - Selective Demolition.
 - 5. Section 03920 – Concrete Resurfacing.
 - 6. Section 07810 – Applied Fireproofing.
 - 7. Section 09967 – Intumescent Paints.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. CFRP-Carbon fiber reinforced polymer.
 - 2. MSDS: Material Safety Data Sheets.
 - 3. NRTL – Nationally Recognized Testing Laboratory.
 - 4. VOC: An acronym for volatile organic compounds, generally meant to refer to organic chemical compounds that have high enough vapor pressures under normal conditions to significantly vaporize and enter the atmosphere.
- B. Definitions:
 - 1. Authority Having Jurisdiction (AHJ): Building Code officials, zoning officials, inspectors, and government and regulatory agencies given the authority to protect the public's health, safety, and welfare.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.
- B. Pre-Installation Meetings:
 1. Prior to application of the bonded carbon fiber reinforced polymer (CFRP) system, convene an onsite meeting to establish and coordinate procedures that will enable the Contractor to provide the best possible product under anticipated field conditions.
 2. Required attendees to this meeting include representatives of organizations and material suppliers involved with the design and construction of CFRP system elements, shoring and bracing Subcontractor, the demolition Subcontractor, the concrete resurfacing Subcontractor, and the fire proofing Subcontractor.
- C. Sequencing:
 1. Clean, prepare, and patch concrete to receive the bonded carbon fiber reinforced polymer (CFRP) system prior to applying this concrete rehabilitation system.
- D. Scheduling:
 1. Prior to beginning installation of the bonded carbon fiber reinforced polymer (CFRP) system, prepare a detailed CFRP Schedule describing the work to be accomplished.
 - a. Submit the CFRP Schedule to the Program/Project Manager for approval.

1.04 SUBMITTALS

- A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Carbon fiber reinforced polymer (CFRP) concrete rehabilitation system.
 - 2) Provide an ICC Evaluation Service Report, compliant with the 2012 IBC, for the proposed products.
 - 3) Provide approved UL rated assembly data for a min 3-hour fire rated assembly per ASTM E119.
 - 4) Properties of the composite materials as determined by independent laboratory testing in accordance with ASTM D7565 and/or ASTM D3039 (tensile modulus, stress and strain).
 - b. Shop Drawings:
 - 1) Proposed concrete rehabilitation material design.
 - 2) Working drawings shall detail the type, locations, dimensions, numbers of layers, and orientation of all FRP materials and coatings to be installed.
 - c. Delegated Design Submittals:
 - 1) Design calculations for the proposed concrete rehabilitation material design.
 - 2) List calling out Special Inspection Requirements that will be required by the Designer, the Manufacturer and any Building Code Requirements.
 - 3) List of special test requirements and acceptable range of values to be used when applying In-Situ Tensile Pull-Off Test (ICRI Technical Guideline No. 210.3-2004) to evaluate existing concrete surface before application of CRFP system and after CRFP system has been installed prior to application of fire resistance materials.
 - 4) Quality Control Manual
 - 5) Design Manual
 - d. Special Procedure Submittals:
 - 1) CFRP Schedule.
 - e. Qualification Statements:
 - 1) Carbon fiber reinforced polymer (CFRP) system installer's qualifications.
 - 2) Testing Agency's qualifications.
 - 3) Professional Engineer's qualifications.
 - 4) Certifications of the applicators.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:

- a. Manufacturer's Instructions:
 - 1) Carbon fiber reinforced polymer (CFRP) system manufacturer's application recommendations.
 - b. Source Quality Control Submittals:
 - 1) Product Test Reports.
 - c. Site Quality Control Submittals:
 - 1) Concrete Rehabilitation Reports
 - d. Manufacturer's Reports:
 - 1) Manufacturer/Suppliers Material Safety Data Sheets (MSDS).
- C. Alternate systems
- 1. Design alternate composite systems to achieve a similar performance to the system shown on the structural drawings. Design calculations for an alternate composite system shall be submitted for approval by the engineer of record, and shall be stamped by a registered Civil or Structural Engineer. Equivalence will be based on stiffness ($E_f \times A_f$). The design modulus (E_f) and associated cross sectional area (A_f) of the FRP system shall be based on published design values consistent with long term durability testing

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
- 1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
 - 2) To perform the Required Inspection per ICC-ES AC178 and furnish Required Documentation per ICC-ES AC178.
 - 2. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky harbor International Airport will employ both an independent Testing and Inspection Agency and the City of Phoenix Testing Laboratory.
 - b. To perform Testing Requirements per ICC-AC178 and provide Testing Reports per ICC-ES AC85.
- B. Qualifications:

1. Carbon Fiber Reinforced Polymer (CFRP) System Installer's Qualifications:
 - a. Employ a carbon fiber reinforced polymer (CFRP) system installer, certified by the CFRP system manufacturer/supplier to install the CFRP system required by this Contract, and having a successful performance record installing similar CFRP systems.
 - b. Employ a CFRP system installer whose superintendent and assistant have a minimum of 3 years' experience installing similar CFRP systems.
 - c. Submit the carbon fiber reinforced polymer (CFRP) system installer's qualifications to the Program/Project Manager for approval.
2. Professional Engineer's Qualifications:
 - a. Employ an independent Professional Engineer, registered in the State of Arizona, who is qualified to perform calculations and design work required under this Section.
 - b. Submit the Professional Engineer's qualifications to the Program/Project Manager for approval.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 1. Deliver materials to the Site in original unopened containers or bundles with labels indicating the manufacturer, product name and designation, expiration date, pot life, curing time, and mixing instructions for multi-component materials.
- B. Storage and Handling Requirements:
 1. Store and handle materials in compliance with the manufacturer's written instructions to prevent their deterioration or damage due to moisture, high or low temperatures, contaminants, or other causes.
 - a. Store materials so they do not contact soil and moisture.
 - b. Store materials so they are not exposed to ultraviolet radiation.
- C. Packaging Waste Management:
 1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

1.07 SITE CONDITIONS

- A. Project Repair work is inside an occupied air-conditioned, smoke controlled building. Work hours will be controlled and limited to late night time hours.
- B. Ambient Conditions:
 1. The relative humidity at the time of installation must be less than 95 percent, the surface temperature must be greater than 5 degrees

Fahrenheit above the dew point, and the concrete must fall between minimum and maximum application temperatures.

- a. If adverse environmental conditions are expected to persist long term, then provide environmental control methods.

PART 2 PRODUCTS

2.01 CARBON FIBER REINFORCED POLYMER (CFRP) SYSTEMS

A. Manufacturers:

1. Manufacturer List:

- a. Fyfe-Aegion Company
- b. Sika Corporation
- c. Approved equal.

2. Substitution Limitations:

- a. The material items herein are manufactured and supplied by Sika Corporation, and establish the minimum standard of quality required for this Contract (ICBO/ICC E.S.R.3288 REPORT).
- b. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from other manufacturers may be provided.

B. Description:

1. Regulatory Requirements:

a. Phoenix Building Construction Code:

- 1) Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments [ICC International Building Code (IBC) as Amended by the City of Phoenix].

C. Performance:

1. Provide a bonded carbon fiber reinforced polymer (CFRP) system capable of withstanding the load requirements indicated without failure, based on testing the manufacturer's standard products similar to those specified for this Contract.

2. Fire-Test-Response Characteristics:

- a. Provide concrete rehabilitation materials that have the fire-test-response characteristics specified as determined when Underwriters Laboratories, Inc. (UL) or another testing and inspecting agency acceptable to the Authorities Having Jurisdiction tests identical products in accordance with the following test methods:
 - 1) Fire-Resistance Ratings for Exterior Open Building Structures:
 - a) Provide fire-resistance ratings of 3 hours when tested in accordance with the requirements specified in ASTM E 119.

- b) The fire-resistance system shall have Class 1 flame and smoke rating as defined in the IBC, per ASTM E84 testing performed by Underwriters Laboratories.
 - 2) Fire-Resistance Ratings for Interior Closed Building Structures:
 - a) Provide fire-resistance ratings of 3 hours when tested in accordance with the requirements specified in ASTM E 119
 - b) The fire-resistance system shall have Class 1 flame and smoke rating as per ASTM E84 testing per Underwriters Laboratories.
 - b. Identify materials with appropriate markings of the applicable testing and inspecting agency.
- D. Design Criteria:
 - 1. Design the concrete rehabilitation system in accordance with the requirements specified in ACI 440R, ACI 440.2R, ACI 503.1, ACI 503.5R, and ACI 546R.
 - 2. Provide compatible primer, fillers, and other materials as required for the proper installation of a complete surface bonded fiber reinforced polymer (FRP) composite system as recommended by the manufacturer, complying with the finish requirements indicated for the application in the Contract Documents, and meeting the requirements for the fire rated assembly specified for the application.
 - 3. Product Data:
 - a. Submit a complete list of the materials, products, and special conditions and procedures proposed for the carbon fiber reinforced polymer (CFRP) concrete rehabilitation and fireproofing systems to the Program/Project Manager for approval, including the following:
 - 1) Manufacturer/Supplier's technical data sheets, including physical, mechanical, and chemical characteristics of the materials, for the products to be used in the CFRP composite system.
 - 2) Manufacturer/Suppliers Material Safety Data Sheets (MSDS) for the products to be used in the CFRP concrete rehabilitation system.
 - 3) Clearly defined time application limits for the primer, tack coat, and saturating resin relative to the temperatures of the base material and ambient air.
 - 4. Shop Drawings:
 - a. Prepare Shop Drawings for the proposed concrete rehabilitation and fireproofing design, including a complete list of materials, products, and plans and details showing special conditions, lap splices, end offset conditions, fire proofing details, and other details.
 - b. Submit the Shop Drawings of the proposed concrete rehabilitation material design, signed and sealed by a Professional Engineer, to the Program/Project Manager for approval.
 - 5. Calculations:

- a. Prepare design calculations for the proposed concrete rehabilitation material design.
- b. Submit the calculations for the proposed concrete rehabilitation material design, signed and sealed by a Professional Engineer, to the Program/Project Manager for approval.

E. Materials:

1. Approved: SikaWrap Hex 103C Carbon fiber fabric). Products include:
 - a. Carbon fiber:
 - 1) Hex 103C fiber – High strength carbon fiber, unidirectional.
 - b. Epoxy: Sikadur 300 Hex 300 epoxy is used as a primer and is also combined with the fiber to form the SikaWrap® System.
 - c. Fire Resistant Finishes: Sikacrete-213F fire protection mortar for applicable fire resistant finish (if required). Alternate finishes must be approved by the owner.
 - d. Field thickened epoxy matrix, which is compatible with composite system's resin matrix, may be used to patch "bugholes" up to 1.5" in depth and to fill voids.
2. Epoxies other than the pre-qualified materials above can be evaluated prior to the tender closing; materials meeting the requirements will be allowed by written addendum.
3. The manufacturer shall provide specific information on physical, mechanical and chemical properties of fiber, epoxy resin and FRP composite.
4. Carbon Fabric:
 - a. Provide unidirectional SikaWrap Hex 103C carbon fabric having a minimum tensile strength of 550 KSI as a cured laminate using Sika Hex 300 epoxy when determined in accordance with the methods specified in ASTM D 3039/D 3039M.
 - 1) Minimum Composite Laminate Thickness: 0.040 inch.
5. Primer:
 - a. Provide Sikadur Hex 300 a low viscosity, two-component epoxy primer as required by the Manufacturer having 100 percent solids, 0 percent volatile organic content (VOC), and the following properties:
 - 1) Minimum Compressive Strength: 10,000 psi when determined in accordance with the methods specified in ASTM D 695.
 - 2) Minimum Flexural Strength: 13,000 psi when determined in accordance with the methods specified in ASTM D 790.
 - 3) Minimum Tensile Strength: 7000 psi when determined in accordance with the methods specified in ASTM ASTM D 638.
6. Tack Coat:
 - a. Provide Sikadur Hex 300 a low viscosity, two-component epoxy tack coat as required by the Manufacturer having 100 percent solids, 0 percent volatile organic content (VOC), and the following properties:

- 1) Minimum Compressive Strength: 7500 psi when determined in accordance with the methods specified in ASTM D 695.
 - 2) Minimum Flexural Strength: 10,000 psi when determined in accordance with the methods specified in ASTM D 790.
 - 3) Minimum Tensile Strength: 5000 psi when determined in accordance with the methods specified in ASTM D 638.
7. Saturating Resin:
- a. Provide Sikadur Hex 300 a low viscosity, two-component epoxy saturating resin as required by the Manufacturer having 100 percent solids, 0 percent volatile organic content (VOC), and the following properties:
 - 1) Minimum Tensile Strength: 8000 psi when determined in accordance with the methods specified in ASTM D 638.

2.02 SOURCE QUALITY CONTROL

- A. Manufacturer Services:
1. Have the manufacturer perform comprehensive tests, witnessed by the Testing Agency, of the current bonded carbon fiber reinforced polymer (CFRP) system in accordance with the methods specified in ASTM D 3039/D 3039M to determine the properties of the system.
 2. Product Test Reports:
 - a. Based on evaluation of the tests performed by the manufacturer, have the Testing Agency submit certified product test reports that indicate compliance of the bonded carbon fiber reinforced polymer (CFRP) system with the specified requirements.
- B. Coordination of Other Tests and Inspections:
1. Notify the code-required Approved Agency responsible for performing special inspections when the carbon fiber reinforced polymer (CFRP) system for this Contract is being mixed, applied, and/or tested.
 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
1. With the carbon fiber reinforced polymer (CFRP) system installer present, examine the concrete, areas, and conditions under which the structural CFRP systems will be applied for compliance with requirements.
 - a. Verify the concrete area is visibly dry and free of moisture.
 2. Examine the existing conditions to identify potential obstructions and constraints.

B. Evaluation and Assessment:

1. When substrate that is defective or unsuitable for installation of the carbon fiber reinforced polymer (CFRP) system is discovered, immediately consult with Program/Project Manager to receive direction.
2. Correct unsatisfactory conditions before proceeding to install the CFRP system.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Protect adjacent areas from damage resulting from installation of the carbon fiber reinforced polymer (CFRP) system.

B. Surface Preparation:

1. Clean, prepare, and patch concrete according to the carbon fiber reinforced polymer (CFRP) system manufacturer's written instructions.
 - a. Prepare concrete that is to receive the CFRP in accordance with the requirements specified in ACI 440R, ACI 440.2R, ICRI 310.1R, and ICRI 310.2.
 - b. Test Surface preparation before application of CFRP system per Manufacturer's requirements using ICRI Guideline No.210.3 -2004 for In-Situ Tensile Pull-Off Tests to evaluate Bond surface of existing concrete.
 - c. Repair cracks and voids per Manufacturer's and Designers requirements either by pressure-injecting an epoxy material in these spaces or by applying a thickened epoxy in accordance with the requirements specified in ACI 224.1R, ACI 503.4, ACI 503.7 and ICRI 320.2R.
 - d. Provide a clean, dust-free, and dry substrate for application of the CFRP system.
 - e. Fill uneven surfaces or recesses with thickened epoxy.

C. Demolition / Removal:

1. Remove protrusions that will interfere with the installation of the carbon fiber reinforced polymer (CFRP) system.
2. Remove existing paint from existing concrete surface that will interfere with the installation and bonding of the carbon fiber reinforced polymer (CFRP) system or its fire resistance protection system.
3. Round off chamfered corners and sharp edges that will interfere with the installation of the carbon fiber reinforced polymer (CFRP) system to have a minimum radius of 1/2 inch.

3.03 APPLICATION

- A. Employ a trained field supervisor to observe all aspects of onsite preparation and material application, including surface preparation, mixing the resin

component, application of the primer, fabric epoxy-saturation, application of the fiber layer, curing of the composites and providing fire-resistance system along with any additional requirements of the Manufacturer's/Designer's furnished Quality Control Manual.

- B. Apply the carbon fiber reinforced polymer (CFRP) system in accordance with the manufacturer's recommendations.
 - 1. Mix the epoxy according to the manufacturer's application instructions.
 - 2. Do not use mixed epoxy that has exceeded its pot life.
 - 3. Submit the carbon fiber reinforced polymer (CFRP) system manufacturer's application recommendations to the Program/Project Manager for information.
- C. Adhere the carbon fabric to the concrete surface as recommended by the manufacturer, and roll out all bubbles and voids between the fabric and the panel.
 - 1. Feather the edges and seams.
- D. Finishing:
 - 1. If the epoxy cures between 24 and 72 hours after the final application of the concrete rehabilitation system, finish the system as specified.
 - 2. If the epoxy cures after 72 hours, roughen the surface of the concrete rehabilitation by hand sanding or brush blasting prior to finishing the system.

3.04 REPAIR/RESTORATION

- A. At the locations where test samples that failed the site tests and inspections specified in Article 3.05 have been taken, take remedial measures to ensure the integrity of the system at those locations.
 - 1. In areas where the site tests have determined insufficient material, take remedial measures.
 - 2. If site tests have determined the material applied to a structural member has material properties below the specified minimum values, install additional layers of the carbon fiber reinforced polymer (CFRP) system until the composite thickness is increased by the same percentage as the deficiency of the material's tensile modulus, or provide other remedial measures as directed by the Program/Project Manager
- B. Inject or back fill small voids and bubbles that are on the order of 3 inches (75mm) in diameter with epoxy.
- C. Report voids and delaminations on the order of 6 inches (150mm) in diameter and areas on the order of 5 inches by 5 inches to the Program/Project Manager.

1. Submit proposed remedial measures to the Program/Project Manager for approval prior to implementing them.
- D. Repair damage to the new or existing structures caused by installing or testing the concrete remediation system at no increase in Contract Price.

3.05 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. During the period when carbon fiber reinforced polymer (CFRP) system is being applied, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing and inspection of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials or proportions requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Fiber-Reinforced Polymer Concrete Rehabilitation Test:
 - a. Test Procedure:
 - 1) Each day that the concrete rehabilitation material is applied, obtain a minimum of two test samples, each consisting of two 12-inch by 12-inch (300mm by 300mm) swatches of cured composite.
 - a) Obtain the test sample materials during the day at appropriate times that will ensure the maximum deviance in the components of the fiber-reinforced composite.
 - b) Prepare the test samples on a smooth, flat, level surface covered with polyethylene sheeting, or 16 mil thick plastic film, that has been primed with epoxy.
 - c) Place a layer of saturated fabric on the epoxy-covered sheeting or film, ~~and apply an additional topping of epoxy.~~
 - d) Cover the sample with plastic film, and squeeze out all bubbles.
 - e) Identify the test samples, and store the samples in a sample box where they will not be moved for a minimum of 48 hours after casting.
 - 2) Submit the test samples to Program/Project Manager.

- 3) The Testing and Inspection Agency will precondition the test samples for 48 hours at 140 degrees Fahrenheit (60 degrees Celsius) before performing the testing.
- 4) The Testing and Inspection Agency will cut test specimens from the test samples.
- 5) The Testing and Inspection Agency will determine the tensile strength, tensile modulus, and percentage elongation in the longitudinal fiber direction in accordance with the methods specified in ASTM D 3039/D 3039M.
- 6) The Testing and Inspection Agency will test a minimum of 15 percent of all test samples in accordance with the requirements specified in ICC-ES AC178.
 - a) If one coupon fails, additional coupon specimens from the same test sample will be tested.
 - b) If the additional test coupons also fail, the second 12-inch by 12-inch (300mm by 300mm) swatch from the same test sample will be tested.
 - c) If the coupons from the second 12-inch by 12-inch (300mm by 300mm) swatch also fail the testing, the remaining test samples from the same day will be tested; and in addition, 25 percent of the remaining samples will be tested using the criteria specified in ICC-ES AC178.
- 7) The Testing and Inspection Agency will make test results available to the Program/Project Manager within 3 weeks of the submission of the test samples.
- b. Acceptance Criteria:
 - 1) Site test samples whose design values are lower than the calculated mean determined from the test results from the testing performed in accordance with the methods specified in ASTM D 3039/D 3039M pass the Fiber-Reinforced Polymer Concrete Rehabilitation Test.
 - a) Acceptable minimum values for the tensile strength, tensile modulus, and percentage elongation may not be below the submitted design values.
 - b) Test samples having values below the submitted design values are considered to be failures, and material represented by the failed test samples require remedial work.
3. Inspections:
 - a. Concrete Rehabilitation Report:
 - 1) Monitor the mixing of the fiber-reinforced polymer concrete rehabilitation system to assure the proper ratio of components, as recommended by the manufacturer, is maintained.
 - 2) Each day, record the batch numbers of the fabric and epoxy used, the square footage of fabric and the volume of epoxy applied, and the locations where the system is installed during the day.

- 3) Report shall include results of testing done by In-Situ Tensile Pull-Off Tests (ICR Guideline 210.3-2004) that evaluate both the clean prepared concrete surface and the bonding of the CFRP to the existing Concrete members.
 - 4) Prepare a Concrete Rehabilitation Report signed and sealed by a Professional Engineer, and that documents the information recorded, includes the test reports and photographs taken of the repaired areas, and certifies that the installation is acceptable.
 - a) Submit the report to the Program/Project Manager for information.
 - b. Special Inspections:
 - 1) The Approved Agency will periodically observe the preparation, mixing, and application of the fiber-reinforced polymer concrete rehabilitation system.
 - 2) The Approved Agency will inspect all areas where the concrete rehabilitation system has been applied for voids, bubbles, and delaminations in accordance with the manufacturer's recommendations.
- B. Non-Conforming Work
1. Remove carbon fiber reinforced polymer (CFRP) determined to be non-conforming, and replace the non-conforming items removed with Work that conforms to the specified requirements.

3.06 CLEANING

- A. Upon completion of the Work of this Section, remove equipment, surplus concrete rehabilitation material, and debris from the Site.
- B. Waste Management:
1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

SECTION 04810

UNIT MASONRY ASSEMBLIES

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for providing the following unit masonry assemblies:
 - a. Concrete masonry units (CMUs).
 - b. Glass block set in mortar.
 - c. Face brick.
 - d. Mortar and grout.
 - e. Reinforcing steel.
 - f. Masonry joint reinforcement.
 - g. Ties and anchors.
 - h. Embedded flashing.
 - i. Miscellaneous masonry accessories
- B. Products Supplied But Not Installed Under This Section:
 - 1. Dovetail slots for masonry anchors, installed under Section 03300, Cast-In-Place Concrete.
 - 2. Anchor sections of adjustable masonry anchors for connecting to structural frame, installed under Section 05120, Structural Steel.
- C. Related Requirements:
 - 1. Section 01316 - Project Meetings.
 - 2. Section 01330 - Submittal Procedures.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called

“credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.

B. Definitions:

1. Authority Having Jurisdiction (AHJ): Building Code officials, zoning officials, inspectors, and government and regulatory agencies given the authority to protect the public’s health, safety, and welfare.
2. Cementitious Material: A mixture of cement and fly ash.
3. Reglet: A groove for guiding or holding a panel, window sash, or similar item; or a narrow, flat molding.
4. Reinforced Masonry: Masonry containing reinforcing steel in grouted cells.

C. Reference Standards:

1. American Concrete Institute (ACI):
 - a. ACI 315 - Details and Detailing of Concrete Reinforcement.
2. American Concrete Institute (ACI)/American Society of Civil Engineers (ASCE)/The Masonry Society (TMS):
 - a. ACI 530/ASCE 5/TMS 402 – Building Code Requirements for Masonry Structures.
 - b. ACI 530.1/ASCE 6/TMS 602 - Specifications for Masonry Structures.
3. ASTM International (ASTM):
 - a. ASTM A 36/A 36M - Standard Specification for Carbon Structural Steel.
 - b. ASTM A 82/A 82M - Standard Specification for Steel Wire, Plain, for Concrete Reinforcement.
 - c. ASTM A 185/A 185M - Standard Specification for Steel Welded Wire Reinforcement, Plain, for Concrete.
 - d. ASTM A 240/A 240M - Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
 - e. ASTM A 307 - Standard Specification for Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength.
 - f. ASTM A 563 - Standard Specification for Carbon and Alloy Steel Nuts.
 - g. ASTM A 563M - Standard Specification for Carbon and Alloy Steel Nuts.
 - h. ASTM A 580/A 580M - Standard Specification for Stainless Steel Wire.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate with the Program/Project Manager and the Phoenix Sky
Harbor International Airport to insure notification is received sufficiently
early to allow them ample time to schedule and perform the required
testing performed by the Testing and Inspection Agency, the Approved
Agency, and the City, prior to incorporating items requiring testing by them
into the Work.
 - 2. Direct and coordinate the placement of metal anchors supplied under this
Section for installation under other Sections.
- B. Pre-Installation Meetings:
 - 1. Attend a pre-installation meeting at the Site held in compliance with the
requirements of Section 01316, Project Meetings, to discuss the
requirements for constructing the unit masonry assemblies to be provided
under this Contract.
- C. Sequencing:
 - 1. Do not apply uniform floor, roof, loads, or concentrated loads for at least 3
days after grouting masonry walls or columns.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Concrete masonry units.
 - 2) Mortar mix designs.
 - 3) Grout mix designs.
 - 4) Reinforcing steel.
 - 5) Masonry joint reinforcement.
 - 6) Masonry ties and anchors.
 - 7) Stainless-steel drill screws for steel studs.
 - 8) Embedded flashing materials.
 - 9) Compressible filler.
 - 10) Pre-formed control joint gaskets.
 - 11) Weep/vent tubing.
 - 12) Cavity drainage material.
 - 13) Reinforcing bar positioners.
 - 14) Masonry cleaners.
 - 15) List of materials used in constructing mockups.
 - b. Shop Drawings:
 - 1) Masonry Units.
 - 2) Reinforcing steel.
 - 3) Fabricated flashing.
 - c. Samples:
 - 1) Full-size Samples for initial selection of exposed concrete masonry units.
 - 2) Full-size Samples for verification of glass block unit and joint materials involving color selection.
 - 3) Samples for initial selection of colored mortar.
 - 4) Samples for verification of exposed concrete masonry units.
 - 5) Samples for verification of weep holes/vents.
 - 6) Samples for verification of accessories to be embedded in the masonry.
 - d. Certificates:
 - 1) Manufacturer's Material Certificates for each type of masonry unit required.
 - 2) Manufacturer's Material Certificates for-cementitious materials.
 - 3) Manufacturer's Material Certificates for each combination of masonry unit type and mortar type.
 - 4) Manufacturer's Material Certificates for each reinforcing bar material and grade.
 - 5) Manufacturer's Material Certificates for each joint reinforcement type and size.

- 6) Manufacturer's Material Certificates for each type and size of anchor, tie, and metal accessory.
- e. Special Procedure Submittals:
 - 1) Cold-weather procedures.
 - 2) Hot-weather procedures.
 - 3) Engineering data, when required by the Authorities Having Jurisdiction (AHJ) to obtain a separate permit.
- B. Informational Submittals:
 - 1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Manufacturer's Concrete Masonry Unit Test reports.
 - b. Site Quality Control Submittals:
 - 1) Installer's field report.
 - 2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements
 - a. Sustainable Design Submittal Documentation:
 - 1) ENVISION Credit RA1.4 – Use Regional Materials: At least 60% of all materials, plants, and soils are sourced within the distances specified: soils (50 mi, 80 km), aggregate (50 mi, 80 km), concrete (100 mi, 160 km), plants (250 mi, 400 km), and all other materials (500 mi, 800 km).
 - 2) ENVISION Credit RA1.3, Use Recycled Materials: At least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Phoenix Building Construction Code:
 - a. Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments [ICC International Building Code (IBC) as Amended by the City of Phoenix].
 - 2. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Inspector.

- c. Both continuous and periodic Special Inspections will be performed during the erection of unit masonry assemblies.
- 3. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency and the City of Phoenix Testing Laboratory.
 - 1) The independent Testing and Inspection Agency must be qualified according to ASTM C 1093 to conduct the testing indicated, and must be acceptable to the Authorities Having Jurisdiction.

B. Certifications:

- 1. Manufacturer's Material Certificates of Compliance:
 - a. Submit material certificates, signed by the manufacturers, to the Program/Project Manager that certify each type and size of the following items complies with the specified requirements, including compliance with the referenced standards and the type designations within the standards:
 - 1) Masonry units:
 - a) Include material test reports and substantiating compliance with the requirements.
 - b) For bricks, include size-variation data verifying that the actual range of sizes falls within the specified tolerances.
 - c) For exposed brick, include a material test report for efflorescence complying with the requirements specified in ASTM C 67.
 - d) For masonry units used in structural masonry, include data and calculations establishing the average net-area compressive strength of the units.
 - 2) Cementitious Materials:
 - a) For each cement product required for mortar and grout, include the brand, type, name of the manufacturer, and weight slips at the time of delivery.
 - b) Pre-Blended, Dry Mortar Mixes:
 - (1) Include a description of the type and proportions of ingredients.
 - c) Grout Mixes:
 - (1) Include a description of the type and proportions of ingredients.
 - 3) Combination of Masonry Unit Type and Mortar Type:
 - a) For each combination of masonry unit type and mortar type, include a statement certifying the net-area compressive strength of the masonry units, the mortar type, and the net-area compressive strength of the masonry determined

according to Table 2105.2.2.1.2 of the ICC International Building Code (IBC) as Amended by the City of Phoenix.

- 4) Reinforcing Bars:
 - a) Include each material and grade indicated in the Contract Documents.
- 5) Joint Reinforcement:
 - a) Include each type and size of joint reinforcement.
- 6) Anchors, Ties, and Metal Accessories:
 - a) Include each type and size of anchor, tie, and metal accessory.

C. Preconstruction Testing:

- 1. The Testing and Inspection Agency may perform preconstruction testing of materials as follows:
 - a. Clay Masonry Unit Test:
 - 1) Test Procedure:
 - a) Each type of clay masonry unit required will be tested in accordance with the methods specified in ASTM C 67 and Chapter 21 of the Phoenix Building Construction Code and Amendments.
 - 2) Acceptance Criteria:
 - a) Clay masonry units complying with the criteria listed in Table 2105.2.2.1.1 of the Phoenix Building Construction Code and Amendments passes the Clay Masonry Unit Test.
 - b. Concrete Masonry Unit Test:
 - 1) Test Procedure:
 - a) Each type of concrete masonry unit required will be tested in accordance with the methods specified in ASTM C 140 and Chapter 21 of the Phoenix Building Construction Code and Amendments.
 - 2) Acceptance Criteria:
 - a) Concrete masonry units complying with the criteria listed in Table 2105.2.2.1.2 of the Phoenix Building Construction Code and Amendments passes the Concrete Masonry Unit Test.
 - c. Grout (Compressive Strength) Test:
 - 1) Test Procedure:
 - a) Each type of grout required will be tested in accordance with the methods specified in ASTM C 1019 and Chapter 21 of the Phoenix Building Construction Code and Amendments.
 - 2) Acceptance Criteria:
 - a) Grout complying with the compressive strength criteria listed in ASTM C 476 passes the Grout (Compressive Strength) Test.

D. Site Samples:

- 1. Samples for Initial Selection:

- a. Submit the following Samples to the Program/Project Manager for selection of the initial materials:
 - 1) For exposed concrete masonry units, [3] full-size Sample units.
 - 2) Colored mortar Samples.
 2. Samples for Verification:
 - a. Submit the following Samples to the Program/Project Manager for verification of the initial selections:
 - 1) Exposed concrete masonry Samples units.
 - 2) Samples of pigmented mortar, made using the same sand and mortar ingredients to be used for the Contract Work.
 - 3) Weep holes/vent Samples matching the color of the mortar color.
 - 4) Samples of accessories to be embedded in the masonry.
- E. Mock-ups:
 1. Build mockups of typical wall areas as shown on the Contract Drawings to verify selections made under the Sample submittals, to demonstrate the aesthetic effects of the materials, and to set quality standards for materials and execution.
 - a. Locate the mock-up(s) where directed by the Program/Project Manager.
 - b. The approval of mockups is for the color, texture, and blending of masonry units; the relationship of the mortar and sealant colors to the masonry unit colors; the tooling of joints; and the aesthetic qualities of workmanship.
 - c. The approval of mockups may also be for other material and construction qualities specifically approved by the Program/Project Manager in writing.
 - d. The approval of mockups does not constitute approval of deviations from the requirements of the Contract Documents contained in the mockups unless such deviations are specifically approved by the Program/Project Manager in writing.
 2. Construct masonry wall mock-up panels sized [5 feet] long by [4 feet] high, which include mortar and accessories, structural backup, flashings, and wall insulation.
 - a. Erect separate panels for each type of unit masonry work.
 - b. In exterior wall mockups, include a sealant-filled joint that is at least 16 inches long; a window opening, complete with a window frame and associated flashing; and flashing installed for the length of the mockup approximately 16 inches below the top of the mockup, including a 24-inch length of flashing where the masonry above the flashing remains uninstalled so the flashing is left exposed to view.
 3. Clean one-half of the exposed faces of mock-ups with masonry cleaner as specified in Article 3.06.
 - a. Apply anti-graffiti coating to cleaned halves of concrete masonry unit mock-ups.

4. Protect accepted mockups from the elements by using a weather-resistant membrane.
5. Do not proceed with masonry Work until the Program/Project Manager has approved the mock-up panel.
6. Do not destroy or move the panel until the Contract Work is completed and accepted by the Program/Project Manager.
 - a. Approved mock-ups may become part of the completed Work if the mock-ups remain undisturbed at the time of Substantial Completion.
 - 1) If the mock-ups are not permitted to be part of the finished Work, demolish and remove them from the Site upon completion and acceptance of the Work of this Section.
7. List of Materials Used in Constructing Mockups:
 - a. As required to identify the materials used for each mock-up, prepare and submit a list of the materials' generic product names, manufacturers, manufacturers' product names, model numbers, lot numbers, batch numbers, source of supply, and other information to the Program/Project Manager for information.
 - 1) Include mix proportions for mortar and grout, and the source of aggregates.
 - 2) Neither the receipt of this list nor the approval of the mock-up constitutes approval of deviations from the Contract Documents unless such deviations are specifically brought to the attention of the Program/Project Manager and approved in writing.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 1. Mortar:
 - a. Deliver pre-blended, dry mortar mix in moisture-resistant containers designed for lifting and emptying into a dispensing silo.
- B. Storage and Handling Requirements:
 1. Masonry Units:
 - a. Store masonry units on elevated platforms in a dry location.
 - b. If the units are not stored in an enclosed location, cover the tops and sides of the stacks with waterproof sheeting, securely tied.
 - 1) Protect concrete masonry units from moisture absorption so that, at the time of installation, the moisture content is not more than the maximum allowed at the time of delivery.
 - 2) If the units become wet, do not install them until they are dry.
 2. Cementitious Materials:
 - a. Store cementitious materials on elevated platforms, under cover, and in a dry location.
 - b. Do not use cementitious materials that have become damp.
 3. Aggregates:
 - a. Store aggregates where grading and other required characteristics can be maintained, and contamination avoided.

4. Masonry Accessories:
 - a. Store masonry accessories, including metal items, so corrosion and the accumulation of dirt and oil is prevented.
5. Mortar:
 - a. Store pre-blended, dry mortar mix in delivery containers on elevated platforms, under cover, and in a dry location, or in a metal dispensing silo with a weatherproof cover.

C. Packaging Waste Management:

1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Cold-Weather Requirements:
 - a. Do not use frozen materials or materials mixed or coated with ice or frost.
 - b. Do not build on frozen substrates.
 - c. Remove and replace unit masonry damaged by frost or by freezing conditions.
 - d. Comply with the cold-weather construction requirements contained in Part 1.8C of ACI 530.1/ASCE 6/TMS 602 as may be amended by the ICC International Building Code (IBC) as Amended by the City of Phoenix.
 - e. Cold-Weather Cleaning:
 - 1) Use liquid cleaning methods only when the air temperature is 40 degrees Fahrenheit (4 degrees Celsius) and above, and will remain so until the masonry has dried, but not less than 7 days after completing cleaning.
 - f. Submit cold-weather procedures with detailed description of methods, materials, and equipment to be used to comply with cold-weather requirements and a curing procedure to the Program/Project Manager for approval.
2. Hot-Weather Requirements:
 - a. Protect unit masonry work when the temperature and humidity conditions produce excessive evaporation of water from the mortar and grout.
 - 1) Provide artificial shade and wind breaks, and use cooled materials as required.
 - 2) For additional information refer to Part 1.8D of ACI 530.1/ASCE 6/TMS 602 as may be amended by the ICC International Building Code (IBC) as Amended by the City of Phoenix.
 - b. When the ambient temperature exceeds 100 degrees Fahrenheit (38 degrees Celsius) or 90 degrees Fahrenheit (32 degrees Celsius) with

a wind velocity greater than 8 mph (13 km/h), do not spread mortar beds more than 48 inches (1200mm) ahead of the masonry.

- c. Maintain the temperature of mortar and grout below 120 degrees Fahrenheit (48.9 degrees Celsius).
- d. Maintain the consistency of the mortar by using cool water.
- e. Use the mortar within 2 hours of the initial mixing.
- f. Set masonry units within 1 minute of spreading the mortar.
- g. Submit hot-weather procedures with detailed description of methods, materials, and equipment to be used to comply with hot-weather requirements and a curing procedure to the Program/Project Manager for approval.

PART 2 PRODUCTS

2.01 UNIT MASONRY ASSEMBLIES

A. Manufacturers:

1. Substitution Limitations:

a. Source Limitations for Masonry Units:

- 1) Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, through one source from a single manufacturer for each product required.

b. Source Limitations for Mortar Materials:

- 1) Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from one manufacturer for each cementitious component and from one source or producer for each aggregate.

B. Performance:

1. Compressive Strengths (f'm):

a. Provide unit masonry that develops net-area compressive strengths (f'm) at 28 days as required by the "General Structural Notes" on the Contract Drawings.

- 1) Determine the compressive strength of clay masonry from the net-area compressive strengths of the masonry units and mortar types according Table 2105.2.2.1.1 of the ICC International Building Code (IBC) as Amended by the City of Phoenix.
- 2) Determine the compressive strength of concrete masonry from the net-area compressive strengths of the masonry units and mortar types according Table 2105.2.2.1.2 of the ICC International Building Code (IBC) as Amended by the City of Phoenix.

2. Fire-Resistance Ratings:

- a. Where indicated, provide materials and construction identical to those of assemblies with fire-resistance ratings determined in accordance with the methods specified in ASTM E 119 by a testing and inspecting agency, by providing an equivalent concrete masonry thickness, or by another means acceptable to the Authorities Having Jurisdiction.

C. Design Criteria

1. Masonry Reinforcement:
 - a. Do not provide unreinforced masonry walls.
2. Product Data:
 - a. Submit the manufacturer's Product Data for each type of product indicated in the Contract Documents and provided.
 - 1) Provide Product Data for each different type, finish, and shape of concrete masonry units to be used.
3. Shop Drawings:
 - a. Prepare Shop Drawings showing both fabrication and installation details for the following items.
 - 1) Masonry Units:
 - a) Show the sizes, profiles, coursing, and locations of special shapes.
 - 2) Reinforcing Steel:
 - a) Detail the bending and placement of the unit masonry reinforcing bars.
 - b) Comply with the requirements specified for detailing concrete reinforcement in ACI 315.
 - c) Show the elevations of reinforced walls.
 - 3) Fabricated Flashing:
 - a) Detail corner units, end-dam units, and other special applications.
 - b. Submit the Shop Drawings to the Program/Project Manager for approval:

D. Materials:

1. Concrete Masonry Units:
 - a. Sustainability Requirements: Regional Content – Provide Concrete Masonry Units that are manufactured and whose raw materials are extracted within a 500 mile radius of the project site.
 - b.
 - c. Provide concrete masonry units complying with the requirements specified in ASTM C 90 for Standard Unit precision; and having the minimum average net-area compressive strength of 3 units, weight classification, and size (width) indicated on the Contract Drawings.
 - 1) Provide concrete masonry units complying with the quality control standards of the Concrete Masonry Association of California and Nevada.
 - 2) Provide units steam-cured or yard air cured for 28 days.
 - 3) Unless otherwise indicated or specified, provide natural cement color smooth faced units.
 - d. Exposed Faces:
 - 1) Unless otherwise indicated in the Contract Documents, provide concrete masonry units having exposed faces of the manufacturer's standard color and texture.

- 2) Where units are to receive a direct application of plaster, provide textured-face units made with gap-graded aggregates.
- 3) Where units are to be left exposed, provide the color and texture matching the range represented by Program/Project Manager's Sample.
 - a) Color Pigment:
 - (1) Provide masonry units with integral color pigment complying with ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures; color stable, free of carbon black, non-fading, and resistant to lime and other alkalis.
- e. Special Shapes:
 - 1) For lintels, corners, jambs, sash, control joints, headers, bonding, and other special conditions, provide special shapes.
 - a) Include matching jamb, lintel, control joint, bond beam, wall cap, and other special shape, type, or size units as required.
 - 2) For interior outside corners, provide bullnose units unless otherwise indicated in the Contract Documents.
 - 3) For exterior outside corners, provide square-edged units unless indicated as bullnose in the Contract Documents.
- f. Exterior/Interior Masonry Unit Types:
 - 1) Provide the types of masonry units indicated on the Contract Drawings.
 - 2) If the types of masonry units are not indicated on the Contract Drawings, provide Type 1, 8-inch by 8-inch by 16-inch, standard face, gray colored units.
2. Glass Block:
 - a. Hollow units made from transparent glass, with manufacturer's standard edge coating.
 - b. Pittsburgh Corning Corp.; www.pittsburghcorning.com
 - c. Approved equal.
 - d. Glass Color: Colorless.
 - e. Pattern: Smooth, undistorted inner and outer faces.
 - f. Sizes: Manufacturer's standard sizes corresponding to nominal sizes indicated on Drawings.
 - g. Thick-Faced Block: Units with faces at least $\frac{3}{4}$ inch (19 mm) thick.
3. Mortar and Grout Materials:
 - a. Portland Cement:
 - 1) Provide Portland cement complying with the requirements for Type II cement specified in ASTM C 150.
 - 2) Provide natural color or white cement as required to produce the mortar color indicated.
 - b. Hydrated Lime:
 - 1) Provide hydrated lime complying with the requirements for Type S lime specified in ASTM C 270.
 - c. Portland Cement-Lime Mix:

- 1) Provide a packaged blend of Portland cement complying with the requirements for Type II cement specified in ASTM C 150, and Type S hydrated lime complying the requirements specified in ASTM C 207.
- d. Mortar Cement:
 - 1) Provide mortar cement complying with the requirements specified in ASTM C 270 and ASTM C 1329, and having maximum air content of 12 percent when tested in accordance with the method specified in ASTM C 185.
 - 2) Do not use masonry Cement.
- e. Aggregate for Mortar:
 - 1) Provide aggregate complying with the requirements specified in ASTM C 144; except for joints less than 1/4 inch (6.5mm) thick, use aggregate having a gradation so 100 percent passes the No. 16 (1.18mm) sieve.
 - 2) For mortar that is exposed to view, provide washed aggregate consisting of natural sand or crushed stone.
- f. Colored-Mortar Aggregates:
 - 1) Provide natural-colored sand or ground marble, granite, or other sound stone of the color necessary to produce the required mortar color.
- g. Aggregate for Grout:
 - 1) Provide aggregate complying with the requirements specified in ASTM C 404.
- h. Mortar Pigments:
 - 1) Provide natural and synthetic iron oxide and chromium oxide pigments compounded for use in mortar mixes.
 - 2) Use only pigments with a record of satisfactory performance in masonry mortar.
 - 3) Manufacturers:
 - a) Bayer AG, Lanxess, Bayferrox® Iron Oxide Pigments, www.bayferrox.com.
 - b) Davis Colors; True Tone Mortar Colors, www.daviscolors.com.
 - c) Solomon Colors, Inc.; SGS Mortar Colors, www.solomoncolors.com.
 - d) Approved equal.
- i. Cold-Weather Admixtures:
 - 1) Provide non-chloride, noncorrosive, accelerating admixtures complying with the requirements for Type C admixtures specified in ASTM C 494/C 494M, and recommended by the manufacturer for use in masonry mortar of the composition indicated.
- j. Water-Repellent Admixtures:
 - 1) Provide liquid water-repellent mortar admixtures intended for use with concrete masonry units containing integral water repellent by the same manufacturer.

- k. Water:
 - 1) Provide potable water.
- 4. Reinforcing Steel:
 - a. Sustainability Requirements: Recycled Content – Provide Steel Reinforcement whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 75 percent.
 - b. Uncoated Steel Reinforcing Bars:
 - 1) Provide uncoated steel reinforcing bars complying with the requirements for Grade 60 (Grade 420) steel specified in ASTM A 615/A 615M or ASTM A 996/A 996M.
 - 2) Wherever number 2 steel reinforcing bars are indicated in the Contract Documents or otherwise required, provide plain steel reinforcement bars complying with the requirements for Grade 80 bars specified in ASTM A 663/A 663M.
 - c. Cold-Drawn Steel Wire:
 - 1) Provide cold-drawn steel wire complying with the requirements specified in ASTM A 82/A 82M.
 - d. Welded Steel Wire Fabric:
 - 1) Provide welded steel wire fabric complying with the requirements specified in ASTM A 185/A 185M.
 - e. Truss Type:
 - 1) Do not provide truss type masonry joint reinforcement.
 - f. Ladder Type:
 - 1) Provide mill-galvanized, carbon steel, hot-dip galvanized carbon steel, or stainless-steel ladder type reinforcing 2 inches less in width than the nominal wall thickness.
 - 2) Manufacturers:
 - a) Dayton Superior Corporation, Dur-O-Wal Division;
www.daytonsuperior.com/DurOWal-main.html.
 - b) Approved equal.
- 5. Masonry Joint Reinforcement:
 - a. Provide galvanized ladder type masonry joint reinforcement complying with the requirements specified in ASTM A 951/A 951M.
 - b. For both interior and exterior walls, provide mill galvanized, carbon-steel wire as follows:
 - 1) Wire Size for Side Rods: W1.7 or 0.148 inch (3.8mm) diameter.
 - 2) Wire Size for Cross Rods: W1.7 or 0.148 inch (3.8mm) diameter.
 - c. Provide masonry joint reinforcement in lengths of not less than 10 feet (3m), with prefabricated corner and tee units where indicated on the Contract Drawings.
 - d. Masonry Joint Reinforcement for Single-Wythe Masonry:
 - 1) Provide ladder type masonry joint reinforcement with a single pair of side rods and cross rods spaced not more than 16 inches (407mm) apart on center.
- 6. Masonry Ties and Anchors:

- a. Unless otherwise indicated in the Contract Documents, provide ties and anchors fabricated from carbon steel wire complying with the requirements specified in ASTM A 82/A 82M mill galvanized with a Class 1 coating complying with the requirements specified in ASTM A 641/A 641M; and from steel plates, shapes, and bars complying with the requirements specified in ASTM A 36/A 36M.
 - 1) If stainless steel wire is indicated for anchors, provide type 304 stainless steel wire complying with the requirements specified in ASTM A 580/A 580M.
 - 2) If stainless steel sheet is indicated for anchors, provide type 304 stainless steel wire complying with the requirements specified in ASTM A 666.
- b. Adjustable Masonry-Veneer Anchors:
 - 1) Provide two-piece vertically or horizontally adjustable masonry-veneer anchor assemblies designed for attachment over sheathing to wood or metal studs.
 - 2) Provide masonry-veneer anchors capable of withstanding a 100 pounds force (445N) load in either tension or compression perpendicular to the plane of the wall without deforming or developing play in excess of 0.05 inch (1.3mm).
- c. Miscellaneous Anchors:
 - 1) Provide the following miscellaneous anchors as required:
 - a) Unit Concrete Inserts:
 - (1) Provide cast-iron or malleable-iron unit inserts for concrete of the type and size indicated on the Contract Drawings.
 - b) Dovetail Slots:
 - (1) Provide dovetail slots fabricated from 0.0336 inch (0.85mm) thick galvanized steel sheet, of the slot size indicated on the Contract Drawings, and having filler strips.
 - c) Anchor Bolts:
 - (1) Provide anchor bolts fabricated from Grade A steel complying with the requirements specified in ASTM A 307, with hex nuts complying with the requirements specified in ASTM A 563 or ASTM A 563M as applicable, and where indicated having flat washers.
 - (a) For exposed exterior anchors, provide Type 304 stainless steel anchors having minimum corrosive resistances.
 - (2) Provide headed bolts of the diameter and length indicated in the Contract Documents; do not provide non-headed (J and L) bolts.
- 7. Stainless-Steel Drill Screws for Steel Studs:
 - a. For steel studs from 0.033 to 0.112 inch (0.8 to 2.8 mm) thick, provide proprietary fasteners consisting of a carbon-steel drill point and a

- 300 Series stainless-steel shank, and complying with the requirements specified in ASTM C 954; except manufactured with a hex washer head and neoprene washer
- b. Provide fasteners having No. 10 diameters and the lengths required to penetrate the steel stud flange with not less than 3 exposed threads.
 - c. Manufacturers:
 - 1) Dayton Superior Corporation, Dur-O-Wal Division; Stainless Steel SX Fastener, www.daytonsuperior.com/DurOWal-main.html.
 - 2) ITW Buildex; Scots long life Tekes, www.itwbuildex.com.
 - 3) Approved equal.
8. Embedded Flashing Materials:
- a. Metal Flashing:
 - 1) Provide embedded flashing complying with the requirements specified in Section 07620, Sheet Metal Flashing and Trim, and the following:
 - a) Unless otherwise indicated in the Contract Documents, provide flashing fabricated from 10 ounce per square foot ($3\text{kg}/\text{m}^2$) weight, or 0.0135 inch (0.34mm) thick, copper for fully concealed flashing.
 - b) Unless otherwise indicated in the Contract Documents, provide flashing fabricated from 16 ounce per square foot ($5\text{kg}/\text{m}^2$) weight, or 0.0216 inch (0.55mm) thick, copper for other than fully concealed flashing.
 - c) If stainless steel flashing is indicated in the Contract Documents, provide 0.016 inch thick Type 304 stainless steel complying with the requirements specified in ASTM A 240/A 240M.
 - 2) Fabricate continuous flashings in 96-inch long sections at a minimum, but do not provide flashing exceeding 12 feet in length.
 - a) Provide splice plates at the joints of formed, smooth metal flashing.
 - 3) For through-wall metal flashing embedded in masonry, fabricate the flashing from sheet metal as specified in Subparagraph 3.05.F.1, but having ribs at 3 inch (75mm) intervals along the length of the flashing designed to provide an integral mortar bond.
 - 4) For metal expansion-joint strips, fabricate the flashing from sheet metal as specified in Subparagraph 3.05.F.1, but formed to the shape indicated on the Contract Drawings.
 - 5) For metal drip edges, fabricate the flashing from sheet metal as specified in Subparagraph 3.05.F.1, but extending at least 3 inches (75mm) into the wall and 1/2 inch (13mm) out from wall, with a hemmed outer edge bent down 30 degrees.
 - 6) For metal flashing terminations, fabricate the flashing from sheet metal as specified in Subparagraph 3.05.F.1, but extending at least 3 inches (75mm) into the wall and out to the exterior face of the wall where the metal is bent back on itself for 3/4 inch (19mm)

and then down 3/8 inch (10mm) into the joint to form a stop for retaining sealant backer rod.

- b. Flexible Flashing:
 - 1) For flexible flashing not exposed to the exterior, unless otherwise indicated provide composite rubberized-asphalt flashing consisting of a pliable, adhesive rubberized-asphalt compound, bonded to a high-density, cross-laminated polyethylene film to produce an overall thickness of not less than 0.040 inch.
 - 2) Manufacturers:
 - a) Carlisle Coatings & Waterproofing; CCW-705-TWF Thru-Wall Flashing, www.carlisle-ccw.com.
 - b) Grace Construction Products, a unit of W. R. Grace & Co. - Conn.; Perm-A-Barrier Wall Flashing, www.na.graceconstruction.com.
 - c) Polytite Manufacturing Corp.; Poly-Barrier Self-Adhering Wall Flashing.
 - d) Approved equal.
- c. Solder and Sealants for Sheet Metal Flashings:
 - 1) Solder for Stainless Steel:
 - a) Provide solder complying with the requirements for Grade Sn60 solder specified in ASTM B 32, with acid flux of a type recommended by the stainless-steel sheet manufacturer.
 - 2) Elastomeric Sealant:
 - a) Provide chemically curing silicone elastomeric sealant complying with the requirements specified in ASTM C 920, and of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim while remaining watertight.
- d. Adhesives, Primers, and Seam Tapes for Flexible Flashings:
 - 1) Provide the flashing manufacturer's standard products or products recommended by the flashing manufacturer for bonding flashing sheets to each other and to substrates.

2.02 MIXES:

- A. Mortar and Grout Mixes:
 - 1. Unless otherwise indicated in the Contract Documents, do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures.
 - a. Do not use calcium chloride in mortar or grout.
 - b. Limit cementitious materials in mortar to Portland cement and lime.
 - c. If cold-weather admixture is used, add the admixture at the same rate for all mortar regardless of weather conditions to ensure that the mortar color is consistent.
 - 2. Pre-blended, Dry Mortar Mix:

- a. Provide dry mortar ingredients in the form of a pre-blended mix.
- b. Portland Cement-Lime Mix:
 - 1) Provide a packaged blend of Portland cement complying with the requirements for Type I or Type III specified in ASTM C 150, and hydrated lime complying with the requirements for Type S specified in ASTM C 207.
- c. Measure the quantities by weight to ensure accurate proportions, and thoroughly blend the ingredients before delivering the mix to the Site.
3. Mortar for Unit Masonry:
 - a. Provide Type S or Type M mortar for unit masonry complying with the Proportion Specification requirements specified in ASTM C 270.
 - 1) Do not use masonry cement.
 - 2) Provide cement-lime mortar; however, mortar cement may be used if it is proportioned as specified in ASTM C 270, has maximum air content of 12 percent when tested in accordance with the method specified in ASTM C 185, and complies with the requirements specified in ASTM C 1329.
 - 3) For masonry below grade or in contact with earth, provide Type M mortar.
 - 4) For reinforced masonry, provide Type S mortar.
 - a) Provide mortar complying with the property requirements for Type S mortar specified in ASTM C 270, using Type II Portland cement complying with the requirements specified in ASTM C 150 and lime.
4. Mortar for Glass Unit Masonry:
 - a. Comply with ASTM C 270, Proportion Specification for Type S mortar.
5. Grout for Unit Masonry:
 - a. Provide grout for unit masonry complying with the requirements specified in ASTM C 476, and having a slump of 8 to 11 inches (200 to 280mm) when measured in accordance with the requirements specified in ASTM C 143/C 143M.
 - 1) Provide grout mixes complying with ASTM C 476 and the specified minimum compressive strength indicated in the General Structural Notes on the Contract Drawings.
 - b. Provide grout of type indicated in the Contract Documents.
 - 1) If the type of grout is not indicated, provide fine or coarse grout of the type indicated in Table 2103.12 of the ICC International Building Code (IBC) as Amended by the City of Phoenix.
 - c. Depending on the dimensions of the grout space, provide fine or coarse grout in accordance with the requirements of Table 7 in ACI 530.1/ASCE 6/TMS 602.
 - 1) The maximum pour height without cleanouts is 5 feet.
 - 2) The maximum pour height with cleanouts is 9 feet.

- B. Submit the mortar and grout mix designs to the Program/Project Manager for approval.

1. Include a description of type and proportions of grout ingredients.
2. For mortar mixes required to comply with a property specification, provide test results indicating the properties when tested in accordance with the requirements specified in ASTM C 270
3. For grout mixes, provide test results indicating the grout compressive strength when tested in accordance with the requirements specified in ASTM C 476.

2.03 ACCESSORIES

A. Glass Unit Masonry Accessories

1. Panel Reinforcement: Ladder-type units, butt welded, not lapped and welded; complying with ASTM A 951 in straight lengths of not less than 10 feet (3m) and as follows:
 - a. Exterior Walls: hot-dip galvanized, carbon wire
 - b. Wire Size: W1.7 or 0.148-inch (3.8 mm) diameter
 - c. Width: 2 inches (50 mm)
 - d. Spacing of Cross Rods: Not more than 16 inches apart.
2. Panel Anchors: Glass block manufacturer's standard perforated steel strips, 0.0359 inch (0.9 mm) by 1-3/4 inches (44 mm) wide by 24 inches (600 mm) long, hot-dip galvanized after fabrication to comply with ASTM A 153/A 153M.
3. Fasteners, General; Unless otherwise indicated, provide Type 304 or Type 316 stainless steel fasteners at exterior walls and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, at interior walls. Select fasteners for type, grade and class required.
4. Asphalt emulsion: Cold-applied asphalt emulsion complying with ASTM D 1187 or ASTM D1227.

B. Compressible Filler:

1. Provide pre-molded filler strips complying with the requirements for Grade 2A1 neoprene material specified in ASTM D 1056.
2. Provide strips that are compressible up to 35 percent, and of the width and thickness indicated in the Contract Documents.

C. Preformed Control-Joint Gaskets:

1. Provide preformed control-joint gaskets designed to fit standard sash blocks, and to maintain lateral stability in masonry walls.
 - a. Provide gaskets sized and configured as indicated on the Contract Drawings.
 - b. Provide gaskets fabricated from either Styrene-Butadiene-Rubber complying with the requirements for Compound Designation M2AA-805 specified in ASTM D 2000, or polyvinyl chloride complying with the requirements for Type PVC-65406 specified in ASTM D 2287.

D. Weep/Vent Tubing:

1. Provide plastic weep/vent tubing fabricated from round 3/8 inch (9mm) outside diameter (OD) medium-density polyethylene, and 4 inches (100mm) long.
 2. Manufacturers:
 - a. Advanced Building Products Inc.; Mortar Maze weep vent, www.advancedflashing.com.
 - b. Dayton Superior Corporation, Dur-O-Wal Division; Cell Vents, www.daytonsuperior.com/DurOWal-main.html.
 - c. Heckmann Building Products Inc.; No. 85 Cell Vent, <http://www.heckmannbuildingprods.com/>.
 - d. Hohmann & Barnard, Inc.; Quadro-Vent, www.h-b.com.
 - e. Wire-Bond; Cell Vent, www.wirebond.com.
 - f. Approved equal.
- E. Cavity Drainage Material:
1. Provide free-draining mesh, made from polymer strands that will not degrade within the wall cavity.
 2. Provide strips the full-depth of cavity and 10 inches wide, with dovetail shaped notches 7 inches deep that prevent the mesh from being clogged with mortar droppings.
 3. Manufacturers:
 - a. Advanced Building Products Inc.; Mortar Break, www.advancedflashing.com.
 - b. Archovations, Inc.; CavClear® Masonry Mat, www.cavclear.com.
 - c. Dayton Superior Corporation, Dur-O-Wal Division; Polytite MortarStop, www.daytonsuperior.com/DurOWal-main.html.
 - d. Mortar Net USA, Ltd.; Mortar Net, www.mortarnet.com.
 - e. Approved equal.
- F. Reinforcing Bar Positioners:
1. Provide wire reinforcing bar positioners designed to fit into the mortar bed joints spanning masonry unit cells, and with loops for holding reinforcing bars in the center of the cells.
 - a. Provide units formed from 0.142 inch (3.6mm) steel wire, hot-dip galvanized after fabrication.
 - b. Provide units with either 2 loops or 4 loops as needed for the number of bars indicated on the Contract Drawings.
 2. Manufacturers:
 - a. Dayton Superior Corporation, Dur-O-Wal Division; D/A 810, D/A 812 or D/A 817, www.daytonsuperior.com/DurOWal-main.html.
 - b. Heckmann Building Products Inc.; No. 376 Rebar Positioner, <http://www.heckmannbuildingprods.com/>.
 - c. Hohmann & Barnard, Inc.; #RB or #RB-Twin Rebar Positioner, www.h-b.com.
 - d. Wire-Bond; O-Ring or Double O-Ring Rebar Positioner, www.wirebond.com.

e. Approved equal.

G. Masonry Cleaners:

1. Proprietary Acidic Cleaner:

- a. Provide the manufacturer's standard-strength cleaner designed for removing mortar/grout stains, efflorescence, and other new construction stains from new masonry without discoloring or damaging masonry surfaces.
- b. Provide a product expressly approved for the intended use by the cleaner manufacturer and the manufacturer of the masonry units being cleaned.

c. Manufacturers:

- 1) Diedrich Technologies, Inc., 202 New Masonry Detergent, www.diedrichtechnologies.com.
- 2) EaCo Chem, Inc.
- 3) ProSoCo, Inc., Sure Klean No. 600 Detergent, www.prosoco.com.
- 4) Approved equal.

2. For masonry not subject to metallic oxidation stains, provide a formulation consisting of a concentrated blend of surface-acting acids, and chelating and wetting agents.

a. Manufacturers:

- 1) Diedrich Technologies, Inc., 202 New Masonry Detergent, www.diedrichtechnologies.com.
- 2) ProSoCo, Inc., Sure Klean No. 600 Detergent, www.prosoco.com.
- 3) Approved equal.

H. Through-Penetration Firestopping Systems:

1. Provide through-penetration firestopping systems complying with the requirements specified in Section 07850, Through-Penetration Firestopping Systems.

2.04 SOURCE QUALITY CONTROL

A. Tests and Inspections:

1. During the period when unit masonry units are being manufactured, the Testing and Inspection Agency and the code-required Approved Agency may perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing and inspection personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
2. Tests:
 - a. The unit masonry unit manufacturer must demonstrate the following quality control tests are performed as required in accordance with the specified codes and standards by submitting test reports documenting compliance with the following tests:
 - b. Concrete Masonry Unit Test:

- 1) Test Procedure:
 - a) Each type of concrete masonry unit required will be tested in accordance with the methods specified in ASTM C 140 and Chapter 21 of the Phoenix Building Construction Code and Amendments.
- 2) Acceptance Criteria:
 - a) Concrete masonry units complying with the criteria listed in Table 2105.2.2.1.2 of the Phoenix Building Construction Code and Amendments passes the Concrete Masonry Unit Test.
- c. Test Reports:
 - 1) Submit test reports for each type of masonry unit required to the Program/Project Manager for approval.
 - a) Include size-variation data for the units, verifying that the actual range of sizes falls within the specified tolerances.
 - b) Include test results, measurements, and calculations establishing the net-area compressive strength of the masonry units.
3. Inspections:
 - a. The Program/Project Manager or Approved Agency may place an Inspector in the unit masonry unit manufacturing plant when the units provided under this Section are being manufactured.
- B. Non-Conforming Work:
 1. Retests of materials failing to comply with the specified requirements may be required to be performed at the Contractor's expense.
- C. Coordination of Other Tests and Inspections:
 1. Notify the code-required Approved Agency responsible for performing special inspections when grout or mortar for this Contract are being mixed and/or tested.
 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Examine field conditions for compliance with for installation tolerance requirements and other conditions affecting performance with the installer present.
 - a. Prepare a written field report, endorsed by the installer, listing conditions found that may be detrimental to the performance of the unit masonry assemblies for the record, and submit this installer's field report to the Program/Project Manager for information.
 - b. Verify that foundations are within the tolerances specified.

- c. Verify that reinforcing dowels are properly placed.
 2. Before installation, examine rough-in and built-in construction to verify the actual locations.
- B. Pre-Installation Testing:
 1. Test cleaning methods on a sample wall panel before proceeding to clean production masonry.
 - a. Clean 1/2 of the sample wall panel, and leave one-half of the panel un-cleaned for comparison purposes
 - b. Obtain the Program/Project Manager's approval of the sample cleaning before proceeding to clean production masonry.
- C. Evaluation and Assessment:
 1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 1. Protect adjacent non-masonry surfaces from contact with masonry cleaner by covering them with a liquid strippable masking agent or polyethylene film and waterproof masking tape.
- B. Surface Preparation:
 1. Keep concrete masonry units and clay tile units dry.
 - a. Do not wet units immediately before or during placement.
 2. Wet those brick having absorption rates in excess of 20 grams per 30 square inches per minute as determined per ASTM C 67 so that the rate of moisture absorption when the bricks are laid does not exceed the permissible amount.
 - a. The brick surface must be dry to the touch when laid.

3.03 INSTALLATION

- A. Provide reinforced cavity and composite walls and other reinforced masonry construction built to the full thickness shown on the Contract Drawings.
 1. Provide single wythe walls of the actual masonry unit widths, using units of the widths indicated.
 2. Reinforce all masonry Work.
 - a. Unless otherwise indicated on the Contract Drawings, place masonry in a running bond.
 3. Align reinforced cells, withes, and voids vertically; and size them so grout pours can be placed and consolidated with a low velocity mechanical vibrator having a 3/4-inch head.
 4. Grout retaining walls and walls below ground solidly with grout.
- B. Masonry Coursing:

1. Maintain masonry courses at a uniform dimension.
 2. Form vertical and horizontal joints of uniform thickness.
 3. Establish the lines, levels, and coursing indicated on the Contract Drawings.
 4. Protect established lines, levels, and coursing from displacement.
- C. Where possible, install full-size units without cutting.
1. Cut units as required to provide a continuous pattern and to fit adjoining construction.
 - a. Furnish motor-driven saws for cutting masonry units that provide clean, sharp, un-chipped edges.
 - b. Allow units cut with water-cooled saws to dry before placing, unless wetting of units is specified.
 2. Install cut units with the cut surfaces and, where possible, the cut edges concealed.
- D. Select and arrange units for exposed unit masonry to produce a uniform blend of colors and textures.
1. Mix units from several pallets or cubes as they are placed.
 2. Where the brick is exposed, provide face brick unless otherwise indicated.
- E. Special Techniques:
1. Laying Masonry Walls:
 - a. Unless otherwise shown on the Contract Drawings, lay out reinforced masonry walls in advance to accurately space surface running bond patterns with uniform joint thicknesses, and to accurately locate openings, movement-type joints, returns, and offsets.
 - 1) Avoid providing less-than-half-size units, particularly at corners, jambs, and wherever possible at other locations where vertical wall reinforcement is required.
 - b. Bond Pattern for Exposed Masonry:
 - 1) Unless otherwise indicated in the Contract Documents, lay exposed masonry in a running bond pattern unless otherwise indicated on the Contract Drawings, but do not use units with less than nominal 8-inch (200mm) horizontal face dimensions at corners, jambs, and other locations where vertical wall reinforcement is required.
 - c. Bond Pattern for Concealed Masonry:
 - 1) For concealed masonry, lay all units in a wythe in a running bond or bonded by lapping not less 1/4 of the unit length.
 - a) At corners, bond and interlock each course of each wythe.
 - b) At corners, jambs, and other locations where vertical wall reinforcement is required, do not use units with less than nominal 8-inch (200mm) horizontal face dimensions.
 - d. Stopping and Resuming Work:
 - 1) In each course, stop work by racking back one-half-unit length for one-half running bond, or one-third-unit length for one-third

- running bond, from those in the course below except where horizontal lap splices are required in the horizontal bond beam reinforcement or the horizontal joint reinforcement.
- a) Do not tooth the masonry at stopping points.
 - 2) When resuming work, clean the exposed surfaces of set masonry, wet clay masonry units lightly if required, and remove loose masonry units and mortar before laying fresh masonry.
 - e. Built-in Work:
 - 1) As construction progresses, build in items specified under this and other Sections of the Specifications.
 - 2) Fill in solidly with masonry around built-in items.
 - 3) Fill space between hollow-metal frames and masonry solidly with mortar, unless otherwise indicated.
 - 4) Where built-in items are to be embedded in cores of hollow masonry units, place a layer of metal lath, wire mesh, or plastic mesh in the joint below, and rod mortar or grout into core.
 - f. Under bearing plates, beams, lintels, posts, and similar items, fill cores in hollow concrete masonry units with grout 24 inches (600mm) unless otherwise indicated.
2. Mortar Bedding and Jointing:
- a. Lay hollow masonry units as follows:
 - 1) On horizontal and vertical face shells, provide full mortar coverage.
 - a) Bed the face shells fully in mortar so the head joint depth equals the depth of the bed joints.
 - 2) In the starting course on footings, and in all courses of piers, columns, and pilasters, and where adjacent to cells or cavities to be filled with grout, bed the webs in mortar.
 - a) Bed the webs of all courses for piers, columns, and pilasters fully in mortar.
 - b) Bed the webs of grouted masonry, including the starting course on footings, fully in mortar.
 - 3) For the starting course on footings where cells are not grouted, spread out a full mortar bed, including the areas under cells.
 - b. Lay solid masonry units with completely filled bed and head joints.
 - 1) Butter the ends with sufficient mortar to fill the head joints, and shove the unit into place.
 - 2) Do not deeply furrow the bed joints or slush the head joints.
 - c. Unless otherwise indicated in the Contract Documents, furnish a jointer larger than the joint thickness; and tool exposed joints to be slightly concave when thumbprint hard.
 - d. For masonry walls to receive plaster or other direct-applied finishes other than paint, cut joints flush unless otherwise indicated.
3. Masonry Joint Reinforcement:
- a. Provide continuous horizontal masonry joint reinforcement as indicated on the Contract Drawings.

- 1) Install the entire length of longitudinal side rods in mortar, with a minimum cover of 5/8 inch (16mm) on the exterior side of the walls, and 1/2 inch (13mm) elsewhere.
 - 2) Lap joint reinforcement a minimum of 12 inches (300mm), with at least one cross wire of each piece of reinforcement in the lap.
 - 3) Space joint reinforcement not more than 16 inches (406mm) apart on center.
- b. Provide reinforcement not more than 8 inches above and below wall openings, and extend the reinforcement 12 inches beyond the openings.
- c. At control and expansion joints, cut or interrupt joint reinforcement unless otherwise indicated in the Contract Documents.
- d. To ensure continuity at corners and wall intersections, provide prefabricated "L" and "T" sections.
- e. To ensure continuity at returns, offsets, column fireproofing, pipe enclosures, and other special conditions, cut and bend reinforcing units as directed by the manufacturer
4. Control and Expansion Joints:
 - a. Install control and expansion joints in unit masonry where indicated on the Contract Drawings.
 - 1) Build-in related items as masonry progresses.
 - b. Do not form a continuous span through movement joints unless provisions are made to prevent in-plane restraint of wall or partition movement.
 - c. Form control joints in concrete masonry by installing preformed control-joint gaskets designed to fit a standard sash block.
 - d. At control joints, do not cut the horizontal bond beam reinforcement at the floor and roof line.
 - 1) Comply with the requirements of special control joint details shown on the Contract Drawings.
 - e. Form expansion joints in brick made from clay by building compressible joint fillers in where indicated in the Contract Documents.
 - f. Provide horizontal, pressure-relieving joints by either leaving an air space or inserting a compressible filler of the width required for installing the sealant and backer rod specified in Section 07920, Joint Sealants; but not less than 3/8 inch.
 - 1) Provide horizontal, pressure-relieving joints beneath shelf angles supporting masonry.
5. Installing Glass Block with Mortar
 - a. Apply a heavy coat of asphalt emulsion to sill and adhere expansion strips to jambs and heads with asphalt emulsion. Allow asphalt emulsion to dry before placing mortar. Trim expansion strips to width required to fit glass block and to full lengths of heads and jambs.

- b. Set glass block with completely filled bed and head joints, with no furrowing, accurately spaced and coordinated with other construction. Maintain $\frac{1}{4}$ inch exposed joint widths unless otherwise indicated.
 - c. Install panel reinforcement in horizontal joints at spacing indicated and continuously from end to end of panels; comply with the following requirements:
 - 1) Vertical Spacing of Panel Reinforcement for Exterior Panels:
Every other course but not more than 16 inches o.c. starting with first course above sill
 - 2) Do not bridge expansion joints with panel reinforcement.
 - 3) Place panel reinforcement in joints immediately above and below all openings within glass unit masonry assemblies.
 - 4) Lap panel reinforcement not less than 6 inches if more than one length is necessary.
 - d. Use plastic spacers for temporary wedges in mortar joints to produce uniform joint widths and to prevent mortar from being squeezed out of joints.
 - e. Keep expansion joints free of mortar.
 - f. Rake out joints indicated to be pointed to a uniform depth sufficient to accommodate pointing material, but not less than joint width.
 - g. Point joints with mortar by filling raked joints and voids. Place and compact pointing mortar in layers not more than $\frac{3}{8}$ inch (10 mm) thick. Compact each layer thoroughly and allow become thumbprint hard before applying next layer. Tool exposed joints slightly concave when pointing mortar is thumbprint hard. Use a smooth plastic jointer larger than joint width.
6. Anchoring Masonry Veneer:
- a. Anchor masonry veneers to wall framing and concrete masonry backup with seismic masonry-veneer anchors in accordance with the following requirements:
 - 1) Fasten seismic anchors through sheathing to the wall framing and to concrete masonry backup using metal fasteners of type indicated in the Contract Documents.
 - a) Provide 2 fasteners unless the anchor design only requires 1 fastener.
 - 2) Embed connector sections and continuous wire in masonry joints.
 - a) Provide not less than 2 inches of air space between the back of the masonry veneer and the face of sheathing.
 - 3) Locate the anchor sections to allow the maximum vertical differential movement of the ties up and down.
 - 4) Space the anchors as indicated in the Contract Documents, but not more than 16 inches apart on center vertically and 24 inches apart on center horizontally, and with not less than 1 anchor for each 2.67 square feet of wall area.
 - a) Provide additional anchors within 12 inches of openings and at intervals around perimeter not exceeding 36 inches.

7. Lintels:
 - a. Provide steel lintels where indicated on the Contract Drawings.
 - b. Provide masonry lintels where shown on the Contract Drawings and where openings of more than 24 inches (610mm) for block-size units are shown without structural steel or other supporting lintels.
 - 1) Provide built-in-place masonry lintels.
 - 2) Provide specially formed bond beam units with reinforcing bars placed as indicated and filled with grout.
 - 3) Temporarily support built-in-place lintels until they have cured.
 - c. Unless otherwise indicated in the Contract Documents, provide a minimum bearing of 16 inches (400mm) at each jamb.
 - d. At door jambs where security control devices are required, provide an additional 8-inches of vertically reinforced block cell at each jamb.
8. Flashing, Weep Holes, Cavity Drainage, and Vents:
 - a. Provide embedded flashing and weep holes in masonry at shelf angles, lintels, ledges, other obstructions to downward flow of water in walls, and where indicated on the Contract Drawings.
 - 1) Install vents at shelf angles, ledges, and other obstructions to upward flow of air in cavities, and where indicated on the Contract Drawings.
 - b. Prepare masonry surfaces so they are smooth and free from projections that could puncture flashing.
 - 1) Unless otherwise indicated in the Contract Documents, place through-wall flashing on a sloping bed of mortar, and cover it with mortar.
 - 2) Before covering through-wall flashing with mortar, seal penetrations in the flashing with adhesive, sealant, or tape as recommended by the flashing manufacturer.
 - c. Install flashing as follows:
 - 1) At masonry-veneer walls, extend flashing through the veneer, across the air space behind the veneer, and up the face of the sheathing at least 8 inches; with the upper edge tucked under building paper or building wrap, and lapping at least 4 inches.
 - 2) At lintels and shelf angles, extend flashing a minimum of 4 inches (100 mm) into masonry at each end.
 - 3) At heads and sills, extend flashing 4 inches (100 mm) at the ends, and turn the flashing up not less than 2 inches (50mm) to form a pan.
 - 4) Beneath flexible flashing at the exterior face of a wall, install metal drip edges.
 - a) Stop the flexible flashing 1/2 inch back from the outside face of the wall, and adhere the flexible flashing to the top of the metal drip edge.
 - 5) Beneath flexible flashing at the exterior face of a wall, install metal flashing termination.

- a) Stop the flexible flashing 1/2 inch back from the outside face of the wall, and adhere the flexible flashing to the top of the metal flashing termination.
 - 6) After masonry wall construction is completed, cut the flexible flashing off flush with the face of the wall.
 - d. Provide weep holes in the head joints in the exterior wythes of the first course of masonry immediately above embedded flashing, and as follows:
 - 1) Use round plastic tubing to form weep holes.
 - 2) Space weep holes formed from the plastic tubing 16 inches (400 mm) apart on center.
 - e. Place cavity drainage material immediately above the flashing in cavities.
 - f. In exterior wythes, provide vents in the head joints at the spacing indicated on the Contract Drawings, formed using the specified weep/vent products.
 - g. Provide reglets and nailers for flashing and other related construction where they are shown to be built into the masonry on the Contract Drawings.
9. Reinforced Unit Masonry Installation:
- a. Temporary Formwork and Shores:
 - 1) Provide formwork and shores to support reinforced masonry elements during construction.
 - 2) Construct formwork conforming to the shape, line, and dimensions shown on the Contract Drawings.
 - a) Make the formwork sufficiently tight to prevent leakage of mortar and grout.
 - b) Brace, tie, and support the forms to maintain its position and shape during the construction and curing of reinforced masonry.
 - 3) Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and other temporary loads that may be placed on them during construction.
 - b. Placing Reinforcement:
 - 1) Place reinforcement in accordance with the requirements specified in ACI 530/ASCE 5/TMS 402.
 - c. Grouting:
 - 1) Do not place grout until the entire height of masonry to be grouted has attained sufficient strength to resist the grout pressure.
 - 2) For cleanouts and for grout placement, comply with the requirements specified in ACI 530/ASCE 5/TMS 402, including the requirements for minimum grout space and maximum pour height.
 - 3) Do not lay masonry block on a freshly grouted wall within 12 hours of grout placement.

F. Interface with Other Work:

1. Build chases and recesses to accommodate items specified in this Section and in other Sections of the Specifications.
2. Leave openings for equipment to be installed before completing masonry.
 - a. After installing equipment, complete the masonry to match the construction immediately adjacent to the opening.

G. Tolerances:

1. Comply with the tolerances specified in ACI 530.1/ASCE 6/TMS 602, and the following tolerances:
 - a. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion and control joints, do not vary from plumb by more than 1/8 inch in 10 feet (3mm in 3m), 1/4 inch in 20 feet, or 1/2 inch (12mm) maximum.
 - b. For vertical alignment of exposed head joints, do not vary from plumb by more than 1/4 inch in 10 feet (6mm in 6m), or 1/2 inch (12mm) maximum.
 - c. For conspicuous horizontal lines, such as exposed lintels, sills, parapets, and reveals, do not vary from level by more than 1/8 inch in 10 feet (3mm in 3m), 1/4 inch in 20 feet, or 1/2 inch (12mm) maximum.
 - d. For exposed bed joints, do not vary from the thickness indicated by more than plus or minus 1/8 inch (3mm), with a maximum thickness limited to 1/2 inch (12 mm).
 - 1) Do not vary from the bed-joint thickness of adjacent courses by more than 1/8 inch (3mm).
 - e. For exposed head joints, do not vary from the thickness indicated by more than plus or minus 1/8 inch (3mm).
 - 1) Do not vary from the adjacent bed-joint and head-joint thicknesses by more than 1/8 inch (3mm).
 - f. For faces of adjacent exposed masonry units, do not vary from flush alignment by more than 1/16 inch except due to warpage of the masonry units within the tolerances specified for the warpage of units.
 - g. For exposed bed joints and head joints of stacked bond, do not vary from a straight line by more than 1/16 inch from one masonry unit to the next.

3.04 REPAIR/RESTORATION

- A. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units.
1. Install new units to match the adjoining units.
 2. Install the new units in fresh mortar, and point the joints to eliminate evidence the damaged or mismatched units have been replaced.
- B. Pointing:

1. During the tooling of joints, enlarge voids and holes, except for weep holes, and completely fill these voids and holes with mortar.
2. Point up joints, including corners, openings, and adjacent construction, to provide a neat, uniform appearance.
3. Prepare joints for sealant application where indicated on the Contract Drawings.

3.05 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. During the period when unit masonry units are being placed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing and inspection personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. Retests of materials failing to comply with the specified requirements will be performed at the Contractor's expense.
2. Mortar Test:
 - a. Test Procedure:
 - 1) For each mortar mix provided, mortar tests will be performed for each 2500 square feet (232m²) of wall area or portion thereof using the mortar mix.
 - 2) The mortar properties will be tested in accordance with the requirements specified in ASTM C 780.
 - b. Acceptance Criteria:
 - 1) Mortar complying with the compressive strength, water retention, and air content requirements specified in ASTM C 270 or ASTM C 1329 for Type S mortar, passes the Mortar Test.
3. Grout Test:
 - a. Test Procedure:
 - 1) For each day of grout placement at each location within each structure, grout tests will be performed.
 - 2) The compressive strength of the grout will be sampled and tested in accordance with the requirements specified in ASTM C 1019.
 - 3) The slump of the grout will be tested in accordance with the requirements specified in ASTM C 143/C 143M.
 - b. Acceptance Criteria:
 - 1) Grout having at least the compressive strength indicated on the Contract Drawings, and the slump specified herein, passes the Grout Test.
4. Concrete Masonry Prism Test:
 - a. Test Procedure:
 - 1) For each type of concrete masonry unit provided, concrete masonry prism tests will be performed for each 5000 square feet

- (465m²) of concrete masonry unit wall area or portion thereof using that type of concrete masonry unit.
- 2) Each type of concrete masonry unit indicated will be tested in accordance with the requirements specified in ASTM C 1314.
 - b. Acceptance Criteria:
 - 1) Concrete masonry units represented by prisms having the minimum F'm compressive strength for the weight classification and size (width) indicated on the Contract Drawings pass the Concrete Masonry Prism Test.
 5. Inspections:
 - a. Allow inspectors access to scaffolding and work areas, as needed to perform inspections.
 - b. Place grout only after inspectors have verified compliance of the grout spaces and grades, sizes, and locations of reinforcement.
 - B. Non-Conforming Work
 1. Defective Units:
 - a. Referenced masonry unit standards may allow a certain percentage of units to exceed tolerances, and to contain chips, cracks, or other defects exceeding the limits stated in the standard.
 - b. Do not use units where such defects, including dimensions that vary from the specified dimensions by more than the stated tolerances, will be exposed in the completed Work or will impair the quality of completed masonry.

3.06 CLEANING

- A. In-Progress Cleaning:
 1. Clean unit masonry as the Work progresses by dry brushing to remove mortar fins and smears before tooling joints.
- B. Final Cleaning:
 1. After mortar is thoroughly set and cured, clean exposed masonry by removing large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
 2. Wet wall surfaces with water before applying cleaners.
 3. Clean concrete masonry by using the cleaning method indicated in NCMA TEK 8-2A applicable to type of stain on exposed surfaces.
 - a. Clean masonry using a proprietary acidic cleaner applied according to the cleaner manufacturer's written instructions.
 4. Remove cleaners promptly by rinsing surfaces thoroughly with clear water.
- C. Protect all sash, metal items, and other corrodible parts of the structure when masonry is cleaned with corrosive solutions.
- D. Waste Management:

1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.
2. Salvageable Materials:
 - a. Unless otherwise indicated, excess masonry materials are considered to be the Contractor's property.
 - b. At completion of unit masonry work, remove salvageable materials from the Site.
3. Excess Masonry Waste:
 - a. Remove excess clean masonry waste that cannot be used as fill and other masonry waste, and place this material in the appropriate container noted in the Waste Management Plan.

3.07 PROTECTION

A. Stain Prevention:

1. Prevent grout, mortar, and soil from staining the face of masonry to be left exposed or painted.
 - a. Immediately remove grout, mortar, and soil that come in contact with such masonry.
2. Protect the bases of walls from rain-splashed mud and from mortar splatter by coverings spread on the ground and over the wall surface.
3. Protect sills, ledges, and projections from mortar droppings.
4. Protect the surfaces of window and door frames, and similar products with painted and integral finishes, from mortar droppings.
5. Turn scaffold boards near the wall on edge at the end of each day to prevent rain from splashing mortar and dirt onto completed masonry.

B. Masonry Protection:

1. During the installation of masonry work, provide temporary bracing.
 - a. Maintain the temporary bracing in place until the building structure provides permanent bracing.
2. During construction, cover the tops of walls, projections, and sills with waterproof sheeting at end of each day's work.
 - a. Extend the cover a minimum of 24 inches (600mm) down both sides of the masonry, and hold the cover securely in place.
 - b. Where 1 wythe of multiwythe masonry walls is completed in advance of other wythes, secure the cover a minimum of 24 inches down the face next to the unconstructed wythe, and hold cover securely in place.
3. Cover partially completed masonry when construction is not in progress.
4. Without damaging the completed work, provide protective boards at exposed external corners which are subject to damage by construction activities.

SECTION 05120

STRUCTURAL STEEL

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for the design, fabrication, and installation of structural metal framing.
 - a. For architecturally exposed structural steel, refer to Section 05121, Architecturally Exposed Structural Steel.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 – Sustainable Design Requirements
 - 3. Section 03600 - Grouts.
 - 4. Section 05121 - Architecturally Exposed Structural Steel.
 - 5. Section 05310 - Steel Deck.
 - 6. Section 07810 - Applied Fireproofing.
 - 7. Section 09960 - High-Performance Coatings.
 - 8. Section 09967 - Intumescent Paints.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. AESS: Architecturally Exposed Structural Steel.
 - 2. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
 - 3. VOC: An acronym for volatile organic compounds, generally meant to refer to organic chemical compounds that have high enough vapor pressures under normal conditions to significantly vaporize and enter the atmosphere.
- B. Reference Standards:
 - 1. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO HB-17 - Standard Specifications for Highway Bridges.
 - 2. American Concrete Institute (ACI):

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. 10 days before structural steel is to be erected, give notice to those performing other construction work related to the steel erection, such as to those performing work that must be supported by or that will provide support of the steel, to allow such items to be introduced or furnished before the steel is erected.
 - 2. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.
- B. Sequencing:
 - 1. Sequence the erection of structural steel to follow construction of supporting concrete and masonry load bearing walls and concrete foundations.
- C. Scheduling:
 - 1. Coordinate the structural steel fabrication schedule with the progress of the Work so delays are avoided.

- a. Ensure materials are delivered to the Site in quantities and at times and intervals that facilitate uninterrupted progress of the Work and continuity of installation.
- b. Deliver anchor rods and other anchorage items to be embedded in or attached to concrete, masonry, or other materials in ample time so that the Work is not delayed.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:

a. Product Data:

- 1) Structural steel.
- 2) High-strength bolted connections fasteners.
- 3) Anchor rods.
- 4) Bolt lubricant.
- 5) Expansion anchors.
- 6) Adhesive anchors.
- 7) Welding electrodes.
- 8) Primer.
- 9) Post-Industrial Recycled Content Affidavit.
- 10) Post-Consumer Recycled Content Affidavit.

b. Shop Drawings:

- 1) Standard details.
- 2) Structural detail drawings.
- 3) Galvanized member drawings.
- 4) Working Drawings.

c. Certificates:

- 1) Structural steel mill test reports.
- 2) Manufacturer's Certification of Fastener Components.
- 3) Hot-Dip Galvanizing Certificate of Compliance.

d. Qualification Statements:

- 1) Welding procedure specifications (WPS) test records.
- 2) Welding Certificates.
- 3) Structural steel fabricator qualifications.
- 4) Hot-dip galvanizing plant's qualifications.
- 5) Structural steel erector qualifications.
- 6) Professional Land Surveyor's qualifications.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA1.3 – Use Recycled Materials

- 1) Submit product data for recycled content indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.

C. Closeout Submittals:

1. Submit the following to the Construction Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Manufacturer's Instructions:
 - 1) Adhesive manufacturer's recommendations.
 - b. Site Quality Control Submittals:
 - 1) Professional Land Surveyor survey of the locations of the top of steel elevations and the edge of slab locations.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Recycled Steel:
 - a. Provide steel with the following percentages of recycled steel:
 - 1) Post-industrial recycled content: 90 percent, minimum.
 - 2) Post-consumer recycled content: 75 percent, minimum.
 - b. Submit written affidavits from the steel manufacturer verifying that the recycled steel content provided complies with the specified requirements.
2. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by a code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - 1) Both continuous and periodic Special Inspections will be performed during the fabrication and erection of structural steel.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
3. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ independent Testing and Inspection Agencies, including the City Building Official and the City of Phoenix Testing Laboratory.

B. Qualifications:

1. Welding Qualifications:
 - a. Welding Procedure Specifications (WPS):

- 1) Prior to beginning work that requires welding, submit the pre-qualifying welding procedures to the Program/Project Manager for approval.
 - 2) For all procedures, other than those set forth in AWS D1.1/D1.1M or AWS D1.5/D1.5M, submit a copy of the welding procedure specifications (WPS) test records to the Program/Project Manager for approval.
- b. Welders' Qualifications:
 - 1) Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders to the Program/Project Manager for approval.
 - 2) Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed for the procedures in the following:
 - a) For station and building connection applications, the qualification tests prescribed in AWS D1.1/D1.1M.
 - b) For guideway members and guideway supporting steel structures, the qualification tests prescribed in AWS D1.5/D1.5M.
 - 3) Submit Welding Certificates certifying the welders employed to fabricate and to erect the Work of this Section have been certified by the American Welding Society (AWS) within the previous 12 months to the Program/Project Manager for approval.
 - a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures and, if pertinent, has undergone recertification.
2. Structural Steel Fabricator's Qualifications:
 - a. Employ a structural steel fabricator experienced in fabricating structural steel similar to that indicated for this Contract.
 - 1) The fabricator chosen must participate in the AISC Certification Program described in AISC 201, and must be designated an AISC Certified Plant, Category BU.
 - 2) Use a structural steel fabricator exhibiting a minimum of 5 continuous years of successful in-service performance.
 - b. Employ a structural steel fabricator having sufficient production capacity to produce and deliver the materials in time to meet the approved construction schedule for this Contract.
 - c. Submit the structural steel fabricator's qualifications to the Program/Project Manager for approval.
3. Hot-Dip Galvanizing Plant's Qualifications:

- a. Employ a firm that is a member of the American Galvanizers Association (AGA) with a hot-dip galvanizing plant for performing galvanizing operations for this Contract.
 - b. Submit a letter on company letter head giving the location of the plant proposed for performing the galvanizing operations and stating the number of years of experience the galvanizing plant has had performing work similar to that required under this Contract to the Program/Project Manager for approval.
 - 4. Structural Steel Erector's Qualifications:
 - a. Employ a structural steel erector experienced in erecting structural steel work similar to that required for this Contract who has a minimum of 5 continuous years of providing successful in-service performance.
 - b. Submit the structural steel erector's qualifications to the Program/Project Manager for approval.
 - 5. Professional Land Surveyor's Qualifications:
 - a. Employ an independent Professional Land Surveyor, registered in the State of Arizona, who is qualified to perform the survey work required under this Section.
 - b. Submit the Professional Land Surveyor's qualifications to the Program/Project Manager for approval.
- C. Certifications:
- 1. Mill Test Reports:
 - a. Submit structural steel mill test reports, signed by the manufacturer of the structural steel products, certifying the products provided comply with the specified requirements.
 - 1) Certify the material provided conforms to the appropriate ASTM specification.
 - 2) For the rolled steel sections, girders, and steel plates for primary and secondary guideway support members, provide Charpy V-notch (CVN) impact test values in accordance with the requirements specified in Subsection 604-2.01 of the ADOT Standard Specifications for Road and Bridge Construction.
 - 2. Manufacturer's Certification of Fastener Components:
 - a. For each type and size of fastener component and each fastener assembly item, submit the manufacturer's certification documents and test reports required by the Specifications, Code, or ASTM procedures.
 - b. For each lot of bolts, nuts, and washers for primary and secondary guideway support members, submit a Certificate of Analysis complying with the requirements specified in Subsection 604-2.03(A) of the ADOT Standard Specifications for Road and Bridge Construction.
 - 3. Hot-Dip Galvanizing Certificate of Compliance:
 - a. For the hot-dip galvanized components provided, submit the original and 2 copies of a Certificate of Compliance from the coating

applicator, signed by the galvanizer and notarized, certifying that the hot-dip galvanized coatings meet or exceed the requirements specified in ASTM A 123/A 123M or ASTM A 153/A 153M, as applicable.

- 1) Certify that samples representing each lot have been tested and inspected in accordance with the requirements of ASTM A 123/A 123M or ASTM A 153/A 153M, as applicable.
 - a) Include a report containing the test results supporting the certification.
- 2) Include a detailed description of the material processed and indicate which ASTM standard applies to the coating provided.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Use special care in shipping structural steel members.
2. Ship small parts, such as bolts, nuts, washers, pins, fillers, and small connecting plates and anchors, in boxes, crates, or barrels.
 - a. Pack each length and diameter of bolt and each size of nut and washer separately.
 - b. Plainly mark an itemized list and description of the contents on the outside of each container.

B. Storage and Handling Requirements:

1. Use special care in handling structural steel members.
2. Store structural steel on platforms, skids, blocking, or other supports to prevent contact with dirt, debris, and moisture.
 - a. Store beams with webs vertically.
 - b. Protect structural steel from exposure to conditions that produce rust.
3. Protect fastener products from dirt and corrosion by placing them in closed containers.
 - a. Store fastener products in a protected shelter, remove fastener components only as necessary, and promptly return unused fasteners to protected storage.
4. Handle structural steel so no parts are bent, broken, or otherwise damaged; and avoid damage to other material and work.
 - a. Exercise care to avoid scraping and over stressing the steelwork.
 - b. Replace bent or damaged pieces, unless the Program/Project Manager authorizes repairs.

PART 2 PRODUCTS

2.01 STRUCTURAL STEEL SYSTEMS

A. Manufacturers:

1. Manufacturer List:

- a. The structural steel fabricator must participate in the AISC Certification Program described in AISC 201, and must be designated an AISC Certified Plant, Category BU.
 - 1) The American Institute of Steel Construction (AISC) maintains a current list of AISC Quality Certified Fabricators at <http://www.aisc.org/find/FindCertifiedCompany.aspx?id=5542>.
- b. Subject to compliance with the requirements specified herein, provide products manufactured by one of the manufacturers listed.
2. Substitution Limitations:
 - a. No substitutions for an AISC Quality Certified Fabricator is allowed for this Contract.
 - b. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from manufacturers other than those listed herein may be provided.
3. Product Options:
 - a. Submit the manufacturer's Product Data for each type of product indicated and provided to the Program/Project Manager for approval.
- B. Regulatory Requirements
 1. Erect structural steel in compliance with the requirements of 29 CFR 1910 and 29 CFR 1926, particularly 29 CFR 1926.754, Structural Steel Assembly, 29 CFR 1926.755, Column Anchorage, and 29 CFR 1926.756, Beams and Columns, and with the requirements of ICC International Building Code (IBC) as Amended by the City of Phoenix.
- C. ENVISION Requirements:
 1. Recycled Content
 - a. Provide Structural Steel whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 75 percent.
 2. Low Emitting Materials – Paints and Coatings
 - a. When paint is field applied to touch-up shop applied primer on surfaces within the building envelop, ensure they have a VOC content not exceeding 100 g/L.
- D. Design Criteria:
 1. The structural steel and connection details shown on the Contract Drawings have been designed in compliance with the applicable requirements of the American Association of State Highway and Transportation Officials (AASHTO), American Institute of Steel Construction (AISC), Arizona Department of Transportation (ADOT), American Welding Society (AWS), ASTM International (ASTM), Phoenix Sky Harbor International Airport (PSHIA), Research Council on Structural Connections (RCSC), and SSPC The Society for Protective Coatings (SSPC), standards listed in Paragraph 1.02.B.
 2. Shop Drawings:

- a. Standard Details:
 - 1) Prior to submitting detailed Shop Drawings for the structures, submit the standard details for typical beam, girder, and column splices, and for moment connection details to the Program/Project Manager for approval.
 - 2) Use the type of shop and field connections shown on the Contract Drawings.
 - a) If no type is shown, use the most appropriate type.
 - b) One-sided or other eccentric connections are not permitted unless detailed on the Contract Drawings.
 - b. Structural Details:
 - 1) Submit Shop Drawings, sealed and signed by a Professional Engineer licensed in the State of Arizona, that identify the structural details as shown on the Contract Drawings, and completely indicate the location of the structural details within the Work of the Contract.
 - a) Indicate the size, weight, and quantities of members; the methods of joining various components; finishes; the location and type of anchors; and necessary dimensions.
 - b) Use the standard welding symbols specified in ANSI/AWS A2.4 on the Shop Drawings showing the size, length, and type of each weld.
 - c) Note variations in tolerances or clearances between various products on the Shop Drawings.
 - d) For shop assemblies that require markings to facilitate identification during erection, provide easy-to-read markings on the Shop Drawings and erection drawings.
 - c. Galvanized Member Shop Drawings:
 - 1) Submit Shop Drawings of the galvanized members showing the lifting/handling lugs for both the galvanizing process and for erection of the members, and list the type of nylon straps/chokers or other lifting aids to be used so the galvanized coatings will not be damaged.
3. Working Drawings:
- a. Submit erection drawings and the setting diagrams, templates, and directions for installing structural framing anchor bolts, bearing plates, and other embedded items.
- E. Materials:
- 1. Steel:
 - a. Provide structural steel meeting the requirements of ASTM A 36/A 36M; ASTM A 572/A 572M, Grade 50; and ASTM A 992/A 992M as noted on the Contract Drawings.
 - 1) Provide rolled sections, girders, and structural steel plate for the primary and secondary guideway support system complying with

the requirements specified in Section 604 of the ADOT Standard Specifications for Road and Bridge Construction.

- b. For the structural steel types listed below, provide steel meeting the requirements of the standards following that type.
 - 1) Rectangular and Square High Strength Steel (HSS) Tubing: Provide steel meeting the requirements of ASTM A 500, Grade B.
 - 2) Steel Pipe: Provide black steel pipe complying with the requirements specified in ASTM A 53/A 53M.
 - 3) Round High Strength Steel (HSS): Provide steel complying with the requirements specified for Grade B steel in ASTM A 500.
 - 4) Steel Bearing Plates for Guideway Bearing Assemblies: Provide steel complying with the requirements specified in ASTM A 36/A 36M.
- 2. Fasteners:
 - a. High-Strength Bolted Connections:
 - 1) High Strength Bolts:
 - a) Provide bolts meeting the requirements of ASTM A 325.
 - 2) Carbon and Alloy Steel Nuts:
 - a) Provide heavy hex nuts meeting the requirements of ASTM A 563.
 - 3) Hardened Steel Washers:
 - a) Provide washers complying with the requirements for Type 1 washers specified in ASTM F 436.
 - 4) Bolts, Nuts and Washers for Guideway Bearing Assemblies:
 - a) For guideway support member connections, provide bolts, nuts and washers complying with the requirements specified in Section 604 of the ADOT Standard Specifications for Road and Bridge Construction, and galvanized in accordance with the requirements specified in ASTM A 153/A 153M.
 - 5) Fastener Assemblies:
 - a) Galvanized high strength bolts and nuts are considered to be a fastener assembly, and the nuts must be lubricated by the Supplier and tested with the high strength bolts furnished.
 - 6) Twist-Off-Type Tension Control Bolt Assemblies:
 - a) For connections not associated with the guideway support system, twist-off-type tension control bolts complying with the requirements specified in ASTM F 1852 may be provided.
 - b. Anchor Rods and Bolts:
 - 1) Rods:
 - a) Provide end-threaded rods complying with the requirements specified for Grades 36, 55, or 105 in ASTM F 1554 as noted on the Contract Drawings.
 - 2) Nuts:

- a) Provide heavy hex nuts complying with the requirements specified in ASTM A 563.
 - 3) Washers:
 - a) Provide washers complying with the requirements specified in ASTM F 436.
 - 4) Anchor Bolts for Guideway Members:
 - a) Provide anchor bolts for bearing assemblies complying with the requirements specified in ASTM A 36/A 36M.
 - c. Bolt Lubricant: Provide bolt lubricant having a molybdenum disulfide base.
 - d. Expansion Anchors:
 - 1) Provide zinc-plated expansion anchors complying with the requirements specified in Appendix D of ACI 318/318R, that have a currently approved ICC-ES Evaluation Report, and having Type 316 stainless steel wedge clips.
 - 2) Manufacturers (and acceptable models):
 - a) Hilti Corporation; Kwik-Bolt TZ, www.hilti.com.
 - b) Simpson Strong Tie, Strong-Bolt, www.strongtie.com.
 - c) Approved equal.
 - e. Adhesive Anchors:
 - 1) Provide adhesive anchors composed of an anchor rod assembly and injection cartridge.
 - a) Provide adhesive anchors complying with the requirements specified in Appendix D of ACI 318/318R, and having a currently approved ICC-ES Evaluation Report.
 - b) For exterior exposed locations, provide only stainless steel adhesive anchor rod assemblies.
 - c) Injection Adhesive:
 - (1) Provide a mixture of resin, hardener, cement, and water that provides optimal curing speed and high strength.
 - (2) Furnish the components in side-by-side refill packs that keep two components separate until use; or alternately furnish the product in large rigid cartridges.
 - 2) Manufacturers (and acceptable models):
 - a) Hilti Corporation; HIT RE 500-SD, www.hilti.com.
 - b) Simpson Strong Tie, XP, www.strongtie.com.
 - c) Approved equal.
- 3. Welding Electrodes:
 - a. For station and building connections, provide welding electrodes complying with the requirements specified for E70XX electrodes in Table 3.1 of AWS D1.1/D1.1M.
 - b. For guideway members, provide welding electrodes complying with the requirements specified in AWS D1.5/D1.5M.
 - c. Provide low-hydrogen electrodes for field welding.
 - 4. Welded Stud Shear Connectors:

- a. For guideway members, provide welded stud shear connectors complying with the requirements specified in Section 604 of the ADOT Standard Specifications for Road and Bridge Construction.
- b. For other than guideway members, provide headed stud type shear connectors (studs) complying with the requirements specified in Section 05310, Steel Deck.

F. Fabrication

1. Shop Fabrication:

- a. Fabricate structural steel in accordance with the Contract Drawings and the referenced AISC standards.
 - 1) For steel associated with the guideway support systems, provide materials complying with the requirements specified in Division 2, Section 11 "Steel Structures" in AASHTO HB-17.
- b. Shearing, Flame Cutting, and Chipping:
 - 1) Perform shearing, flame cutting, and chipping carefully and accurately so residual stress is not induced in the metal being cut.
 - a) Flame-cut the edges of members subjected to dynamic loading either by using a mechanically guided torch or by hand, and remove all nicks.
 - (1) Fabricate the radii of re-entrant gas-cut fillets as large as practicable, but in no case less than 3/4 inch.
 - (2) Perform flame cutting so the metal being cut is not carrying stress.
 - (3) Finish the exposed edges of members that were flame-cut by hand by grinding.
 - b) Add additional reinforcing as required where members are cut or coped to meet framing conditions.
- c. Bolt Holes:
 - 1) Punch, drill, subpunch, subdrill, or ream holes for bolts as required in accordance with the requirements specified in the following:
 - a) For station and building connections, in ANSI/AISC 360.
 - b) For guideway support structure connections, in Division 2, Section 11 "Steel Structures" in AASHTO HB-17.
- d. Holes for Other Work:
 - 1) Provide holes required for securing other work to structural steel framing and for passage of other work through members as shown on the final approved Shop Drawings.
 - a) Ream, drill, or punch holes perpendicular to the metal surface.
 - b) Do not flame cut holes or enlarge them by burning.
 - 2) Do not make additional openings in members not shown on the final approved Shop Drawings unless approval to do so is received from the Program/Project Manager.

- e. Mill the ends of columns and other members that will transmit loads in bearing.
- f. Except where welded connections are shown, for shop connections use bolts complying with the requirements specified in ASTM A 325.
 - 1) Install and tighten high strength bolts in accordance with the requirements of the RCSC Specification for Structural Joints Using High Strength Bolts.
 - 2) Arrange the bolts as indicated on the Contract Drawings; or if not indicated, arrange the bolts so that heads show in areas exposed to view.
 - 3) Clearly indicate the bolt arrangements on Shop Drawing submittals.
- g. Welding:
 - 1) Perform welding in accordance with AWS D1.1/D1.1M, except as modified herein.
 - 2) Use a welding procedure and sequence of welding that minimizes stresses and prevents needless distortion.
 - a) If it is necessary to straighten transverse warpage of flanges, use controlled heating along the outside face.
 - b) Allow for expected weld shrinkage when laying out and assembling members in the shop.
 - c) Trim members to size only when most or all of welding has been completed.
 - 3) On Architectural Exposed Structural Steel (AESS), prevent surface bleeding of back-side welding.
 - a) Provide continuous welds of uniform size and profile.
 - b) Grind butt welds flush.
 - c) Dress exposed welds.
 - 4) Weld tabs for temporary bracing and safety cabling at points concealed from view in the completed structure.
 - a) For guideway support steel, perform welding in accordance with the requirements specified in AWS D1.5/D1.5M.
- h. Properly mark and match mark materials to facilitate handling and field assembling components.
 - 1) Mark each member with its weight.
 - 2) Match-mark all shop pre-fitted members.

G. Finishes:

1. Primer Materials:

- a. ENVISION Requirements: For field applied paints used to touch up shop applied primer, provide paints with no more than 100 g/L of measured VOC content. This requirement does not apply to paints or primers applied to finishes outside of the building envelope.
- b. Provide a two-component fast-curing, low volatile organic compounds (VOC), metallic zinc-rich epoxy primer complying with the requirements specified in SSPC-Paint 20.

- c. Manufacturers:
 - 1) International Protective Coatings, Interzinc 315,
www.international-pc.com.
 - 2) Approved equal.
- 2. Finish Materials:
 - a. For Station and building structures, refer to the requirements specified in Section 07810, Applied Fireproofing, and Section 09960, High-Performance Coatings, for shop and field finish materials required for painted and coated surfaces.
 - b. Below Grade Coating:
 - 1) Where structural steel is to be placed below grade, apply a coal tar epoxy coating to provide a total coating thickness of 20 mils.
- 3. Shop Finishing Methods:
 - a. Unfinished Surfaces on Station and Building Structures:
 - 1) Do not paint the following surfaces of structural steel members:
 - a) Connection plates and members where slip-critical connections are required.
 - b) Surfaces in contact with fireproofing as specified in Section 07810, Applied Fireproofing.
 - c) Surfaces to be encased in concrete, except for the initial 2 inches of the length embedded.
 - d) Top flanges of beams to which metal decking or shear connectors are to be attached.
 - e) Surfaces that are within 0.5 inch of the toe of a weld prior to welding.
 - b. Finished Surfaces:
 - 1) Surface Preparation:
 - a) For station and building structures, clean the surfaces in accordance with the requirements of SSPC-SP 3 Power Tool Cleaning found in the SSPC Painting Manual.
 - b) For guideway support structures, clean steel surfaces in accordance with the requirements specified in Section 610 of the ADOT Standard Specifications for Road and Bridge Construction.
 - 2) Galvanizing:
 - a) For station and building structural steel specified to be galvanized, hot-dip galvanize the steel members and fabrications in accordance with ASTM A 123/A 123M to the thicknesses specified therein.
 - 3) Apply Primer:
 - a) For stations and buildings, immediately after surface preparation of structural steel apply the primer according to the manufacturer's instructions at a rate as recommended in the SSPC Painting Manual to provide a dry film thickness of not less than 1.5 mils.

- b) For guideway support structures, apply prime coats to structural steel in accordance with the requirements specified in Section 610 of the ADOT Standard Specifications for Road and Bridge Construction.
- c) Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
- d) For members to receive intumescent paint, apply a primer compatible with the finish coat specified in Section 09967, Intumescent Paints.
- 4) Apply Finish Coats:
 - a) For stations and buildings, apply finish coats of paint to structural steel in accordance with the requirements specified in Section 09960, High-Performance Coatings.
 - b) For guideway support structures, apply finish coats of paint to structural steel in accordance with the requirements specified in Section 610 of the ADOT Standard Specifications for Road and Bridge Construction.
- c. Cleaning:
 - 1) After structural steel for stations and buildings is fabricated, clean heavy deposits of oil and grease from unpainted structural steel surfaces in accordance with applicable AISC standards.

2.02 ACCESSORIES

A. Grout:

- 1. Provide non-shrink, non-metallic grout as specified in Section 03600, Grouts.

2.03 SOURCE QUALITY CONTROL

A. Tests and Inspections:

- 1. Materials and fabrication procedures specified in this Section require advance examination or laboratory testing by the code-required Approved Agency for performing Special Inspections and the Testing and Inspection Agency.
 - a. Provide these inspection and testing entities with access to the places where structural steel work is being fabricated or produced so the required inspections and testing can be performed before the material is shipped.
 - b. Both continuous and periodic Special Inspections will be performed during the fabrication of structural steel.
- 2. Material Tests:
 - a. Test Procedure:
 - 1) Material and physical analyses and tests as required by the ASTM Specifications referenced in Subparagraph 1.02.B.6 will be performed, including tests on filler metals for welding, and

- mechanical tests for high-strength threaded fasteners will be performed.
- b. Acceptance Criteria:
 - 1) Materials complying with the requirements of the standards are acceptable.
 - 3. Structural Steel Connection Tests:
 - a. Test Procedure:
 - 1) Shop-bolted structural steel connections will be inspected and tested in accordance with the International Building Code as Amended by the City of Phoenix, the AISC specifications listed in Subparagraph 1.02.B.4, and the RCSC Specification for Structural Joints Using ASTM A 325 or ASTM A 490 Bolts.
 - a) Test and inspect the connections for guideway support members in accordance with the requirements specified in Section 604 of ADOT Standard Specifications for Road and Bridge Construction.
 - 2) For slip-critical and pretension connections, 2 bolts, or 10 percent of the bolts, per connection, whichever is greater, will be tested.
 - b. Acceptance Criteria:
 - 1) The use of proper fastening components will be verified.
 - 2) Proper fabrication of the connected elements will be verified.
 - 4. Shop Welding Tests:
 - a. Test Procedure:
 - 1) Shop-welded connections will be tested in accordance with the requirements of AWS D1.1/D1.1M and the following:
 - a) The entire length of all full penetration welds will be visually inspected and ultrasonically tested in accordance with the requirements of ASTM E 164.
 - b) The entire length of all fillet welds will be visually inspected.
 - c) Fillet welds will be tested in accordance with the requirements for the Magnetic Particle Method specified in ASTM E 709 and the following.
 - (1) For gusset plates welded to steel members, 20 percent of fillet weld locations will be tested.
 - (2) For all other fillet weld locations, a minimum of 5 percent of the welds will be tested.
 - d) Both the type and location of all weld defects found in the work and the work required to correct these deficiencies will be recorded.
 - b. Acceptance Criteria:
 - 1) Perform and record the work to correct the deficiencies discovered.
 - 5. Inspections:
 - a. Shop Welding:

- 1) All welders and welding materials being supplied under this Contract will be verified as properly certified.
 - 2) Shop welds made during fabrication of structural steel assemblies will be inspected by performing a visual inspection of the full length of the welds.
 - 3) Welds of guideway support members will be inspected in accordance with the requirements specified in Section 604 of the ADOT Standard Specifications for Road and Bridge Construction.
- B. Non-Conforming Work:
1. Promptly remove and replace materials or fabricated components that do not comply with specified requirements.
 2. Depending on the amount of non-conforming work encountered, the amount of testing required may be modified.
- C. Coordination of Other Tests and Inspections:
1. Notify the code-required Approved Agency responsible for performing special inspections when structural steel for this Contract is being fabricated, shipped, and/or tested.
 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
1. Before proceeding to erect the structural steel, verify the elevations of concrete and masonry bearing surfaces and the locations of anchorages are in compliance with the Contract Documents and ready to receive the work of this Section.
 2. Ensure anchor rods, bolts, and other embedded items that vary in location from the dimensions shown on the Contract Drawings are positioned within the tolerances listed in AISC 303.
- B. Evaluation and Assessment:
1. Immediately report any errors in the structural steel which will prevent the proper erection and fitting of parts.
 - a. Report errors resulting from either shop fabrication or deformation resulting from handling or transportation.
 2. Do not proceed with erection until unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Surface Preparation:

1. If anchor rods or bolts were cast in the substructure when it was constructed, ensure they are held firmly in the correct position and at the proper elevation by suitable templates.
2. Install Expansion and Adhesive Anchors:
 - a. Install expansion and adhesive anchors in strict accordance with the manufacturer's instructions and the applicable approved ICC-ES Legacy Report.
 - 1) Drill holes of the required diameter and depth consistent with the anchor manufacturer's installation instructions using a rotary hammer type drill.
 - b. Expansion Anchor Installation:
 - 1) Embed expansion anchors to a minimum embedment of 8 bolt diameters, unless otherwise indicated on the Contract Drawings or in the manufacturer's instructions.
 - c. Adhesive Anchor Installation:
 - 1) Prior to setting the adhesive anchor studs, clean loose material from the drilled holes by first blowing oil-free compressed air from the back of the hole until the air is free of dust, next brush the hole 2 times with a brush having a diameter the same as the borehole, and then blow oil-free compressed air into the hole twice more until the air stream is free of dust.
 - a) Repeat this procedure as needed.
 - b) Comply with additional requirements of the adhesive manufacturer's recommended procedures.
 - c) Ensure the brush is the correct size for each hole, and replace worn out brushes.
 - 2) Cover each cleaned hole until an adhesive anchor is actually installed in it.
 - 3) Embed the anchor rods in adhesive within the holes in accordance with the recommendations of the adhesive manufacturer.
 - a) Embed anchor rods to a minimum embedment of 8 rod diameters, unless otherwise indicated on the Contract Drawings or in the manufacturer's instructions.
 - b) Do not disturb the anchor/dowel until the gel-time has elapsed.
 - c) Do not apply a load/torque to the anchor until the cure time has elapsed.
 - d) Submit the adhesive manufacturer's recommendations regarding adhesive application, gel/cure times, and acceptable environmental conditions such as ambient temperatures.
3. Thoroughly clean surfaces to be joined.

3.03 ERECTION

- A. Provide temporary shores, guys, braces, and other supports during erection to keep structural steel secure, plumb, and in alignment against temporary construction loads and loads equal in intensity to design loads.
 - 1. Use temporary bracing to resist loads to which the structures may be subjected, including loads from erection equipment or its operation.
 - 2. Leave temporary bracing in place as long as may be required for safety.
- B. Erect structural steel elements plumb, in the location and at the elevation shown on the Contract Drawings, and in accordance with the match marks, pertinent regulations, and the referenced AISC standards.
 - 1. Align column bases and bearing plates for beams and similar structural members using steel wedges or shims.
 - 2. Do not field cut or alter structural members without the approval of the Program/Project Manager.
 - 3. Allow concrete foundations to cure for a minimum of 14 days before tightening anchor rod hardware.
 - a. Do not tighten anchor rod hardware using impact torque wrenches.
- C. Apply a coal tar epoxy coating to steel below grade.
- D. Bolted Connections:
 - 1. For connections using high-strength steel bolts, comply with the requirements of the referenced AISC Specifications.
 - a. For guideway support member connections comply with the requirements specified in Section 604 of ADOT Standard Specifications for Road and Bridge Construction and with AASHTO HB-17.
 - b. Assemble high-strength bolted parts so they fit solidly together when assembled.
 - 1) Remove scale, dirt, butts, and other defects liable to prevent proper seating when joint surfaces are assembled, particularly joint surfaces adjacent to washers.
 - 2) Do not use gaskets or any other interposed compressible materials.
 - 3) Only use drift pins for bringing members into position, not to enlarge or distort holes.
 - 2. Ensure that holes are not enlarged, and that drifting occurring during assembly does not disturb metal in the vicinity of holes.
 - a. Enlarge holes to admit bolts for connections only if approved by the Program/Project Manager.
 - 1) Make the enlargement by reaming and not by burning.
 - 2) Avoid hand reaming.
 - 3. As erection progresses, install sufficient bolts in the work to resist dead loads, wind loads, and erection loads.

- a. Arrange and insert the bolts so the bolt heads show in areas exposed to view.
 - b. Do not permanently fasten the bolted connections until the structural steel has been sufficiently aligned and bolted to support as much of the structure as possible by such fastening work.
 4. For bearing-type connections, tighten the ASTM A 325 bolts to a snug tight condition by either applying a few impacts from an impact wrench or the full effort of an ironworker using an ordinary spud wrench so all plies of the connected material have been brought into firm contact.
 5. For slip-critical and pretension connections, tighten the ASTM A 325 bolts, nuts, and twist-off-type tension control bolt in accordance with the referenced AISC specifications.
 - a. Clean oil, paint, and lacquer from the contact surfaces of slip-critical joints.
- E. Field Welding:
 1. Field welding is only permitted where approved by the Program/Project Manager, indicated on the Contract Drawings, or indicated in the approved Shop Drawings.
 - a. Securely tighten erection bolts used in welded construction and leave them in place.
 - b. Field welding rigid frame flange connection plates on columns may only be done if required for ease of erection; and if required, must be clearly indicated on the approved Shop Drawings and approved by the Program/Project Manager.
 2. Weld guideway support members in accordance with the requirements specified in Section 604 of the ADOT Standard Specifications for Road and Bridge Construction.
- F. Grouting Bearing Plates:
 1. After the supported members for building structures have been aligned and properly positioned, and the anchor nuts have been tightened, dry-pack the entire area under bearing plates with non-shrink non-metallic grout as indicated on the Contract Drawings.
 2. Do not place concrete on steel structures until the grout is in place and anchor nuts have been tightened.
- G. Interface with Other Work:
 1. Prior to installing metal decking, clean all heavy rust, mill scale, dirt or other material from the unpainted top flanges of supporting beams.

3.04 REPAIR

- A. Immediately after erection, clean field welds, bolted connections, and areas where shop paint is abraded; and prime them with paint of the same quality as that used for the shop coat.

1. For stations and buildings, prime them with paint in accordance with the requirements specified in Section 09960, High-Performance Coatings.
 2. For guideway elements, prime them with paint in accordance with the requirements specified in the ADOT Standard Specifications for Road and Bridge Construction.
- B. Repair galvanized areas damaged by welding and flame cutting, and during handling, transport, and erection.
1. For stations and buildings, use an approved repair method in accordance with the requirements specified in ASTM A 780.
 2. For guideway elements, use an approved repair method in accordance with the requirements specified in ADOT Standard Specifications for Road and Bridge Construction.
- C. Apply touch-up paint to exposed areas.
1. For stations and buildings, use material complying with the requirements specified in Section 09960, High-Performance Coatings.
 2. For guideway elements, use material complying with the requirements specified in ADOT Standard Specifications for Road and Bridge Construction.

3.05 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
1. During the period when structural steel is being erected, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - 1) Both continuous and periodic Special Inspections will be performed during the erection of structural steel.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency and/or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
 2. Connection Testing
 - a. Test Procedure:
 - 1) The field-bolted structural steel connections will be inspected and tested in accordance with the AISC specifications listed in

Subparagraph 1.02.B.4, and the RCSC Specification for Structural Joints Using ASTM A 325 or ASTM A 490 Bolts.

- a) Test and inspect the connections for guideway support members in accordance with the requirements specified in Section 604 of ADOT Standard Specifications for Road and Bridge Construction.
 - 2) Use of proper fastening components and proper fabrication of connected elements will be verified.
 - 3) 2 bolts or 10 percent per connection for each slip-critical and pretension connection will be tested.
 - b. Acceptance Criteria:
 - 1) Connections complying with the requirements specified in the AISC and RCSC specifications will be acceptable.
3. Field Welding Testing:
- a. Test Procedure:
 - 1) Field welds made during erection of structural steel assemblies will be inspected and tested, first by having a visual inspection of the full length of all welds performed, and then by having field-welded connections inspected and tested in accordance with the requirements of AWS D1.1/D1.1M and the following:
 - a) For guideway support member connections comply with the requirements specified in Section 604 of ADOT Standard Specifications for Road and Bridge Construction and with AASHTO HB-17.
 - b) Prior to the ultrasonic testing, remove run-off tabs of full penetration welds and grind those areas smooth, then magnetic particle testing (MT) of the ends will be performed.
 - c) The entire length of all full penetration welds will be ultrasonically tested in accordance with the requirements of ASTM E 164.
 - d) The entire length of all fillet welds will be tested in accordance with the requirements for the Magnetic Particle Method specified in ASTM E 709 and the following.
 - (1) For beam connection plates (angles) welded to plates embedded in concrete, all welds will be tested.
 - (2) For diagonal bracing members welded to gusset plates 40 percent of the fillet weld locations will be tested.
 - (3) For gusset plates welded to steel members, 40 percent of the fillet weld locations will be tested.
 - (4) For all other fillet weld locations, a minimum of 10 percent of the welds will be tested.
 - 2) Both the type and location of defects found in the work will be recorded.
 - b. Acceptance Criteria:

- 1) Field welds complying with the requirements specified in the AWS and ASTM specifications will be acceptable.
4. Inspections:
 - a. Inspect the high-strength bolted connections and welded connections.
 - b. Have the Professional Land Surveyor survey each elevated framed level to determine the locations of the top of steel elevations and the edge of slab locations, and verify that the structure is square, plumb, and level in accordance with AISC tolerances, including special tolerances for AECS.
 - 1) Submit a certified copy of the Professional Land Surveyor survey of the locations of the top of steel elevations and the edge of slab locations to the Program/Project Manager for approval.
 - c. Verify only erectors qualified as specified herein erect the structural steel.
 - d. Verify the welders and welding materials in the field are properly certified.
- B. Non-Conforming Work
 1. Promptly remove and replace Work that does not comply with specified requirements.
 - a. Correct deficiencies in the Work that inspections and test reports have indicated to be not in compliance with requirements.
 2. Record the work required and the work performed to correct deficiencies in field welding.
 3. Depending on the amount of non-conforming work encountered, the amount of testing required may be modified.

3.06 CLEANING

- A. Waste Management:
 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

SECTION 05210

STEEL JOISTS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for fabricating, furnishing, and installing steel joists at the locations indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 – Sustainable Design Requirements
 - 3. Section 05120 - Structural Steel.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
- B. Reference Standards:
 - 1. American Welding Society (AWS):
 - a. ANSI/AWS D1.1/D1.1M, Structural Welding Code - Steel.
 - 2. City of Phoenix (COP):
 - a. Phoenix Building Construction Code and Amendments.
 - 3. International Code Council (ICC):
 - a. ICC International Building Code (IBC) as Amended by the City of Phoenix.
 - 4. Steel Joist Institute (SJI):
 - a. SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders.
 - 1) ANSI/SJI-K-1.0, Standard Specifications for Open Web Steel Joists, K-Series.
 - a) SJI Standard Load Table/Open Web Steel Joists, K-Series.
 - b) SJI KCS Joists Load Table
 - c) SJI K-Series Economy Table

- d) SJI Standard Load Table in Metric Units/Open Web Steel Joists, K-Series.
- 2) ANSI/SJI-LH/DLH-1.0, Standard Specifications for Longspan Steel Joists, LH-Series and Deep Longspan Steel Joists, DLH-Series.
 - a) SJI Standard Load Table/Longspan Steel Joists, LH-Series.
 - b) SJI Standard Load Table/Deep Longspan Steel Joists, DLH-Series.
 - c) SJI Standard Load Table in Metric Units/Longspan Steel Joists, LH-Series.
 - d) SJI Standard Load Table in Metric Units/Deep Longspan Steel Joists, DLH-Series.
- 3) ANSI/SJI-JG-1.0, Standard Specifications for Joist Girders.
 - a) Joist Girders/Design Guide Weight Table for Joist Girders (Inch-Pound Units).
 - b) Joist Girders/Design Guide Weight Table for Joist Girders (Metric Units).
- 4) SJI Recommended Code of Standard Practice for Steel Joists and Joist Girders.
- 5. The Society for Protective Coatings (SSPC):
 - a. SSPC Painting Manual.
 - 1) SSPC-SP 1, Solvent Cleaning.
 - 2) SSPC-Paint 15, Steel Joist Shop Primer.
- 6. U. S. Government:
 - a. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 Occupational Health and Safety Standards.
 - 2) 29 CFR 1926 Safety and Health Regulations for Construction.
 - b. Institute for Sustainability Infrastructure (ISI)
 - a. ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. 10 days before steel joists are to be erected, give notice to those performing other construction work related to the joist erection, such as to those performing work that must be supported by or that will provide support of the joists, to allow such items to be introduced or furnished before the joists are erected.
 - 2. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.

B. Sequencing:

1. Sequence the erection of steel joists to follow erection of supporting structural steel and concrete and masonry load bearing walls.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:

a. Product Data:

- 1) Product Data for the materials and products provided.
- 2) Post-Industrial Recycled Content Affidavit.
- 3) Post-Consumer Recycled Content Affidavit.

b. Shop Drawings:

- 1) Steel joists.

c. Certificates:

- 1) Joist Manufacturer's Certification.
- 2) Fabricator Welders Certification.
- 3) Erector Welders Certification.

d. Special Procedure Submittals:

- 1) Documentation qualifying the welding processes.

e. Qualification Statements:

- 1) Steel joist fabricator qualifications.
- 2) Steel joist erector qualifications.

B. Engineered Submittals:

1. Submit drawings and calculations that are appropriately signed and sealed by a professional structural or civil engineer registered in Arizona to the design professional in responsible charge for review. Review of engineered drawings and calculations will be for general conformance with the design intent of the structure and submittal compliance.

C. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA1.3 – Use Recycled Materials
 - 1) Submit product data for recycled content indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Special Inspections:

- a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - b. Both continuous and periodic Special Inspections will be performed during the fabrication and erection of structural steel.
 - 2. Phoenix Building Construction Code:
 - a. Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments.
- B. Qualifications:
 - 1. Welding Qualifications:
 - a. Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders and welding procedures to the Program/Project Manager for approval.
 - 1) For all procedures, other than those set forth in AWS D1.1/D1.1M, submit a copy of the procedure qualification test records.
 - b. Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed in AWS D1.1/D1.1M for the procedures.
 - 1) Submit certificates certifying that the welders employed to fabricate and to erect the Work of this Section have been AWS certified within the previous 12 months to the Program/Project Manager for approval.
 - a) Include certified copies of qualification test records that indicate each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures and, if pertinent, has undergone recertification.
 - 2. Steel Joist Fabricator Qualifications:
 - a. Only employ a steel joist fabricator certified by the Steel Joist Institute (SJI) to manufacture the joists and insure they comply with SJI standards, and who has successfully fabricated steel joist systems of similar size and complexity for a continuous period of at least 5 years immediately prior to the GMP Proposal date.
 - b. Submit the steel joist fabricator's qualifications to the Program/Project Manager for approval.
 - 3. Steel Joist Erector Qualifications:
 - a. Only employ a steel joist erector who has successfully erected steel joist systems of similar size and complexity for a continuous period of 5 years immediately prior to the GMP Proposal date
 - b. Submit the steel joist qualifications to the Program/Project Manager for approval.
- C. Certifications:
 - 1. Joist Manufacturer's Certification:

- a. Submit the joist manufacturer's certification that joists provided comply with the requirements of the SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders for the type of joists specified.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 1. Deliver steel joists as recommended by the Steel Joist Institute (SJI).
- B. Storage and Handling Requirements:
 1. Store and handle steel joists as recommended by the Steel Joist Institute (SJI).
 - a. Handle and store joists in a manner to avoid deforming the members, to avoid excessive stresses, and to maintain the shop coat of paint intact without rusting.

PART 2 PRODUCTS

2.01 MANUFACTURED UNITS

- A. Steel Joists:
 1. Provide steel joists fabricated in accordance with the requirements of 29 CFR 1926; the American Welding Society (AWS), Steel Joist Institute (SJI), and The Society for Protective Coatings (SSPC) standards listed in Paragraph 1.02.B, and as specified herein.
 2. Provide joist type as indicated on the Contract Drawings.
- B. Bridging:
 1. Provide horizontal and/or diagonal type bridging complying with the requirements of the SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders for the type of joists being fabricated.
- C. End Anchorages:
 1. Unless otherwise indicated, provide end anchorages complying with the requirements of the SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders.
 - a. Provide anchors to secure joist ends to adjacent construction.
 - b. Provide bridging anchors for the ends of all bridging lines terminating at walls or beams.
- D. Header Units:
 1. Provide header units for K-series joists to support the tail joists at openings in the roof system not framed with steel shapes.
- E. Bearings:

1. Provide special depth bearings for K-series joists at locations shown on the Contract Drawings or where K-series joists are adjacent to LH or DLH series joists.

F. Ceiling Extensions:

1. Provide ceiling extensions in those areas where ceiling materials attach directly to joist bottom chords.
 - a. Extend such ceiling extensions no closer than one inch from wall surfaces.

2.02 MANUFACTURERS:

A. Manufacturer List:

1. Subject to compliance with the requirements specified in this Section, manufacturers offering products that may be incorporated in the Work include the following:
 - a. Nucor Corporation - Vulcraft Group, www.vulcraft.com.
 - b. The New Columbia Joist Company, a subsidiary of Bouras Industries, Inc., www.njb-united.com/ncj.
 - c. Canam Steel Corporation, <http://www.canam-steeljoists.ws/www/v4/ecanams.nsf..>
 - d. Approved equal.

2.03 REGULATORY REQUIREMENTS:

- A. Provide steel joists in compliance with the requirements of 29 CFR 1910 and 29 CFR 1926, particularly 29 CFR 1926.757 Open Web Steel Joists, and with the requirements of ICC International Building Code (IBC) as Amended by the City of Phoenix.
- B. Buy America:
 1. All steel joists used for this Contract must be American-made.
 2. Submit a guarantee certifying that all steel used for the Work of this Contract is American-made.

2.04 SUSTAINABILITY REQUIREMENTS:

A. ENVISION Requirements:

1. Recycled Content
 - a. Provide Steel Joists who's combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 75 percent.
2. Low Emitting Materials – Paints and Coatings
 - a. When paint is field applied to touch-up shop applied primer on surfaces within the building envelop, ensure they have a VOC content not exceeding 100 g/L.

2.05 DESIGN CRITERIA:

- A. Provide steel joists designed in accordance with the requirements of 29 CFR 1926, particularly 29 CFR 1926.757 Open Web Steel Joists; and with the requirements of the American Welding Society (AWS), Steel Joist Institute (SJI), and The Society for Protective Coatings (SSPC) standards listed in Paragraph 1.02.B.
 - 1. When the strength of the member is calculated, the area of holes must be deducted from the area of chords.
- B. Provide steel joists designed to resist the specified loading indicated on the Contract Drawings.
- C. Submit the manufacturer's Product Data, for the materials and products provided, to the Program/Project Manager for approval.
 - 1. Include specifications and the manufacturer's installation instructions for each type of joist provided and its accessories.
- D. Submit Shop Drawings of the steel joists to the Program/Project Manager for approval.
 - 1. Include detailed drawings showing the layout of joist units, special connections, jointing, and accessories.
 - a. Include the mark, number, type, location, and spacing of the joists and bridging.
 - 2. Include templates or location drawings for installation of anchor bolts.

2.06 MATERIALS:

- A. Steel:
 - 1. Provide steel complying with the requirements of the SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders.
 - 2. Provide steel having a yield strength of 50,000 psi.
- B. Welding Electrodes:
 - 1. Provide welding electrodes and filler metal conforming to the requirements of the AWS standards referenced in the SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders.

2.07 FABRICATION:

- A. Shop Fabrication:
 - 1. Fabricate steel joists in accordance with the requirements of 29 CFR 1926; the American Welding Society (AWS), Steel Joist Institute (SJI), and

The Society for Protective Coatings (SSPC) standards listed in Paragraph 1.02.B, and as specified herein.

2. Holes in Chord Members:
 - a. Provide holes in chord members where shown for securing other work to the steel joists.

2.08 FINISHES:

- A. Primer Materials:
 1. Provide steel primer complying with the requirements for Type 1, red oxide steel joist shop paint as specified in SSPC Paint Specification No.15.
- B. Shop Finishing Methods:
 1. Before applying shop primer, remove loose scale, heavy rust, and other foreign materials from fabricated joists and accessories, and clean the surfaces with solvent in accordance with the requirements of SSPC-SP 1.
 2. Apply one coat of steel primer to the steel joists and accessories in accordance with the manufacturer's recommended procedures and mil thickness.
 - a. Minimum Thickness: 1 mil.
 3. Do not prime surfaces of fabricated joists and accessories that will be fireproofed.

2.09 ACCESSORIES

- A. Standard Accessories:
 1. Provide the manufacturer's standard accessories complying with the requirements of the SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders.
- B. Anchor Bolts and Other Devices:
 1. Furnish anchor bolts and other devices to be built into concrete and masonry construction for attaching the steel joists.
 - a. Provide anchors meeting the requirements of Section 05120, Structural Steel.
 - b. Furnish templates for accurately locating anchors in such other work.

2.10 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.

2. Testing and Inspection Agency Qualifications:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky harbor International Airport will employ independent Testing and Inspection Agencies, including the City Building Official and the City of Phoenix Testing Laboratory.
 3. Materials and fabrication procedures specified in this Section require advance examination or laboratory testing by the code-required Approved Agency for performing Special Inspections and the Testing and Inspection Agency.
 - a. Provide these inspection and testing entities with access to the places where steel joists are being fabricated or produced so the required inspections and testing can be performed before the material is shipped.
 4. Inspections:
 - a. Verify that only fabricators qualified as specified herein produce the steel joists.
 - b. Shop welds made on joists are subject to inspection and testing.
- B. Non-Conforming Work:
1. Promptly remove and replace materials or fabricated components that do not comply with specified requirements.
- C. Coordination of Other Tests and Inspections:
1. Notify the code-required Approved Agency responsible for performing special inspections when steel joists for this Contract are being fabricated, shipped, and/or tested.
 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.
 - a. Provide full access to the Work.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
1. Prior to erecting the steel joists, have the steel joist erector verify that the preparatory work is complete, and ready to receive the joists.
 - a. Verify that the elevations of concrete and masonry bearing surfaces are correct.
 - b. Verify that the locations of anchors and other devices for attaching the steel joists to concrete and masonry construction are correct.
 2. Report discrepancies to the Program/Project Manager.
- B. Evaluation and Assessment:

1. Do not begin erecting steel joists until the supporting work is in place and secured.

3.02 ERECTION

- A. Place and secure steel joists in accordance with the requirements of the SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders, the approved Shop Drawings, and as otherwise specified herein.
 1. Use only erectors qualified as specified herein.
- B. Placing Joists:
 1. Position and space the joists on the supporting work as shown on the Contract Drawings and as specified.
 2. Accurately align and adjust the location and spacing of the joists before permanently fastening them.
- C. Bridging:
 1. Install bridging between joists simultaneously with joist erection and before any construction loads are applied.
 - a. Provide temporary bridging, connections, and anchors to ensure lateral stability during construction.
 - b. Where bridging lines terminate at walls or beams, anchor the ends of both the top and bottom chords of the bridging.
 2. Do not provide fewer rows of bridging than shown in the appropriate bridging table in the SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders.
 3. Provide a single line of bridging at the first bottom chord panel point at each end of every joist.
 4. Space the bridging rows in the span so that the spacing between bridging is uniform.
- D. Interface with Other Work:
 1. Fastening Joists:
 - a. Field weld the ends of joists to the supporting steel in accordance with the requirements of the SJI Catalog of Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders for the type of joist used.
 - 1) Coordinate the welding sequence and welding procedure with the placement of the joists.
 - b. Bolt joists to supporting steel at columns.

3.03 REPAIR/RESTORATION

- A. Field Painting:

1. After the joists have been installed, paint all field-installed bolt heads, nuts, and welded areas; and paint abraded or rusty surfaces on joists and steel supporting members
 - a. Wire brush and solvent clean surfaces where the prime coat has been damaged before applying this touch-up paint.
2. Use the same type of paint for field painting as was used for shop priming.

3.04 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. During the period when the steel joists are being erected, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing and inspection of materials and procedures.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - 1) Both continuous and periodic Special Inspections will be performed during the erection of steel joists.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Inspections:
 - a. Verify that only erectors qualified as specified herein erect the steel joists.
 - b. Joists welded in place are subject to inspection and testing.

B. Non-Conforming Work

1. Promptly remove and replace Work that does not comply with specified requirements.
 - a. Correct deficiencies in the Work that inspections and test reports have indicated to be not in compliance with requirements.

SECTION 05310

STEEL DECK

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for providing steel decking at locations indicated on the Contract Drawings, including the following:
 - a. Roof decking.
 - b. Composite floor decking.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 – Sustainable Design Requirements.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 03300 – Cast-In-Place Concrete.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
- B. Reference Standards:
 - 1. American Iron and Steel Institute (AISI):
 - a. AISI North American Specification for the Design of Cold-Formed Steel Structural Members.
 - 2. ASTM International (ASTM):
 - a. ASTM A 108 - Standard Specification for Steel Bars, Carbon and Alloy, Cold-Finished.
 - b. ASTM A 653/A 653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - c. ASTM A 780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
 - d. ASTM A 924/A 924M - Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.

 - b. Institute for Sustainability Infrastructure (ISI)
 - a. ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. 10 days before steel deck is to be erected, give notice to those performing other construction work related to the deck erection, such as to those performing work that must be supported by or that will provide support of the deck, to allow such items to be introduced or furnished before the deck is erected.
 - 2. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.
- B. Sequencing:
 - 1. Sequence the erection of steel deck to follow erection of supporting structural steel, steel joists, and concrete and masonry load bearing walls.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. In accordance with the requirements of Section 01330, Submittal Procedures, submit the following to the Program/Project Manager for approval:
 - a. Product Data:
 - 1) Steel roof deck.
 - 2) Steel composite floor deck.

- 3) Mechanical fasteners.
 - 4) Rib closure strips.
 - 5) Pour stops and girder fillers.
 - 6) Column closures, end closures, Z-closures, and cover plates.
 - 7) Weld washers.
 - 8) Roof sump pans.
 - 9) Flat receiver pans.
 - 10) Galvanizing repair paint.
 - 11) Headed stud type shear connectors (studs).
 - 12) Hanger attachment devices.
 - b. Shop Drawings:
 - 1) Deck panel layout; anchorage details; conditions requiring closure panels, special jointing, and other accessories.
 - c. Certificates:
 - 1) Manufacturer's Certification
 - 2) Steel Certificate.
 - d. Delegated Design Submittals:
 - 1) Pour sequences, maximum square footage of each pour, and pour joint locations.
 - e. Special Procedure Submittals:
 - 1) Welding procedure qualification test records.
 - f. Qualification Statements:
 - 1) Installer's qualifications.
 - 2) Welder Certificates.
- B. Informational Submittals:
- 1. In accordance with the requirements of Section 01330, Submittal Procedures, submit the following to the Program/Project Manager for information:
 - a. Manufacturer's Instructions:
 - 1) Manufacturer's installation instructions.
 - 2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA1.3 – Use Recycled Material
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. At least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - b. L

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
- 1. Special Inspections:

- a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
 - c. Periodic Special Inspections will be performed during the fabrication and erection of structural steel.
- B. Qualifications:
- 1. Installer Qualifications:
 - a. Engage an experienced Installer who has completed steel deck installation similar in material, design, and extent to that indicated for this Contract, and which exhibits a record of successful in-service performance.
 - 1) Submit the Installer's qualifications to the Program/Project Manager for approval.
 - 2. Welding Qualifications:
 - a. Welding Procedure Specifications (WPS):
 - 1) Prior to beginning work that requires welding, submit the pre-qualifying welding procedures to the Program/Project Manager for approval.
 - 2) For all procedures, other than those set forth in AWS D1.1/D1.1M or AWS D1.3, submit a copy of the welding procedure specifications (WPS) test records to the Program/Project Manager for approval.
 - b. Welders' Qualifications:
 - 1) Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders to the Program/Project Manager for approval.
 - 2) Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed for the procedures in AWS D1.1/D1.1M or AWS D1.3:
 - 3) Submit Welding Certificates certifying the welders employed to fabricate and to erect the Work of this Section have been AWS certified within the previous 12 months to the Program/Project Manager for approval.
 - a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the

required welding procedures and, if pertinent, has undergone recertification.

C. Certifications:

1. Manufacturer's Certification:

- a. Submit a manufacturer's certification certifying the Work performed under this Section complies with the specified requirements.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Use special care in shipping steel deck.
2. Ensure materials are delivered to the Site at times and intervals that facilitate uninterrupted progress of the Work and continuity of installation.
 - a. Deliver anchor rods and other anchorage items to be embedded in or attached to concrete, masonry, or other materials in ample time so the Work is not delayed.

B. Storage and Handling Requirements:

1. Store decking on platforms, skids, blocking or other supports, and with one end elevated.
2. Protect decking from the weather with non-asphaltic waterproof covering, adequately ventilated to prevent condensation.
3. Do not damage decking during handling or rigging.
 - a. Do not use decking for bulk storage, or as a working platform for other construction materials.
 - b. Do not overload decking during installation and the entire construction period.
 - c. Do not place deck bundles on unbolted/unwelded building frames.
4. During installation, do not locate bundles of uninstalled decking where they will overload supporting members.

1.07 SITE CONDITIONS

A. Ambient Conditions:

1. Do not weld decking when the base metal temperature is below 32 degrees Fahrenheit (0 degrees Celsius), or when the surface to be welded is wet.

PART 2 PRODUCTS

2.01 MANUFACTURER LIST

- A. Subject to compliance with the requirements specified in this Section, manufacturers offering products that may be incorporated in the Work include the following:

1. Vulcraft, a Division of Nucor Corporation, www.vulcraft.com.

2. Wheeling Corrugating Company, a Division of Wheeling-Pittsburgh Steel Corporation, www.wheelingcorrugating.com.
3. Verco Manufacturing Company, www.vercodeck.com.
4. Or equal.

2.02 REGULATORY REQUIREMENTS:

- A. Phoenix Building Construction Code:
 1. Provide the Work of this Section in accordance with the requirements of the Phoenix Building Construction Code and Amendments.
- B. Occupational Safety and Health Administration (OSHA):
 1. Place steel deck in compliance with the requirements of 29 CFR 1910 and 29 CFR 1926, particularly 29 CFR 1926.754, Structural Steel Assembly, related OSHA Directive Number CPL 02-01-034 [Old Directive Number CPL 2-1.34].

2.03 SUSTAINABILITY REQUIREMENTS:

- A. ENVISION Requirements:
 1. Recycled Content
 - a. Provide Structural Steel whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 25 percent.
 2. Low Emitting Materials – Paints and Coatings
 - a. When paint is field applied to touch-up shop applied primer on surfaces within the building envelop, ensure they have a VOC content not exceeding 100 g/L.

2.04 DESIGN CRITERIA

- A. Steel Deck Panels:
 1. Provide steel deck panels designed in accordance with the requirements of SDI 30, or that have an approved ICC Evaluation Service Evaluation Report listing the gravity and diaphragm load values of the decking.
 - a. Provide deck configurations complying with basic design specifications in SDI 30, and as specified herein.
 2. Structural Properties:
 - a. Provide roof and floor deck sections having structural properties computed in accordance with the AISI North American Specification for the Design of Cold-Formed Steel Structural Members.
 - 1) Do not support other construction from the steel roof deck, including but not limited to suspended ceilings, light fixtures, ducts, piping, conduits, other equipment, or utilities and similar items.

- B. Product Data:
 - 1. Submit the manufacturer's Product Data for each product specified and provided to the Program/Project Manager for approval.
 - 2. Submit the manufacturer's installation instructions for each product specified to the Program/Project Manager for information.
- C. Shop Drawings:
 - 1. Submit detailed Shop Drawings showing the layout of deck panels; anchorage details; and every condition requiring closure panels, special jointing, or other accessories to the Program/Project Manager for approval.
- D. Welding Standards:
 - 1. Comply with applicable provisions of AWS D1.1/D1.1M and AWS D1.3.

2.05 MATERIALS

- A. Roof Deck:
 - 1. Steel Roof Deck:
 - a. Steel Sheet: Provide steel sheet classified as Grade 33 or higher Structural Steel (SS) with Coating Designation G 60 per ASTM A 653/A 653M, and zinc coated according to ASTM A 924/A 924M.
 - b. Provide roof deck having the deck profile and depth, and the design uncoated-steel thickness, indicated on the Contract Drawings.
 - c. Provide roof deck units in lengths capable of spanning 3 or more supports, and designed with overlapping side joints, unless otherwise indicated.
 - d. For areas where insulating concrete is to be placed, provide vented decking.
- B. Floor Deck:
 - 1. Steel Composite Floor Deck:
 - a. Steel Sheet: Provide steel sheet classified as Grade 40 or higher Structural Steel (SS) with Coating Designation G 60 per ASTM A 653/A 653M, and zinc coated according to ASTM A 924/A 924M.
 - b. Provide floor deck having the deck profile depth, and the design uncoated-steel thickness, indicated on the Contract Drawings.
 - c. Provide floor deck units in lengths capable of spanning 3 or more supports, and designed with overlapping side joints, unless otherwise indicated.

2.06 SHOP FABRICATION

- A. Fabricate roof and floor panels in accordance with the requirements of SDI 30:

1. Fabricate steel composite floor deck panels with integrally embossed or raised pattern ribs and interlocking side laps, and having at a minimum the section properties indicated.
 2. Weld studs in accordance with Section 7 in AWS D1.1/D1.1M; and provide welds meeting the mechanical properties for welded Type B studs in Table 7.1.
- B. Provide decking free of lubricants and oils which would impair the adhesion of spray-on fireproofing.
- C. Accessory Fabrication:
1. Steel Sheet Accessories:
 - a. Fabricate steel sheet accessories from steel sheet classified as Grade 33 or higher Structural Steel (SS) with Coating Designation G 60 in accordance with ASTM A 653/A 653M, and within the tolerances specified in ASTM A 924/A 924M.
 2. Miscellaneous Roof Deck Accessories:
 - a. Fabricate miscellaneous roof deck accessories, such as steel sheet ridge and valley plates, finish strips, and reinforcing channels, from the same material and thickness as the roof deck.

2.07 ACCESSORIES

- A. Provide accessory materials for steel deck that comply with the requirements indicated and the recommendations of the steel deck manufacturer.
1. Mechanical Fasteners:
 - a. Provide the manufacturer's standard, corrosion-resistant, low-velocity, powder-actuated or pneumatically driven carbon steel fasteners; or self-drilling, self-threading screws, that have a current approved ICC Evaluation Service Legacy Report.
 2. Rib Closure Strips:
 - a. Provide the manufacturer's standard vulcanized, closed-cell, synthetic rubber rib closure strips.
 3. Pour Stops and Girder Fillers:
 - a. Provide pour stops and girder fillers fabricated from the same steel sheet material as the deck panels, and of the thickness and profile indicated.
 4. Column Closures, End Closures, Z-Closures, and Cover Plates:
 - a. Provide column closures, end closures, Z-closures, and cover plates fabricated from the same steel sheet material and thickness as the deck panels, unless otherwise indicated.
 5. Weld Washers:
 - a. Provide the manufacturer's standard uncoated-steel sheet weld washers, shaped to fit the deck rib.
 - b. Washer Thickness: 0.0598 inch.
 - c. Pre-punched Hole Diameter: 3/8 inch, minimum.

6. Roof Sump Pans:
 - a. Fabricate roof sump pans with level bottoms and sloping sides to direct water flow to a drain from a single piece of galvanized sheet steel 0.071 inch (14 gage) thick, minimum.
 - b. Provide sump pans of adequate size to receive roof drains, and having bearing flanges not less than 3 inches wide.
 - c. Recess sump pans not less than 1-1/2 inches below the roof deck surface unless otherwise shown or required by the deck configuration.
 - d. Cut holes for drains in the roof sump pans in the field.
7. Flat Receiver Pans:
 - a. Provide the manufacturer's standard size flat receiver pans, fabricated from a single piece of the same steel sheet as the deck panels.
 - b. Receiver Pan Thickness: 0.071 inch, minimum.
 - c. Cut holes for drains in the flat receiver pans in the field.
8. Reinforcement at Deck Openings:
 - a. Unless otherwise shown, prior to cutting openings provide additional steel reinforcement and closure pieces as required to provide strength, continuity of the deck, and support for other work.
9. Galvanizing Repair Paint:
 - a. Provide high zinc-dust content paint complying with the requirements of ASTM A 780 to repair damaged galvanized surfaces.
10. Headed Stud Type Shear Connectors (Studs):
 - a. Provide headed stud type shear connectors (studs) meeting the requirements of ASTM A 108.
11. Hanger Attachment Devices:
 - a. Provide the manufacturer's standard hanger attachment devices.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Examine the deck support framing and other field conditions for compliance with the specified installation tolerances and other conditions which may affect the performance of the steel deck.
- B. Evaluation and Assessment:
 1. Do not install steel deck on support framing insufficient to support the decking, or that would detrimentally affect the performance of the deck.

3.02 INSTALLATION

- A. Requirements Applicable to Both Roof and Floor Deck:
 1. Install roof and floor deck panels and accessories according to applicable Specifications and the commentary of SDI 30, the manufacturer's recommendations, ICC Evaluation Service Evaluation Report

requirements for the decking selected, and the requirements of this Section.

2. Cut and neatly fit roof and floor deck panels and accessories around openings and other work projecting through or adjacent to the decking.
3. Place roof and floor deck panels on supporting framing, and adjust the panels to their final position with the ends accurately aligned and bearing on the supporting framing before being permanently fastened to the framing.
 - a. Place roof and floor deck units in lengths that span 3 or more supports with overlapping side laps, unless otherwise indicated.
 - b. Place roof and floor deck panels flat and square, and fasten them to the supporting framing without warp or deflection.
 - c. Provide miscellaneous steel, as required, at columns and at beam/column moment connections to adequately support the weight of construction loadings.
 - d. Do not leave roof and floor deck unattached at the end of each day's work.
4. Comply with AWS D1.1/D1.1M and AWS D1.3 requirements and procedures for manual shielded metal arc welding, appearance and quality of welds, and methods for correcting welding work.

B. Additional Requirements Applicable to Roof Deck Installation:

1. Fasten roof deck panels to each steel supporting member as shown on drawings in General Structural Notes. Where deck fastening is not shown on drawings, weld the bottom flutes of roof deck panels to each steel supporting member using fusion welds as follows.
 - a. Weld the panels at each support, with a minimum of 1 weld per flute and 1 weld on each side of side seams at each support.
 - b. Weld Diameter: 3/4 inch, nominal.
 - c. Weld Spacing Parallel to Flutes: Space welds at 12 inches on center, except in the 10-foot by 10-foot area at building/diaphragm corners where 6-inch weld spacing is required.
 - d. Weld Washers: Install weld washers at each weld location recommended by the deck manufacturer.
2. Side Lap and Perimeter Edge Fastening:
 - a. Fasten side laps and perimeter edges using one of the following methods:
 - 1) Provide piercing or crimping type connections, similar to the "Punch Lok" system by Verco, spaced 24 inches apart on center.
 - a) Do not use a button punching system.
 - 2) Mechanically fasten the side laps and perimeter edges of panels located between supports using self-drilling, number 12 diameter by 3/4-inch long, galvanized carbon steel screws spaced no more than 12 inches apart.
 - a) Verify that the deck side laps have been rolled during the manufacturing process to receive screws in the side lap joint.

3. End Bearing:
 - a. Unless otherwise noted on the Contract Drawings, install deck ends over the supporting framing with a minimum end bearing of 1-1/2 inches, and with end joints overlapped.
4. Roof Sump Pans and Sump Plates:
 - a. Install roof sump pans and sump plates over openings provided in the roof decking, and weld their flanges to top of the deck.
 - b. Space welds not more than 6 inches apart with at least one weld at each corner.
5. Miscellaneous Roof Deck Accessories:
 - a. Install ridge and valley plates, finish strips, cover plates, end closures, and reinforcing channels according to the deck manufacturer's recommendations.
 - b. Weld the miscellaneous roof deck accessories to the substrate to provide a complete deck installation.
6. Provide additional reinforcement and closure pieces at openings as required for strength, continuity of decking, and support of other work as follows:
 - a. Reinforce decking around openings having a 6-inch to 12-inch dimension in any direction by placing a steel sheet over the opening on the top of the decking, and fusion welding the sheet to the top surface of the deck.
 - 1) Provide sheet steel of the same quality as the deck units, and at least 12-inches wider and longer than the opening unless otherwise indicated on the Contract Drawings.
 - 2) Provide welds at each corner and along each side spaced not more than 12 inches apart on center.
 - b. For openings with a 12-inch or greater dimension in any direction, provide additional miscellaneous structural steel members on all sides of each opening as indicated on the Contract Drawings.
 - c. If more than one penetration occurs in a deck panel, contact the Program/Project Manager for reinforcement requirements.
 - d. Do not cut unscheduled openings through the deck without the approval of the Program/Project Manager.
- C. Additional Requirements Applicable to Floor Deck Installation:
 1. Fasten roof deck panels to each steel supporting member as shown on drawings in General Structural Notes. Where deck fastening is not shown on drawings, weld the edge ribs of floor deck panels to each steel supporting member using fusion welds or elongated welds of equal strength.
 - a. Provide welds at each flute and on each side of lap joints at flutes.
 - b. Weld Diameter: 3/4 inch, nominal (1/2-inch diameter fusion area).
 - c. Weld Washers: Install weld washers at each weld location recommended by the deck manufacturer.
 2. Side Lap and Perimeter Edge Fastening:

- a. Butt the end joints of deck panels at support beams; do not overlap them.
 - b. Mechanically fasten the side laps and perimeter edges of panels located between supports using self-drilling, number 12 diameter, carbon steel screws spaced no more than 24 inches apart.
3. End Bearing:
 - a. Install deck ends over the supporting framing with a minimum end bearing of 2 inches, and with end joints butted.
4. Shear Connectors (Studs):
 - a. Arrange and space the studs as indicated on the Contract Drawings.
 - b. Weld the shear connectors through the floor deck to the support framing according to AWS D1.1/D1.1M and the manufacturer's instructions.
 - 1) Install shear connectors in accordance with the requirements of AWS D1.1/D1.1M and ANSI/AWS D1.3 using automatic welding equipment.
 - 2) Clean the surface before welding the studs to the floor deck.
 - c. Break ferrules away from all studs.
 - d. Shear connectors shown on the Contract Drawings are based on the deck types and sizes specified.
 - 1) Should any deck be installed with characteristics different than the specified deck, increase the number of shear connectors to provide a capacity equivalent to the specified deck at no increase in Contract Price.
5. Pour Stops and Girder Fillers:
 - a. Weld steel sheet pour stops and girder fillers to the supporting structure according to SDI 30 recommendations unless otherwise indicated.
6. Floor Deck Reinforcement and Closures:
 - a. Weld steel sheet column closures, cell closures, and Z-closures to the floor deck according to SDI 30 recommendations to provide tight-fitting closures at the open ends of ribs and the sides of decking.
 - b. Weld cover plates at changes in direction of the floor deck panels unless otherwise indicated.
 - c. Provide additional reinforcement and closure pieces at openings as required for strength, continuity of decking, and support of other work as follows:
 - 1) For openings having a 6-inch to 12-inch dimension in any direction, reinforce the decking around the openings by placing a steel sheet over the opening on the top of the decking, and fusion welding the sheet to the top surface of the deck.
 - a) Provide sheet steel of the same quality as the deck units, and at least 12-inches wider and longer than the opening unless otherwise indicated.

- b) Provide welds at each corner and spaced not more than 12-inches on center along each side.
 - 2) For openings greater than 12 inches but less than 18 inches in any direction, reinforce the decking with steel as specified in Subparagraph 3.02.C.6.c.1, and provide two No. 4 reinforcing steel bars on each side of the opening unless noted otherwise on the Contract Drawings.
 - 3) For openings having an 18-inch or greater dimension in any direction, provide additional miscellaneous structural steel members on all sides of each opening as indicated on the Contract Drawings.
 - 4) Where several penetrations in a floor deck panel must occur close together, space these openings so each penetration can be examined individually if possible; and if the following criteria cannot be met, treat each opening as a long slot with a dimension equal to the distance between the outer edges of the outer most penetration:
 - a) For a series of openings, each less than 6 inches, provide a minimum of 12 inches between the openings where the center to center dimension between the penetrations equals the largest opening diameter plus 12 inches.
 - b) For a series of openings, each greater than 6 inches but less than 10 inches, provide a minimum of 18 inches between penetrations.
 - c) For a series of openings, each greater than 10 inches but less than 18 inches, notify the Program/Project Manager of the locations prior to placing concrete.
 - 5) Do not cut unscheduled openings through the deck without the approval of the Program/Project Manager.
 - 6) If questions occur related to the type/amount of reinforcement to be provided at floor openings, contact the Program/Project Manager prior to placing concrete.
- D. Interface with Other Work:
 - 1. Provide complete deck installations ready for concrete placement onto the deck, except for minor alterations required to accommodate small floor penetrations.
 - a. Coordinate the small penetrations with the mechanical, plumbing, and electrical disciplines.
 - b. Install closure sections, pour stops, and edge bent plates as required.
 - c. Provide adequately supported deck edges capable of supporting the weight of the concrete and construction loading without additional deck alterations.
 - d. At columns, install supplemental materials of sufficient strength to provide fall protection for personnel and to prevent objects from falling through the deck to lower levels.

2. Placing Topping Materials onto Deck Panels:
 - a. Prior to placing concrete or other topping materials onto the metal deck, submit the pour sequences, maximum square footage of each pour, and pour joint locations to the Program/Project Manager for approval.
 - b. Prior to placing concrete or other topping materials onto the deck panels, refer to the Contract Drawings for guidelines to determine if the deck must be temporarily shored during placement or concreting operations; and remove foreign matter from the deck panels.
 - c. Place concrete onto the deck panels in a uniform manner over the supporting structure and from a low level to avoid impact loading.
 - d. Spread the concrete placed toward the center of the deck span.
 - e. Finish slabs in accordance with the requirements specified in Section 03300, Cast-In-Place Concrete, and on the Contract Drawings.
3. Hangers Attached to Deck Units:
 - a. For supporting ceilings, air ducts, diffusers, or lighting fixtures, install approved hanger attachment devices, i.e. clips, where hangers are to be attached to deck units.
 - 1) Locate hanger attachment devices at not more than 24 inches apart on center in both directions, not over 9 inches from walls at ends, and not more than 12 inches from walls at sides, unless otherwise indicated.
 - b. For mounting mechanical, plumbing, and electrical equipment, install adjustable metal deck hanger rod assemblies in the deck prior to placing slab concrete.
 - 1) The maximum hanger loads and minimum hanger spacing are defined on the Contract Drawings.
 - 2) Where load and spacing criteria cannot be met, install supplemental framing.

3.03 REPAIR/RESTORATION

- A. Damaged Decking:
 1. Repair or replace damaged decking prior to placing topping materials on the decking.
- B. Roof Decking Welds:
 1. Clean and repair field roof decking welds with not less than 2 coats of galvanized repair paint.
- C. Galvanizing Repairs:
 1. Repair damaged galvanized coatings by preparing surfaces and using galvanized repair paint according to the requirements of ASTM A 780 and the manufacturer's instructions.

3.04 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. During the period when steel deck is being erected, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - 1) Periodic Special Inspections will be performed during the erection of steel deck.
 - 2) Field welds are subject to testing and inspection.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency and/or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
2. Stud Type Shear Connector Test:
 - a. Test Procedure:
 - 1) Prior to the start of each day's production welding of headed stud type shear connectors (studs), and also after welding equipment has been moved or changed, weld and test 2 test studs in the presence of the Code Required Approved Agency for Special Inspections.
 - a) The Approved Agency will test these studs by striking the studs with a hammer until they are bent to a 30-degree angle from vertical.
 - (1) If either stud's weld fails in the weld zone during this testing, correct or adjust the welding operation and weld new studs to replace the failed stud(s).
 - (2) Test the new studs the same way the original studs were tested.
 - b) Do not begin production welding until 2 consecutively welded studs are found satisfactory by the Approved Agency.
 - c) Replace the studs which fail inspection by the Approved Agency.
 - 2) The Approved Agency will inspect and test shear connector welds according to the requirements of AWS D1.1 for stud welding.
 - a) All field-welded shear connectors will be inspected and tested according to the requirements of AWS D1.1 for stud welding.

- b) The Approved Agency will conduct the inspections and tests required, and verify that welders are properly certified.
 - (1) All shear connector welds will be visually inspected.
 - (2) When visual inspections reveal either less than a continuous 360-degree flash or welding repairs to any shear connector, bend tests will be performed.
 - (3) When weld fracture occurs on shear connectors already tested, tests will be conducted on additional shear connectors according to the requirements of AWS D1.1.
 - b. Acceptance Criteria:
 - 1) The stud type shear connectors must pass the testing as specified in the test procedure.
 - 3. Confirmation Testing:
 - a. Test Procedure:
 - 1) The Code Required Approved Agency for Special Inspections will perform additional tests, at the Contractor's expense, as necessary to reconfirm any noncompliance of the original work, and to show compliance of corrected work.
 - b. Acceptance Criteria:
 - 1) The work must conform to specified requirements.
 - 4. Inspections:
 - a. Verify that only erectors qualified as specified herein erect the steel deck.
 - b. After placing the decking but prior to placing topping materials, inform the Code Required Approved Agency for Special Inspections that the decking is ready to be inspected for tears, dents, and other damage that may prevent the deck from acting as a form or diaphragm.
 - c. All welds will be visually inspected.
- B. Non-Conforming Work
 - 1. Correct deficiencies in steel deck Work and shear connector placement that inspections and test reports have indicated are not in compliance with specified requirements.
 - a. Record the work required and performed to correct deficiencies.
 - b. Promptly remove and replace Work that does not comply with specified requirements.

3.05 CLEANING

- A. Prior to placing topping materials onto the deck panels, remove all soil, debris, standing water, loose mill scale, and other foreign matter from the deck panels.
- B. Waste Management:
 - 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

3.06 PROTECTION

- A. Protect and maintain the steel decking to ensure that it is not damaged or deteriorated by the time topping materials are placed.

SECTION 05314

LONG SPAN STEEL ROOF DECK

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for providing long span steel roof decking at the locations indicated on the Contract Drawings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01780 - Closeout Submittals.
 - 3. Section 09960 - High-Performance Coatings.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. DFT: Dry film thicknesses.
 - 2. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
 - 3. NRC: Noise reduction coefficient.
- B. Reference Standards:
 - 1. American Iron and Steel Institute (AISI):
 - a. AISI North American Specification for the Design of Cold-Formed Steel Structural Members.
 - 2. ASTM International (ASTM):
 - a. ASTM A 653/A 653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - b. ASTM A 780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
 - c. ASTM A 924/A 924M - Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.
 - d. ASTM C 423 – Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.

- e. ASTM E 795 - Standard Practices for Mounting Test Specimens During Sound Absorption Tests.
- 3. American Welding Society (AWS):
 - a. AWS D1.1/D1.1M Structural Welding Code - Steel.
 - b. AWS D1.3; Structural Welding Code - Sheet Steel.
- 4. City of Phoenix (COP):
 - a. Phoenix Building Construction Code and Amendments.
- 5. International Code Council (ICC):
 - a. ICC International Building Code (IBC) as Amended by the City of Phoenix.
- 6. ICC Evaluation Service, Inc. (ICC ES), <http://www.icc-es.org/reports/index>:
 - a. ICC ES Report™ ESR-2196 – Hilti Kwik-Pro Self-Drilling Screws.
- 7. Steel Deck Institute (SDI):
 - a. SDI 30, Design Manual for Composite Decks, Form Decks and Roof Decks.
- 8. U.S. Government:
 - a. Occupational Safety and Health Administration (OSHA):
 - 1) 29 CFR 1910 Occupational Health and Safety Standards.
 - 2) 29 CFR 1926 Safety and Health Regulations for Construction.
 - 3) OSHA Directive Number CPL 02-01-034 [Old Directive Number CPL 2-1.34] Inspection Policy and Procedures for OSHA's Steel Erection Standards for Construction.
- 9. Institute for Sustainability Infrastructure (ISI):
 - a. ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

- 1. Coordinate the location and size of shop cut access openings in the bottom of the long span steel roof decking panels required to accommodate the Work of other Sections with the decking manufacturer.
- 2. 10 days before steel deck is to be erected, give notice to those performing other construction work related to the deck erection, such as to those performing work that must be supported by or that will provide support of the deck, to allow such items to be introduced or furnished before the deck is erected.
- 3. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.

B. Sequencing:

1. Sequence the erection of steel deck to follow erection of supporting structural steel, steel joists, and concrete and masonry load bearing walls.

1.04 SUBMITTALS

A. Action Submittals:

1. In accordance with the requirements of Section 01330, Submittal Procedures, submit the following to the Program/Project Manager for approval:
 - a. Product Data:
 - 1) Steel roof deck.
 - 2) Roof deck thermal insulation.
 - 3) Roof deck acoustic insulation.
 - 4) Rib closure strips.
 - 5) Pour stops and girder fillers.
 - 6) Flat receiver pans.
 - 7) Reinforcement at deck openings, including column closures, end closures, Z-closures, and cover plates.
 - 8) Access panels; full width.
 - 9) Mechanical fasteners.
 - 10) Galvanizing repair paint.
 - 11) Hanger attachment device.
 - 12) Finishes.
 - 13) Post-Industrial Recycled Content Affidavit.
 - 14) Post-Consumer Recycled Content Affidavit.
 - b. Shop Drawings:
 - 1) Deck panel layout; deck profile and material thickness; finish; anchorage details; conditions requiring closure panels, special jointing, and other accessories.
 - c. Certificates:
 - 1) Manufacturer's Certification
 - 2) Steel Certificate.
 - d. Special Procedure Submittals:
 - 1) Welding procedure specification (WPS) test records.
 - e. Qualification Statements:
 - 1) Installer's qualifications.
 - 2) Welder Certificates.

B. Informational Submittals:

1. In accordance with the requirements of Section 01330, Submittal Procedures, submit the following to the Program/Project Manager for information:
 - a. Manufacturer's Instructions:
 - 1) Manufacturer's installation instructions.

2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA 1.3 - Use Recycled Materials
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - b. Paints and Coatings
 - 1) Submit product data highlighting the VOC content for any field applied paint used to touch up shop applied primer.

1.05 QUALITY ASSURANCE

A. Regulatory Requirements:

1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
 - c. Both continuous and periodic Special Inspections will be performed during the fabrication and erection of structural steel.
2. Testing and Inspection Agencies:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ both an independent Testing and Inspection Agency and the City of Phoenix Testing Laboratory.

B. Qualifications:

1. Long Span Steel Roof Deck Installer's Qualifications:
 - a. Engage an experienced Installer who has completed steel deck installation similar in material, design, and extent to that indicated for this Contract, and which exhibits a record of successful in-service performance.
 - 1) Submit the Installer's qualifications to the Program/Project Manager for approval.
2. Welding Qualifications:
 - a. Welding Procedure Specifications (WPS):

- 1) Prior to beginning work that requires welding, submit the pre-qualifying welding procedures to the Program/Project Manager for approval.
- 2) For all procedures, other than those set forth in AWS D1.1/D1.1M or AWS D1.3, submit a copy of the welding procedure qualification test records (PQRs) and welding procedure specifications (WPSs) to the Program/Project Manager for approval.
- b. Welders' Qualifications:
 - 1) Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders to the Program/Project Manager for approval.
 - 2) Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed in AWS D1.1/D1.1M or AWS D1.3 for the procedures.
 - 3) Submit Welding Certificates certifying the welders employed to fabricate and to erect the Work of this Section have been certified by the American Welding Society (AWS) within the previous 12 months to the Program/Project Manager for approval.
 - a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures and, if pertinent, has undergone recertification.

C. Certifications:

1. Manufacturer's Certification:
 - a. Submit a manufacturer's certification certifying the Work performed under this Section complies with the specified requirements.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Use special care in shipping steel deck.
2. Ensure materials are delivered to the Site at times and intervals that facilitate uninterrupted progress of the Work and continuity of installation.

B. Storage and Handling Requirements:

1. Store decking on platforms, skids, blocking or other supports, and with one end elevated.
2. Protect decking from the weather with non-asphaltic waterproof covering, adequately ventilated to prevent condensation.
3. Do not damage decking during handling or rigging.
 - a. Do not use decking for bulk storage, or as a working platform for other construction materials.

- b. Do not overload decking during installation and the entire construction period.
- c. Do not place deck bundles on unbolted/unwelded building frames.
- 4. During installation, do not locate bundles of uninstalled decking where they will overload supporting members.

1.07 SITE CONDITIONS

- A. Ambient Conditions:
 - 1. Do not weld decking when the base metal temperature is below 32 degrees Fahrenheit (0 degrees Celsius), or when the surface to be welded is wet.

PART 2 PRODUCTS

2.01 LONG SPAN STEEL ROOF DECK SYSTEM

- A. Manufacturer List
 - 1. Subject to compliance with the requirements specified in this Section, manufacturers offering products that may be incorporated in the Work include the following:
 - a. Epic® Metals Corporation, www.epicmetals.com.
 - b. Metal Dek Group, a Unit of CSi® (Consolidated Systems Incorporated), <http://www.metaldek.com>.
 - c. Approved equal.
- B. Description:
 - 1. Regulatory Requirements:
 - a. Phoenix Building Construction Code:
 - 1) Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments [ICC International Building Code (IBC) as Amended by the City of Phoenix].
 - b. Federal Occupational Safety and Health Administration (OSHA) Requirements:
 - 1) Place steel deck in compliance with the requirements of 29 CFR 1910 and 29 CFR 1926, particularly 29 CFR 1926.754, Structural Steel Assembly, related OSHA Directive Number CPL 02-01-034 [Old Directive Number CPL 2-1.34].
 - 2. Sustainability Requirements:
 - a. Sustainability Requirements:
 - 1) Recycled Content
 - a) Provide Long Span Steel Roof Deck whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 20 percent.

- b) Provide Glass Fiber insulation whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 20 percent.
 - 2) Low Emitting Materials – Paints and Coatings
 - a) When paint is field applied to touch-up shop applied primer on surfaces within the building envelop, ensure they have a VOC content not exceeding 100 g/L.
- C. Performance:
 - 1. Fire Hazard Rating:
 - a. Provide insulation, both thermal and acoustic types, having a Class 2 (Flame Spread of 75 or less; Smoke Development rating of 450 or less) rating when tested in accordance with the methods specified in ASTM E 84.
 - 2. Acoustic Type Panels:
 - a. For interior spaces, provide acoustic type panels having a noise reduction coefficient (NRC) of at least 0.9 as established by testing the panels in accordance with the methods specified in ASTM C 423.
 - b. Provide acoustic insulation in the cells of acoustic type panels so additional acoustic insulation is not required above the panels to achieve the specified noise reduction coefficient (NRC).
- D. Design Criteria:
 - 1. Steel Deck Panels:
 - a. Provide steel deck panels designed in accordance with the requirements of SDI 30, listing the gravity and diaphragm load values of the decking.
 - 1) Provide deck configurations complying with basic design specifications in SDI 30, and as specified herein.
 - b. Structural Properties:
 - 1) Provide roof deck sections having at a minimum the structural properties required by the General Structural Notes on the Contract Drawings and computed in accordance with the AISI North American Specification for the Design of Cold-Formed Steel Structural Members.
 - 2) Access Panels:
 - a) Provide access panels and fastenings for those panels in accordance with the manufacturer's recommendations.
 - b) Provide roof deck panels that have access panels or other modifications that have the same carrying capacity as panel sections not having the access panels or other modifications.
 - 2. Welding Standards:
 - a. Comply with applicable provisions of AWS D1.1/D1.1M and AWS D1.3.
 - 3. Product Data:

- a. Submit the manufacturer's Product Data for each product specified and provided to the Program/Project Manager for approval.
 - 1) Include data regarding the steel roof deck properties.
 - 2) Include data regarding the steel roof deck finishes.
 - b. Submit the manufacturer's installation instructions for each product specified to the Program/Project Manager for information.
4. Shop Drawings:
- a. Submit detailed Shop Drawings showing the layout of deck panels; deck profile and material; finish; anchorage details; and every condition requiring closure panels, special jointing, access panel opening locations and details, and other accessories to the Program/Project Manager for approval.
 - 1) Indicate areas to receive acoustic insulation, thermal insulation, or both types of insulation.

2.02 COMPONENTS

A. Roof Deck:

1. Steel Roof Deck:
 - a. Steel Sheet: Provide steel sheet classified as Grade 40 or higher Structural Steel (SS) with Coating Designation G 60 per ASTM A 653/A 653M, and zinc coated according to ASTM A 924/A 924M.
 - b. Provide roof deck having the deck profile, depth, and the design uncoated-steel thickness indicated on the Contract Drawings.
2. Roof Deck Thermal Insulation:
 - a. Provide factory-installed roof deck thermal insulation consisting of two-component polyurethane foam which cures to a semi-rigid closed cell foam upon the chemical reaction of the components.
 - 1) Spray-apply the insulation to the roof panels to insulate, fill, and seal voids; deaden sound; and reduce vibration in the panels.
 - b. Provide roof deck thermal insulation having the characteristics specified in Table 05314-1.

Table 05314-1 Roof Deck Thermal Insulation Characteristics		
Characteristic	Value	Test Method
Density	1.75 pound per cubic foot (28kg/m ³)	ASTM D 1622
K-Factor	0.182 BTU-inches per square foot-hour-degree Fahrenheit (W/m·K)	ASTM C 518
R-Value	6.2 per inch after aging 28 days	N/A

Table 05314-1 Roof Deck Thermal Insulation Characteristics		
Characteristic	Value	Test Method
Air Barrier Properties		
At a pressure of 6.24 pounds per square foot (300Pa)	Less than 0.01 cubic feet per minute per square foot (0.05L/s/m ²)	ASTM E 283
At a pressure of 1.57 pounds per square foot (75Pa)	Less than 0.0025 cubic feet per minute per square foot (0.0125L/s/m ²)	ASTM E 283
Perm Rating		
For 1 inch (2.54cm)	1.99	ASTM E 96, Method A
For 2.5 inches (6.35cm)	1.18	ASTM E 96, Method A
Tensile Strength in the parallel direction	46 psi (317kPa)	ASTM D 1623
Compressive Strength		
In the parallel direction at 10 percent	27 psi (186kPa)	ASTM D 1621
In the perpendicular direction at 10 percent	18 psi (124kPa)	ASTM D 1621
Dimensional Stability		
Heat Age - Plus 158 degrees Fahrenheit (70°C)	Minus 0.6 percent	ASTM D 2126
Humid Age - Plus 158 degrees Fahrenheit (70°C), 100 percent Relative Humidity	Plus 2.9 percent	ASTM D 2126
Cold Age - Minus 4 degrees Fahrenheit (-20°C)	Minus 0.3 percent	ASTM D 2126
Closed Cell Content	Greater than 90 percent	ASTM D 2856
Fire Rating	Class 2 (Flame Spread of 75 or less; Smoke Development rating of 450 or less)	ASTM E 84

c. Manufacturers:

- 1) Fomo Products, Inc., www.fomo.com.
 - 2) Approved equal.
3. Roof Deck Acoustic Insulation:
 - a. Provide glass fiber acoustic insulation batts.
 - 1) Provide insulation resistant to the effects of moisture, oil, grease, and most acids; and that resists shrinking, settling, breakdown, and sagging caused by vibration.
 - a) Moisture Absorption: Less than 1.0 percent by volume.
 - 2) Provide insulation that does not breed or promote the growth of fungi and bacteria.
 - b. Provide a black acrylic coating on the underside of the insulation.
- B. Rib Closure Strips:
 1. Provide the manufacturer's standard vulcanized, closed-cell, synthetic rubber rib closure strips.
- C. Pour Stops and Girder Fillers:
 1. Provide pour stops and girder fillers fabricated from the same steel sheet material as the deck panels, and of the thickness and profile indicated.
- D. Flat Receiver Pans:
 1. Provide the manufacturer's standard size flat receiver pans, fabricated from a single piece of the same steel sheet as the deck panels.
 2. Receiver Pan Thickness: 0.071 inch, minimum.
 3. Cut holes for drains in the flat receiver pans in the field.
- E. Reinforcement at Deck Openings:
 1. Unless otherwise shown, prior to cutting openings provide additional steel reinforcement and closure pieces as required to provide strength, continuity of the deck, and support for other work, including column closures, end closures, Z-closures, and cover plates.
- F. Access Panels:
 1. Provide access panels fabricated from steel and having the same steel grade and thickness as the deck material specified in the General Structural Notes on the Contract Drawings.
 - a. Provide Envista FNA Hinged Access Panels, or approved equal.
 - 1) Size: As indicated in Contract Drawings.
 - 2) Factory prime access panels and hinge.
 - 3) Finish: High-performance coating as specified.
 - 4) Color: match adjacent deck surface
 - b. If the deck material is not specified in the General Structural Notes on the Contract Drawings, at a minimum provide 18 gage steel.
 - c. Galvanize, paint, and fabricate the access panels to match the profile of adjacent deck surfaces, including stiffening ribs and perforations.

- d. Coordinate the access panel sizes with the access panel opening sizes in the roof decking.
2. Apply a finish to the access panels matching the finish of the adjacent deck surfaces.
3. Install Number 10 screws, furnished by the long span steel roof deck manufacturer for attaching the access panels in the field, through screw holes pre-punched in the access covers 4 inches to 8 inches apart on center in accordance with the manufacturer's requirements.

2.03 FINISHES:

- A. Provide the long span steel roof deck manufacturer's standard finish.
 1. If the manufacturer's system is typically finished in the field, comply with the finish requirements specified in Section 09960, High-Performance Coatings, and shop-prime the deck with primers compatible with the field-applied coatings.
 2. If the manufacturer's system is typically finished in the shop, comply with the finish requirements specified in this Article.
- B. Primer Materials:
 1. Provide an epoxy primer.
 2. Manufacturers:
 - a. Metal Dek Group, a Unit of CSI® (Consolidated Systems Incorporated), Versa-Shield™ 10 Paint System, <http://www.metaldek.com>.
 - b. Approved equal.
- C. Finish Materials:
 1. Provide a polyamide epoxy intermediate coat.
 2. Provide an aliphatic polyurethane topcoat.
 3. Provide the color selected by the Program/Project Manager from the manufacturer's full range.
 4. Manufacturer:
 - a. Metal Dek Group, a Unit of CSI® (Consolidated Systems Incorporated), Versa-Shield™ 10 Paint System, <http://www.metaldek.com>.
 - b. Approved equal.
- D. Shop Finishing Methods:
 1. Prior to painting the bottom surfaces of the steel roof deck members, chemically clean the galvanized steel, and then coat it with a pretreatment.
 2. Following the pretreatment, factory-spray-apply the three-coat system to the members so they have the following dry film thicknesses (DFT); and oven-cure the system:
 - a. Primer:

- 1) Apply primer so its dry film thickness is within the range from 0.2 mil to 0.3 mil.
- b. Intermediate Coat:
 - 1) Apply the intermediate coat so its dry film thickness is within the range from 2.0 mils to 6.0 mils.
- c. Topcoat:
 - 1) Apply the topcoat so its dry film thickness is within the range from 20 mils to 30 mils.

2.04 SHOP FABRICATION

- A. Provide roof panels cold-formed by the continuous roll forming process, and resistance-welded together to form an integral unit.
 1. Fabricate the roof deck panels to have interlocking and vertically self-aligning sidelaps that produce a flush appearance with tight fitting joints from the underside.
 2. Roll-form shallow stiffening ribs into the bottom plates of roof deck.
 - a. Locate the ribs in the area between the webs to enhance the flatness of the bottom plate.
 3. Access Panel Openings:
 - a. Shop-cut openings for access panels between the ribs in the bottom plate area of the long span steel roof decking as follows, or as recommended by the manufacturer to comply with requirements to maintain the structural properties of the long span steel roof decking.
 - 1) Cut openings 6 inches wide by the required length, but not more than 8 feet long.
 - 2) Coordinate the access panel opening sizes cut into the bottom of the roof decking with the access panel sizes.
 - 3) Maintain at least 12 inches between adjacent access panel openings.
- B. Acoustic Type Panels:
 1. Acoustic Insulation:
 - a. In the cells of acoustic type panels, provide factory-installed acoustic insulation batts.
 2. To enhance the acoustic performance of the panels, perforate the bottom plates of acoustic type panels between the webs so there are uniform rows of perforations.
 - a. Install the insulation so the black acrylic coating on the underside of the insulation faces the perforations.
 - b. To avoid plugging the perforated holes in the panels during field painting, support the acoustic insulation above the bottom plate by providing either individual clips or continuous mesh.

- C. After forming and welding the roof panels, paint the bottom surfaces of the panels with the manufacturer's standard primer at the factory to insure exposed welds are coated.
 - 1. Before factory painting the exposed galvanized steel panel, chemically clean it, next apply an acid wash pretreatment, followed by a coat of the manufacturer's standard primer, and then oven bake the panel.
 - 2. It is the responsibility of the Contractor to provide field-applied finish paint compatible with the factory applied prime paint if field repairs are required, or if the finish coat is to be applied in the field.
- D. Steel Sheet Accessories:
 - 1. Fabricate steel sheet accessories from steel sheet classified as Grade 40 or higher Structural Steel (SS) with Coating Designation G60 in accordance with ASTM A 653/A 653M, and within the tolerances specified in ASTM A 924/A 924M.
- E. Miscellaneous Roof Deck Accessories:
 - 1. Fabricate miscellaneous roof deck accessories, such as finish strips, from the same material and thickness as the roof deck.

2.05 ACCESSORIES

- A. Provide accessory materials for the steel roof deck that comply with the requirements indicated and the recommendations of the steel roof deck manufacturer.
 - 1. Mechanical Fasteners:
 - a. Provide the manufacturer's standard, corrosion-resistant, low-velocity, powder-actuated or pneumatically driven carbon steel fasteners; or self-drilling, self-threading screws, that have a current approved ICC Evaluation Service Report.
 - b. Manufacturers:
 - 1) Hilti Corporation, KWIK-Pro Self-Drilling Screws 12-24 HWH, ICC ES Report ESR-2196, <http://www.us.hilti.com/holus>.
 - 2) ITW Buildex and Illinois Tool Works, Inc., TEKS® self-drilling tapping screws 12-24 HWH, ICC ES Report ESR-1976, <http://www.itwbuildex.com>
 - 3) Approved equal.
 - 2. Galvanizing Repair Paint:
 - a. Provide high zinc-dust content paint complying with the requirements of ASTM A 780 to repair damaged galvanized surfaces.
 - 3. Hanger Attachment Device:
 - a. Consult the manufacturer's product data for minimum spacing, load capacities, and proper installation procedure of the hanging devices.
 - b. Coordinate the total imposed load criteria and the allowable spacing requirements for hanger embeds placed into the metal decking so they do not exceed the values indicated on the Contract Drawings.

- c. Manufacturers:
 - 1) Böllhoff Rivnut, Inc., Rivnuts®, www2.boellhoff.com.
 - 2) ITW Buildex and Illinois Tool Works, Inc., Sammy X-Press®, www.ibwbuildex.com.
 - 3) Approved equal.
- 4. Air Dams:
 - a. Provide air dams where panels continue from the interior of the building through to the exterior of the building, to block the movement of conditioned air from the interior of the building to the exterior.

2.06 SOURCE QUALITY CONTROL

- A. Tests and Inspections:
 - 1. Code-Required Approved Agency for Performing Special Inspections:
 - a. To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
 - 2. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky harbor International Airport will employ independent Testing and Inspection Agencies, including the City Building Official and the City of Phoenix Testing Laboratory.
 - 3. Materials and fabrication procedures specified in this Section require advance examination or laboratory testing by the code-required Approved Agency for performing Special Inspections and the Testing and Inspection Agency.
 - a. Provide these inspection and testing entities with access to the places where steel deck is being fabricated or produced so the required inspections and testing can be performed before the material is shipped.
 - 4. Noise Reduction Coefficient (NRC) Test:
 - a. Test Procedure:
 - 1) Representative samples of acoustic type panels will be tested in accordance with the method specified in ASTM C 423 and ASTM E 795 to determine the noise reduction coefficient (NRC) of the fabricated panels.
 - b. Acceptance Criteria:
 - 1) The acoustic type panels must have a noise reduction coefficient (NRC) of at least 0.9 to pass the Noise Reduction Coefficient (NRC) Test.

B. Non-Conforming Work:

1. Promptly remove and replace materials or fabricated components that do not comply with specified requirements.
- C. Coordination of Other Tests and Inspections:
 1. Notify the code-required Approved Agency responsible for performing special inspections when steel deck for this Contract is being fabricated, shipped, and/or tested.
 2. Cooperate with the code-required Approved Agency when they are performing required material verifications and other special inspections.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Examine the deck support framing and other field conditions for compliance with the specified installation tolerances and other conditions which may affect the performance of the steel deck.
- B. Evaluation and Assessment:
 1. Do not install steel deck on support framing insufficient to support the decking, or that would detrimentally affect the performance of the deck.

3.02 INSTALLATION

- A. Before the roof deck is permanently fastened, place the deck on the supporting frame, and adjust it to its final position with its ends accurately aligned and adequately bearing on the supporting frame.
 1. Maintain consistent coverage so the panels located in adjacent bays will be properly aligned.
- B. Cut roof deck to suit Site conditions in a neat and professional manner.
 1. Only cut those openings indicated on the structural Contract Drawings.
 2. Cut and reinforce other openings required only as approved by the Program/Project Manager.
- C. Fasten the roof deck to the supporting members as specified in the General Structural Notes on the Contract Drawings.
 1. If the roof deck fastening requirements are not specified in the General Structural Notes on the Contract Drawings, provide three 3/4-inch diameter puddle welds for each 24-inch wide panel to fasten the roof deck to the supporting members, or fasten the roof deck as indicated on the manufacturer's erection drawings.
 2. Fasten the sides of roof deck located at the perimeter of the building to supporting members as indicated on the Contract Drawings.

- a. If the fastening requirements for the sides of roof deck located at the perimeter of the building are not indicated on the Contract Drawings fasten the sides with 3/4-inch diameter puddle welds at a maximum spacing of 12 inches on center or less as indicated on the manufacturer's erection drawings.
3. Fasten the roof deck sidelaps together as indicated on the Contract Drawings.
 - a. If the fastening requirements for the roof deck sidelaps are not indicated on the Contract Drawings fasten the roof deck sidelaps using Number 12 screws spaced apart a maximum of 36 inches on center or less as indicated on the manufacturer's erection drawings.
- D. Do not apply construction loads to the deck until after the panels are permanently fastened to supporting members, and the sidelaps are attached.
 1. Do not apply construction loads exceeding the capacity of the panels.
- E. Do not suspend items such as ceilings, light fixtures, conduit, pipe and ductwork from the roof deck without specific approval from the Program/Project Manager.
- F. Fasten transition plates, eave plates, and supplied reinforcement for small openings as indicated on the manufacturer's erection drawings.
- G. Do not leave roof deck unattached at the end of each day's work.
- H. Perform connecting welding work in accordance with the requirements specified in AWS D1.1/D1.1M and AWS D1.3.
- I. Interface with Other Work:
 1. Hangers Attached to Deck Units:
 - a. For supporting ceilings, air ducts, diffusers, or lighting fixtures, install approved hanger attachment devices, where hangers are to be attached to deck units.
 - 1) Provide the manufacturer's standard hanger attachment devices.
 - 2) For spacing, restrictions, load capacities, and proper installation procedures, consult the manufacturer's Product Data.
 - 3) Do not suspend items from the roof panels without the approval of the Program/Project Manager.

3.03 REPAIR/RESTORATION

- A. Damaged Decking:
 1. Repair or replace damaged decking prior to placing topping materials on the decking.
- B. Roof Decking Welds:

1. Clean and repair field roof decking welds with not less than 2 coats of galvanized repair paint.
- C. Galvanizing Repairs:
 1. Repair damaged galvanized coatings by preparing surfaces and using galvanized repair paint according to the requirements of ASTM A 780 and the manufacturer's instructions.

3.04 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 1. During the period when steel deck is being erected, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - 1) Periodic Special Inspections will be performed during the erection of steel deck.
 - 2) Field welds are subject to testing and inspection.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency and/or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
 2. Confirmation Testing:
 - a. Test Procedure:
 - 1) The Code Required Approved Agency for Special Inspections will perform additional tests, at the Contractor's expense, as necessary to reconfirm any noncompliance of the original work, and to show compliance of corrected work.
 - b. Acceptance Criteria:
 - 1) The work must conform to specified requirements.
 3. Inspections:
 - a. Verify that only erectors qualified as specified herein erect the steel deck.
 - b. After placing the decking, inform the Code Required Approved Agency for Special Inspections that the decking is ready to be inspected for tears, dents, and other damage that may prevent the deck from acting as a diaphragm.
 - c. All welds will be visually inspected.

**B. Non-Conforming Work**

1. Correct deficiencies in steel deck placement that inspections and test reports have indicated are not in compliance with specified requirements.
 - a. Record the work required and performed to correct deficiencies.
 - b. Promptly remove and replace Work that does not comply with specified requirements.

3.05 PROTECTION

- A. Protect and maintain the steel decking to ensure it is not damaged or deteriorated by the time topping materials are placed.

SECTION 05400

COLD-FORMED METAL FRAMING

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for cold-formed metal framing units, including C-shaped steel studs.
- B. Related Requirements:
 - 1. Section 01316 - Project Meetings.
 - 2. Section 01330 - Submittal Procedures.
 - 3. Section 01360 - Sustainable Design Requirements.
 - 4. Section 01780 - Closeout Submittals.
 - 5. Section 09260 - Gypsum Board Assemblies.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users..
- B. Reference Standards:
 - 1. American Iron and Steel Institute (AISI):
 - a. AISI S100 - North American Specification for the Design of Cold-Formed Steel Structural Members.
 - b. AISI S200 - North American Standard for Cold-Formed Steel Framing – General Provisions.
 - c. AISI S201 - North American Standard for Cold-Formed Steel Framing – Product Data.
 - d. AISI S210 - North American Standard for Cold-Formed Steel Framing – Floor and Roof System Design.
 - e. AISI S211 - North American Standard for Cold-Formed Steel Framing – Wall Stud Design.
 - f. AISI S212 - North American Standard for Cold-Formed Steel Framing Header Design.
 - g. AISI S213 - North American Standard for Cold-Formed Steel Framing – Lateral Design.

2. American Society of Civil Engineers (ASCE):
 - a. ASCE/SEI 7 – Minimum Design Loads for Buildings and Other Structures.
3. American Welding Society (AWS):
 - a. AWS D1.3 - Structural Welding Code–Sheet Steel.
4. ASTM International (ASTM):
 - a. ASTM A 653/A 653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - b. ASTM A 1003/A 1003M – Standard Specification for Steel Sheet, Carbon, Metallic and Non-Metallic Coated for Cold-Formed Framing Members.
 - c. ASTM A 1008/A 1008M – Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Allow, High-Strength Low-Allow with Improved Formability, Solution Hardened, and Bake Hardenable.
 - d. ASTM A 1011/A 1011M – Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
 - e. ASTM C 955 – Standard Specification for Load-Bearing (Transverse and Axial) Steel Studs, Runners (Tracks), and Bracing or Bridging for Screw Application of Gypsum Panel Products and Metal Plaster Bases.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved

Agency, and the City, prior to incorporating items requiring testing by them into the Work.

2. Coordinate the layout and support requirements for Work interfacing with the cold-formed metal framing.

B. Pre-Installation Meetings:

1. Prior to the start of the metal framing system installation, convene a meeting at the Site in accordance with the requirements specified in Section 01316, Project Meetings, to review areas of potential interference and conflicts with the installers of other Work, such as door and window frames, mechanical Work, and electrical Work; and to review Special Inspections that may be required by the Phoenix Building Construction Code and Amendments [ICC International Building Code (IBC) as Amended by the City of Phoenix].

C. Sequencing:

1. Coordinate the cold-formed metal framing fabrication schedule with construction progress to avoid delaying the work.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Studs and joists.
 - 2) Welding electrodes.
 - 3) Mechanical fasteners.
 - 4) Rust-inhibitive primer.
 - 5) Post-Industrial Recycled Content Affidavit.
 - 6) Post-Consumer Recycled Content Affidavit.
 - b. Shop Drawings:
 - 1) Plans, elevations, and details of cold-formed metal wall and ceiling framing systems.
 - c. Certificates:
 - 1) Cold-formed steel mill certificates or certified test reports.
 - d. Delegated Design Submittals:
 - 1) Professional Engineer's calculations.
 - e. Qualification Statements:
 - 1) Cold-formed metal framing fabricator's qualifications.
 - 2) Cold-formed metal framing installer/framer's qualifications.
 - 3) Professional Engineer's qualifications.
 - 4) Welding procedure qualification test records (PQRs).
 - 5) Welding procedure specifications (WPSs).
 - 6) Welding Certificates.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) ICC-ES Evaluation Reports for manufactured connectors.
 - b. Manufacturer's Instructions:
 - 1) Letters from the stud and joist manufacturers indicating welding electrodes qualified for use with the studs and joists.
 - 2) Manufacturer's installation instructions for each component and accessory.
2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA1.3 – Use Recycled Material
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. At least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by a code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - 1) Both continuous and periodic Special Inspections will be performed during the fabrication and erection of cold-formed metal framing.
 - b. Code-Required Approved Agency for Performing Special Inspections:
 - 1) To perform the special inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
2. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered special inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ independent Testing and Inspection Agencies, including the City Building Official and the City of Phoenix Testing Laboratory.
3. Fire-Rated Assemblies:
 - a. For framing units that are components of assemblies required by the Contract Documents to have a fire-resistance rating, including those

assemblies required to comply with governing regulations, provide units that have been approved by the Authorities Having Jurisdiction.

B. Qualifications:

1. Cold-Formed Metal Framing Fabricator's Qualifications:

- a. Employ a cold-formed metal framing fabricator that has a minimum of 5 years of continuous experience successfully fabricating in-service cold-formed metal framing similar to that indicated for this Contract.
 - 1) The cold-formed metal framing fabricator chosen, and its Subcontractors, must be members of the Steel Framing Alliance (SFA).
- b. Employ a cold-formed metal framing fabricator having sufficient production capacity to produce and deliver the materials in time to meet the approved construction schedule for this Contract.
- c. Submit the cold-formed metal framing fabricator's qualifications to the Program/Project Manager for approval.

2. Cold-Formed Metal Framing Installer/Framer's Qualifications:

- a. Employ a cold-formed metal framing installer/framer that has a minimum of 5 years of continuous experience successfully installing and framing cold-formed metal framing systems similar to those indicated for this Contract.
 - 1) The cold-formed metal framing installer/framer chosen, and its Subcontractors, must be members of the Steel Framing Alliance (SFA).
- b. Submit the cold-formed metal framing installer/framer's qualifications to the Program/Project Manager for approval.

3. Professional Engineer's Qualifications:

- a. Employ an independent Professional Engineer, registered in the State of Arizona, who has a minimum of 5 years experience, and who is qualified to perform the structural design calculations and to prepare the details and specifications required under this Section.
- b. Submit the Professional Engineer's qualifications to the Program/Project Manager for approval.

4. Welding Qualifications:

- a. Welding Procedure Specifications (WPS):
 - 1) Prior to beginning work that requires welding, submit the pre-qualifying welding procedures to the Program/Project Manager for approval.
 - 2) For all procedures, other than those set forth in AWS D1.3, submit a copy of the welding procedure qualification test records (PQRs) and welding procedure specifications (WPSs) to the Program/Project Manager for approval.
- b. Welders' Qualifications:
 - 1) Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders to the Program/Project Manager for approval.

- 2) Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed in AWS D1.3 for the procedures.
- 3) Submit Welding Certificates certifying the welders employed to fabricate and to erect the Work of this Section have been certified by the American Welding Society (AWS) within the previous 12 months to the Program/Project Manager for approval.
 - a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures and, if pertinent, has undergone recertification.

C. Certifications:

1. Cold-Formed Steel Mill Certification:
 - a. Submit mill certificates, signed by the producer of the rolled cold-formed steel products, or certified test reports from a qualified independent testing agency, certifying the products provided comply with the specified requirements, to the Program/Project Manager for approval.
 - 1) Certify the material provided conforms to the appropriate ASTM specification.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Ensure materials are delivered to the Site at times and intervals that facilitate uninterrupted progress of the Work and continuity of installation.
2. Mark and color-code materials and members in accordance with industry standards AISI S200 and AISI S201.

B. Storage and Handling Requirements:

1. Protect fastener and connector products from dirt and corrosion by placing them in closed containers.
 - a. Store fastener and connector products in a protected shelter, remove fastener and connector components only as necessary, and promptly return unused fasteners and connector to protected storage.

C. Packaging Waste Management:

1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

PART 2 PRODUCTS

2.01 METAL FRAMING COMPONENTS

A. Description:

1. Regulatory Requirements:

a. Phoenix Building Construction Code:

- 1) Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments [ICC International Building Code (IBC) as Amended by the City of Phoenix].

2. Sustainability Requirements:

a. ENVISION Requirements:

- 1) Recycled Content
 - a) Provide Steel Joists who's combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 25 percent.

B. Performance:

1. Allowable Deflections:

a. Unless otherwise indicated in the Contract Documents, provide cold-formed metal framing designed to accommodate the following maximum allowable deflections for the application indicated:

- 1) Exterior glazed wall horizontal deflection: $L/600$, where L is the wall height.
 - a) Design exterior walls to comply with horizontal deflection requirements without considering contributions from sheathing materials
- 2) Exterior un-glazed wall horizontal deflection: $L/240$, where L is the wall height.
 - a) Design exterior walls to comply with horizontal deflection requirements without considering contributions from sheathing materials
- 3) Interior wall horizontal deflection: $L/360$, where L is the wall height.
- 4) Ceiling joist vertical deflection in ceilings accessible for maintenance or storage: $L/480$, where L is the span length.
- 5) Ceiling tile support system vertical deflection: $L/240$, where L is the span length.
- 6) Finished ceiling (gypsum board) support system vertical deflection: $L/360$, where L is the span length.

C. Design Criteria:

1. Design Standards:

- a. Design, fabricate, and erect materials for the Work of this Section in accordance with the American Iron and Steel Institute (AISI)

requirements specified in AISI S100, AISI S200, AISI S201, AISI S210, AISI S211, AISI S212, and AISI S213.

- 1) Provide cold-formed metal framing having at a minimum the wall thicknesses and the floor and ceiling depths shown in the Contract Drawings.
2. Design Loads:
 - a. Provide cold-formed metal framing designed to accommodate the design live and dead loads specified in the ICC International Building Code (IBC) as Amended by the City of Phoenix and ASCE/SEI 7, but not less than the following uniform live loads:
 - 1) Load perpendicular to exterior walls: 30 pounds per square foot.
 - 2) Load perpendicular to interior walls in public occupied areas: 10 pounds per square foot.
 - 3) Load perpendicular to interior walls in non-public occupied areas: 5 pounds per square foot.
 - 4) Vertical loads on ceilings accessible for maintenance or storage: 40 pounds per square foot.
 - 5) Vertical loads on inaccessible ceilings: 10 pounds per square foot.
 - b. For wind and seismic loading requirements, comply with the design criteria indicated on the Contract Drawings.
3. Product Data;
 - a. Submit Product Data for each component and accessory proposed for the cold-formed metal framing to the Program/Project Manager for approval.
 - 1) Include Product Data for the anchors and connectors required by the design delegated to the Contractor-employed Professional Engineer.
4. Shop Drawings:
 - a. Submit Shop Drawings showing plans, elevations, and details of cold-formed metal wall and ceiling framing systems to the Program/Project Manager for approval.
 - 1) Show the layout, spacing, sizes, capacities, thicknesses, fabricated lengths, and types of cold-formed metal framing.
 - 2) Show reinforcing channels, framing out of openings including header and door framing details, supplemental framing, strapping, bracing, bridging, splices, accessories, and attachments to adjoining Work.
 - a) Include lateral bracing drawings and details.
 - 3) Show the types and sizes of fasteners and anchors, including manufactured connectors and mechanical fasteners, and anchorage and connection details.
5. Calculations:
 - a. Have the Professional Engineer perform the design calculations required to size members, and prepare details of connections and

other structural data including specifications for fasteners, anchors, and other structural items required.

- 1) Calculate the structural properties of studs and joists in accordance with the requirements specified in AISI S100.
- b. Submit the Professional Engineer's calculations to the Program/Project Manager for approval.

D. Materials:

1. Studs and Joists:

- a. Provide steel studs and joists of the type, size, shape, and thickness (mils/gage) indicated on the Shop Drawings prepared by the Contractor's Professional Engineer and submitted to and approved by the Program/Project Manager.
 - 1) Provide steel studs complying with the requirements specified in ASTM C 955, and formed from steel complying with the requirements for Grade 50 steel specified in ASTM A 653/A 653M.
 - 2) Provide steel runners (tracks), bridging, and accessories formed from steel complying with the requirements for Grade 33 steel specified in ASTM A 653/A 653M.
 - 3) With each type of framing required, provide the steel runners (tracks), blocking, bridging, bridge clips, lintels, clip angles, shoes, reinforcements, fasteners, and accessories for the application indicated in the approved Shop Drawings and required for a complete metal framing system.
- b. Stud and Joist Shapes:
 - 1) Provide C-shaped studs and joists having minimum 1-1/4 inch flange widths, a stiffened lip.
 - 2) For bridging and blocking, provide studs and joists having punched webs as required for the approved design.
- c. Steel:
 - 1) For 54-mil (16 gage) and heavier units, provide components fabricated from structural quality steel sheet having a minimum yield point of 50,000 psi, and that complies with the requirements specified in ASTM A 653/A 653M, ASTM A 1008/A 1008M, or ASTM A 1011/A 1011M.
 - 2) For 43-mil (18 gage) and lighter units, provide components fabricated from standard commercial quality steel sheet having a minimum yield point of 33,000 psi, and that complies with the requirements specified in ASTM A 653/A 653M, ASTM A 1008/A 1008M, or ASTM A 1011/A 1011M.
- d. Welding Electrodes:
 - 1) Provide welding electrodes as recommended by the stud manufacturer and that comply with the requirements of AWS D1.3.
 - a) Submit letters indicating the welding electrodes qualified for use with each type of stud and joist provided from the stud

and joist manufacturers to the Program/Project Manager for information.

- e. Fasteners:
 - 1) Provide nuts, bolts, washers, screws, and other fasteners that have a corrosion resistant finish.
 - 2) Provide headed type anchor bolts for use in cast-in-place concrete.
 - 3) For manufactured connectors, only provide connectors having a current ICC-ES Evaluation Reports.
 - a) Submit ICC-ES Evaluation Reports for the manufactured connectors proposed for use under this Section to the Program/Project Manager for information.
 - 2. Framing and Furring Members:
 - a. For steel framing and furring members for screw attached gypsum board, provide materials complying with the requirements specified in Section 09260, Gypsum Board Assemblies.
- E. Fabrication:
- 1. Shop Fabrication:
 - a. Jigs:
 - 1) Furnish jig templates to hold members in the proper alignment and position during fabrication so components can be consistently placed.
 - b. Fastening:
 - 1) Attach similar components by welding, bolting, or screw fasteners, whichever is the manufacturer's standard method.
 - 2) Attach dissimilar structural components by bolting or screw fasteners; whichever is the manufacturer's standard method.
 - a) Isolate components made from dissimilar materials from each other to prevent galvanic action.
 - 3) Tying framing components using wire is unacceptable.
 - 2. Fabrication Tolerances:
 - a. Fabricate components within the allowable maximum variation from plumb, level, and true to line of 1/8 inch in 10 feet.
- F. Finishes:
- 1. Primer Materials:
 - a. Provide zinc-oxide or another similar rust-inhibitive primer recommended by the cold-formed metal framing manufacturer and compatible with the galvanized metal framing products provided.
 - 2. Shop Finishing Methods:
 - a. Unless otherwise indicated in the Contract Documents, galvanize cold-formed metal materials in accordance with the requirements for Type H and L products specified in ASTM A 1003/A 1003M, which requires galvanizing complying with the requirements for Coating Designation G60 specified in ASTM A 653/A 653M, for a normal

exposure condition enclosed within a building envelope with a controlled environment.

- b. Shop-apply a prime coat finish consisting of 1 coat of rust-inhibitive primer on the main framing components.
- c. Unless otherwise indicated, finish installation accessories to match the finish of the main framing components.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Examine areas and substrates to receive cold-formed metal framing for compliance with requirements and other conditions affecting performance.
- B. Evaluation and Assessment:
 1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install cold-formed metal framing systems in accordance with the manufacturer's printed or written instructions and recommendations.
 1. Perform welding using certified welders having experience welding light gage members in accordance with the requirements specified in AWS D1.3 and the AISI standards listed herein.
 - a. Clean welded areas and weld affected areas in accordance with the requirements specified in SSPC-SP 2 or SSPC-SP 3, and coat them with a minimum of 2 coats of zinc-rich paint.
 2. Saw cut metal studs square and true.
 - a. Do not cut studs using a torch.
 3. Do not splice studs or tracks used as a built-up king stud.
 4. Submit installation instructions for each component and accessory proposed for the cold-formed metal framing to the Program/Project Manager for approval.
- B. Runner Tracks:
 1. Install continuous tracks sized to match the studs being installed.
 2. Accurately align the tracks to match the layout at the base and top of the studs.
 3. Secure the tracks as recommended by the stud manufacturer, for the type of construction involved, except comply with the following requirements:
 - a. For nail or power-driven fasteners, do not space the fasteners more than 24 inches apart on center.
 - b. For other than nail or power-driven fasteners, do not space the fasteners more than 16 inches apart on center.

- c. Provide fasteners at the corners and ends of tracks.
- C. Wall Studs:
 - 1. Set studs plumb unless the studs are required for diagonal bracing, non-plumb walls, warped surfaces, or other similar applications.
 - 2. Secure wall studs to the top and bottom runner tracks by either welding or screw fastening at both the inside and outside flanges of the runner tracks.
 - 3. Set studs no more than 16 inches apart on center.
 - 4. For studs at exterior walls, the width and gage are indicated on the Contract Drawings.
 - 5. For studs at interior non-load-bearing partitions, comply with the requirements specified in Section 09260, Gypsum Board Assemblies, and AISI S200 for non-structural studs.
- D. Supplementary Supports:
 - 1. Wherever walls or partitions are indicated to support fixtures, equipment, services, casework, heavy trim and furnishings, or similar work requiring attachment to the wall or partition; install supplementary framing, blocking, and bracing in the metal framing system.
 - 2. If the type of supplementary support is not otherwise indicated in the Contract Documents, provide support complying with the manufacturer's recommendations and industry standards, and taking the loading or weight resulting from the item supported into consideration.
- E. Wall Openings:
 - 1. For wall openings larger than 2 feet square, frame the opening with a double stud at each jamb of the frame unless the manufacturer's instructions show or indicate more than 2 studs.
 - 2. Provide runner tracks and jack studs above and below wall openings.
 - a. Anchor the tracks to the jamb studs with stud shoes or by welding, and space the jack studs the same as the full-height studs of the wall.
 - 3. Secure the stud system wall opening frame in the manner indicated herein.
- F. Expansion and Control Joints:
 - 1. Frame both sides of expansion and control joints with separate studs.
 - 2. Do not bridge the joint with components of the stud system.
- G. Horizontal Stiffeners:
 - 1. Provide horizontal stiffeners in the stud system spaced vertically no more than 48 inches apart on center, and attached at each stud intersection.
- H. Special Techniques:
 - 1. Where required to reinforce joists at interior supports, provide a single short length of joist section located directly over the interior support, a

snap-on shoe, a side-piece reinforcement lapped 30 percent, or another method recommended by the joist manufacturer.

- I. Interface with Other Work:
 - 1. Where the stud system abuts structural columns or walls, including masonry walls, anchor the ends of the stiffeners to the supporting structure.
 - 2. Dissimilar Metals:
 - a. Isolate cold-formed metal framing products from contact with dissimilar metals, such as copper or brass, to prevent galvanic action.
- J. Erection Tolerances:
 - 1. Bolt or weld wall panels at both horizontal and vertical junctures so flush, even, true-to-line joints result.
 - 2. Do not allow the variation in plane and true position between prefabricated assemblies exceed 1/16 inch.

3.03 REPAIR

- A. Touch up damaged shop-applied protective coatings using compatible primers for prime-coated surfaces, and a galvanizing repair system for galvanized repair surfaces.

3.04 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 - 1. During the period when cold-formed metal framing is being erected, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - 1) Both continuous and periodic Special Inspections will be performed during the erection of cold-formed metal framing.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency and/or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
- B. Inspections:

1. Verify that prefabricated assemblies are within the erection tolerances specified herein.
2. Welding and welders are subject to Special Inspections.
3. Connections made with high strength bolts are subject to Special Inspections.
4. Verify that connections have the appropriate number of fasteners as indicated in the approved Shop Drawing plans and details.
5. Verify that dissimilar metals are isolated to prevent galvanic action.

C. Non-Conforming Work

1. Correct deficiencies in the Work that inspections have indicated to be not in compliance with requirements.

3.05 CLEANING

A. Waste Management:

1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

SECTION 05500

METAL FABRICATIONS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for the following metal fabrications:
 - a. Steel framing and supports for mechanical and electrical equipment.
 - b. Steel framing and supports for applications where framing and supports are not specified in other Sections.
 - c. Loose bearing and leveling plates.
 - d. Steel weld plates and angles for casting into concrete not specified in other Sections.
 - e. Miscellaneous metal trim.
 - f. Metal ladders.
 - g. Metal bollards.
 - h. Metal downspout boots.
 - i. Metal platforms.
 - j. Steel edging headers
- B. Products Supplied But Not Installed Under This Section:
 - 1. The following products are furnished under this Section, but are installed under other Sections:
 - a. Loose steel lintels.
 - b. Anchor bolts, steel pipe sleeves, and adhesive and expansion-type inserts indicated to be cast into or post installed into concrete or unit masonry Work.
- C. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01780 - Closeout Submittals.
 - 3. Section 03300 - Cast-In Place Concrete.
 - 4. Section 05120 - Structural Steel.
 - 5. Section 05511 – Metal Stairs
 - 6. Section 05520 – Handrails and Railings
 - 7. Section 05530 - Gratings.
 - 8. Section 06105 - Miscellaneous Carpentry.
 - 9. Section 05580 – Formed Metal Fabrications.

1.02 REFERENCES

- A. Abbreviations and Acronyms:

1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
2. VOC: An acronym for volatile organic compounds, generally meant to refer to organic chemical compounds that have high enough vapor pressures under normal conditions to significantly vaporize and enter the atmosphere.

B. Reference Standards:

1. Aluminum Association (AA):
 - a. AA DAF-45 – Designation System for Aluminum Finishes.
2. American Architectural Manufacturers Association (AAMA):
 - a. AAMA 611 - Voluntary Specification for Anodized Architectural Aluminum.
3. American Institute of Steel Construction (AISC):
 - a. AISC 201 - Certification Program for Structural Steel Fabricators.
4. American National Standards Institute (ANSI):
 - a. ANSI A14.3 – Ladders – Fixed - Safety Requirements.
5. American Society of Mechanical Engineers (ASME):
 - a. ASME B18.2.1 – Square and Hex Bolts and Screws (Inch Series).
 - b. ASME B18.6.3 – Slotted and Recessed Head Machine Screws and Machine Screw Nuts.
 - c. ASME B18.21.1 – Lock Washers (Inch Series).
 - d. ASME B18.22.1 – Plain Washers.
6. American Welding Society (AWS):
 - a. AWS D1.1/D1.1M – Structural Welding Code-Steel.
 - b. AWS D1.2/D1.2M - Structural Welding Code-Aluminum.
 - c. AWS D1.3 - Structural Welding Code–Sheet Steel.
 - d. AWS D1.6 - Structural Welding Code–Stainless Steel.
7. ASTM International (ASTM):
 - a. ASTM A 27/A 27M – Standard Specification for Steel Castings, Carbon, for General Application.
 - b. ASTM A 36/A 36M – Standard Specification for Carbon Structural Steel.
 - c. ASTM A 47/A 47M – Standard Specification for Ferritic Malleable Iron Castings.
 - d. ASTM A 48/A 48M – Standard Specification for Gray Iron Castings.
 - e. ASTM A 53/A 53M – Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.

1.03 ADMINISTRATIVE REQUIREMENTS

A. Coordination:

1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.
2. Coordinate the installation of anchorages for metal fabrications with installation of the metal fabrications.
 - a. 10 days before the metal fabrications are to be installed, give notice to those performing other construction work related to the miscellaneous metal installation, such as to those performing work that must be supported by or that will provide support of the miscellaneous metal, to allow such items to be introduced or furnished before the miscellaneous metal is installed.

B. Scheduling:

1. Coordinate the metal fabrications fabrication schedule with construction progress to avoid delaying the Work.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Shop Drawings:
 - 1) Shop Drawings showing fabrication and installation details for the proposed metal fabrications.
 - b. Samples:
 - 1) Materials and finished products as may be requested by the Program/Project Manager.
 - c. Delegated Design Submittals:
 - 1) Structural analysis data.
 - d. Qualification Statements:
 - 1) Welding procedure qualification test records (PQRs).
 - 2) Welding procedure specifications (WPSs).
 - 3) Welding Certificates.
 - 4) Fabricator Qualifications.
 - 5) Professional Engineer's credentials.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) ICC-ES Reports for expansion and adhesive anchors.
 - b. Manufacturer's Instructions:
 - 1) Expansion and adhesive anchor manufacturers' installation recommendations.
2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA1.3 – Use Recycled Material
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. At least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - b. Paints and Coatings
 - 1) Submit product data highlighting the VOC content for any field applied paint used to touch-up shop applied primer.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by the code-required Approved Agency are necessary to obtain approval of the Work of this Section.

- b. Both continuous and periodic Special Inspections will be performed during the fabrication and erection of structural steel.
- 2. Phoenix Building Construction Code:
 - a. Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments.

B. Qualifications:

- 1. Fabricator's Qualifications:
 - a. Employ a firm experienced in producing metal fabrications similar to those indicated for this Contract, who is either AISC-certified in accordance with the requirements specified in AISC 201 or listed in the current City of Phoenix approved fabricators list with a record of successful in-service performance, and with sufficient production capacity to produce required units without delaying the Work.
 - 1) Submit Fabricator Qualifications to demonstrate the capabilities and experience of the Fabricator, including a list of completed projects with project name, addresses, names of designers and owners, and other information applicable.
- 2. Professional Engineer's Qualifications:
 - a. Engage a qualified Professional Engineer registered in the State of Arizona to perform structural analysis required for the metal fabrication.
 - b. Submit the Professional Engineer's credentials to the Program/Project Manager for information.
- 3. Welding Qualifications:
 - a. Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders and welding procedures to the Program/Project Manager for approval.
 - 1) For all procedures, other than those set forth in AWS D1.1/D1.1M, AWS D1.2/D1.2M, AWS D1.3, and AWS D1.6, submit a copy of the welding procedure qualification test records (PQRs) and welding procedure specifications (WPSs) to the Program/Project Manager for approval.
 - b. Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed in AWS D1.1/D1.1M, AWS D1.2/D1.2M, AWS D1.3, and/or AWS D1.6, for the procedures.
 - 1) Submit Welding Certificates certifying the welders employed to fabricate and to install the Work of this Section have been certified in accordance with American Welding Society (AWS) standards within the previous 12 months to the Program/Project Manager for approval.
 - a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the

required welding procedures and, if pertinent, has undergone recertification.

C. Site Samples:

1. Submit Samples representative of the materials and finished products as may be requested by the Program/Project Manager.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:

1. Coordinate delivery to the Site of anchorages, setting drawings, diagrams, templates, instructions, and directions for installing anchorages.
2. Ensure materials are delivered to the Site at times and intervals that facilitate uninterrupted progress of the Work and continuity of installation.

B. Storage and Handling Requirements:

1. Protect fastener products from dirt and corrosion by placing them in closed containers.
 - a. Store fastener products in a protected shelter, remove fastener components only as necessary, and promptly return unused fasteners to protected storage.

PART 2 PRODUCTS

2.01 METAL FABRICATIONS

A. Description:

1. Regulatory Requirements:
 - a. Phoenix Building Construction Code:
 - 1) Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments and the ICC International Building Code (IBC) as Amended by the City of Phoenix].
 - b. Ladders:
 - 1) Fabricate ladders in accordance with the requirements specified in 29 CFR 1910.27 Fixed Ladders, and 29 CFR 1926.1053 Ladders.
2. Sustainability Requirements:
 - a. Recycled Content
 - 1) Provide Structural Steel whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 75 percent.
 - b. Low Emitting Materials – Paints and Coatings
 - 1) When paint is field applied to touch-up shop applied primer on surfaces within the building envelop, ensure they have a VOC content not exceeding 100 g/L.

B. Design Criteria:

1. Form metal fabrications from materials of the size, thickness, and shapes indicated but not less than that needed to comply with performance requirements indicated.
 - a. Work to the dimensions indicated or approved on Shop Drawings, using proven details of fabrication and support.
 - b. Use the type of materials indicated or specified for the various components of each metal fabrication.
 - c. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges.
2. Thermal Movement:
 - a. To prevent buckling, opening up of joints, and overstressing of welds and fasteners, during the design, fabrication, and installation of installed metal assemblies allow for thermal movement resulting from a maximum temperature change (range) of 100 deg Fahrenheit (55.5 deg Celsius) in the ambient temperature.
 - b. Base design calculations on the actual surface temperatures of metals due to both solar heat gain and nighttime sky heat loss.
3. Metal Surfaces:
 - a. For metal fabrications exposed to view in the completed Work, provide materials selected for their surface flatness, smoothness, and freedom from surface blemishes.
 - b. Do not use materials with exposed pitting, scam marks, roller marks, rotted trade names, or roughness.
4. Fasteners:
 - a. Select fasteners of the type, grade, and class required.
 - b. Unless otherwise indicated in the Contract Documents, provide the following types of fasteners for metal fabrications:
 - 1) For exterior walls, provide Type 304 stainless steel bolts and fasteners.
 - 2) For interior walls, provide fasteners and bolts zinc-plated in accordance with the requirements for Class Fe/Zn 5 coating specified in ASTM B 633.
 - 3) For fastening aluminum, provide stainless steel fasteners.
 - c. Expansion Anchors:
 - 1) For non-structural applications, provide expansion anchor bolt and sleeve assemblies with the capability to sustain, without failure, the following loads as determined by testing conducted by a qualified independent testing agency in accordance with the requirements specified in ASTM E 488:
 - a) When installed in unit masonry, a load equal to 6 times the load imposed.
 - b) When installed in concrete, a load equal to 4 times the load imposed.
 - 2) For non-structural applications, provide minimum expansion anchor embedment equal to 8 times the anchor diameter unless calculations from a registered Professional Engineer are provided.

- 3) For structural applications, provide expansion anchor bolt and sleeve assemblies as specified in the structural Sections and indicated on the Contract Drawings.
 - d. Adhesive Anchors:
 - 1) For structural applications, provide adhesive anchors as specified in the structural Sections and indicated on the Contract Drawings.
 - e. Provide expansion and adhesive anchors having ICC-ES Reports™ (ESRs) showing they comply with the applicable codes.
 - 1) Submit the ICC-ES Reports for the anchors to the Program/Project Manager for information.
 - 5. Shop Drawings:
 - a. Submit Shop Drawings showing fabrication and installation details for the proposed metal fabrications to the Program/Project Manager for approval.
 - 1) Include plans, elevations, sections, and details of metal fabrications and their connections
 - 2) Show anchorage and accessory items.
 - 3) Submit setting drawings, diagrams, templates, instructions, and directions for installing anchorages.
 - a) Provide templates for anchors and bolts specified for installation under other Sections.
 - 6. Calculations:
 - a. For installed products indicated to comply with design loads, submit structural analysis data signed and sealed by the qualified Professional Engineer responsible for their preparation to the Program/Project Manager for approval.
- C. Materials
- 1. Ferrous Metals:
 - a. Structural Steel:
 - 1) For structural steel framing system components, provide materials complying with the requirements specified in Section 05120, Structural Steel.
 - b. Steel Plates, Shapes, and Bars:
 - 1) Provide steel plates, shapes, and bars complying with the requirements specified in ASTM A 36/A 36M.
 - c. Stainless Steel Sheet, Strip, Plate, and Flat Bars:
 - 1) Provide stainless steel sheet, strip, plate, and flat bars complying with the requirements for Type 304 stainless steel specified in ASTM A 666.
 - a) Perforations:
 - (1) Where required, provide custom perforations as indicated in the Contract Drawings.
 - (a) Provide straight-line 1/8 inch by 3/4 inch slots, 40 percent open.
 - b) Finish:

- (1) Provide a bright, directional satin finish: No. 4, unless otherwise specified.
- d. Stainless Steel Bars and Shapes:
 - 1) Provide stainless steel bars and shapes complying with the requirements for Type 304 stainless steel specified in ASTM A 276.
- e. Steel Tubing:
 - 1) Provide cold-formed steel tubing complying with the requirements specified in ASTM A 500
- f. Steel Pipe:
 - 1) Provide standard weight (schedule 40) steel pipe complying with the requirements specified in ASTM A 53/A 53M, unless otherwise indicated in the Contract Documents or another weight required by structural loads.
- g. Cast Iron:
 - 1) Provide Class 30 cast iron pipe complying with the requirements specified in ASTM A 48/A 48M, unless otherwise indicated in the Contract Documents or another weight required by structural loads.
2. Nonferrous Metals:
 - a. Aluminum Plate and Sheet:
 - 1) Provide Alloy 6061-T6 aluminum plate and sheet complying with the requirements specified in ASTM B 209.
 - b. Aluminum Extrusions:
 - 1) Provide Alloy 6063-T6 aluminum extrusions complying with the requirements specified in ASTM B 221.
 - c. Aluminum-Alloy Rolled Tread Plates:
 - 1) Provide Alloy 6061-T6 aluminum-alloy rolled tread plates complying with the requirements specified in ASTM B 632/B 632M.
3. Fasteners:
 - a. Bolts and Nuts:
 - 1) Provide regular hexagon-head steel bolts complying with the requirements specified for Grade A bolts in ASTM A 307.
 - 2) Provide steel hex nuts complying with the requirements specified in ASTM A 563 (ASTM A 563M).
 - 3) Provide steel flat washers where indicated in the Contract Documents.
 - b. Anchor Bolts:
 - 1) Provide Grade 36 anchor bolts complying with the requirements specified in ASTM F 1554.
 - c. Eyebolts:
 - 1) Provide eyebolts complying with the requirements specified in ASTM A 489.
 - d. Machine Screws:

- 1) Provide machine screws complying with the requirements specified in ASME B18.6.3.
 - e. Lag Bolts:
 - 1) Provide lag bolts complying with the requirements specified in ASME B18.2.1.
 - f. Plain Washers:
 - 1) Provide plain round washers complying with the requirements specified in ASME B18.22.1.
 - g. Lock Washers:
 - 1) Provide helical, spring type lock washers complying with the requirements specified in ASME B18.21.1.
 - h. Cast-in-Place Anchors in Concrete:
 - 1) Provide anchors capable of sustaining, without failure, a load equal to 4 times the load imposed as determined by testing conducted by a qualified independent testing agency in accordance with the requirements specified in ASTM E 488.
 - 2) Provide either threaded or wedge type anchors.
 - 3) Provide galvanized ferrous castings, either malleable iron castings complying with the requirements specified in ASTM A 47/A 47M, or cast steel castings complying with the requirements specified in ASTM A 27/A 27M.
 - 4) Provide bolts, washers, and shims as required, hot-dip galvanized in accordance with the requirements specified in ASTM A 153/A 153M.
 - i. Expansion Anchors:
 - 1) For non-structural applications in interior locations, provide carbon steel expansion anchors zinc-plated in accordance with the requirements for Class Fe/Zn 5 coating specified in ASTM B 633.
 - 2) For non-structural applications in exterior locations, provide expansion anchors having Alloy Group 1 stainless steel bolts complying with the requirements specified in ASTM F 593, and stainless-steel nuts complying with the requirements specified in ASTM F 594.
 4. Gratings:
 - a. Provide metal bar gratings and anchors, and metal frames and supports for the gratings in accordance with the requirements specified in Section 05530, Gratings.
- D. Components
1. Aluminum Ladders:
 - a. Fabricate ladders for the locations shown from aluminum Alloy 6063-T6 having a mill finish, and with the dimensions, spacing, details, and anchorages indicated on the Contract Drawings.
 - 1) If the dimensions, spacing, details, and anchorages are not indicated on the Contract Drawings, fabricate ladders in accordance with the requirements specified in ANSI A14.3 and

this Section, and submit Shop Drawings showing the proposed design to the Program/Project Manager for approval.

b. Caged Access Ladders:

1) Side Rails:

- a) Provide continuous side rails fabricated from 1-3/4-inch (45mm) by 3-inch (76mm) aluminum tube with a 1/8-inch wall thickness, and having eased edges, and spaced 24 inches (610mm) apart.
- b) Extend the side rails 42 inches (1.1m) above the top rung, and return the rails to the wall or structure, unless other secure handholds are provided.

2) Rungs:

- a) Provide rungs fabricated from 1-1/4-inch square aluminum tube with corrugated surfaces spaced 12 inches (310mm) apart on center.
- b) Fit and locate the rungs on the centerline of the side rails.
- c) Plug weld and grind smooth the bar rungs on outer side rail faces.
- d) Provide nonslip corrugated surfaces on each rung.

3) Intermediate Platforms:

- a) If indicated on the Contract Drawings, provide intermediate crossover platforms.

(1) Treads:

- (a) Provide platform treads fabricated from 6-inch (152mm) wide by 1-3/4-inch (45mm) deep aluminum treads having a corrugated surface.

(2) Platform Frames:

- (a) Provide frames for the intermediate crossover platforms fabricated from 5-inch (127mm) aluminum channels.

(3) Guardrails:

- (a) Provide guardrails at the intermediate crossover platforms fabricated from 1-1/4-inch square aluminum tube with corrugated surfaces.
- (b) Provide 42-inch high guardrails connected to the side rails of 2 ladder segments as detailed on the Contract Drawings and approved Shop Drawings.

4) Safety Cages:

- a) If indicated on the Contract Drawings, provide safety cages for the ladders fabricated from 2-inch wide by 1/4-inch thick aluminum vertical strips and horizontal hoops welded together to form a cage around the ladder as detailed on the Contract Drawings and approved Shop Drawings.
- b) Provide at least 27 inches of clearance from the ladder to the back of the cage.

- c) Locate the bottom of the cage 7 feet above grade or 7 feet above the closest intermediate platform below the cage.
 - d) Extend the safety cages at least 42 inches (1.1m) above the top rung, and attach the extension to the side rails as detailed on the Contract Drawings and approved Shop Drawings.
 - 5) Safety Post Extensions:
 - a) For fixed ladders, provide safety post extensions fabricated from tubular aluminum sections, and having adjustable mounting brackets designed to be attached to the top of the ladder.
 - b) Design the safety post extensions for manual operation, and provide a mechanism consisting of a mechanical pin for locking the safety post in place when it has been fully extended.
 - 6) Support Brackets:
 - a) Wall Brackets:
 - (1) Provide wall brackets fabricated from flat bar aluminum at least 2 inches (50mm) wide by 1/4-inches (6mm) thick.
 - b) Floor Brackets:
 - (1) Provide floor brackets fabricated from flat bar aluminum at least 2 inches (50mm) wide by 1/4-inches (6mm) thick to anchor the side rails to the floor.
 - c) Allow at least 7 inches (180mm) clearance from the wall to the center line of the rungs.
 - 7) Manufacturers:
 - a) ACL Industries, Inc., Model ACL-390A,
<http://www.aclindustries.com>.
 - b) Approved equal.
- 2. Steel Ladders:
 - a. Fabricate ladders for the locations shown from steel with the dimensions, spacing, details, and anchorages indicated on the Contract Drawings.
 - 1) If the dimensions, spacing, details, and anchorages are not indicated on the Contract Drawings, fabricate ladders in accordance with the requirements specified in ANSI A14.3 and this Section, and submit Shop Drawings showing the proposed design to the Program/Project Manager for approval.
 - b. Side Rails:
 - 1) Provide continuous side rails fabricated from 1/2-inch (12mm) by 2-1/2-inch (64mm) flat steel bar having eased edges, and spaced 18 inches (460 mm) apart.
 - 2) Extend the side rails 42 inches (1.1m) above the top rung, and return the rails to the wall or structure, unless other secure handholds are provided.
 - c. Rungs:

- 1) Provide rungs fabricated from 3/4-inch (19mm) diameter steel bar spaced 12 inches (310mm) apart on center.
 - 2) Fit and locate the rungs on the centerline of the side rails.
 - 3) Plug weld and grind smooth the bar rungs on outer side rail faces.
 - 4) Provide nonslip surfaces on the top of each rung.
 - d. Support Brackets:
 - 1) Provide welded or bolted steel brackets to support each ladder at the top and bottom, and at intermediate points spaced not more than 5 feet (1.5m) apart on center.
 - a) Size the brackets to support the design dead and live loads indicated in the Contract Documents, and to hold the centerline of the ladder rungs clear of the wall surface by not less than 7 inches (180mm).
 - (1) If the adjacent structure does not extend above the top rung, goose-neck the extended rails back to the structure to provide secure ladder access.
3. Loose Lintels:
 - a. Provide loose lintels fabricated from steel angles and shapes of the sizes indicated in the Contract Documents for the openings and recesses in masonry walls and partitions, and at the locations indicated in the Contract Documents.
 - b. Weld adjoining members together to form a single unit where indicated in the Contract Documents.
 - c. Size the loose lintels so equal bearing is provided at each end of the lintel as follows:
 - 1) For spans up to 6 feet, provide 4 inches of bearing at each end.
 - 2) For spans between 6 and 10 feet, provide 8 inches of bearing at each end.
 - 3) For spans greater than 10 feet, if any, provide an equal bearing of 1 inch per foot of clear span at each side of openings, unless otherwise indicated in the Contract Documents.
4. Loose Bearing and Leveling Plates:
 - a. For steel items bearing on masonry or concrete construction, provide loose bearing and leveling plates fabricated so they are flat, free from warps or twists, and of the required thickness and bearing area.
 - b. Drill the loose bearing and leveling plates to receive anchor bolts, and for grouting as required.
 - c. After fabrication, galvanize the loose bearing and leveling plates.
5. Miscellaneous Framing and Supports:
 - a. Provide steel framing and supports for the applications indicated in the Contract Documents that are not a part of structural steel framework and not specified in other Sections as required to complete the Work.
 - b. Fabricate units to the sizes, shapes, and profiles indicated in the Construction Documents, and as required to receive adjacent construction retained by framing and supports.

- 1) Unless otherwise indicated, fabricate units from steel shapes, plates, and bars of welded construction using mitered joints for field connection.
- 2) Cut, drill, and tap units to receive hardware, hangers, and similar items.
- c. Attachments:
 - 1) Equip units with integrally welded anchors for casting into concrete or building into masonry.
 - a) If units must be installed after concrete is placed, provide inserts.
 - b) Provide anchor units consisting of 1-1/4-inch (32mm) wide by 8-inch (200mm) long by 1/4-inch (6mm) thick steel straps, minimum.
 - d. Galvanize miscellaneous framing and supports where indicated in the Construction Documents.
 - e. Prime miscellaneous framing and supports with zinc-rich primer where indicated in the Construction Documents.
6. Miscellaneous Metal Trim:
 - a. Formed Metal Fabrications:
 - 1) Formed metal fabrications including, but not limited to, the following are specified in Section 05580, Formed Metal Fabrications:
 - a) Metal panel cladding.
 - b) Metal panel beam wraps.
 - c) Metal column covers.
 - d) Baggage cart protection rails.
 - e) Corner guards.
 - f) Metal base.
 - g) Break metal shapes.
 - h) Metal panel escalator cladding.
 - i) Metal panel soffits and bulkheads.
 - b. Unless otherwise indicated, fabricate miscellaneous trim units from structural steel shape, plates, and bars of the profiles shown in the Construction Drawings with continuously welded joints, and smooth exposed edges.
 - 1) Miter the corners, and use concealed field splices wherever possible.
 - c. Provide cutouts, fittings, and anchorages as required to coordinate assembly and installation of miscellaneous trim units with other work.
 - d. For embedding miscellaneous trim in concrete or masonry construction, weld anchors to the trim.
 - 1) Space the anchors not more than 6 inches (150mm) from each end, 6 inches (150mm) from corners, and 24 inches (600mm) apart on center, unless otherwise indicated in the Construction Documents.
 7. Metal Bollards:

- a. Fabricate metal bollards from Schedule 80 steel pipe.
 - b. Fill bollards with concrete mounding to the surface.
 - c. For anchoring bollards, provide sleeves fabricated from steel pipe having a 1/4-inch (6.4mm) thick steel base plate welded to the bottom of the pipe.
8. Metal Downspout Boots:
 - a. Provide metal downspout boots fabricated from cast gray iron in the lengths indicated in the Contract Documents.
 - 1) Provide inlets of a size and shape to suit the downspouts.
 - 2) Provide vertical outlets to discharge onto splash blocks or pavement.
 - b. Finish the downspout boots to match the finish color of the adjacent materials.
9. Rough Hardware:
 - a. Furnish bent, or otherwise custom-fabricated, bolts, plates, anchors, hangers, dowels, and other miscellaneous steel and iron shapes as required for framing and supporting woodwork, and for anchoring or securing woodwork to concrete or other structures.
 - 1) Straight bolts and other stock rough hardware items are specified in Section 06105, Miscellaneous Carpentry.
 - b. Fabricate items to the sizes, shapes, and dimensions required.
 - 1) Furnish malleable-iron washers for heads and outs that bear a wood structural connection, and furnish steel washers elsewhere.
10. Rain Water Pipe Attachment Straps:
 - a. Provide stainless steel rain water pipe attachment straps complying with the requirements for Type 304 stainless steel or Type 316 stainless steel specified in ASTM A 666.
11. Roof Drain Leaders – Exposed
 - a. Unless otherwise indicated, fabricate exposed roof drain leaders from structural steel shape, plates, tubes and bars of the profiles shown in the Construction Documents with continuously welded joints, and smooth exposed edges.
 - b. Provide cutouts, fittings, and anchorages as required to coordinate assembly and installation of drain leaders with other work.
 - c. For embedding sleeves in concrete construction, weld anchors to the trim.
 - 1) Space the anchors not more than 6 inches from each end, 6 inches from corners, and 24 inches apart on center, unless otherwise indicated in the Construction Documents.
 - d. Weld tabs to frames and coordinate with fireproofing and finishing of the AECS.
 - e. Deliver components to site shop primed for field applied high performance coating.
12. Roof Drain Downspout Nozzle – Exposed

- a. Fabricate exposed roof drain downspout nozzles from cast nickel bronze with anchor flange, countersunk mounting holes, and IPS threaded (standard), no hub, or push-on connection.
 - 1) Manufacturers:
 - a) Watts, www.watts.com
 - b) Zurn, www.zurn.com

2.02 ASSEMBLY/FABRICATION:

A. Factory Assembly:

1. Preassemble items in the shop to the greatest extent possible.
2. Disassemble units only as necessary for shipping and handling limitations.
3. Provide connections that maintain the structural value of the joined pieces.
4. Clearly mark units for reassembly and coordinated installation.
5. Prevent galvanic corrosion by preventing dissimilar metals from contacting each other.

B. Shop Fabrication:

1. Shear and punch metals cleanly and accurately, and remove burrs.
2. Unless otherwise indicated in the Contract Documents, ease exposed edges to a radius of approximately 1/32 inch (1mm).
3. Form bent-metal corners to the smallest radius possible without causing grain separation or otherwise impairing the work.
4. Remove sharp or rough areas on exposed traffic surfaces.
5. Weld corners and seams continuously, and comply with the following requirements:
 - a. Use materials and methods that minimize distortion and develop strength and corrosion resistance of the base metals.
 - b. Obtain fusion without undercut or overlap.
 - c. Remove welding flux immediately.
 - d. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing, and the contour of the welded surface matches those adjacent.
6. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners wherever possible.
 - a. Provide exposed fasteners of the type Indicated, or if not indicated, Phillips flat-head (countersunk) screws or bolts.
 - b. Locate joints where least conspicuous.
7. Provide an anchorage of the type indicated in the Contract Documents.
 - a. Coordinate the anchorage with the supporting structure.
 - b. Fabricate and space anchoring devices to secure the metal fabrication rigidly in place, and to support the indicated loads.
 - c. For exterior applications, provide either Type 304 stainless steel or hot-dipped galvanized anchorages.
8. Cut, reinforce, drill, and tap the metal fabrications as indicated to receive finish hardware, screws, and similar items.

9. Fabricate joints that will be exposed to the weather so water is excluded, or provide weep holes where water may accumulate.
10. Factory-apply protective coatings to aluminum surfaces that will come into direct contact with concrete, cement grout materials, or other dissimilar materials that would cause galvanic corrosion of the metal.

2.03 MIXES:

A. Concrete Materials and Properties:

1. Provide concrete materials complying with the requirements specified in Section 03300, Cast-in-Place Concrete, for normal-weight, air-entrained, ready-mix concrete with a minimum 28-day compressive strength of 3000 psi (20MPa), unless higher strengths are indicated.

B. Nonshrink, Nonmetallic Grout:

1. Provide factory-packaged, non-ferrous-aggregate nonshrink grout complying with the requirements specified in ASTM C 1107/C 1107M, having a minimum 28-day strength of 7000 psi, and having a flowable or plastic consistency; or provide other nonshrink grout specifically recommended by the equipment manufacturer for heavy-duty loading applications.

2.04 FINISHES:

A. Primer Materials:

1. Shop Primers:
 - a. Where applicable, provide shop primers complying with the requirements specified in the appropriate Division 9 Sections.
2. Universal Shop Primer:
 - a. Provide fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with the requirements specified in MPI # 79.
3. Zinc-Rich Primer:
 - a. Provide Type II zinc-rich primer complying with the requirements specified in SSPC–Paint 20 or SSPC–Paint 29, and compatible with the topcoat.
 - b. Provide primer having a VOC content of 3.5 pounds per gallon or less when calculated in accordance with 40 CFR 59, Subpart D (EPA Method 24).
 - c. Manufacturers:
 - 1) International Protective Coatings, Interzinc® 315 Epoxy Zinc-Rich Primer, <http://www.international-pc.com/>.
 - 2) Sherwin-Williams Company, Corothane I GalvaPac Zinc Primer, www.sherwin-williams.com.
 - 3) Tnemec Company, Inc., Tneme-Zinc 90-97, www.tnemec.com.
 - 4) Approved equal.
4. Galvanizing Repair Paint:

- a. For re-galvanizing welds in steel, provide high-zinc-dust-content paint complying with the requirements specified in SSPC-Paint 20.
 - b. Apply 2 coats.
 5. Bituminous Paint:
 - a. Provide a cold-applied asphalt emulsion complying with the requirements specified in ASTM D 1187.
- B. Finish Materials:
 1. Galvanizing:
 - a. For galvanizing steel and iron products, except hardware, provide galvanizing complying with the requirements specified in ASTM A 123/A 123M.
 - b. For galvanizing steel and iron hardware, provide galvanizing complying with the requirements specified in ASTM A 153/A 153M.
 2. Aluminum Finishes:
 - a. As-Fabricated Finish:
 - 1) Provide an AA-M10 finish (mechanical finish: as fabricated, unspecified) complying with the requirements specified in AA DAF-45.
 - b. Class I, Clear Anodic Finish:
 - 1) Provide an AA-M12C22A41 finish (mechanical finish: nonspecular as fabricated) complying with the requirements specified in AA DAF-45.
 - c. Chemical Finish:
 - 1) Provide an etched, medium matte finish.
 - d. Anodic Coating:
 - 1) Provide an Architectural Class I finish (clear coating 0.018mm or thicker) complying with the requirements specified in AAMA 611.
- C. Shop Finishing Methods:
 1. For recommendations relative to applying and designing finishes, comply with the recommendations specified in NAAMM/NOMMA 500.
 2. Finish metal fabrications after assembly.
 3. Galvanize exterior and interior miscellaneous steel trim where indicated in the Contact Documents.
 4. Prime exterior and interior miscellaneous steel trim with zinc-rich primer where indicated in the Contact Documents.
 5. Preparation for Shop Priming:
 - a. Prepare ferrous metal surfaces to comply with the minimum SSPC surface preparation requirements specified, and for the environmental exposure conditions of the installed metal fabrications.
 - 1) For interiors (SSPC Zone 1A), prepare the surface in accordance with the requirements specified in SSPC-SP 3.
 - 2) For exteriors (SSPC Zone 1B) and items to receive zinc-rich primer, prepare the surface in accordance with the requirements specified in SSPC-SP 6.

6. Unless otherwise indicated in the Contract Documents, apply shop primer to uncoated surfaces of the metal fabrications in accordance with the requirements specified in SSPC-PA 1 for shop painting, except for the following surfaces:
 - a. Uncoated surfaces with galvanized finishes.
 - b. Uncoated surfaces to be embedded in concrete, sprayed-on fireproofing, or masonry.

2.05 ACCESSORIES

- A. Welding Rods and Bare Electrodes:
 1. Provide welding rods and bare electrodes selected according to the American Welding Society (AWS) specifications for the metal alloy to be welded.
- B. Metal Stairs:
 1. For metal framed stairs with metal pan, metal plate, or grating treads, provide metal stairs complying with the requirements specified in Section 05511, Metal Stairs.
- C. Handrails and Railings:
 1. For metal pipe and tube handrails and railing systems, provide handrails and railings complying with the requirements specified in Section 05520, Handrails and Railings.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 1. Field Measurements:
 - a. Check actual locations of walls and other construction to which metal fabrications must fit by making accurate field measurements before fabricating the metal fabrications.
 - 1) Show recorded measurements on the final Shop Drawings.
 - b. Where field measurements cannot be made without delaying the Work, guarantee dimensions, and proceed with fabricating products without field measurements.
 - 1) Coordinate construction to ensure that actual dimensions correspond to the guaranteed dimensions.
 - 2) Allow for trimming and fitting.

3.02 PREPARATION

- A. Surface Preparation:
 1. Provide anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction.

- a. Set sleeves in concrete with their tops flush with the finish surface elevations.
 - 1) Prevent water and concrete from entering the sleeves.
- b. Install expansion and adhesive anchors in accordance with the manufacturer's recommendations and ICC-ES Report requirements.
 - 1) Submit the expansion and adhesive anchor manufacturers' installation recommendations to the Program/Project Manager for information.

3.03 INSTALLATION

- A. Cutting, Fitting, and Placement:
 1. Cut, drill, and fit miscellaneous metal fabrications as required for installation.
 2. Accurately set the metal fabrications in the proper location, in the proper alignment, and at the proper elevation when measured from established lines and levels, with edges and surfaces level, plumb, true, and free of rack.
- B. Connections:
 1. Fit exposed connections accurately together to form hairline joints.
 2. Weld connections that are not to be left as exposed joints but cannot be shop-welded because of shipping size limitations.
 3. Do not weld, cut, or abrade the surfaces of exterior units that have been hot-dip galvanized after fabrication, and are intended for bolted or screwed field connections.
- C. Field Welding:
 1. Provide materials and employ methods that minimize distortion and develop the strength and corrosion resistance of the base metals.
 2. Obtain fusion without undercut or overlap.
 3. Remove welding flux immediately.
 4. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing, and the contour of welded surface matches those adjacent.
- D. Special Techniques:
 1. Installing Miscellaneous Metal Framing and Supports:
 - a. Install framing and supports to comply with the requirements of the items being supported as indicated in the manufacturer's written instructions and the requirements indicated in approved Shop Drawings.
 2. Installing Bearing and Leveling Plates:
 - a. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen the surfaces to improve bond to surfaces.

- b. Check aluminum materials that are to be mounted on concrete, masonry, or other similar materials to verify that factory-applied coatings to prevent galvanic corrosion have not been damaged.
 - 1) If these coatings have been damaged or are missing, apply material approved by the manufacturer to repair the damage or protect the aluminum materials from corrosion.
 - c. Clean bottom surface of bearing plates, but do not remove protective coatings applied to prevent corrosion.
 - d. Set loose leveling and bearing plates on wedges, shims, or leveling nuts.
 - e. After the bearing members have been positioned and plumbed, tighten the anchor bolts.
 - f. Do not remove wedges or shims, but if they protrude, cut them off flush with the edge of the bearing plate before packing the plates with grout.
 - 1) In concealed locations not exposed to moisture, provide nonshrink grout, either metallic or nonmetallic.
 - 2) In exposed locations; unless otherwise indicated provide nonshrink, nonmetallic grout.
 - 3) Pack the grout solidly between the bearing surfaces and the plates so no voids remain.
 - 3. Installing Metal Bollards:
 - a. Anchor bollards in concrete with pipe sleeves preset and anchored into the concrete.
 - b. After the bollards have been inserted into the sleeves, fill the annular space between bollards and sleeves solidly with nonshrink, nonmetallic grout, mixed and placed in accordance with the grout manufacturer's directions.
 - c. Fill the bollards solidly with concrete.
 - 1) Mound top surface of uncapped bollards so the bollard will shed water.
 - 2) Allow the concrete to cure for 7 days before installing metal caps on capped bollards.
 - 4. Stripe paint corners, crevices, bolts, welds, and sharp edges.
- E. Interface with Other Work:
 - 1. Fastening to In-Place Construction:
 - a. Provide anchorage devices and fasteners where necessary for securing miscellaneous metal fabrications to in-place construction.
 - b. Provide threaded fasteners for concrete and masonry inserts, toggle bolts, through-belts, lag bolts, wood screws, and other connectors as required.
 - c. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry or similar construction.

3.04 REPAIR/RESTORATION

A. Touchup Painting:

1. Clean field welds, bolted connections, and abraded areas of shop paint; and paint exposed areas with same material as used for shop painting to comply with SSPC-PA 1 requirements for touching up shop-painted surfaces.
2. Apply by brush or spray to provide a 2.0-mil (0.05mm) minimum dry film thickness.

B. Galvanized Surfaces:

1. Clean field welds, bolted connections, and abraded areas, and repair galvanizing to comply with the requirements of ASTM A 780

3.05 SITE QUALITY CONTROL

A. Site Tests and Inspections:

1. During the period when metal fabrications are being installed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - 1) Both continuous and periodic Special Inspections will be performed during the installation of post installed anchors for mounting ladders, platforms, safety cages, and other safety related devices or similar fabricated items used for access.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency and/or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.

3.06 CLEANING

A. Waste Management:

1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

END OF SECTION

Rev. No.	Rev. Date	RFC/CN/CO	Section(s) Affected	Comments
0	10/06/201	N/A	All	First edition.
1	12/20/2017	N/A	1.02.A.1, 1.02.B.15, 1.04.B.2, 2.01.A	Add requirements for ENVISION Sustainability Rating System

SECTION 05511

METAL STAIRS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for preassembled steel stairs with concrete-filled treads.
 - 2. Requirements for steel tube railings attached to metal stairs.
- B. Products Supplied But Not Installed Under This Section:
 - 1. Anchor and Bolt Templates:
 - a. Templates for the anchors and bolts which will be installed under other Sections, but which are required for the installation of the metal stairs provided under this Section, are included under this Section.
- C. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 03300 - Cast-In-Place Concrete.
 - 5. Section 03410 - Plant-Precast Structural Concrete.
 - 6. Section 05521 - Pipe and Tube Railings.
 - 7. Section 09912 – Painting.
 - 8. Section 09960 - High-Performance Coatings.
 - 9. Section 16130 – Raceway and Boxes
 - 10. Section 16521 – Exterior Lighting

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
- B. Definitions:
 - 1. Authority Having Jurisdiction (AHJ): Building Code officials, zoning officials, inspectors, and government and regulatory agencies given the authority to protect the public’s health, safety, and welfare.

C. Reference Standards:

1. American Society of Civil Engineers (ASCE)/Structural Engineering Institute (SEI):
 - a. ASCE/SEI 7 - Minimum Design Loads for Buildings and Other Structures.
2. American Society of Mechanical Engineers (ASME):
 - a. ASME B18.2.1 – Square and Hex Bolts and Screws (Inch Series).
 - b. ASME B18.6.3 – Slotted and Recessed Head Machine Screws and Machine Screw Nuts.
 - c. ASME B18.21.1 – Lock Washers (Inch Series).
 - d. ASME B18.22.1 – Plain Washers.
3. American Welding Society (AWS):
 - a. AWS D1.1/D1.1M - Structural Welding Code - Steel.
 - b. AWS D1.3; Structural Welding Code - Sheet Steel.
4. ASTM International (ASTM):
 - a. ASTM A 36/A 36M - Standard Specification for Carbon Structural Steel.
 - b. ASTM A 47/A 47M – Standard Specification for Ferritic Malleable Iron Castings.
 - c. ASTM A 48/A 48M – Standard Specification for Gray Iron Castings.
 - d. ASTM A 82/A 82M - Standard Specification for Steel Wire, Plain, for Concrete Reinforcement.
 - e. ASTM A 123/A 123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
 - f. ASTM A 153/A 153M - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
 - g. ASTM A 185/A 185M - Standard Specification for Steel Welded Wire Reinforcement, Plain, for Concrete.
 - h. ASTM A 283/A 283M - Standard Specification for Low and Intermediate Tensile Strength Carbon Steel Plates.
 - i. ASTM A 307 – Standard Specification for Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength.
 - j. ASTM A 500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
 - k. ASTM A 510 - Standard Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel.
 - l. ASTM A 510M - Standard Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel [Metric].
 - m. ASTM A 513 - Standard Specification for Electric-Resistance-Welded Carbon and Alloy Steel Mechanical Tubing.
 - n. ASTM A 563 - Standard Specification for Carbon and Alloy Steel Nuts.
 - o. ASTM A 563M - Standard Specification for Carbon and Alloy Steel Nuts [Metric].
 - p. ASTM A 780 - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.

- q. ASTM A 786/A 786M - Standard Specification for Hot-Rolled Carbon, Low-Alloy, High-Strength Low-Alloy Steel Floor Plates.
- r. ASTM A 1008/A 1008M – Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Allow, High-Strength Low-Allow with Improved Formability, Solution Hardened, and Bake Hardenable.
- s. ASTM A 1011/A 1011M – Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
- t. ASTM A 1018/A 1018M - Standard Specification for Steel, Sheet and Strip, Heavy-Thickness Coils, Hot-Rolled, Carbon, Commercial, Drawing, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
- u. ASTM B 221 – Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
- v. ASTM B 221M – Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes [Metric].
- w. ASTM B 633 – Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel.
- x. ASTM D 1187 - Standard Specification for Asphalt-Base Emulsions for Use as Protective Coatings for Metal.
- y. ASTM F 593 - Standard Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
- z. ASTM F 594 - Standard Specification for Stainless Steel Nuts.
- aa. ASTM F 1267 - Standard Specification for Metal, Expanded, Steel.
- bb. ASTM F 1554 - Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength.
- cc. ASTM F 1941 - Standard Specification for Electrodeposited Coatings on Threaded Fasteners (Unified Inch Screw threads(UN/UNR)).
- dd. ASTM F 1941M - Standard Specification for Electrodeposited Coatings on Threaded Fasteners [Metric].
- 5. City of Phoenix (COP):
 - a. Phoenix Building Construction Code and Amendments.
- 6. International Code Council (ICC):
 - a. ICC International Building Code (IBC) as Amended by the City of Phoenix.
- 7. The Master Painters Institute (MPI):
 - a. MPI # 79 - Primer, Alkyd, Anti-Corrosive for Metal.
- 8. National Association of Architectural Metal Manufacturers (NAAMM):
 - a. Architectural Metal Products Division (AMP):
 - 1) NAAMM/NOMMA AMP 500 – Metal Finishes Manual for Architectural and Metal Products.
 - 2) NAAMM AMP 510 - Metal Stairs Manual [*out of print; being revised*].

- b. Metal Bar Grating Division (MBG):
 - 1) ANSI/NAAMM MBG 531 - Metal Bar Grating Manual.
- 9. National Ornamental and Miscellaneous Metals Association (NOMMA):
 - a. NOMMA Voluntary Joint Finish Standards.
- 10. The Society for Protective Coatings (SSPC):
 - a. SSPC Steel Structures Painting Manual.
 - 1) SSPC-PA 1 - Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel.
 - 2) SSPC-SP 3 - Surface Preparation Specification No. 3 Power Tool Cleaning.
 - 3) SSPC-SP 6/NACE No. 3 - Surface Preparation Specification No. 6 Commercial Blast Cleaning.
- 11. Institute for Sustainability Infrastructure (ISI):
 - 1) ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate with the Program/Project Manager and the Phoenix Sky Harbor International Airport to insure notification is received sufficiently early to allow them ample time to schedule and perform the required testing performed by the Testing and Inspection Agency, the Approved Agency, and the City, prior to incorporating items requiring testing by them into the Work.
 - 2. Coordinate the locations of hanger rods and struts with other work so they will not encroach on required stair widths, and will be within the fire-resistance-rated stair enclosure.
- B. Sequencing:
 - 1. Sequence the erection of metal stairs to follow construction of supporting concrete and masonry load bearing walls and concrete foundations.
 - 2. Deliver sleeves, concrete inserts, anchor bolts, and items with integral anchors that are to be embedded in concrete or masonry so they can be incorporated into the Work in time to not delay the Work.

1.04 SUBMITTALS

- A. Action Submittals:
 - 1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Prefilled metal-pan stair treads.
 - 2) Nonslip aggregates and nonslip-aggregate finishes.
 - 3) Abrasive nosings.

- 4) Paint products.
 - 5) Conduit
 - 6) Light Fixtures
 - b. Shop Drawings:
 - 1) Metal stair and railing systems.
 - c. Samples:
 - 1) Samples for the initial selection of colors, textures, or designs for those products requiring selections to be made.
 - d. Certificates:
 - 1) Recycled steel content affidavit.
 - e. Delegated Design Submittals:
 - 1) Structural design for the metal stair and railing system.
 - f. Qualification Statements:
 - 1) Professional Engineer's qualifications.
 - 2) Welding procedure specifications (WPS) test records.
 - 3) Welding Certificates.
- B. Informational Submittals:
 - 1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA 1.3 - Use Recycled Materials
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - b. Paints and Coatings
 - 1) Submit product data highlighting the VOC content for any field applied paint used to touch-up shop applied primer

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Phoenix Building Construction Code:
 - a. Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments.
 - b. If required by the Authorities Having Jurisdiction (AHJ), submit the necessary engineering data to the AHJ to obtain a separate permit for the Work of this Section.
 - 2. Special Inspections:
 - a. Under the ICC International Building Code (IBC) as Amended by the City of Phoenix, special inspections by a code-required Approved Agency are necessary to obtain approval of the Work of this Section.
 - 1) Both continuous and periodic Special Inspections will be performed during the fabrication and erection of metal stairs.
 - b. Code-Required Approved Agency for Performing Special Inspections:

- 1) To perform the Special Inspections required by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Program/Project Manager acting as the Phoenix Sky Harbor International Airport's agent will employ an independent Approved Agency.
3. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered Special Inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ independent Testing and Inspection Agencies, including the City Building Official and the City of Phoenix Testing Laboratory.
- B. Qualifications:
 1. Metal Stair Installer's Qualifications:
 - a. Employ the fabricator of the metal stairs to install the stairs.
 2. Professional Engineer's Qualifications:
 - a. Employ a qualified Professional Engineer licensed in the State of Arizona, and capable of performing testing and engineering analysis of the manufacturer's standard units in assemblies similar to those proposed for the Work of this Contract in order to prepare a complete structural design for the metal stair and railing system Work required under this Contract.
 - b. Submit the Professional Engineer's qualifications to the Program/Project Manager for approval.
 3. Welding Qualifications:
 - a. Welding Procedure Specifications (WPS):
 - 1) Prior to beginning work that requires welding, submit the pre-qualifying welding procedures to the Program/Project Manager for approval.
 - 2) For all procedures, other than those set forth in AWS D1.1/D1.1M or AWS D1.3, submit a copy of the welding procedure specifications (WPS) test records to the Program/Project Manager for approval.
 - b. Welder Qualifications:
 - 1) Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders to the Program/Project Manager for approval.
 - 2) Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed in AWS D1.1/D1.1M and AWS D1.3 for the procedures to be used.
 - 3) Submit Welding Certificates certifying the welders employed to fabricate and to erect the Work of this Section have been certified by the American Welding Society (AWS) within the previous 12 months to the Program/Project Manager for approval.

- a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures and, if pertinent, has undergone recertification.
- C. Site Samples:
 - 1. For the initial selection of colors, textures, or designs for those products requiring selections to be made, prepare Samples; and submit the Samples to the Program/Project Manager so the selections can be made.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Ensure materials are delivered to the Site at times and intervals that facilitate uninterrupted progress of the Work and continuity of installation.
- B. Storage and Handling Requirements:
 - 1. Store metal stairs on blocking or other supports to prevent contact with dirt, debris, and moisture.
 - a. Protect metal stairs from exposure to conditions that produce rust.
 - 2. Protect fastener products from dirt and corrosion by placing them in closed containers.
 - a. Store fastener products in a protected shelter, remove fastener components only as necessary, and promptly return unused fasteners to protected storage.
 - 3. Handle metal stairs so no parts are bent, broken, or otherwise damaged; and avoid damage to other material and work.
 - a. Exercise care to avoid scraping and over stressing the steel.
 - b. Replace bent or damaged pieces, unless the Program/Project Manager authorizes repairs.
- C. Packaging Waste Management:
 - 1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

PART 2 PRODUCTS

2.01 STAIR ASSEMBLIES

- A. Manufacturers:
 - 1. Manufacturer List:
 - a. Steel-Framed Stairs:
 - 1) Alfab, Inc., www.alfabinc.com
 - 2) American Stairs, Inc., www.americanstair.com.

- 3) Sharon Stairs, www.sharonstair.com.
 - 4) Approved equal.
 2. Substitution Limitations:
 - a. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from manufacturers other than those listed herein may be provided.
- B. Sustainability Requirements:
 1. Recycled Content
 - a. Provide Structural Steel whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 75 percent.
 2. Low Emitting Materials – Paints and Coatings
 - a. When paint is field applied to touch-up shop applied primer on surfaces within the building envelop, ensure they have a VOC content not exceeding 100 g/L.
- C. Performance:
 1. Structural Performance of Stairs:
 - a. Provide metal stairs capable of withstanding the effects of gravity loads and the following loads and stresses within the limits and under the conditions indicated:
 - 1) Uniform Load: 100 pounds force per square foot (4.79kN/m²).
 - 2) Concentrated Load: 300 pounds force (1.33kN) applied on an area of 4 square inches (2580mm²).
 - 3) Uniform and concentrated loads need not be assumed to act concurrently.
 - b. Stair Framing:
 - 1) Provide metal stair framing capable of withstanding the stresses resulting from railing loads in addition to the loads specified in Subparagraph 2.01.C.1.a.
 - c. Limit the deflection of the stair treads, platforms, and framing members to L/360 or 1/4 inch (6.4mm), whichever is less.
 - d. Shall incorporate electrical conduit for stair mounted light fixtures.
 2. Structural Performance of Stair Railings:
 - a. Provide railings capable of withstanding the effects of gravity loads and the following loads and stresses within the limits and under the conditions indicated:
 - 1) Handrails and Top Rails of Guards:
 - a) Uniform Load: 50 pounds force per foot (0.73kN/m) applied in any direction.
 - b) Concentrated Load: 200 pounds force (0.89kN) applied in any direction.
 - c) Uniform and concentrated loads need not be assumed to act concurrently.
 - 2) Infill of Guards:

- a) Concentrated Load: 50 pounds force per square foot (2.39kN/m²) applied horizontally.
 - b) Uniform Load: 25 pounds force per foot (0.36kN/m) applied in any direction.
 - c) Infill load and other loads need not be assumed to act concurrently.
 - 3. Seismic Performance:
 - a. Provide metal stairs capable of withstanding the effects of earthquake motions determined according to ASCE/SEI 7.
 - 1) The Component Importance Factor to use is 1.5.
 - 4. Lighting Performance:
 - a. Provide lighting on stairwell to meet minimum 5 foot-candle average, 10 to 1 avg/min. Lighting shall include stairs, landings, and 5' from last stair both at top and bottom.
 - b. LED light fixtures with color temperature of 4000K specified in Section 16521 – Exterior Lighting.
- D. Design Criteria:
- 1. Structural Design:
 - a. Furnish a complete structural design for the metal stair and railing system prepared by the Professional Engineer and complying with the performance requirements and design criteria indicated herein.
 - b. Submit the structural design for the metal stair and railing system, including analysis data signed and sealed by the Professional Engineer responsible for their preparation, to the Program/Project Manager for approval.
 - 2. NAAMM Stair Standard:
 - a. Unless more stringent requirements are indicated in the Contract Documents, design the metal stairs and railings in accordance with the minimum standards specified in NAAMM AMP 510 for the designated class of the stair.
 - 1) Preassembled Stairs: Commercial class.
 - 2) Ornamental Stairs: Architectural class.
 - 3) Industrial-Type Stairs: Industrial class.
 - 3. Product Data:
 - a. Submit Product Data for the materials and products proposed to perform the Work of this Section to the Program/Project Manager for approval, including the following:
 - 1) Concrete filled metal-pan stair treads.
 - 2) Nonslip aggregates and nonslip-aggregate finishes.
 - 3) Abrasive nosings.
 - 4) Paint products.
 - 5) Conduit.
 - 6) Light fixture.
 - 4. Shop Drawings:
 - a. Prepare Shop Drawings of the metal stair and railing system.

- 1) Include plans, elevations, sections, details, and attachments to other work.
- 2) Include setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors that are to be embedded in concrete or masonry.
 - a) For anchors and bolts required for installation of the metal stairs, but required to be installed under other Sections, prepare anchor and bolt templates.
- 3) Include conduit routing and light fixtures types for lighting as shown on the Contract Documents.
- b. Submit the metal stair and railing system Shop Drawings and anchor and bolt templates to the Program/Project Manager for approval.

E. Materials:

1. Metal Surfaces:
 - a. Unless otherwise indicated in the Contract Documents, provide metal materials with smooth, flat surfaces.
 - b. For metal components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.
2. Steel Plates, Shapes, and Bars:
 - a. Provide steel plates, shapes, and bars complying with the requirements specified in ASTM A 36/A 36M.
3. Cold-Rolled Steel Sheet:
 - a. Unless another grade is required by design loads for exposed applications, provide uncoated cold-rolled steel sheet at a minimum complying either with the requirements for Type B commercial steel (CS), or Grade 25 (Grade 170) structural steel (SS), specified in ASTM A 1008/A 1008M.
4. Hot-Rolled Steel Sheet:
 - a. Unless another grade is required by design loads, provide uncoated hot-rolled steel sheet at a minimum complying either with the requirements for Type B commercial steel (CS), or Grade 30 (Grade 205) structural steel, specified in ASTM A 1011/A 1011M.
5. Steel Tubing:
 - a. Provide cold formed steel tubing complying with the requirements specified in ASTM A 500.
 - b. Provide welded steel tubing complying with the requirements specified in ASTM A 513.
6. Fasteners:
 - a. Provide zinc-plated fasteners with a coating complying with the requirements specified in ASTM B 633 or ASTM F 1941 (ASTM F 1941M).
 - 1) For exterior fasteners, provide a Class Fe/Zn 12 coating.

- 2) For fasteners built into exterior walls, provide a Class Fe/Zn 5 coating.
 - b. Select fasteners of the type, grade, and class required.
7. Welding Rods and Bare Electrodes:
 - a. Furnish welding rods and bare electrodes selected in accordance with the requirements for the metal alloy being welded in the American Welding Society (AWS) references.
8. Heavy duty ADA grating:
 - a. Unless otherwise indicated in drawings, (or approved equal product) provide type 64-10-WH-60 1/8" Wheels n' Heels InVent Heavy Duty Grade 50 Carbon Steel Grating with OnGrip Spray Traction Surface and Galvanized finish.
 - b. Fabricated by assembling tubular steel cross bars through round holes in 1/8" thick rectangular top surface bars space 5/8" on center and 1/8" thick rectangular heavy duty cross bars space 3-3/4" on center that are then permanently locked in place by swaging.
 - c. Heavy duty main bars are 4" on center inserted beneath and perpendicular to the top surface then fillet at each main bearing bar / heavy cross bar intersection.
 - 1) Top surface bar Spacing: 5/8" on center.
 - 2) Top surface bar depth is 1" and thickness is 1/8" to provide 5/16" space between bars.
 - 3) Main Bearing Bars 1/4" thick spaced 4" on center and their depth is to be based on loading requirements and the clear span shown on the drawings. Main bearing bars are perpendicular to top surface bars.
 - 4) Heavy Duty Cross Bars 1-1/2" x 1/8" are flush with top surface and spaced 3-3/4" on center.
 - 5) All Top Surface Bars shall have OnGrip Spray Traction Surface.
9. Concrete Materials:
 - a. Unless otherwise indicated in the Contract Documents, provide concrete materials complying with the requirements for normal-weight, air-entrained, ready-mix concrete with a minimum 28-day compressive strength of 3000 psi (20MPa) specified in Section 03300, Cast-In-Place Concrete.
10. Welded Wire Fabric:
 - a. Unless otherwise indicated in the Contract Documents, provide 6-inch by 6-inch (152mm by 152mm), W1.4 by W1.4, welded wire fabric complying with the requirements specified in ASTM A 185/A 185M.
11. Anchors:
 - a. Provide the manufacturer's standard anchors, either integral or applied to metal stair units, for embedding units in concrete.
12. Tread Warning Stripe:
 - a. Provide 2-inch wide, contrasting color tread warning stripe.
13. Integral Detectable Warning Stripe

- a. Provide nosings with integral detectable warning stripe to match tread style and color.
- b. Finish Color: As selected by Architect.
- 14. Conduit
 - a. Provide minimum 1" rigid conduit specified in Section 16130 – Raceways and Boxes.
- 15. Light Fixture
 - a. Provide LED light fixtures with color temperature of 4000K specified in Section 16521 – Exterior Lighting.

F. Shop Fabrication:

- 1. Stair Assemblies:
 - a. Provide complete stair assemblies, including metal framing, hangers, struts, railings, clips, brackets, bearing plates, and other components necessary to support and anchor the stairs and platforms on the supporting structure.
 - 1) Unless otherwise indicated in the Contract Documents, join components together by welding.
 - 2) Provide connections that maintain the structural value of the joined pieces.
 - 3) For exterior stairs, fabricate the treads and platforms so the finished walking surfaces slope to drain the surfaces.
- 2. Preassembled Stairs:
 - a. Assemble preassembled stairs in the shop to the greatest extent possible.
 - b. Disassemble units only as necessary for shipping and to accommodate handling limitations.
- 3. Metal Fabrication:
 - a. Cut, drill, and punch metals cleanly and accurately.
 - 1) Remove burrs and ease edges.
 - 2) Remove sharp or rough areas on exposed surfaces.
 - b. Bent Metal Corners:
 - 1) Form bent-metal corners to the smallest radius possible without impairing the work.
 - c. Welded Connections:
 - 1) Fabricate welded connections in accordance with the following requirements:
 - a) Use materials and methods that minimize distortion and develop the strength and corrosion resistance of the base metals.
 - b) Obtain fusion without undercut or overlap.
 - c) Remove welding flux immediately.
 - d) Unless otherwise indicated in the Contract Documents, weld exposed corners and seams continuously.

- e) At exposed connections, finish exposed welds in accordance with the NOMMA Voluntary Joint Finish Standards for Type 1 welds (no evidence of a welded joint).
 - f) Grind welded joints smooth so no sharp or abrasive corners, edges, or surfaces remain.
 - d. Exposed Connections:
 - 1) Form exposed connections so they have flush and smooth hairline joints.
 - 2) Provide concealed fasteners wherever possible.
 - e. Joints:
 - 1) Locate exposed joints where they will be the least conspicuous.
 - 2) Fabricate joints that will be exposed to the weather so water will be excluded from the joint.
 - a) Provide weep holes where water may accumulate.
- 4. Steel-Framed Stair Fabrication:
 - a. Stair Framing:
 - 1) Fabricate stringers from steel channels.
 - a) Provide closures for exposed ends of channel stringers.
 - 2) Construct platforms from steel channel headers and miscellaneous framing members as needed to comply with performance requirements.
 - 3) Weld stringers to headers, and weld framing members to stringers and headers.
 - 4) If bolts are used for fastening the framing together, fabricate and join the stair framing so the bolts are not exposed on finished surfaces.
 - b. Metal-Pan Stairs:
 - 1) For metal-pan stairs, fabricate the risers, subtread pans, and subplatforms from steel sheet having the thickness needed to comply with performance requirements, but not less than 0.067 inch (1.7mm) thick; and formed to have the configurations shown on the Contract Documents.
 - a) Provide either stair assemblies with metal-pan subtreads filled during fabrication with reinforced concrete, or provide epoxy-resin-filled treads, reinforced with glass fibers and having a slip-resistant, abrasive surface.
 - 2) For metal-grating stairs, fabricate the risers, treads and nosings from steel sheet having the thickness needed to comply with performance requirements, but not less than 0.067 inch (1/7 mm) thick; and formed to have the configurations shown on the Contract Documents.
 - a) Provide tread as a prefabricated heavy duty ADA compliant steel bar grating with checkered plate angle nosing, and standard end plates.
- 5. Stair Railings:

- a. For pipe and tube railings not attached to the metal stairs or to the walls adjacent to the metal stairs, provide pipe and tube railings complying with the requirements specified in Section 05521, Pipe and Tube Railings.
- b. For railings attached to the metal stairs or to walls adjacent to metal stairs, fabricate the railing from steel tube in accordance with the design requirements, dimensions, details, finishes, and member sizes indicated in the Contract Documents, including the wall thicknesses of the tubes, post spacing, and anchorages, but not according to requirements less than those needed to withstand the loads indicated in the Contract Documents.
 - 1) Rails and Posts:
 - a) Provide 1-5/8-inch (41mm) diameter top and bottom rails, and 1-1/2-inch (38mm) square posts.
 - 2) Picket Infill:
 - a) Where picket infill is indicated in the Contract Documents, provide 1-1/2-inch (37mm) by 1/2-inch (13mm) flat pickets spaced to provide less than 4 inches (100mm) clear between pickets.
- c. Provide welded connections when fabricating railings.
 - 1) Cope components at connections to provide a close fit, or use fittings designed for this purpose.
 - 2) At connections, including at fittings, weld all around.
- d. Changes of Direction:
 - 1) Form changes in direction of railings by bending the rails, or by inserting prefabricated elbow fittings.
- e. Curves:
 - 1) Form curves by bending members in jigs that produce a uniform curvature without buckling the rails.
- f. Exposed Ends of Railing Members:
 - 1) Close the exposed ends of railing members by using prefabricated end fittings.
- g. Wall Returns:
 - 1) At the ends of wall-mounted handrails, provide wall returns.
- h. Brackets, Flanges, Fittings, and Anchors:
 - 1) Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnecting stair railings components; and for attaching stair railings to other work.
 - a) Connect stair railing posts to the stair framing by welding the posts directly to the stair framing.
 - b) For non-galvanized railings, provide non-galvanized ferrous metal fittings, brackets, fasteners, and sleeves; except provide galvanized anchors for the anchors to be embedded in exterior masonry and concrete construction.
- i. Fillers:

- 1) To transfer wall bracket loads through wall finishes, such as plaster or gypsum board, provide fillers made from steel plate or other suitably crush-resistant material.
- 2) Size the fillers to suit the wall finish thicknesses.

G. Finishes:

1. Primer Materials:

a. Shop Primers:

- 1) Provide shop primers complying with the requirements specified in Section 09912, Painting, and Section 09960, High-Performance Coatings.
- 2) Universal Shop Primer:
 - a) Provide fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with the requirements specified in MPI # 79, and compatible with the topcoat.

2. Shop Finishing Methods:

- a. Finish metal stairs after assembly.
- b. For finish designations and application recommendations, comply with the requirements specified in NAAMM/NOMMA AMP 500.
- c. Shop Priming:
 - 1) Prepare uncoated ferrous-metal surfaces for priming in accordance with the requirements specified in SSPC-SP 6/NACE No. 3.
 - 2) Apply shop primer to the uncoated surfaces of metal stair components in accordance with the requirements specified in SSPC-PA 1 for shop painting.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Before proceeding to erect the metal stairs, verify the elevations of concrete and masonry bearing surfaces and the locations of anchorages are in compliance with the Contract Documents and ready to receive the work of this Section.
2. Verify that wall surfaces adjacent to handrail to be installed are smooth.

B. Evaluation and Assessment:

1. Immediately report any errors in the metal stairs which will prevent the proper installation and fitting of parts.
 - a. Report errors resulting from either shop fabrication or deformation resulting from handling or transportation.
2. Do not proceed with erection until unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Protect adjacent areas from damage resulting from installation of the metal stairs.
- B. Surface Preparation:
 - 1. If anchor rods or bolts or other embedded items were cast in the substructure when it was constructed, ensure they are held firmly in the correct position and at the proper elevation by suitable templates.
- C. Demolition / Removal:
 - 1. Perform the cutting, drilling, and fitting required for installing the metal stairs.

3.03 INSTALLATION

- A. Metal Stair Installation:
 - 1. Provide temporary bracing or anchors in formwork for items to be built into concrete, masonry, or similar construction.
 - 2. Set the metal stair units so they are free of rack.
 - 3. Set each metal stair unit in its proper location, and to the correct alignments and elevations measured accurately from established lines and levels.
 - 4. Unless otherwise indicated in the Contract Documents, install the metal stairs by welding the stair framing to the steel structure or to weld plates cast into the concrete.
 - a. For cast-metal units that are to be set into concrete, apply bituminous paint to their concealed surfaces.
 - b. For extruded units that are to be set into concrete, apply clear lacquer to their concealed surfaces.
 - 5. Fit exposed field connections accurately together to form hairline joints.
 - 6. Where stairs are enclosed by gypsum board shaft-wall assemblies, provide hanger rods or struts to support the landings from the floor construction above or below.
 - a. Locate hanger rods and struts where they will not encroach on required stair widths, and will be within the fire-resistance-rated stair enclosure.
 - 7. Where masonry walls will support the metal stairs, before installing the masonry provide temporary supporting struts that are designed for facilitating erection of steel stair components.
- B. Concrete Fill:
 - 1. Place and finish concrete fill for treads and platforms in accordance with the requirements specified in Section 03300, Cast-In-Place Concrete.

C. Installing Steel Tube Railings:

1. Before anchoring steel tube railing systems, adjust the railing at abutting joints to ensure the alignment matches.
2. Space posts at the spacing specified or indicated on the Contract Drawings; in no spacing is specified or indicated, space the posts as required to handle the design loads.
3. Anchor the steel tube posts to steel supporting members by directly welding the posts to the members.
4. To anchor handrail ends to concrete and masonry, weld round steel flanges to the rail ends, and post-install anchors and bolts in the concrete or masonry.

D. Special Techniques:

1. Field Welding:
 - a. Comply with requirements for welding specified in Subparagraph 2.01.F.3.c.
 - b. Weld the connections that are not to be left as exposed joints, but that could not be shop welded due to shipping size limitations.
 - c. Do not weld, cut, or abrade the surfaces of exterior units that have been hot-dip galvanized after fabrication, and are for bolted or screwed field connection.
2. Tread Warning Stripes:
 - a. On each exterior stair and top landing, apply a tread warning stripe 1 inch from the edge of the nosing of the stair or landing.
 - b. On each interior top and bottom landing, apply a tread warning stripe 1 inch from the edge of the nosing of the landings.
3. Conduit, Wire, and Light Fixture
 - a. Install conduit to light fixture locations as identified in the shop drawings.
 - b. Provide pull boxes in conduit runs that exceed 180 degrees.
 - c. Mount light fixtures in accordance with manufacturer instructions.

E. Interface with Other Work:

1. To attach handrails to walls, provide wall brackets having a 1-1/2 inch clearance from the inside face of the handrail to the finished wall surface.
 - a. Locate the brackets as specified or indicated on the Contract Drawings.
 - 1) If no location is specified or indicated, locate the brackets as required to handle the structural loads.
 - b. For anchorage to concrete and solid masonry, provide drilled-in expansion shields and hanger or lag bolts.
 - 1) For concealed bolt anchoring of handrails to walls, provide a bracket having a flange tapped for concealed threaded hanger bolts.
 - 2) For exposed bolt anchoring of handrails to walls, provide a bracket having predrilled holes for exposed bolts.

- c. For anchorage to hollow masonry, provide toggle bolts.
- d. For anchorage to gypsum board assemblies, provide self-tapping screws of a size and type necessary for attaching the brackets directly to the steel framing or concealed steel reinforcements and for supporting the structural loads.

3.04 REPAIR/RESTORATION

- A. Touchup Painting:
 - 1. Immediately after metal stairs are erected, clean the field welds, bolted connections, and abraded areas of shop paint; and paint the exposed areas using the same material used for the shop painting in accordance with the requirements specified in SSPC-PA 1 for touching up shop-painted surfaces.
- B. Repairing Galvanized Surfaces:
 - 1. Clean field welds, bolted connections, and abraded areas of galvanized metal stairs, and repair the galvanizing in accordance with the requirements specified in ASTM A 780.

3.05 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 - 1. During the period when metal stairs are being installed, the Testing and Inspection Agency and the code-required Approved Agency must perform routine and other testing of materials.
 - a. Advise the Testing and Inspection Agency and code-required Approved Agency sufficiently in advance of operations to allow testing personnel to be assigned and to provide sufficient time for quality tests to be performed and completed.
 - b. The Testing and Inspection Agency and the code-required Approved Agency will perform additional materials testing due to changes in materials requested by the Contractor or testing required due to failure of material to meet specified requirements.
 - c. Failure of the Testing and Inspection Agency or the code-required Approved Agency to detect defective work will not prevent its rejection later when the defect is discovered, neither does it obligate the Program/Project Manager or Phoenix Sky Harbor International Airport to grant final acceptance of the Work.
 - 2. Inspections:
 - a. Inspect the bolted and welded connections.
 - b. Confirm the metal stairs are square, plumb, and level.
 - c. Verify the welders and welding materials in the field are properly certified.
- B. Non-Conforming Work

1. Promptly remove and replace materials or fabricated components that do not comply with specified requirements.

3.06 CLEANING

A. Waste Management:

1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

SECTION 05520

HANDRAILS AND RAILINGS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for shop fabricated steel and aluminum handrails and railings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 05120 - Structural Steel.
 - 3. Section 09960 - High Performance Coatings.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
 - 2. VOC: An acronym for volatile organic compounds, generally meant to refer to organic chemical compounds that have high enough vapor pressures under normal conditions to significantly vaporize and enter the atmosphere.
- B. Reference Standards:
 - 1. Aluminum Alloy Association, Inc.
 - a. Aluminum Standards and Data.
 - 2. American Welding Society (AWS):
 - a. AWS D1.1/D1.1M – Structural Welding Code-Steel.
 - b. AWS D1.2/D1.2M - Structural Welding Code-Aluminum.
 - c. AWS Specifications for Welded Highway and Railway Bridges.
 - 3. ASTM International (ASTM):
 - a. ASTM A 36/A 36M – Standard Specification for Carbon Structural Steel.

- b. ASTM A 53/A 53M – Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
- c. ASTM A 123/A 123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
- d. ASTM A 500 – Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
- e. ASTM A 780 – Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
- f. ASTM B 241/B 241M - Standard Specification for Aluminum and Aluminum-Alloy Seamless Pipe and Seamless Extruded Tube.
- 4. City of Phoenix (COP):
 - a. Phoenix Building Construction Code and Amendments.
 - b. Phoenix Supplemental Standard Details for Public Works - Construction:
 - 1) Detail No. P1173 Handrail Detail.
- 5. Society for Protective Coatings (SSPC):
 - a. SSPC-SP 1 – Solvent Cleaning.
 - b. SSPC-Paint 20 – Zinc-Rich Primers (Type I, “Inorganic,” and Type II, “Organic”).
 - c. SSPC-Paint 29 – Zinc Dust Sacrificial Primer, Performance-Based.
 - d. SSPC-PA 1 – Shop, Field and Maintenance Painting.
- 6. United States Government:
 - a. Environmental Protection Agency (EPA):
 - 1) 40 CFR 59 – National Volatile Organic Compound Emission Standards for Consumer and Commercial Products.
- 7. Institute for Sustainability Infrastructure (ISI):
 - 1) ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination
 - 1. Coordinate the installation of handrails with installation of the adjacent construction.
- B. Scheduling
 - 1. Coordinate the handrail fabrication schedule with construction progress to avoid delaying the Work.

1.04 SUBMITTALS

- A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Shop Drawings:
 - 1) Railing and handrail systems.
 - b. Samples
 - 1) Samples as may be requested by the Program/Project Manager.
 - c. Certificates:
 - 1) Mill reports for steel and aluminum materials.
 - d. Qualifications:
 - 1) Welding procedure qualification test records.
 - 2) Welding Certificates.
 - 3) Fabricator Qualifications.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA 1.3 - Use Recycled Materials
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - b. Paints and Coatings
 - 1) Submit product data highlighting the VOC content for any field applied paint used to touch-up shop applied primer.

1.05 QUALITY ASSURANCE

A. Regulatory Agency Sustainability Approvals:

1. Phoenix Building Construction Code:
 - a. Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments.

B. Qualifications:

1. Fabricator Qualifications:
 - a. Employ a firm experienced in producing metal handrails similar to that indicated for this Contract, and with a record of successful in-service performance, as well as sufficient production capacity to make required units.
 - 1) Submit Fabricator qualifications to demonstrate the capabilities and experience of the Fabricator, including a list of completed projects with project name, addresses, names of designers and

- owners, and other information applicable to the Program/Project Manager for approval.
2. Welding Qualifications:
 - a. Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders and welding procedures to the Program/Project Manager for approval.
 - 1) For all procedures, other than those set forth in AWS D1.1/D1.1M and AWS D1.2/D1.2M, submit a copy of the welding procedure qualification test records.
 - b. Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed in AWS D1.1/D1.1M and AWS D1.2/D1.2M, for the procedures.
 - 1) Submit Welding Certificates certifying the welders employed to fabricate and to install the Work of this Section have been AWS certified within the previous 12 months to the Program/Project Manager for approval.
 - a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures and, if pertinent, has undergone recertification.
- C. Certifications:
1. Submit certified copies of mill certificates certifying compliance with the requirements specified in this Section to the Program/Project Manager for approval.
 - a. Mill certificates are not required for miscellaneous hardware, nuts, bolts, washers, and similar items.
- D. Site Samples:
1. Submit Samples of the materials and finished products as may be requested by the Program/Project Manager to the Program/Project Manager for approval.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Storage and Handling Requirements:
1. Deliver materials to the Site on the day(s) of installation.
 2. Do not store materials at the Site.
 3. Package and protect materials to limit field repairs.

PART 2 PRODUCTS

2.01 HANDRAILS AND RAILINGS

A. Sustainability Requirements:

1. Recycled Content
 - a. Provide Structural Steel whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 75 percent.
2. Low Emitting Materials – Paints and Coatings
 - a. When paint is field applied to touch-up shop applied primer on surfaces within the building envelop, ensure they have a VOC content not exceeding 100 g/L.

B. Design Criteria:

1. Provide handrails and railings designed in accordance with Detail No. P1173 in the Phoenix Supplemental Standard Details for Public Works – Construction.
2. For metal fabrications exposed to view in the completed Work, provide materials selected for their surface flatness, smoothness, and freedom from surface blemishes.
3. Do not use materials with exposed pitting, scam marks, roller marks, rotted trade names, or roughness.
4. For structures on curves, either horizontal or vertical, provide railing conforming closely to the curvature of the structure.
5. Evenly space vertical posts.
6. Shop Drawings:
 - a. Submit Shop Drawings of railing and handrail systems showing fabrication and installation details for the proposed metal fabrications to the Program/Project Manager for approval.
 - 1) Include plans, elevations, sections, and details of handrails and their connections
 - 2) Show anchorage and accessory items.
 - 3) Submit setting drawings, diagrams, templates, instructions, and directions for installing anchorages.

C. Materials:

1. Ferrous Metals:
 - a. Steel Plates, Shapes, and Bars:
 - 1) Provide steel plates, shapes, and bars complying with the requirements specified in ASTM A 36/A 36M.
 - b. Steel Tubing:

- 1) Provide cold-formed steel tubing complying with the requirements specified in ASTM A 500.
 - c. Steel Pipe:
 - 1) Provide standard weight (schedule 40) steel pipe complying with the requirements specified in ASTM A 53/A 53M.
2. Non-Ferrous Metals:
 - a. Aluminum Seamless Pipe:
 - 1) Provide Alloy 6063-T6 aluminum pipe or seamless tube complying with the requirements specified in ASTM B 241/B 241M.
 - 2) Provide materials complying with the aluminum standards and data published by the Aluminum Alloy Association, Inc.
3. Fasteners:
 - a. Select fasteners of the type, grade, and class required.
 - b. Unless otherwise indicated in the Contract Documents, provide the following types of fasteners:
 - 1) For exterior applications, provide Type 304 stainless steel bolts and fasteners.
 - 2) For fastening aluminum, provide stainless steel fasteners.
 - c. Expansion Anchors:
 - 1) Provide expansion anchor bolt and sleeve assemblies as specified in Section 05120, Structural Steel, and indicated on the Contract Drawings.
- D. Shop Fabrication:
 1. Fabricate railings and handrails from welded or seamless members of the size and thickness shown on the Contract Drawings.
 2. Provide railing panels that are straight and true to the dimensions indicated.
 3. Galvanize railings and handrails in accordance with the requirements specified in ASTM A 123/A 123M.
 4. Shear and punch metals cleanly and accurately, and remove burrs.
 5. Remove sharp or rough areas on exposed surfaces.
 6. Weld corners and seams continuously, and comply with the following requirements:
 - a. Use materials and methods that minimize distortion and develop strength and corrosion resistance of the base metals.
 - b. Obtain fusion without undercut or overlap.
 - c. Remove welding flux immediately.
 - d. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing, and the contour of the welded surface matches those adjacent.
 7. Provide an anchorage of the type indicated in the Contract Documents.

- a. Coordinate the anchorage with the supporting structure.
- b. Fabricate and space anchoring devices to secure the metal fabrication rigidly in place, and to support the indicated loads.
8. Fabricate joints that will be exposed to the weather so water is excluded, or provide weep holes where water may accumulate.

E. Finishes:

1. Primer Materials:

a. Zinc-Rich Primer:

- 1) Provide zinc-rich primer complying with the requirements specified in SSPC-Paint 20 or SSPC-Paint 29, and compatible with the topcoat.
- 2) Provide primer having a volatile organic compound (VOC) content of 3.5 pounds per gallon or less when calculated in accordance with 40 CFR 59, Subpart D (EPA Method 24).

3) Manufacturers:

- a) International Protective Coatings, Interzinc® 315 Epoxy Zinc-Rich Primer, <http://www.international-pc.com/>.
- b) Sherwin-Williams Company, Corothane I GalvaPac Zinc Primer, www.sherwin-williams.com.
- c) Tnemec Company, Inc., Tneme-Zinc 90-97, www.tnemec.com.
- d) Approved equal.

2. Finish Materials:

a. Galvanizing Repair Paint:

- 1) For re-galvanizing welds in steel, provide high-zinc-dust-content paint complying with the requirements specified in SSPC-Paint 20.
- 2) Apply 2 coats.

3. Shop Finishing Methods:

a. Galvanized Surfaces:

- 1) Clean surfaces to be galvanized following the solvent cleaning procedures specified in SSPC-SP 1.
- 2) Galvanize railings and handrails in accordance to the requirements specified in ASTM A 53/A 53M after fabrication.
- 3) Provide a minimum weight of coating of 1.80 ounces per square foot.
- 4) Provide a finished product free from blisters and excess spelter, and provide an even, smooth, and uniform coating.
- 5) Uncoated spots or damaged coatings due to poor workmanship, rough handling or other reason are cause for rejection.
- 6) Wire test coupons for determining the quality of galvanizing to the materials to be galvanized before immersion so the amount of

coating deposited on the materials will be represented on the test coupons.

- b. Painted Surfaces:
 - 1) Prime surfaces.
 - 2) Paint the railings and handrails in accordance with the requirements specified in Section 09960, High Performance Coatings.
 - 3) Provide the color indicated in the Contract Drawings.

2.02 ACCESSORIES

- A. Furnish all required fittings, anchoring hardware, and miscellaneous accessories as required to provide a complete system, fabricated, painted and installed in accordance with the Contract Drawings and this Section.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Verify adjacent construction is complete and ready for installation of handrails prior to delivery of materials to Site.
 - 2. Field Measurement:
 - a. Verify dimensions of other construction by field measurements before fabrication of handrails and railings, and indicate the measurements on Shop Drawings.

3.02 PREPARATION

- A. Surface Preparation
 - 1. Provide anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction.
 - a. Set sleeves in concrete with their tops flush with the finish surface elevations.
 - 1) Prevent water and concrete from entering the sleeves.

3.03 INSTALLATION

- A. Accurately set the handrails in the proper location, in the proper alignment, and at the proper elevation when measured from established lines and levels, with the edges and surfaces level, plumb, true, and free of rack.
 - 1. Install posts and balusters vertical and parallel.

B. Tolerances:

1. Deviation from the vertical for the full height of the panel is not to exceed 5/8-inch.

3.04 REPAIR

A. Touchup Painting:

1. Clean field welds, bolted connections, and abraded areas of shop paint; and paint exposed areas with same material as used for shop painting to comply with SSPC-PA 1 requirements for touching up shop-painted surfaces.
2. Apply paint by either brush or spray to provide a 2.0 mil (0.05mm) minimum dry film thickness.

B. Galvanized Surfaces:

1. Clean field welds, bolted connections, and abraded areas, and repair galvanizing in accordance with the requirements specified in ASTM A 780.

PIPE AND TUBE RAILINGS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for steel pipe and tube railings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 05511 - Metal Stairs.
 - 5. Section 09260 - Gypsum Board Assemblies.
 - 6. Section 09912 – Painting.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Coordinate the installation of the anchorages for the pipe and tube railings with the Work of other Sections.
- B. Sequencing:
 - 1. Deliver setting drawings, templates, and directions for installing anchorages for the pipe and tube railings, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry to the Site in time so the installation of the anchorages will not delay the Work.
 - 2. Sequence the installation of the pipe and tube railings so wall attachments are made only to completed walls.
 - a. Do not support railings temporarily by any means that do not satisfy the structural performance requirements.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Anchoring cement.
 - 2) Anchors.
 - 3) Fasteners.
 - 4) Grout.
 - 5) Paint products.
 - b. Shop Drawings:
 - 1) Pipe and tube railing system.
 - c. Samples:
 - 1) Samples for initial selection.
 - 2) Verification Samples for sections of each distinctly different linear railing member.
 - 3) Verification Samples for fittings and brackets.
 - 4) Mock-up of an assembled railing system.
 - d. Certificates:
 - 1) Mill certificates for stainless steel products.
 - e. Delegated Design Submittals:
 - 1) Structural analysis data for the pipe and tube railing system.
 - f. Qualification Statements:
 - 1) Professional Engineer qualifications.
 - 2) Welding procedure specifications (WPS) test records.
 - 3) Welding Certificates.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - a. ENVISION Credit RA 1.3 - Use Recycled Materials
 - 1) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or volume) of materials used are from reclaimed or recycled materials.
 - b. Paints and Coatings
 - c. Submit product data highlighting the VOC content for any field applied paint used to touch-up shop applied primer.

1.05 QUALITY ASSURANCE

- A. Regulatory Agency Sustainability Approvals:
 - 1. Phoenix Building Construction Code:
 - a. Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments.
 - 2. Testing and Inspection Agency:
 - a. To perform testing and inspections not considered Special Inspections by the ICC International Building Code (IBC) as Amended by the City of Phoenix, the Phoenix Sky Harbor International Airport will employ independent Testing and Inspection Agencies, including the City Building Official and the City of Phoenix Testing Laboratory.
- B. Qualifications:
 - 1. Professional Engineer Qualifications:
 - a. Have the pipe and tube railing manufacturer employ a licensed Professional Engineer, registered in the State of Arizona, who has experience performing design calculations for standard pipe and tube railing units and preparing Shop Drawings.
 - 1) Submit the Professional Engineer's qualifications to the Program/Program Manager for approval.
 - 2. Welding Qualifications:
 - a. Welding Procedure Specifications (WPS):
 - 1) Prior to beginning work that requires welding, submit the pre-qualifying welding procedures to the Program/Project Manager for approval.
 - 2) For all procedures, other than those set forth in AWS D1.1/D1.1M or AWS D1.6, submit a copy of the welding procedure specifications (WPS) test records to the Program/Project Manager for approval.
 - b. Welder Qualifications:
 - 1) Prior to beginning work that requires welding, submit the procedures to be used for pre-qualifying welders to the Program/Project Manager for approval.
 - 2) Only use welders, tackers, and welding operators demonstrating they are qualified to perform the types of work required by having passed the qualification tests prescribed in AWS D1.1/D1.1M and AWS D1.6, for the procedures to be used.
 - 3) Submit Welding Certificates certifying the welders employed to fabricate and to install the Work of this Section have been certified by the American Welding Society (AWS) within the previous 12 months to the Program/Project Manager for approval.

- a) Include certified copies of qualification test records and photographic identification indicating each welder, welding operator, and tacker employed to perform the Work has satisfactorily passed the AWS qualification tests for the required welding procedures and, if pertinent, has undergone recertification.
- C. Certifications:
 - 1. Mill Certificates:
 - a. Submit mill certificates for stainless steel products, signed by the manufacturers and certifying that the stainless steel products furnished comply with the requirements specified, to the Program/Project Manager for approval.
- D. Site Samples:
 - 1. Samples for Initial Selection:
 - a. For products involving selection of color, texture, or design, including mechanical finishes on stainless steel, submit Samples to the Program/Project Manager for approval of the initial selections.
 - 2. Verification Samples:
 - a. For each type of exposed finish required, submit verification Samples to the Program/Project Manager for approval, including the following:
 - 1) Sections of each distinctly different linear railing member, including handrails, top rails, posts, and balusters.
 - 2) Fittings and brackets.
- E. Mock-Ups:
 - 1. For each type of exposed finish required, submit a mock-up of an assembled railing system, made from full-size components, including the top rail, post, handrail, and infill, to the Program/Project Manager for approval.
 - a. The mock-up need not be full height.
 - b. Show the method of finishing and connecting members at intersections.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- B. Storage and Handling Requirements:

1. Protect fastener products from dirt and corrosion by placing them in closed containers.
 - a. Store fastener products in a protected shelter, remove fastener components only as necessary, and promptly return unused fasteners to protected storage.
- C. Packaging Waste Management:
 1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

PART 2 PRODUCTS

2.01 ASSEMBLIES

- A. Manufacturers:
 1. Manufacturer List:
 - a. Pisor Industries, Inc.
 - b. Sharpe Products, <http://sharpeproducts.com/favicon.ico>.
 - c. Wagner, R & B, Inc.; a division of the Wagner Companies, www.wagnercompanies.com.
 - d. Approved equal.
 2. Substitution Limitations:
 - a. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from manufacturers other than those listed herein may be provided.
 - b. Source Limitations:
 - 1) Obtain each type of railing through one source from a single manufacturer.
- B. ENVISION Requirements:
 1. Recycled Content
 - a. Provide Structural Steel whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 75 percent.
 2. Low Emitting Materials – Paints and Coatings
 - a. When paint is field applied to touch-up shop applied primer on surfaces within the building envelop, ensure they have a VOC content not exceeding 100 g/L.
- C. Performance:
 1. Anchors:

- a. Provide anchors with the capability to sustain the following loads, as determined by a qualified independent Testing and Inspection Agency in accordance with the testing methods specified in ASTM E 488, without failure:
 - 1) When installed in unit masonry, a load equal to 6 times the load imposed.
 - 2) When installed in concrete, a load equal to 4 times the load imposed.
- D. Design Criteria:
 - 1. For steel tube railings associated with metal stairs, provide railings complying with the requirements specified in Section 05511, Metal Stairs.
 - 2. Connections:
 - a. Design connections to maintain the structural value of joined pieces.
 - b. Design connections that will be exposed to weather to exclude water, and to include weep holes where water may accumulate.
 - 3. Close exposed ends of railing members with prefabricated end fittings.
 - 4. Wall Returns:
 - a. Unless otherwise indicated, provide wall returns at the ends of wall-mounted handrails.
 - 1) Close the ends of returns unless the clearance between the end of the rail and the wall is 1/4 inch or less.
 - 5. Thermal Movements:
 - a. Prevent buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects in exterior railings, by providing railings designed to allow thermal movement resulting from the following maximum change (range) in ambient and surface temperatures.
 - 1) Ambient Temperature Change (Range): 120 degrees Fahrenheit,
 - 2) Material Surfaces Temperature Change (Range): 180 degrees Fahrenheit.
 - b. Base engineering calculations on the surface temperatures of the materials due to both solar heat gain and nighttime-sky heat loss.
 - 6. Control of Corrosion:
 - a. Prevent galvanic action and other forms of corrosion in railings by insulating metals and other materials from direct contact with incompatible materials.
 - 7. Product Data:
 - a. Submit Product Data for the materials and products proposed to perform the Work of this Section to the Program/Project Manager for approval, including the following:
 - 1) Anchoring cement.

- 2) Anchors.
- 3) Fasteners.
- 4) Grout.
- 5) Paint products.
8. Shop Drawings:
 - a. Prepare Shop Drawings of the pipe and tube railing system.
 - 1) Include plans, elevations, sections, details, and attachments to other work.
 - 2) Include setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors that are to be embedded in concrete or masonry.
 - b. Submit the pipe and tube railing system Shop Drawings to the Program/Project Manager for approval.
9. Design Calculations:
 - a. For pipe and tube railing system products required to comply with the specified design loads, prepare structural analysis data signed and sealed by the qualified Professional Engineer responsible for their preparation.
 - b. Submit the structural analysis data for the pipe and tube railing system to the Program/Project Manager for approval.

E. Materials:

1. Railing Components:
 - a. Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.
 - b. Plates, Shapes, and Bars:
 - 1) Provide steel plates, shapes, and bars complying with the requirements specified in ASTM A 36/A 36M.
 - c. Tubing:
 - 1) Provide either cold formed steel tubing complying with the requirements specified in ASTM A 500, or Type 5 mandrel drawn steel tubing complying with the requirements specified in ASTM A 513.
 - d. Brackets, Flanges, and Anchors:
 - 1) Unless otherwise indicated, provide cast or formed metal brackets, flanges, and anchors fabricated from same material and having the same finish as the rails being supported.
 - 2) Provide wall brackets providing a 1-1/2-inch clearance from the inside face of the handrail to the finished wall surface, and having predrilled holes for exposed bolt anchorage.
2. Welding Rods and Bare Electrodes:

- a. Provide welding rods and bare electrodes selected in accordance with the requirements specified in the AWS specifications for the metal alloy being welded.
- 3. Fasteners:
 - a. Fasteners for Steel Railings:
 - 1) Provide steel fasteners plated in accordance with the requirements specified for Class Fe/Zn 25 electrodeposited zinc coating in ASTM B 633.
 - b. Fasteners for Anchoring Railings to Other Construction:
 - 1) Provide a type, grade, and class of fastener selected to produce connections suitable for anchoring the railings to the other types of construction indicated in the Contract Documents, and capable of withstanding the design loads specified.
 - c. Fasteners for Interconnecting Railing Components:
 - 1) Provide concealed fasteners for interconnecting railing components, and for attaching the railing components to other work, unless exposed fasteners are unavoidable or are the standard fastening method for the railings indicated in the approved Shop Drawings.
 - 2) For exposed fasteners, provide square or hex socket flat-head machine screws unless otherwise indicated.
- 4. For galvanized railings, provide hot-dip galvanized fittings, brackets, fasteners, sleeves, and other ferrous components.
- 5. For non-galvanized steel railings, provide non-galvanized ferrous-metal fittings, brackets, fasteners, and sleeves, except galvanize the anchors to be embedded in exterior concrete or masonry.

F. Fabrication:

- 1. Shop Fabrication:
 - a. Fabricate railings of the design, dimensions, member sizes and spacing, details, finish, and anchorage indicated in the Contract Documents, but not less than those required for supporting the structural loads.
 - 1) Provide weep holes where water may accumulate.
 - b. Metal Fabrication:
 - 1) Form the railing work true to line and level, with accurate angles and surfaces.
 - a) Form changes in direction as detailed.
 - b) Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required.

- (1) Maintain the cross section of each member throughout the entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of the components.
- 2) Cut, drill, and punch metals cleanly and accurately.
 - a) Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated.
 - b) Remove sharp or rough areas on exposed surfaces.
- 3) Welded Connections:
 - a) Unless otherwise indicated, fabricate railings with welded connections in accordance with the following requirements:
 - (1) Use materials and methods that minimize distortion and develop the strength and corrosion resistance of the base metals.
 - (2) Obtain fusion without undercut or overlap.
 - (3) Remove welding flux immediately.
 - (4) At connections, cope the components to provide a close fit, or provide fittings designed for this purpose.
 - (5) At connections, including at fittings, weld all around.
- 4) Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.
- 5) At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing, and the welded surfaces match the contours of adjoining surfaces.
- 6) Grind welded joints and surfaces smooth so no sharp or abrasive corners, edges, or surfaces survive.
- 7) Unless the vent and drain holes that will be exposed in the finished Work are indicated to remain as weep holes, plug the holes with zinc solder, and file the solder off to create a smooth surface.

G. Assembly:

1. Factory Assembly

- a. Assemble railings in the shop to the greatest extent possible to minimize field splicing and assembly.
- b. Disassemble units only as necessary for shipping and handling limitations.
- c. Clearly mark units for reassembly and coordinated installation.

H. Finishes:

1. Primer Materials:

- a. For primer materials applied to pipe and tube railings, provide primer complying with the requirements specified in Section 09912, Painting.

2. Finish Materials:
 - a. Galvanizing:
 - 1) For hot-dip galvanized railings, provide galvanizing complying with the requirements specified in ASTM A 123/A 123M.
 - 2) For hot-dip galvanized hardware, provide galvanizing complying with the requirements specified in ASTM A 153/A 153M.
 - b. For paint finishes applied to pipe and tube railings, provide paint complying with the requirements specified in Section 09912, Painting.
3. Shop Finishing Methods:
 - a. For finish designations and application recommendations, comply with the requirements specified in NAAMM/NOMMA AMP 500.
 - b. Hot-dip galvanize exterior steel and iron railings, including hardware, after fabrication.
 - c. Unless otherwise indicated, apply shop primer and shop paint to the uncoated surfaces of the railing components, except those with galvanized finishes and those to be embedded in concrete or masonry, in accordance with the requirements specified in SSPC-PA 1 for shop painting.
 - 1) Stripe paint corners, crevices, bolts, welds, and sharp edges.
 - 2) Provide exposed fasteners with a finish matching the appearance, including the color and texture, of the railings.

2.02 ACCESSORIES

- A. Anchoring Cement:
 1. Provide a factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at the Site to create a pourable anchoring, patching, and grouting compound.
 2. For exterior locations and where indicated, provide a formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating, and that is recommended by the manufacturer for exterior use.
- B. Anchors:
 1. Provide cast-in-place, chemical, or torque-controlled expansion anchors, fabricated from corrosion-resistant materials.
- C. Backing for Anchoring Railings:
 1. For anchoring railings, provide metal backing complying with the requirements specified in Section 09260, Gypsum Board Assemblies.
- D. Bituminous Paint:

1. Provide a cold-applied asphalt emulsion complying with the requirements specified in ASTM D 1187.

E. Nonshrink, Nonmetallic Grout:

1. Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

PART 3 EXECUTION

3.01 EXAMINATION

A. Verification of Conditions:

1. Verify the actual locations of walls and other construction contiguous with the railings by taking field measurements before fabricating the railings, and indicate these measurements on Shop Drawings.
2. Examine gypsum board assemblies, where they have been reinforced to receive anchors, to verify that the locations of concealed reinforcements have been clearly marked for the railing installer.
 - a. Locate the reinforcements, and mark their locations if this has not already been done.
3. Ensure that wall surfaces adjacent to the handrail are smooth.

B. Evaluation and Assessment:

1. Immediately report any errors in the pipe and tube railings which will prevent the proper installation and fitting of parts.
 - a. Report errors resulting from either shop fabrication or deformation resulting from handling or transportation.
2. Do not proceed with erection until unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Protection of In-Place Conditions:

1. Protect adjacent areas from damage resulting from installation of the pipe and tube railings.

B. Surface Preparation:

1. If anchor rods or bolts or other embedded items were cast in the substructure when it was constructed, ensure they are held firmly in the correct position and at the proper elevation by suitable templates.

C. Demolition / Removal:

1. Perform the cutting, drilling, and fitting required for installing the pipe and tube railings.

3.03 INSTALLATION

A. Pipe and Tube Railing Installation:

1. Set pipe and tube railings accurately in location, alignment, and elevation
 - a. Measure the railings from established lines and levels.
 - b. Set the railings free of rack.
2. Fit exposed field connections accurately together to form tight, hairline joints.
3. Do not weld, cut, or abrade surfaces of railing components that have been coated or finished after fabrication, and that are intended for field connection by mechanical or other means without further cutting or fitting.
 - a. Perform cutting, drilling, and fitting required for installing the railings.
4. Before anchoring pipe and tube railing systems, adjust the railing at abutting joints to ensure the alignment matches.

B. Railing Connections:

1. Welded Connections:
 - a. For permanently connecting railing components, provide fully welded joints.
 - b. For field welding, comply with the requirements specified for shop welded connections in Subparagraph 2.01.F.1.b.3.
2. Expansion Joints:
 - a. Install expansion joints at the locations indicated in the Contract Drawings, but not farther apart than required to accommodate thermal movement.
 - 1) Locate the joints within 6 inches of a post.
 - b. Provide an internal slip-joint sleeve extending 2 inches beyond the joint on either side, and fastened securely to one side.

C. Anchoring Posts:

1. For posts to be installed in concrete, either form or core-drill holes not less than 5 inches deep and 3/4 inch larger than the outside diameter of the posts.
2. Clean loose material out of the holes, insert the posts in the holes, and fill the annular space between the post and the concrete with nonshrink, nonmetallic grout or anchoring cement, mixed and placed to comply with the anchoring material manufacturer's written instructions.
3. Cover the anchorage joints with flanges made from the same metal as the posts, welded to the posts after the anchoring material has been placed.

D. Anchoring Railing Ends:

1. Anchor railing ends to concrete and masonry using round flanges connected to the railing ends, and anchored to the wall construction with anchors and bolts.

E. Attaching Handrails to Walls:

1. Provide wall brackets to attach handrails to walls.
2. Locate wall brackets as indicated in the Contract Documents; or, if not indicated, at the spacing required to support structural loads.
3. Secure the wall brackets to the building construction as follows:
 - a. For concrete and solid masonry anchorage, provide drilled-in expansion shields and hanger or lag bolts.
 - b. For hollow masonry anchorage, provide toggle bolts.
 - c. For steel-framed gypsum board partitions, fasten the brackets with toggle bolts installed through the flanges of the steel framing or through concealed steel reinforcements.

F. Interface with Other Work:

1. Provide anchorage devices and fasteners where necessary for securing railings, and for properly transferring loads, to in-place construction.
 - a. To interconnect railing members to other work, provide wall brackets, flanges, miscellaneous fittings, and anchors unless otherwise indicated.
 - b. At railing brackets and fittings fastened to plaster or gypsum board partitions, prevent rotation of the brackets and fittings or crushing of the substrate by providing fillers made from crush-resistant material, or use other means, to transfer the wall loads to the structural supports through the wall finishes.
 - c. For connecting railings to concrete or masonry work, provide inserts and other anchorage devices.
 - 1) Fabricate anchorage devices capable of withstanding the loads imposed by the railings.
 - 2) Coordinate the anchorage devices with the supporting structure.

G. Tolerances:

1. Set posts plumb within a tolerance of 1/16 inch in 3 feet.
2. Align rails so variations from level for horizontal members, and variations from parallel with the rake of steps and ramps for sloping members, do not exceed 1/4 inch in 12 feet.

3.04 REPAIR/RESTORATION

- A. Restore finishes damaged during the installation and construction period so no evidence remains of correction work.
 - 1. Return items that cannot be refinished in the field to the shop.
 - 2. Make required alterations and refinish the entire unit, or provide new units.
- B. Touchup Painting:
 - 1. Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Section 09912, Painting.
- C. Galvanized Surfaces:
 - 1. Clean field welds, bolted connections, and abraded areas and repair galvanizing in accordance with the requirements specified in ASTM A 780.

3.05 SITE QUALITY CONTROL

- A. Site Tests and Inspections:
 - 1. Inspections:
 - a. Inspect the bolted and welded connections.
 - b. Confirm the pipe and tube railings are square, plumb, and level.
 - c. Verify that the welders and welding materials in the field are properly certified.
- B. Non-Conforming Work
 - 1. Promptly remove and replace materials or fabricated components that do not comply with specified requirements.

3.06 CLEANING

- A. Clean aluminum and stainless steel by washing thoroughly with clean water and soap and rinsing with clean water.
- B. Waste Management:
 - 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

3.07 PROTECTION

- A. Protect the finishes of pipe and tube railings from damage during the construction period by furnishing temporary protective coverings approved by the railing manufacturer.
 - 1. Remove the protective coverings at the time of Substantial Completion.

SECTION 05522

TEMPERED GLASS RAILING ASSEMBLIES

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for a factory-fabricated structural glass balustrade system glazed with tempered glass.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01316 - Project Meetings.
 - 3. Section 01360 - Sustainable Design Requirements.
 - 4. Section 01780 - Closeout Submittals.

1.02 REFERENCES

- A. Reference Standards:
 - 1. American National Standards Association (ANSI):
 - a. ANSI Z97.1 – Safety Glazing Materials Used in Buildings – Safety Performance Specifications and Methods of Test.
 - 2. ASTM International (ASTM):
 - a. ASTM E 488 – Standard Test Methods for Strength of Anchors in Concrete and masonry Elements.
 - 3. City of Phoenix (COP):
 - a. Phoenix Building Construction Code and Amendments.
 - 4. International Code Council (ICC):
 - a. ICC International Building Code (IBC) as Amended by the City of Phoenix.
 - 5. United States Government:
 - a. Consumer Product Safety Commission (CPSC):
 - 1) 16 CFR 1201 – Safety Standard for Architectural Glazing Materials.
 - 6. Institute for Sustainability Infrastructure (ISI):
 - 1) ENVISION Rating System For Sustainable Infrastructure - 2015 ISI, Inc.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination:
 - 1. Furnish the tempered glass railing components that are to be installed in other Work to the installer of that other Work, including blocking, sleeves, inserts, anchor bolts, embedded plates, and supports for attachment of the anchors for the tempered glass railing assemblies.

B. Pre-Installation Meetings:

1. One week prior to the start of the tempered glass railing system installation, convene a meeting at the Site in accordance with the requirements specified in Section 01316, Project Meetings, to review the installation of tempered glass railing components that are to be installed in other Work and areas of potential interference and conflicts with the installers of other Work.
 - a. Attendees at the pre-installation meeting must include, but are not limited to, the following:
 - 1) Contractor.
 - 2) Tempered glass railing manufacturer's representative.
 - 3) Program/Project Manager.
 - 4) Subcontractors performing adjacent work.
 - b. Coordinate the diagrams, templates, instructions, and directions for installation of anchorages and fasteners.

1.04 SUBMITTALS

A. Action Submittals:

1. Submit the following to the Program/Project Manager for approval in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Product Data:
 - 1) Tempered glass railing assemblies.
 - b. Shop Drawings:
 - 1) Tempered glass railing assemblies.
 - c. Qualification Statements:
 - 1) Tempered glass railing installer's qualifications.

B. Informational Submittals:

1. Submit the following to the Program/Project Manager for information in accordance with the requirements of Section 01330, Submittal Procedures:
 - a. Test and Evaluation Reports:
 - 1) Test and evaluation reports for the tempered glass railing system.
 - b. Manufacturer's Instructions:
 - 1) Tempered glass railing manufacturer's written installation instructions and drawings.
2. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01360, Sustainable Design Requirements.
 - 1) ENVISION Credit RA 1.3 - Use Recycled Materials
 - a) Submit product data for recycled content indicating post-consumer recycled content and one-half pre-consumer recycled content for those products having recycled content. Include statement indicating at least 20% (by weight or

volume) of materials used are from reclaimed or recycled materials.

2) Adhesives and Sealants

- a) Submit product data highlighting the VOC content for any field applied sealant used.

C. Closeout Submittals:

1. Submit the following to the Program/Project Manager in accordance with the requirements of Section 01780, Closeout Submittals:
 - a. Warranty Documentation:
 - 1) Tempered Glass Railing Assemblies Warranty.

1.05 QUALITY ASSURANCE

A. Qualifications:

1. Tempered Glass Railing Installer's Qualifications:
 - a. Employ mechanics experienced in the erection of architectural metal and glass to install the tempered glass railing.
 - b. Submit the tempered glass railing installer's qualifications to the Program/Project Manager for approval.

B. Preconstruction Testing:

1. Test and Evaluation Reports:
 - a. Submit test and evaluation reports for the tempered glass railing system, prepared by an independent testing laboratory and that show the tempered glass railing complies with the specified design and performance requirements, to the Program/Project Manager for information.
 - 1) If test and evaluation reports for the tempered glass railing system prepared by an independent testing laboratory are unavailable, have an approved independent testing laboratory perform physical tests on the tempered glass railing system and prepare test and evaluation reports to show the tempered glass railing complies with the specified design and performance requirements.
 - a) Submit the test and evaluation reports prepared by the independent testing laboratory for the tempered glass railing system to the Program/Project Manager for information.

C. Mock-Ups:

1. Provide a railing/glass system mock-up in accordance with the requirements specified in Section 01454, Mock-Up Requirements; and constructed of the same railing/glass type specified to demonstrate the aesthetic effects and set the quality standards for fabrication and installation.
2. Locate the mock-up where directed by the Program/Project Manager.
 - a. The approved mock-up may remain as part of the Work.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Acceptance Requirements:
 - 1. Deliver the tempered glass railing assemblies in factory-provided protective coverings and packaging.
 - 2. Protect railing and glass materials against damage during transit, delivery, storage, and installation at the Site.
 - 3. Inspect the railing and glass materials upon their delivery to the Site for damage.
- B. Storage and Handling Requirements:
 - 1. Store the tempered glass railing materials and components prior to installation under cover in a dry location.
- C. Packaging Waste Management:
 - 1. Dispose of packaging waste in accordance with the requirements of the Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

1.07 SITE CONDITIONS

- A. Ambient Conditions:
 - 1. Do not install rail/glass systems until the area is enclosed, and the ambient temperature of the space is at least 65 degrees Fahrenheit and not more than 95 degrees Fahrenheit.
 - 2. For 24 hours before, during, and 24 hours after installation of the tempered glass railing system, maintain the ambient temperature of the space at not less than 65 degrees Fahrenheit, and not more than 95 degrees Fahrenheit.

1.08 WARRANTY

- A. Manufacturer Warranty:
 - 1. Tempered Glass Railing Assemblies Warranty:
 - a. Warrant the tempered glass railing assemblies against defects in materials, fabrication, finishes, and installation within the 1-year period after the Date of Substantial Completion:
 - 1) Submit a Tempered Glass Railing Assemblies Warranty on the tempered glass railing assemblies' manufacturer's standard or customized form, without monetary limitation, in which the tempered glass railing assembly manufacturer agrees to repair or replace tempered glass railing assemblies that fail in materials or workmanship within the specified warranty period to the Program/Project Manager for approval.

PART 2 PRODUCTS

2.01 TEMPERED GLASS RAILING ASSEMBLIES

- A. Manufacturers:
 - 1. Manufacturer List:
 - a. Subject to compliance with the requirements specified herein, provide products manufactured by one of the manufacturers listed.
 - b. Manufacturers:
 - 1) Blumcraft of Pittsburgh; www.blumcraft.com
 - 2) Approved equal.
 - 2. Substitution Limitations:
 - a. Subject to compliance with the requirements specified, products approved by the Program/Project Manager from manufacturers other than those listed herein may be provided.
 - b. Source Limitations:
 - 1) Obtain tempered glass railing assemblies from a single source from a single manufacturer.
- B. Description:
 - 1. Regulatory Requirements:
 - a. Phoenix Building Construction Code:
 - 1) Perform the Work of this Section in accordance with requirements of the Phoenix Building Construction Code and Amendments and the ICC International Building Code (IBC) as Amended by the City of Phoenix.
- C. Sustainability Requirements:
 - 1. Recycled Content
 - a. Provide Stainless Steel Framing whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 25 percent.
 - b. Provide Aluminum Framing whose combined post-consumer recycled content and one-half pre-consumer recycled content is no less than 33 percent.
 - 2. Low Emitting Materials – Adhesives and Sealants
 - a. Provide silicon sealant with a VOC content of 250g/L or less.
- D. Design Criteria:
 - 1. Structural Requirements:
 - a. Provide tempered glass railing assemblies designed to withstand the structural loads specified in Table 05522-1.

Table 05522-1 Structural Load for Rail Heights of 3'-6" and Less			
Distributed Load (Pounds per Linear Foot)	Concentrated Load (Pounds)	Glass Thickness (Inches)	Minimum Length of Rail (Inches)
50	200	1/2	48
100	300	3/4	30

1. Mounting Assembly:
 - a. Provide a two-piece aluminum mounting system design that requires one "base member" to be permanently installed to the building structure, and prepared to receive the other "insert member" that has been securely bonded to the glass.
2. Handrails:
 - a. Provide aluminum handrails bonded to the top of the glass railing.
3. Filler Strips/Covers:
 - a. Provide filler strips/covers appropriate for the type of rail/glass and the glass thickness.
 - 1) Provide appropriate end caps where required to finish off the ends of the mounting members.
4. Product Data:
 - a. Obtain the manufacturer's Product Data for the tempered glass railing assemblies, including descriptions of materials, components, finishes, fabrication details, glass, anchors, and accessories.
 - 1) Include the manufacturer's installation instructions and instructions for care and cleaning of the tempered glass railing.
 - b. Submit the Product Data for the tempered glass railing assemblies to the Program/Project Manager for approval.
5. Shop Drawings:
 - a. Prepare Shop Drawings for the tempered glass railing assemblies.
 - 1) Indicate the sizes, layout, thicknesses, and loading conditions for the glass.
 - 2) Indicate the railing system elevations and sections, details of the profile, connection attachments, anchorage, size and type of fasteners and accessories, joint locations, brazed connections, transitions, terminations, and installation drawings.
 - b. Submit the Shop Drawings for the tempered glass railing assemblies to the Program/Project Manager for approval.

E. Materials:

1. Glass:

- a. Provide fully tempered glass complying with the requirements for safety glazing materials specified in ANSI Z97.1 and with the requirements for glass Categories 1 and 2 specified in 16 CFR 1201.

- b. Provide 1/2 inch or 3/4 inch thick glass as required to meet the structural loads specified in Table 05522-1.
 - c. Provide glass panels that can be removed for replacement at the building Site without chipping out the glass.
- 2. Stainless Steel:
 - a. Provide stainless steel having a Number 4 satin finish.

2.02 ACCESSORIES

- A. Anchors:
 - 1. For attachment of the tempered glass railing system to concrete, provide anchors capable of sustaining without failure a load equal to 4 times the load imposed when tested in accordance with the methods specified in ASTM E 488.
 - 2. Provide 1/2-inch by 4-inch concrete anchors.
- B. Cap Screws:
 - 1. For drilled and tapped or drilled and bolted attachment of the tempered glass railing system to steel, provide 1/2-inch, stainless steel, socket head cap screws.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Verify that the substrate and Site conditions are acceptable and ready to receive the tempered glass railing assemblies.
 - 2. Verify the field dimensions of the locations and areas to receive the tempered glass railing assemblies before fabricating the assemblies.
- B. Evaluation and Assessment:
 - 1. Notify Program/Project Engineer immediately of conditions that would prevent satisfactory installation.
 - 2. Do not proceed with work until detrimental conditions have been corrected.

3.02 PREPARATION

- A. Protection of In-Place Conditions:
 - 1. Protect adjacent areas from damage resulting from installation of the tempered glass railing assemblies.
- B. Surface Preparation:
 - 1. Clean surfaces to receive the tempered glass railing assemblies.
 - 2. For tempered glass railing installations in concrete, space anchor holes 12 inches apart center-to-center.

3. For drilled and tapped or drilled and bolted attachment of tempered glass railings to steel, space holes 24 inches apart center-to-center.

C. Demolition/Removal:

1. Remove materials and substances detrimental to the installation.

3.03 INSTALLATION

A. Review the tempered glass railing installation drawings before beginning installation of the tempered glass railing assemblies.

1. Comply with tempered glass railing manufacturer's installation instructions and drawings.
 - a. Submit the tempered glass railing manufacturer's written installation instructions and drawings to the Program/Project Manager for information.

B. Mounting Base Assembly:

1. Rigidly anchor the mounting base to the floor or stairs using sufficient reinforcement and anchoring as required and approved by the Program/Project Manager.
2. Draw the mounting screws and fittings up tightly.

C. Isolate dissimilar materials with a bituminous coating, bushings, grommets, or washers to prevent electrolytic corrosion.

D. Set the rails plumb and aligned.

E. Tolerances:

1. Install the tempered glass railing assemblies in compliance with the following installation tolerances:
 - a. Maximum Variation from Plumb: 1/4 inch per floor level, non-cumulative.
 - b. Maximum Offset from True Alignment: 1/4 inch.
 - c. Maximum Out-of-Position: 1/4 inch.

3.04 REPAIR/RESTORATION

A. Repair damage to exposed finishes so the repaired finishes are indistinguishable from undamaged areas.

1. If damage to finishes and components cannot be repaired to be indistinguishable from undamaged finishes and components, replace the damaged items with new undamaged replacements.

3.05 SITE QUALITY CONTROL

A. Manufacturer Services:

1. Engage the services of the manufacturer to furnish field observation of the tempered glass railing installation.

3.06 CLEANING

- A. Remove protective film from exposed surfaces.
- B. Metal:
 1. Clean exposed metal finishes with potable water and a mild detergent in accordance with manufacturer recommendations.
 2. Do not use abrasive materials, chemicals, detergents, or other substances that may damage the material or finish to clean the exposed metal finishes.
- C. Glass and Glazing:
 1. Clean the glazing surfaces.
 2. Remove excess glazing sealant compounds, dirt, and other substances.
- D. Waste Management:
 1. Comply with the requirements of the approved Waste Management Plan specified in Section 01360, Sustainable Design Requirements.

3.07 PROTECTION

- A. Protect installed components and finishes from damage after installation.

SECTION 05530

GRATINGS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Requirements for metal bar gratings and anchors.
 - 2. Requirements for metal frames and supports for gratings.
 - 3. Requirements for glass-fiber-reinforced plastic gratings.
- B. Related Requirements:
 - 1. Section 01330 - Submittal Procedures.
 - 2. Section 01360 - Sustainable Design Requirements.
 - 3. Section 01780 - Closeout Submittals.
 - 4. Section 05500 - Metal Fabrications.
 - 5. Section 05511 – Metal Stairs.
 - 6. Section 05521 – Pipe and Tube Railings.

1.02 REFERENCES

- A. Abbreviations and Acronyms:
 - 1. ADA: Americans with Disabilities Act.
 - 2. ADAAG: Americans with Disabilities Act Accessibility Guidelines.
 - 3. ENVISION: The Envision sustainable infrastructure rating system is a comprehensive framework of 60 sustainability criteria that address the full range of environmental, social, and economic impacts to sustainability in project design, construction, and operation. These criteria—called “credits”—are arranged in five categories: Quality of Life, Leadership, Resource Allocation, Natural World, and Climate and Risk. The full Envision guidance manual detailing the credits is provided at no cost to users.
- B. Reference Standards:
 - 1. American Society of Mechanical Engineers (ASME):
 - a. ASME B18.21.1 – Lock Washers (Inch Series).
 - b. ASME B18.22.1 – Plain Washers.
 - 2. American Association of State Highway and Transportation Officials (AASHTO):
 - a. AASHTO Standard Specifications for Highway Bridges.
